alex.wirth@student.um.si, robert.repnik@um.si

Abstract – It is well known that videos in education have some advantages in specific areas. We have made the experiment to see the effect of video in physics education. Our goal was to see if short video clips can improve understanding of physics – optics. In our experiment we wanted to test the principle "*learning by doing*" with the specific emphasis on creativity. Students were divided into two separate groups with the same assignment. First group was to prepare a video without any additional instruction from lecturer but they were not limited by any other means. The second group was further divided into two teams. Both teams got the same instruction how to create educational video clips. The difference between these two teams was that one team was given the detailed analysis of previously created bad educational video on the same topic while the other did not. Since creativity cannot be though and has to come from the individuals own inspiration we wanted to know if too many instructions actually influence the outcome of the students' performance.

I. INTRODUCTION

Instructional video is relatively new in education although it was first used in World War II. In distance education we have years of experience with the e-learning materials production. Only in the last few years recordings of lectures on the web becomes feasible [1]. Never the less e-materials are undoubtedly on the raise, enhancing many of their advantages and minimizing disadvantages (like burdening the eyes). But there is still an open problem of reliability of information if they are not reviewed [2]. Furthermore e-learning materials are useful addition to the educational process. If used appropriately they can help improve students' understanding the basic concepts of natural sciences [3].

At the Faculty of Natural Sciences and Mathematics all students of special didactics study programs have ICT course. This course prepares them for the various application of ICT in education.

In the past research it was shown that the use of instructional video brings only minor improvements in students' knowledge but its other value is tremendous [1][4]. They proved that the instructional video is very good for skill training [1]. But making of the instructional video is very time consuming. If there are no evaluation of the additional workload, teachers will not prepare any additional instructional videos [5]. This fact is neglected in our educational institutions and is actually quite a shame because e-learning materials are interesting addition to the learning process, in particular for natural sciences [6].

We have to emphasise that instructional videos cannot substitute lectures and should only be used as a secondary source of knowledge. Not only instructional videos but all e-learning materials have some drawbacks. If they are (too) good they lower the classroom attendance [5]. Anyway, the student population is not entirely uniform and it is shown many times that older the students are less they are familiar with the technology and more they are conservative in their preferences [7]. But new generations are more ICT literate and they will demand more, high quality instructional videos and e-learning materials in general.

II. INSTRUCTIONS FOR MAKING A INSTRUCTIONAL VIDEO

With optical set from a seller nT-BROG students were to prepare instructional videos that will help understand optics. Video is not meant to substitute the experiment, but should be consider as its supplement. Video is meant to help learners to refresh their knowledge gained somewhere else (in the school at physics lessons or physic courses – summer schools, etc.)

Though instructional video looks simple on the design paper its actual production requires many skills. Light consideration is the one that cannot be dismissed in video recording for good visibility and reflection issues. . Viewers of the experiment need to get good impression of the surroundings of the experiment and scale. To prevent video shaking a tripod should be used. These are only technical consideration in the video recording. The other considerations are also highly important – aesthetic aspect. No matter what kind of learning materials is prepared it needs to be aesthetically pleased and didactically suitable. [1] [2]. To be didactically suitable the physics experiment must be easy to understand with the clear intention for the viewer. Focus of the video is experiment and not the preparation of the experiment even if it may be considered highly important for teachers who want to prepare the same experiment. Though sound is not important in the video of the experiment it is not uncommon to prepare suitable sound background or audio narration if this is feasible. For the real universal video learning materials (hearing impaired people too) all elements should be visual. Textual of image explanations are therefore necessary in such educational video. If video is further processes it is possible to include subtitles. From the users perspective subtitles can be turned on and off and even

switched between different languages. This would enable to produce multilingual learning materials. Any text, schemas and images used in video should be verified by the experts who know the experiments thoroughly.

Students get the following assignments for the video production:

- Concave mirror,
- Convex mirror,
- Mirror 1,
- Lens 1,
- Lens 2,
- Lens 3,
- Lens 5,
- Lens 6,
- Lens 7,
- Lens 8,
- Refraction of light,
- Reflection of light,
- Model of a healthy eye,
- Model of short-sighted eye (+correction),
- Model of far-sighted eye (+correction).

Student also receive additional instructions that video should be interesting for the learners and that all exposed parts of the body that are recorded on the video should have not jewellery or tattoos. Audio background should match the scene of the video, be neutral to the viewer, and obay the copyright restrictions.

III. METODOLOGY

In our case we prepare single case study. We analysed videos that were made by the students of previously described groups. In the analysis we exposed the good and the bad issues in the instructional videos. But to make things more interesting we compare our result with the instructional video made from the interdisciplinary group of students from physics and computer science who have different instruction but the same outcome. Their goal was to made instructional video for students competition and that was all they were instructed. The topics, approach and implementation was entirely up to them.

IV. INSTRUCTIONAL VIDEO

First group that had no instructions how to make a video generally made bad instructional videos. Their videos were shaky, experiment was not in centre of video, and hand that moved the lenses and mirrors is considered the nuisance (fig. 1 and 2). Though students today have sufficient ICT knowledge and are considered highly innovative their video were dull and provide no viewers appealing.

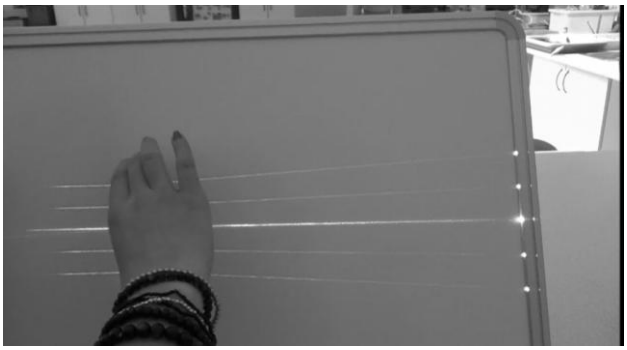

Fig. 1: Example of a bad instructional video.

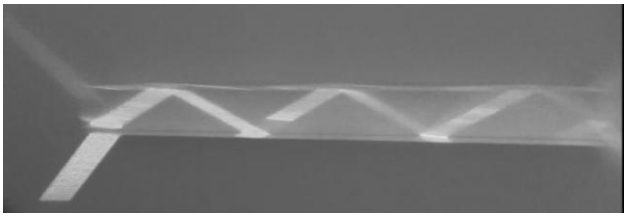

Fig. 2: Blurry image due to quick movement of a camera.

The second group got more instructions how to prepare instructional video. But for this experiment we divide them into two subgroups. First subgroup did not see videos (from other groups) and receive analytical view what is considered good and bad instructional video, while the second subgroup does. As expected the subgroup that has instruction and sees video from other groups made the best instructional video. Room in which they filmed videos was darker than room from the first subgroup. Darker room exposed the contrast between laser and white blackboard in the background but the scale is still visible. They used a scale and showed the point where the rays meet (focus) but they did not show that the lens is at the base of a scale (fig. 3). Unfortunately the reflection of cameraman is seen on the video (fig. 4).

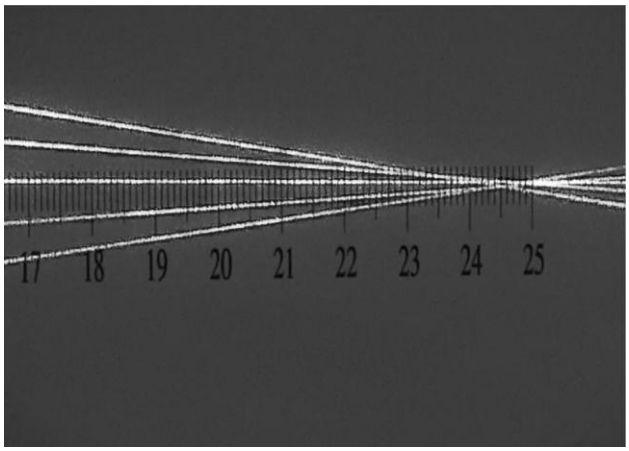

Fig. 3: Scale was used. Images tend to be black and white. Room is darker but you can still see the scale – that way contrast between background and laser is better. Sadly it was not shown that lens is at the base of a scale. From this image you cannot identify the focal length of a lens.

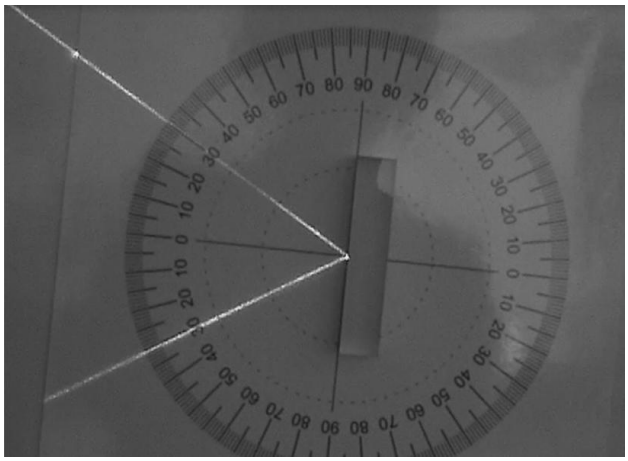

Fig. 4: Entry angle and reflective angle are nicely visible but there should be no shadow of camera operator.

The best videos made the team from the second group that saw bad videos from the first group. They got the chance to see and correct all the mistakes of the first group. It turn out that they took their chance to improve flaws of the first group. They also made better videos then the other team of the second group. For example they showed that the centre of a lens was at the base of the scale and enable viewer to determine focal length of a lens. Table 1 shows us bad and good activity in instructional video production.

Table 1: Differences between good and bad doings when making an instructional video.

BAD	**GOOD**
shaky videos	use a tripod
recording room in which you are making videos	experiment in centre of a video
kitschy transitions	neutral music
to dark or to bright videos	there should be just enough light that scale is visible but not too much so that there is a good contrast between laser and background
video substituting the experiment	appealing videos so that students are motivated to watch it at home – that way they refresh their acquired knowledge

V. INTERDISCIPLINARY TEAM

We also analysed one older video which was made by five students. Two of them were physicists, the other three were computer science teachers. They made very good instructional video on optics. Not only did they use video but they included animations (fig 5). Animations are unrealistic but they are very pure and minimalistic. In real world video it is often very difficult to expose everything but animations can be prepared in sterile environment and easily achieve that. In video they included nice neutral music. The transitions between inscriptions, animations and experiments are not too aggressive; and experiments were all in the centre of the video.

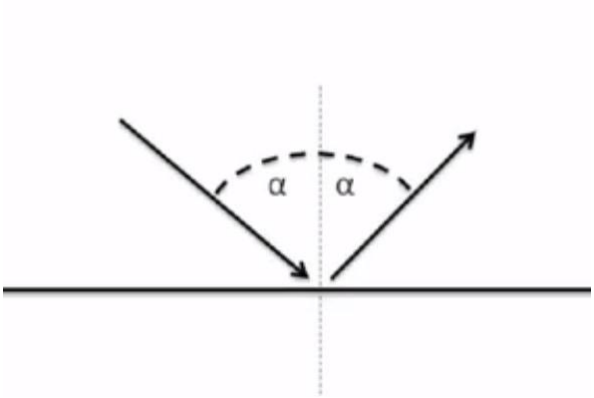

Fig 5: Use of animations in instructional video.

Though they were not given any instructions for their work they prepare good instruction video. This may contradicts our findings that students will make better instructional video if they are given instructions. But we must not forget few vital things they had. They knew that their product is going to be for the competition, and they were highly motivated because they know the prize they can achieve in the competition. In general such high motivation is hard to achieve between students and it is also true that students know they can get different grades for their work. Some of them see no need to score the highest grade. This does not contradict with the findings that not all students are suitable to participate in different projects.

VI. CONCLUSION

In this article we presented the results of research made between students of physics. Now it is evident that instructions do not kill the inventiveness. We showed that student would make better instructional videos when they are provided with good end extensive instructions. But there are some experiences that come only with time and practice. One who has more of them will make better instructional videos. And at the end we would really like to emphasize the effect of motivation on the quality of the product.

Examples of Best Practice of University-Industry Collaboration in the Domain of Electro-CAD Application by using EPLAN P8 and E-learning Systems

D.Lukac*
* Rheinische Fachhochschule Köln gGmbH,
University of Applied Sciecens, Köln, Germany
lukac@rfh-koeln.de

Abstract - Requirements of the industry are reflected into the curricula of the universities oriented to application oriented sciences. Nevertheless, a coordination of the teaching contents to the industrial requirements often does not work efficiently enough because, on the one hand, the dynamism of the changes of the useful teaching contents becomes sluggish at the universities compared with the industry, on the other hand it often does not come to the desired long-term collaboration between universities and industrial companies. In this work different collaboration examples are presented. Also the state of the art of a successful collaboration and the further development of certification program between university and a next-door international enterprise in Cologne, Germany, in the domain of the Electro-CAD application are presented. Special look is give on the technical part of data exchange management. Some examples of such collaboration in the everyday practice at the Cologne University of Applied Sciences by use of the E-learning systems ILIAS and EPLAN Electric P8 software are presented.

I. INTRODUCTION

Who has influenced first whom, one theorist a practical person or vice versa, remains an unanswered philosophical question. However, one thing is sure, theory needs a useful - meant is for the industry useful - practice. This is nothing new; however, till these days this so called university-industry education often does not work in fact. There are many companies which have recognized these problems and out of it, have tailor-made education-oriented continuing education offers for educational institutions. Those especially in regard of different hardware and software solutions like companies as Festo [1], Christiani [2] or Lybold didactics [3] do that. Such systems are surely advantageous for special or university education, but they have a great disadvantage. It is, that without suitable training and permanent continuing education of students and above all of lecturers who have a task to transmit the knowledge to students, such systems becomes very fast outdated provided knowledge. Not out of dated but an up-to date education is asked, which is oriented to the developments of the industry. Consequently the questions arise, how such educational purpose can be reached, and above how this objective can be financed and technically developed in the long-term and which requirements have to be taken into consideration behind the sole readiness to collaborate?

II. BEST PRACTICE EXAMPLES OF UNIVERSITY-INDUSTRY COLLABORATIONS

A. *Technical University in Berlin and Deutsche Telekom*

There are many examples of collaboration between colleges or universities and industrial companies. One interesting example is collaboration between Technical University in Berlin and Deutsche Telekom in the area of innovations in ITC in form of so-called "Deutsche Telekom Laboratories" [4].

Figure 1. Deutsche Telekom Laboratories

Innovations in the sphere of information and communication change the world and are the base for a sustainable development within the national economy. They can be inspired by customers or by research, to solve problems basically better. To form promising innovations, is a job which must be solved by the science as well as by the enterprises. The connection of both worlds has chosen Deutsche Telekom as a beginning of their promising objective. Together with the Technical University in Berlin it has founded the Deutsche Telekom Laboratories on the campus of the Technical University in Berlin. The

mission is: to set up indicative research of innovative information technologies close to market and telecommunication technologies. Top researchers realize together with experts of Telekom they visions to the creation of the information technology and telecommunications from tomorrow. In Telekom Laboratories the know-how of Deutsche Telekom with the potentials by top researchers from all over the world is bundled up. Telekom Laboratories form the crystallisation point of state-of-the-art knowledge to disruptive, meant is revolutionary, technologies of the future.

B. *Technical University and SAP*

Another interesting example is the cooperation of the Technical University in Darmstadt and the company SAP, in the form of the so-called "SAP Research Centre" also called “SAP Living Lab” [5].

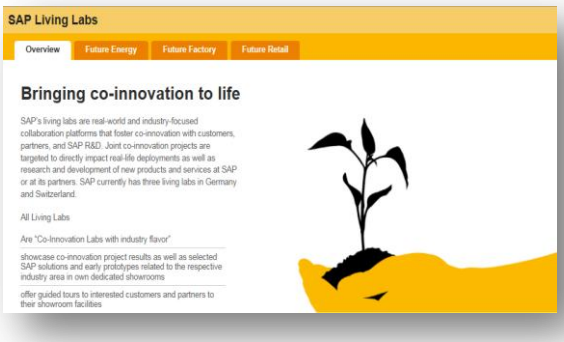

Figure 2. SAP Living Lab

“SAP Research”, the SAP own research department with the head office in small German town Walldorf and scientist of Technical University in Darmstadt co-operate successfully on several research fields since many years as for example "knowledge work in highly dynamic working surroundings", "interaction models for improved use friendliness" and "new methods for the software engineering". These areas are observed in their interlinking potentials and are from special strategical interest for SAP, because they have a strong influence on the use friendliness of the future products. Thus the intelligent software environments are developed for the business application which open varied or new services to the user. According to [6] "The cooperation is another example of the close collaboration between the Technical University in Darmstadt and an extremely innovative enterprise". The cooperation also encloses a common doctoral candidate's program: Together with SAP scientists research will do each year up to 14 doctoral candidates in subjects like "creation of future working environments". In cooperation with more than 30 leading universities SAP Research investigates worldwide new technologies and examines this for their potential for innovative software solutions or commercial models. With it the pioneering role SAP should become protected by applied technology research and be further developed. Besides, the new location the SAP Research strategy underlines the collaborative research with the aim to strength the European IT-research scene which should be opened even further for new partners. In common projects with customers, technology partners and universities the bases for future commercial uses and their infrastructures are investigated and developed. Besides, German SAP Research pursues two other partners in Brisbane (Australia) and Pretoria (South Africa), in addition also three SAP Research Centers in Palo Alto (USA), Montréal (Canada) and Sophia Antipoli (France).

C. *University of Heidelberg and Nikon LLC*

Also is to be mentioned the collaboration between University of Heidelberg with the company Nikon LLC in the form of so-called "Nikon Imaging Center (NIC)".

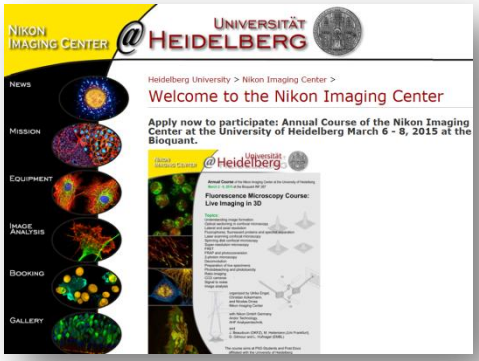

Figure 3. Nikon Imaging Center (NIC).

Nikon Imaging centre is a light-microscopic equipment of the university at BioQuant, the Center for “Quantitative Analysis of Molecular and Cellular Biosystems” [12] in cooperation with the Nikon LLC, Nikon Instruments Europe B.V. as well as other internationally operating enterprises. The life sciences and the medicine of the university receive with the NIC access the newest microscopic procedures and instruments [7] .

D. *University in Passau and Siemens AG*

There are not so many examples in the area of the CAD / CAE cooperation between universities and industrial partners. Nevertheless the cooperation between Siemens AG and University in Passau is to be mentioned as one example. Thus company Siemens supports new seminar offer with CAD software.

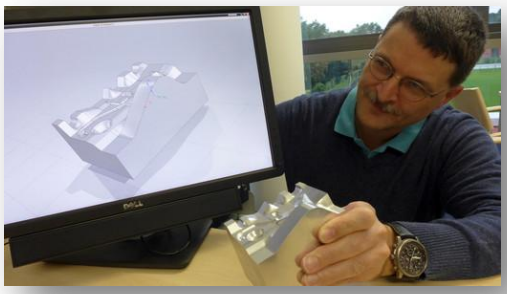

Figure 4. Nikon Imaging Center (NIC) at University in Passau .

Students of the informatics courses as well as mobile and embedded systems courses can visit since winter semester in 2013/14 for the first time a seminar to the subject CAD and learn to work with the professional CAD software NX. Cooperation with Siemens makes this offer possibly [8].

E. Rheinische Fachhochschule Köln and EPLAN Software and Services GmbH & Co.KG

Another successful example in the area of CAD/CAE about which already 5 years ago has been reported at the MIPRO conference and which is still successfully functioning, is cooperation between EPLAN Software and Services GmbH & Co.KG and Rheinische Fachhochschule Köln – University of Applied Sciences [9]. To develop and keep functional such wide and successful cooperation, are different success factors determinative. Among the rest, these factors are: functioning data interfaces (in this case based on E-Learning system ILIAS) to the industry tailor-made education offers at schools and colleges, permanent continuing education of the lecturers and development of suitable practice exercises and study course plans for schools and universities [10]. It means, in order to come along with the development of the new versions of the software, it is necessary to continuously develop examination questions, either in English language for international certifications and also in German language for national ECS examinations. Export function of the data exchenge file is presented in following figure.

Figure 5. Interface for creation of XML data exchange file

This enormous and complex task can only be efficiently solved, if collaboration partners, Rheinische Fachhochschule and EPLAN Company agree to work simulations and to develop clear interfaces for data exchanges. In the case of definitions of the examinations questions, for data exchange is XML file defined. One example of the XML file is presented in following.

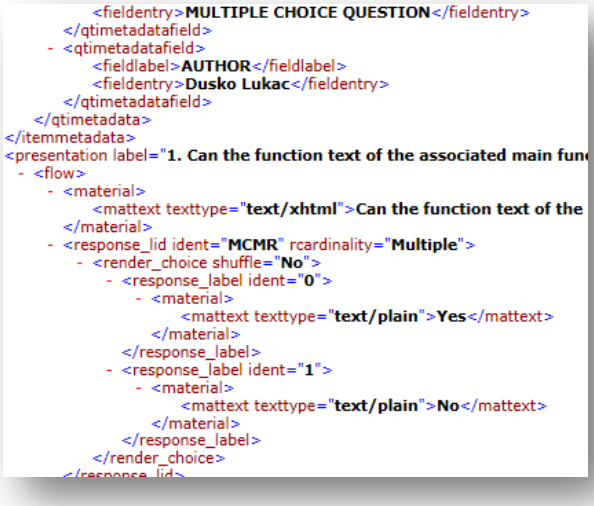

Figure 6. Example of edited XML file used for data exchange

This file allows definitions of the questions type as e.g. multiple choice with single or multiple answers, free text questions, java applet combined questions and answers. On this way, efficient work is possible and technical fundament for well-organized development of the whole program is achievable. The online-examination portal for EPLAN Certified Student (ECS) exam is presented in following:

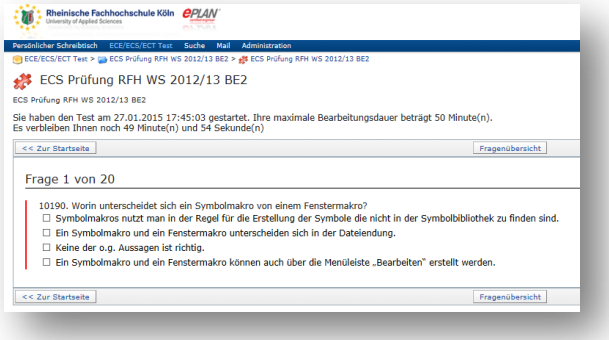

Figure 7. Online examination portal based on ILIAS Learning Management System

III. UNIVERSITY-INDUSTRY COLLABORATIONS IN DER AREA OF CAD/CAE

A. Eplan Certified Student – Examples based on platform 2.4

As already mentioned, a successful education oriented to industry at colleges requires a structured and planning oriented education, which takes into consideration the newest technical developments. Thus Rheinische Fachhochschule Köln – University of Applied Sciences uses currently the newest version of the software EPLAN Electric P8, not only to provide the basis knowledge on the new platform, but also new functions from the version 2.4. In the following some of the new functions used in everyday educational practice are presented. So, for

example, the simplistic representation of the PLC structures with one-pole functions under 2.4 makes the documentation and management more clearly and with it much easier. Also the management of the, so called “part projects”, increases the overview of the whole project. From the project, relevant parts can be extracted, worked on individually and bring together again later in the whole project. With it an entire and highly qualitative documentation is generated and users can better concentrate upon his/her area of responsibility. The platform EPLAN supports numerous norms as for example the IEC 81346; now the marking of project sides according to IEC 61355 is possible. With this kind of the marking an object characteristic is used for the definition of the project structure. Besides, with the object sign a document, it means a project sides, is assigned to certain object (function, place or product). This marking can be also used in connection with an interface to PLM/PDM or ERP systems. Now also other devices like converter, engines or valves with bus connections can be a component of a PLC bus system. Devices with several, different bus systems are better supported with it. Also additional PLC manufacturers were taken up for the bidirectional data exchange - for example ABB., Mitsubishi Electric and 3S. [11]

B. Example 1 – Device oriented projecting

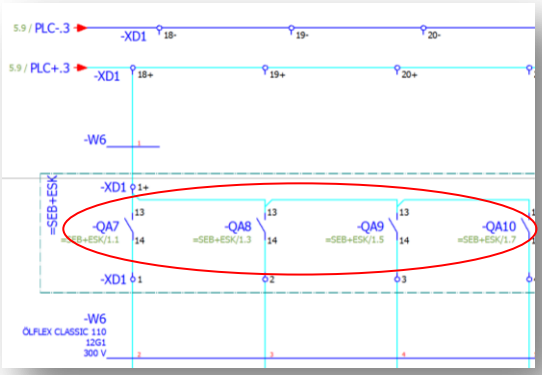

Figure 8. NOC placed device oriented

The present example concerns so-called device oriented projecting of the motor protection switch contacts -QA7 to- QA10. This means that the so called normally open contacts (NOC) are not to be placed out of symbol library, but there are dependent on company product (article) observable in the device navigator. This functionality becomes clearer to understand if live presented.

C. Example 2 – Enlarged data exchange with Siemens SIMATIC STEP 7

For the new EPLAN version 2.4. the PLC interface was extended for the data exchange between EPLAN Electric P8 and the configuration PLC software " Siemens SIMATIC STEP 7". Now for PLC cards different start addresses and addressing ranges can be defined. For this purpose both following propreties are available in the PLC boxes in the switch plan:

1. Addressing range 2 (ID 20299)
2. Start address 2 of the PLC card (ID 20255)

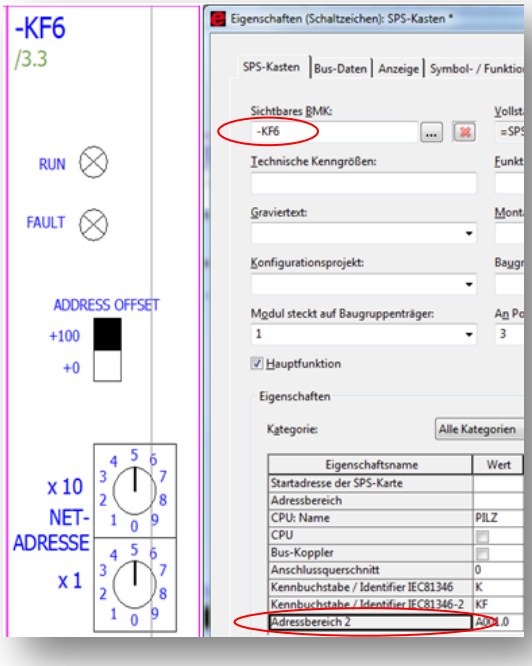

Figure 9. New possibilities for definiton of start addresses and addressing ranges for PLCs

With it the addressing range 2 and start address 2 of the SPS map are evaluated. The control box “Separate addressing area for inputs and outputs” must be deactivated. In that case for the PLC cards which have inputs as well as outputs with the help of the property “Addressing range 2” one can fix a separate addressing range for the outputs. Every PLC connection must have an unequivocal name, i.e. if the address "A001.0" exists, the address "E001.0" cannot be awarded any more. With the new function a common addressing range is used for PLC in and outputs. In this case the addresses are distinguished, in addition, by the prefix, i.e. within a PLC addresses with the same byte and bit address may seem, e.g., "A001.0" and "E001.0".

IV. CONLUSION

Paper gives examples and an overview of best practices collaboration between the university and industrial companies in Germany. Examples of the best practice collaboration in the area of CAD/CAE applications are comparatively seldom in regard of wide use of the CAD/CAE software in developed industrial countries. On the one side the reasons are to be find in the undeveloped trials to start such collaborations, on the other side, long-term collaborations between industrial companies and universities are threatened by slow and inertially development up to date course at universities and the lack of efficient working interfaces, either

technical but also managerial. In this paper an example of functioning technical data exchange is presented as well as examples of day by day examination tasks based on the newest release of EPLAN P8 software. Also one important reason of failure of such collaborations is lack of access to the newest industrial development by universities, and on the other side, lack of financial support to update the equipment and software at universities in order to come along with the industrial development. Industrial companies on the other side, search for same working attitudes which are not always given at universities, because of the different nature of the work. Therefore, industrial companies must make concessions in regard of financial support of universities as a part of their long-term marketing strategy as well as possible acceptance of the different working attitudes, on the other side, universities must offer potential parsons which are able and compliant to sustainable work on the maintenance and further development of the joint educational programs between the mentioned parties.

ACKNOWLEDGMENT

The development for this paper was supported by the Rheinische Fachhochschule Köln and EPLAN Software and Services Company. In developing the ideas presented here, I have received helpful input from training team of the EPLAN Company. I also thank reviewers for their feedback.

Self-Paced Computer Aided Learning of Music Instruments

Mladen Konecki
Faculty of Organization and Informatics, Varaždin, Croatia
mladen.konecki@foi.hr

Abstract - Many people want to learn how to play a musical instrument. Modern business life however makes hard for people to make time for scheduled musical lessons. People tend to find time for this kind of activities in various periods of their working day. This implies that some kind of self-paced learning system would be well-suited for this kind of learning. Self-paced learning systems would have to be able to track progress of its users and also adapt its courses depending on one's abilities and the speed of progress. In this paper this kind of system is described and discussed. The question that needs to be answered is whether people in fact have real interest for this kind of system and what aspects of this kind of system they find important. This paper presents research results that give answers to these questions. Presented results are discussed and directions for future research are also stated and elaborated.

Keywords **- musical instruments, self-paced learning, automated and adaptive learning system**

I. INTRODUCTION

A. The impact of music and music education

Music is an integral part of everyday life. Most of people like to listen some kind of music. There are reports which have shown that music can have beneficial effects on people in many different ways. For example, listening to music can enhance one's spatial-temporal reasoning [1]. It also can have positive effect on listeners' mood [2].

But there are even more research papers which have shown that music training has positive effect on people. In [3][4] is shown that music lessons can enhance one's IQ. Music training can also enhance one's auditory skills [5]. Also, short-term music training can enhance listener's verbal intelligence and executive function [6]. Another research has shown that brain structures differ between musicians and non-musicians [7]. Musicians practice various complex motor, auditory and multimodal skills and [8] reports that children who had music training have long term enhancement of visual-spatial, verbal and mathematical performance.

B. Statistical data about music education

Statistical data shows that in recent years more and more people tend to learn how to play musical instruments [9]. In the U.S., in 2002 there were 15,74 million musical players and in 2010 that number has raised to 18,08 millions. International Music Products Association conducts a telephone surveys every 3 years [10]. Their research data shows that in 2009 there was a musical instrument player in 58% of households in the U.S., compared to 1997 when this number was 38%. The percentage of households with two or more players was 34% in 1997 and in 2009 it was 43% [10]. When considering how many people have taken music lessons during their lifetime in the U.S., it can be seen that this number has decreased from 47% to 35,6% from year 1982 to year 2012 [11]. This fact raises a question how it is possible that there are more musicians and less people that are taking formal music lessons. The most probable answer to this question is that today there are more ways to learn how to play musical instrument than before. In the year 2000, 25% of musicians have taken their first music lessons at school. In the year 2006, this percentage dropped to 16% and then in 2009 came back to 22%. The number of people that have taught themselves how to play musical instrument in the year 2000 was 14%, in the year 2006 was 26% and in the year 2009 decreased to 20% [10]. Today, people can search the Internet and find lessons and learn how to play musical instrument on their own. In the year 2003, 20% of people used Internet and other alternative sources to learn how to play musical instrument, but in the year 2009 this percentage was increased to 30% [10] which was almost third of all music players. There is so much knowledge on one's disposal today and people can learn things much easier than before. Survey conducted by Australian Nexus Survey showed that in the year 2001, 15% of music players became interested in music on their own while in the year 2007 this percentage has increased to 21% [10]. In the U.K. 43% of music players stated that they learned to play musical instrument on their own. Music Council of Australia conducted survey in 2001 and found that 75% of people that don't play musical instrument wanted to learn how to play one and 49% of them still wanted to learn [12]. These data show that there is a big interest for music education. Today, various technology can be used to find new ways of teaching people how to play musical instruments and that is the trend of the future.

C. Paper overview

In this paper, a short overview of computer educational systems that exist in the domain of music education is given. A short overview of proposed model that is adaptive to learners' skills and needs and that enables self-paced learning is also presented. Conducted survey among the students with the goal to conclude whether people have real interest in this kind of system is

also presented and elaborated. In the conclusion some final remarks about presented topic are made and pointers for future research are given.

II. RELATED WORK

A. Computers in music education

There are many applications of computer technology in music education. According to [13], there are several main categories where people can apply computers in music education:

- teaching fundaments of music
- teaching of musical performance skills
- performing of various analysis of music
- teaching of musical composition skills

There are numerous representatives for each of given categories. Of course, computer programs in these categories are partially overlapping. In [13] several created systems for each category are stated. Some of the most popular are:

- Hyperscore [14] which teaches children to make music and rhythmic patterns by hand drawing.
- Continuator [15] which teaches children music concepts through simple computer games.
- Music Ace 2 [16] which consists of 24 short games and enables its users to follow their progress and earn medals.
- MiBAC Music Lessons 2 [17] which can help in acquiring ear training and sight-singing skills as well as harmony concepts.
- Practica-Musica [18] which has 225 lessons that teach basic music playing concepts.
- GNU Solfege [19] which is free ear training program that provides customization of existing exercises.

B. Computers as tutoring systems

The category that is the most important for this topic is teaching of music performance skills. To help people in acquiring playing skills these systems must be able to capture players' input, to analyze captured data and to give proper feedback. Some of the most popular educational systems in this domain that can be found are:

- i-Maestro [20] is computer system that enables its user to learn bowed musical instruments, especially violin. It has many modules and it enables collaboration between professor and students in the class, while learning music theory and making music sheets. Based on input audio and movement sensors it can give its users feedback on their playing accuracy, body posture and gesture accuracy although interpretation of results is done by professor. It's however not fully automated. System can also generate different exercises.
- Violin Tutor [21] is a software that helps beginners that are just starting to play violin. It captures audio data over microphone and transcribes that signal into music notes. On the interface learners can see interactive music notes, 2D violin fingerboard where learners can see what they need to play and 3D animation that shows to the learners how to play. By audio frequency analysis, system can show its learners weather they played correctly or not and what was meant to be played.
- pianoFORTE [22] is a system that can capture users' piano playing over MIDI interface. It tracks several aspects of playing: dynamics, tempo, articulation and synchronization of music events. After playing, system shows to users in graphical form what was played correctly and where mistakes were made. This is useful since new players usually have problems with self-evaluation.
- PianoTutor [23] has some main features of intelligent tutoring system. It captures users' piano playing over MIDI interface, it can detect various mistakes in playing (in pitch, dynamics, notes length) and based on the type of mistake it gives proper exercises to help users to learn how to correct those mistakes. It has around 100 lessons. Order of the lessons is determined by users' level of skill.
- IMUTUS [24] is a project that is aimed at the development of an open platform for training users to play by using recorder. Practicing environment was created where developed system could record users' playing over the microphone and then analyze and evaluate users' performance. It points out where mistakes were made and helps users to focus on those parts of the score.
- VEMUS [25] project is based on IMUTUS project but its use is expanded on brass instruments, such as saxophone, flute and clarinet. Its goal is to make intelligent tutoring environment for practicing of playing alone, where system gives proper feedback based on the type of mistakes that are made. Its main goal is to make a virtual music school.

There are also many commercial products on the market [26]. Most of them are made for learning of piano playing since almost third of all music students play piano [10]. These products usually have simple features which can capture users' piano playing over MIDI interface and give feedback on what was played correctly. Lessons are always the same for all users.

There are also many educational games [27]. They are mostly fun to play with, but some of them have educational features. For example, "Rocksmith" is a computer game in which people can plug their real electric guitar (or electric bass) and learn how to play real instruments. There are also games like "Rock Band" in which people can play drums with playing mechanics that is very similar to real drumming.

C. Motivation

Educational goals and educational purpose of computer aided systems in music education have been mentioned and established, but another very important factor for music education is also motivation. Without proper motivation in the learning process, students will not learn much and will struggle while learning. On the other hand, motivated students are learning faster and better. Csikszentmihalyi directly talks about education and motivation and brings these two concepts together in his motivational theory called "The flow theory" [28]. He defines flow state as a state that's optimal for efficient learning. He defines 9 dimensions that are necessary in order to achieve the flow state [28]:

1. Clear goals in every moment - to have clear goals, there has to be instructional model in computer system that will guide users and tell them what to do next, based on their previous results.
2. Clear and immediate feedback - there has to be a proper feedback that shows what was played good and where mistakes were made. Most of computer systems described have this component.
3. Balance between the perceived challenges and perceived skills - lessons must be challenging so learner is not bored but they also shouldn't be too difficult because learner might get discouraged. Based on playing results, computer system should chose harder or easier lessons for the learner.
4. Merging of action and awareness - it's a state in which learner is focused while achieving his goal and he is not aware of that. Computer systems are suitable for achieving this state. By making learning a fun experience, learner is perceiving that he's having fun and not that he is learning. For example, by adding backing tracks while playing lessons, learner might have a feeling that he is in a band and that should make the experience more fun.
5. Freedom from distractions - with computer screen and headphones, computer systems can minimize distractions from surroundings and make learner fully focused on his actions.
6. No fear from failure - sometimes people can feel anxiety when they have to learn something they are not good at. When learning on a computer system, nobody is listening except the "computer", so this kind of learning can lower this anxiety.
7. Loss of self-consciousness - elements of computer games can make people forget about themselves as they become fully emerged in situation that they are in. As was mentioned before, computer systems can make learners fully focused on activities they are doing and with background music learners can have feeling that they are performing in a band, that they are part of a successful music group, etc.
8. Time distortion - when fully focused, learners can easily lose track of time and that is good if that happens in the learning process because learners are in that way willing to spend more time learning. This usually happens when people play computer games and when they are having fun. By making learning process game-like and fun, learners are encouraged to spend more time learning and by doing that they learn more.
9. Autotelic or self-rewarding experience - when activity is so fun and good that by just doing that activity, learner feels rewarded, then learner is experiencing autotelic state. In this state learner can learn in optimal way.

As can be seen, motivation is very important factor in the learning process. By having these dimensions in mind, a successful computer learning system that will be able to optimize learning experience can be developed.

D. Proposed model

Existing intelligent tutoring systems are based on capturing users playing and giving feedback based on the type of mistakes that were made. Database of lessons are mostly static and all users get the same lessons. Fig. 1. [29] shows reasoning mechanics that was developed and used in previously developed computer systems. Pointing out where mistakes were made during instrument playing is one of the main dimensions in Csikszentmihalyis model. Most of developed systems have this feature but usually goals are not clear and specially balance between perceived challenges and skills is not managed in any way. Usually, there are lessons that are static (always the same) and there is only one path through the knowledge base and lessons.

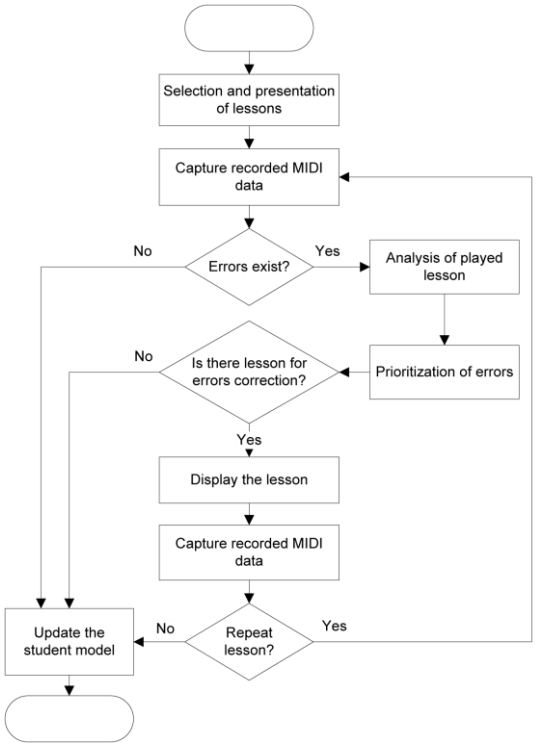

Figure 1. Model of reasoning mechanics in previously developed computer systems

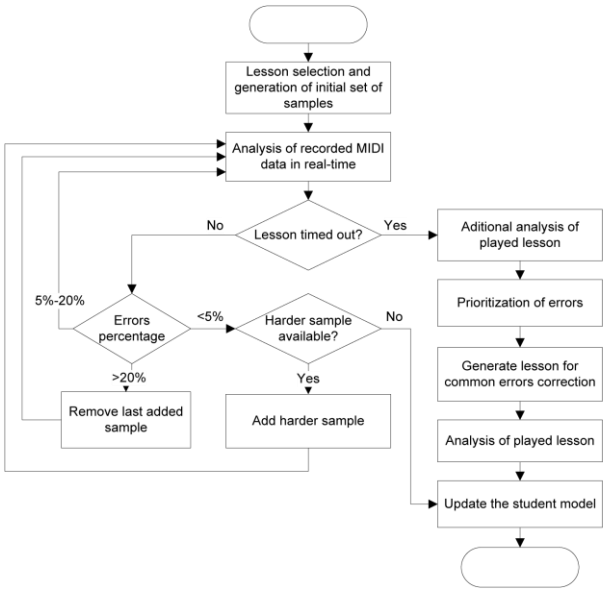

Figure 2. Proposed model of reasoning mechanics in real-time

In order to provide somewhat improved solution a new model which is shown in Fig. 2 is proposed and it enables real-time feedback and real-time adaptation to learners' skills [29]. Music lessons are divided into smaller patterns and based on percentage of correctly played patters, lessons are adapting in real-time. If percentage of correctly played patters is high, then new harder patterns are added into lessons. If that percentage is lower than expected, then harder patterns are removed and easier patterns are included. Also, after every particular lesson, types of mistakes are analyzed. Based on the highest amount of specific types of mistakes, additional lessons are generated. These lessons are always a bit different, because they are generated based on patterns from the knowledge base and types of mistakes that were made. Finally, path through knowledge base is not static but dynamic. Players that will have higher percentage in pattern playing will go faster through the knowledge base while those that learn slower will have a slower pace. Each lesson has a clear goal and that is to learn patterns that are presented. To additionally motivate learners, musical backing tracks are used to make playing experience even more interesting.

III. RESEARCH RESULTS

A. Motivation

Statistical data that was presented in the introduction of this paper shows that high number of people want to learn how to play music instrument. Important question was how these people perceive the concepts that have been presented in proposed new model. One of the important steps in creating adaptive learning systems is to determine users' needs but generally not much evaluation in the domain of intelligent tutoring systems can be found. For example, Violin Tutor has been evaluated by 12 users [21]. PianoFORTE was evaluated but evaluation results have never been published [22]. PianoTutor was evaluated by 18 users [23], where 10 finished evaluation process. i-Maestro has many modules for technology-enhanced learning but evaluation results were never published [20]. IMUTUS project was tested on 12 users, 6 in IMUTUS group and 6 in control group [24]. Although these studies gave positive feedback, studies on a larger scale are needed to get statistically more significant results.

B. Questionnaire results

We conducted a survey to determine perception of potential users of our proposed model and its features. Survey was conducted among 126 students (n=126). Answers were based on Likert scale, where 1 means "strongly disagree", 2 "disagree", 3 "neutral", 4 "agree" and 5 "strongly agree". Results of conducted research are shown in Table I.

TABLE I. RESULTS OF QUESTIONNAIRE RESEARCH

No.	Questionnaire item	Mean	Std. dev.
Q1	I want to learn how to play a musical instrument.	3,72	1,25
Q2	In my daily schedule I don't have time to attend music school.	3,89	1,25
Q3	I would like to have possibility to learn how to play a musical instrument with self-paced tempo and schedule.	4,22	0,97
Q4	I would like to be able to learn how to play a musical instrument with the help of a computer.	3,90	1,19
Q5	I would like to get feedback of my learning progress while learning to play a musical instrument with a computer.	4,12	1,14
Q6	I want music lessons to adapt to my knowledge and my tempo of progress.	4,29	0,96
Q7	I think it's important that the content of music lessons adapt individually to every learner.	4,24	1,01
Q8	I think it's important that the order of music lessons adapt individually to every learner.	4,28	0,92
Q9	I consider that automated learning of playing a musical instrument by using computer is important.	3,72	1,02
Q10	I would recommend automated learning system of playing a musical instrument that adapts to learners skills and needs to my colleagues.	3,96	1,03
Q11	Automated and adaptive way of learning how to play a musical instrument would make learning process easier.	4,07	0,96
Q12	Automated and adaptive way of learning how to play a musical instrument would make learning process more interesting.	4,20	0,97

The research results have shown that most of the students would like to learn how to play a musical instrument (58%). This data is consistent with the statistical data presented in the introduction about the number of people that still want to learn how to play. Most of the students perceive that they don't have enough time in their daily schedules to attend music lessons. But as it was mentioned before, there are alternatives. More and more people learn how to play a musical instrument on their own. But that is highly unstructured and unsystematic way of learning. Research results have shown that people would like to learn how to play a musical instrument with the help of computer, considering their own tempo and schedule. Feedback has been

reported as very important to everyone. But aspect that was perceived as even more important is to have adaptive way of learning where lessons and their content adapt to students' knowledge and skills (Q6, Q7, Q8). Students perceive that this kind of learning would be both easier and more interesting and that they would recommend this kind of learning to their colleagues.

IV. CONCLUSION

Music is an integral part of modern society and music education is important for many people. More and more technology is becoming an integral part of all educational systems. There are a few intelligent tutoring systems that are designed to learn their users how to play a musical instrument and provide users with feedback about their playing. Adaptability to users' needs, skills and their knowledge is an integral part of those systems. The new proposed model extends existing systems with real-time feedback mechanism and generated lessons that help users to correct their errors in playing. Research results have shown that those capabilities are very important to students. With higher adaptability, lessons are more suited for each individual and that optimizes educational process. Students perceive that with this kind of system, learning process would be easier and more interesting. Both motivational and educational goals would be reached. Development of adaptive intelligent tutoring system based on new proposed model that will teach students how to play drums will be a part of future research. This system will then be compared to other alternative ways of learning how to play drums in order to conclude whether its additional adaptability has any positive effects on achieving educational goals and whether students will be more motivated by using this system.

vslavuj@uniri.hr, bkovacic@uniri.hr, ijugo@uniri.hr

Abstract - **Intelligent tutoring systems (ITS) are able to provide a personalized approach to learning by assuming the role of a real teacher/expert who adapts and steers the learning process according to the specific needs of each learner. This is done by taking into account a number of learner features and deciding on the best action to follow at any point in the learning process. Within the field of computer assisted language learning (CALL), the "computer-as-a-tutor" modality has been widely accepted for some time now, although it has long been overshadowed by the "computer-as-a-tool" modality. This was mainly due to the observable lack of interactivity of language learning systems and the inability of technology to show "intelligence". However, the development of artificial intelligence in general, and natural language processing, user modeling and ITSs in particular, gave impetus for the development of the field referred to as intelligent CALL (ICALL). The paper at hand outlines and briefly discusses the issues surrounding the development and use of ITSs for language learning, taking also into account the broader context of (I)CALL, and gives an overview of such systems already in use.**

I. INTRODUCTION

When considering any form of technology-enhanced or technology-based education regarding any subject matter, it is necessary to address the issue of learner variability. For some time now, it has been recognized that the educational paradigm "one size fits all" is not the right approach when dealing with a heterogeneous population of learners, as learners may differ in a number of characteristics and individual traits, which makes each learner's approach to learning unique [1][2][3]. Taking care of learner differences is often a difficult task, especially in cases where these differences are rather prominent, and requires a great amount of planning time and effort from the teacher. A personalized approach to instruction is particularly important in educational contexts where the teacher is not immediately present (but rather distant), or is altogether absent. Such cases include, among others, online learning environments and web-based learning, the use of standalone tutorial software, and hybrid approaches to using technology. Leaving learners on their own in such environments, offering them no or loosely structured guidance through the learning process, might lead to poor attainment and subsequent failure of the teaching curriculum.

The field of computer assisted language learning (CALL) is not an exception. However, it needs to be pointed out that using computers (or other technologies such as mobile devices, CD players or TV) in the context of language learning is somewhat different than is the case with learning in other fields [4]: besides being one of the most complex undertakings, the process of learning natural languages is additionally complicated by the fact that it requires both knowledge-based and skill-based approach [5].

There is a general consensus and an abundance of research evidence that the use of technology, computers in particular, has positive effects in the language learning context (e.g. in [1] and [6]), and that technology could be used as the basis for an individualized approach to learning languages [7][8]. The main question thus is not whether to use computers for language learning/teaching, but how to employ them so that learner needs are met [9].

As suggested in [8], the main goal of CALL should be to simulate human teachers and their pedagogical competence whenever, wherever and to whomever necessary. It is possible to achieve individualization in both commonly accepted modalities within CALL, namely, computer-as-a-tool and computer-as-a-tutor. Within the computer-as-a-tool paradigm, computers are employed as mere teaching tools which increase the efficiency and/or efficacy of the language learning and teaching process [10]. Personalization in this context remains the responsibility of the teacher and should be addressed during the process of preparing and setting up learning tasks. This is achievable by, e.g., scaling the complexity of a task, suggesting the use of software packages which are likely to help learners in carrying out their tasks (such as online thesaurus or translation software), pairing or grouping learners appropriately or even choosing the right Web 2.0 tools that will be most beneficial for the development of a targeted skill. Conversely, the computer-as-a-tutor paradigm represents the situations in which the computer has temporarily taken over the role of a language teacher with the aim of addressing all learner needs as a human teacher would [10]. Moreover, the computer is responsible for tracking learner's interaction with the designated software, storing that information for future reference, making pedagogical decisions, identifying learner errors and hypothesizing about the underlying cause(s), forming appropriate feedback meaningful for the learner, and, finally, adjusting its assumption about the overall level of learner's knowledge of the subject matter. This however requires the usage of more sophisticated educational software that employs rather complex, intelligent and adaptive technologies - exemplified by user modeling (UM),

natural language processing (NLP), expert systems (ES), adaptive systems (AS) and intelligent tutoring systems (ITS) – and constitutes what is generally referred to as intelligent computer assisted language learning (ICALL) [11]. Our focus in this paper will primarily rest on ITSs as examples of systems taking over the role of real language teachers, but we will also touch upon other above stated technologies as they often appear as an integral part of ITSs.

The aim of this paper is to outline and discuss the issues surrounding the development and use of ITSs in the field of computer assisted language learning, taking also into consideration the broader context of (I)CALL. The paper also aims to give an overview of such systems developed for research purposes or successfully integrated into the language learning process.

The paper is structured as follows. Firstly, a theoretical framework for using ITSs in language learning is set. Secondly, the issues surrounding the development and use of ITSs for language learning are outlined and discussed. Thirdly, a variety of language-learning ITSs already in use are described as well as how they are employed to address different language learning skills. Finally, conclusions about using ITSs for language learning are reached.

II. Intelligent Tutoring Systems in Language Learning

The field of ITS is usually referred to as the field of research which deals with the modes of designing and developing adaptive and intelligent educational systems [12]. The term is further used to mark a range of computer-based instructional systems which keep up-to-date models containing information about what and how to teach, and use that knowledge for personalizing the access to learning [2].

Although ITSs are now generally accepted and seen as useful within the field of (I)CALL, we need to point out however that the situation was somewhat different a couple of decades ago, as practitioners mostly disregarded the tutor role of computers and only focused on the computer-as-a-tool modality [10]. The literature enumerates a number of possible reasons why language tutoring software was underappreciated and, consequently, marginalized, but we single out two reasons that in our opinion seem most plausible.

Firstly, the view that tutorial software is behavioral in nature and uses only "drill and kill" type of exercises deterred a number of teachers from using it, as it did not adhere to the dominant teaching methodology based on the notion of communicativeness [4][10].

Secondly, with the appearance of personal computers, too much was expected of CALL. Looking back at that period from our current standpoint we can clearly see that technology was not mature enough back then and software development lagged behind hardware development. As a consequence, there was a general disappointment with such software as it was rather rigid and lacked both interactivity and intelligence [5][10][13].

Notwithstanding, language tutoring systems are now widely acknowledged and are seen as being able to address more than just simple grammar and vocabulary teaching/learning, but they need to be designed keeping in mind learners' and instructors' needs [4][14].

General architecture of an ITS suggests that there are four functional components to every such system: domain or expert knowledge model, learner model, tutoring or instructional or adaptation model and user interface model [2][15]. In the section to follow we describe each of the ITS architecture components in more detail with a special emphasis on how they are applied in the language learning context. Our account will include an additional module frequently used in language learning oriented ITSs, namely the feedback module.

A. *The Domain Model*

The domain model contains all the expert knowledge of a particular domain that needs to be taught by the system [2][11]. It details different concepts of the learning domain, their hierarchy, mutual interconnection, and how they relate to educational resources to be delivered [16][17]. Broadly speaking, there are three main ways how domain models are conceptualized [16]: the set/vector model, the hierarchy model and the network model. The most popular and widely used type of domain model is the network model. In this model, the concepts are arranged into a network and are interconnected by different types of links. The most common type of links are, amongst others, prerequisite links, "is-a" or "part-of" links, and remedial links [16]. Links in both hierarchy and network models are very useful in for improving the accuracy of the learner model. For example, in case the learner does not possess knowledge related to a certain concept (e.g., formation of the Simple Past Tense), the links help in providing the most likely remedial concepts (e.g., irregular verb forms). Conversely, if the learner possesses knowledge related to a certain concept (e.g., formation of the first conditional), the links help in identifying other concepts that the learner is likely to know (e.g., the Simple Present Tense).

B. *The Learner Model*

In order to recognize individual learners' needs successfully and take appropriate pedagogical action, a piece of software needs to be able to track what learners do with it while learning a language, i.e., how they behave during usage [18][19]. Such monitoring entails the creation and constant updating of a student model which gathers all the necessary data from the learner, be it the learning path, correctness of answers to questions, time taken to offer a solution, or the overall success in solving a task [2][14][19][20]. Learner models may contain other relevant information about the learner as well, such as their previous level of linguistic knowledge, learning style preference, cognitive style, strategic competence, goals or interests, to name just a few [2][21]. Typically, the information in the model should be enough to differentiate between learners who are using the system on the basis of their knowledge, task performance, overall proficiency, goals or background, and take appropriate action to personalize their learning experience [16][22]. Hence, the main goal of a learner model is to support the process of making assumptions about the learner and to support

pedagogical decision-making concerning, e.g., the feedback to be delivered back to the learner or the choice of appropriate follow-up activities, as defined in the instructional model [23]. The two broadly recognized and used approaches to student modeling are stereotype modeling and feature-based modeling [16].

However, we should be aware that monitoring is not an end in itself [20][23][24]: in addition to carefully deciding what and when to monitor, the tracking process is further complicated by the issue of appropriate interpretation of the gathered data and correctness of inferences made from that data. Erroneous assumptions about the learner's input, his language knowledge and skills, may cause wrong action by the system, consequently leading to an inefficient learning process and poor language attainment [14].

C. The Tutoring Model

The tutoring model is made up of rules that define how a system should act during runtime, taken into consideration the data from the learner model [17]. It specifies which pedagogical action should be taken following each user activity. Therefore, this model defines what, when and how to adapt within the system [25]. In order for the adaptive action of a language learning-oriented ITS to be effective, the knowledge from language learning theory (usually First language acquisition (FLA) or Second language acquisition (SLA)) and pedagogical practice should be included as part of this model.

D. The User Interface Model

The interface model was only recently added to the above three, and is concerned with the graphical environment through which educational content is delivered to the learner [2]. In particular, it deals with the representation of instructional material, mostly focusing on multimedia and its advantages for the learner.

E. The Feedback Module

Another important and frequently included element of an ITS for language learning is the feedback module. Language teachers are often engaged in giving feedback to learners concerning their progress, success on a particular task, language areas they need to work on, etc. Similarly, tutoring systems should also be able to adequately respond to a learner activity.

Giving feedback may consist in a straightforward declaration of errors (e.g., *The answer you provided is not correct.*), request for additional clarification (e.g., *What do you mean by…*) or restating something in a correct manner [18]. In many ways this entails the usage of NLP techniques so that the computer is able to make sense of the learner's written or spoken input.

From the point of view of technology, there are three possible approaches to appropriate feedback formation: pattern matching-based approach, statistical-based approach and rule-based approach [26].

III. Issues Surrounding the Development of ITSs

Designing each of the components of an ITS for language learning requires a careful consideration of the needs of both learners and teachers. In the light of that and based on available reports from literature on specific language-learning ITSs, we point out some of the issues that may arise during the development process, briefly explain them, and, where appropriate, offer some suggestions as to possible solutions.

One of the frequently noticed issues in language-learning ITSs is over-restricting the learning domain, both horizontally and vertically. Horizontal domain restriction refers to a system's tendency to focus on a single linguistic skill (listening, reading, speaking and writing) or form (grammar, vocabulary) rather than a combination of them. Including a whole range of skills/forms or even all of them into the ITS would be more in line with the nature of language learning, which emphasizes the integration of both productive and receptive skills, visual and auditory input, written and spoken output, form and communicative competence, etc [27]. Conversely, vertical domain restriction refers to the inability of an ITS to cater for learners with different levels of language proficiency (e.g., CEFR proficiency levels A1 – C2), which decreases the number of potential system users and, consequently, system's (potential) financial value. We maintain that a possible solution and a more sensible approach would be to offer learning content designed for a wide range of skills, forms and ability levels, and use the knowledge about the learner, kept by the ITS, to detect which skills/forms are needed by each learner. Moreover, learner data should be used to identify the learner's current level of proficiency, offer learning materials that are appropriate for the identified level, and decide when the new level of proficiency has been reached.

The issue of user input evaluation is also a significant one. Whereas evaluation of certain linguistic skills and forms can be automated and independently done by the system (e.g., reading, listening and grammar), some skills are notoriously difficult for the computer to evaluate on its own. This particularly holds for productive skills, namely speaking and writing, which involve unrestricted user output. Even though natural language processing and speech recognition techniques have come a long way in terms of accurately evaluating user output, they maintain to exhibit certain flaws [13]. At present, a computer is still unable to fully replace a human being when it comes to evaluating unrestricted oral or written output. However, restricting user output to a particular domain with specific vocabulary (e.g., describe a room or a person, explain a shopping list) might make a significant difference in rising the accuracy of evaluating output.

Another issue, related to vertical domain restriction, is standardization and comparability between systems. Most of the ITSs reported in literature do not use some generalized framework of ability reference (such as CEFR or ILR scale) to define the level of learner proficiency for which the learning content of the ITS is intended, but specify such a level in terms of school grade or educational level only (e.g., college freshmen course). This significantly affects learner mobility between different ITSs, mostly because learners are unable to

objectively assess how appropriate the language learning system is for their proficiency level. Furthermore, the results of using an ITS for language learning should be observable as a shift in the proficiency level, quantified in familiar terms, and available for analysis for third parties. Aligning the content with any of the internationally set and verified standards for language learning proficiency levels can be a way to successfully address such issues.

Designing learning materials that will be presented to a learner during the educational process involve several issues that need to be acknowledged. The most notable among those is the issue of interactivity of learning materials. When using languages for communication, learners are engaged in an interactive process of sending and receiving messages through a number of communication channels. In certain cases, the meaning of messages cannot be fully grasped simply on the basis of the sum of words and their meanings, but other elements, such as tone of voice, gestures and body language, and contextual information, need to be taken into consideration. Hence, learning materials should reflect real world communicative situations, which is possible to achieve through the use of multimedia. Another issue related to learning materials is how to keep learners motivated during the learning process, and how to actively involve them to work with materials at hand. One possible way is to give small-scale task to the learner, such as "click on the right word" or "translate a particular word", which can also serve as indicators of learner knowledge and progression through the learning domain.

Feedback module design should deal with the issue of selecting or generating appropriate feedback once the learners have finished interacting with the system and the computer has evaluated their response. The feedback message in language-learning environments needs to be beyond a simple correct-incorrect statement: it needs to be able to point out the source of the linguistic problem and offer appropriate scaffolding towards obtaining correct knowledge. Additionally, the degree of feedback explicitness should depend on the already discussed level of language proficiency: more explicit feedback for lower-ability learners, and less explicit for higher-ability ones.

The final issue we point out here is how to model language teacher competences and their teaching strategies. For some time now, there seems to exist a strong tendency towards socio-cultural and socio-cognitive approaches to language learning, where the communicative function of language is strongly emphasized. As explained in [27], such an approach underlines two key concepts, namely tasks and interaction: language users and learners are seen as "social agents" who use their "communicative language competences" in numerous "language activities" to exchange meaningful messages as they try to accomplish a particular "task" at hand. The role of the language teacher in such a model seems to be the one of support, providing the learners with tasks appropriate to their level of knowledge and skill, observing their performance during the communicative act, and offering appropriate feedback. Additionally, based on the existing evidence (usually in the form of previous performance results), the teacher decides upon the best action to follow, be it a remedial task or a task involving the acquisition of new knowledge. ITSs can be considered a technology capable of successfully taking over the responsibilities of the language teacher. In order to do so, an ITS needs to be designed specifically for language learning purposes: sound pedagogy and language teaching methodology, supported by what is known from FLA or SLA theory, represents the basis on which to design an intelligent computer assisted language learning system.

The issues reflected upon above do not make up a definitive list of all the possible issues that may arise during language-learning ITS design, but they represent situations often encountered in practice. Moreover, these issues contribute to the discussion on the complexity of the process of conceptualizing an intelligent system for language learning which is one of the topics addresses in this paper.

IV. Examples of ICALL Systems in Use

There have been numerous reports on the development of ICALL systems over the years; however, it seems that most of the systems have remained in the prototype phase or have been developed purely for research purposes. Literature review has revealed three systems in particular that are confirmedly used in the language classroom, integrated into the foreign language learning curriculum, and continuously updated and improved [14]: E-Tutor for learning German as a second language, TAGARELA system for learning Portuguese at the university level, and Robo-Sensei for Japanese.

E-Tutor system is a comprehensive Web-based learning environment for university level learners of German. It employs AI and NLP techniques in order to achieve individualized learning experience. The system is mainly focused on vocabulary and grammar improvement for which it offers several types of exercises, namely translation, dictation, sentence formation and providing the missing word. Evaluation of these activities is supported by NLP and feedback is generated based on learner performance. In addition, each section has activities for listening and reading comprehension, culture and writing. Writing assessment, however, is not automated, and is done by the teacher [19][23].

TAGARELA is an ICALL system for learning university level Portuguese, intended to complement the existing pedagogical materials. It serves the purpose of an electronic workbook, and offers feedback on spelling, morphology, syntax and semantics to each individual learner. There are six activity types in total: reading and listening comprehension, picture description, rephrasing, fill-in-the-blanks and vocabulary exercises. Creators of the system point out four main tasks the system can perform: detect errors in the student input, diagnose knowledge level and skills of the learner, adapt the system accordingly and generate feedback [14][21].

Robo-Sensei is used for teaching and learning Japanese in 24 lessons, and focuses mainly on translation tasks. It receives input from the learner, performs itemization and morphological analysis, and parses the sentence syntactically. However, the sequence of

activities is the same for all learners, as is the feedback. Thus, the system does not adapt to student level of proficiency or knowledge about particular language items, but only offers NLP services [28].

Additional examples of ICALL systems address a variety of language skills. Thus, in Ref. [24] and [29] reports on WUFUN are found. WUFUN is a system for Chinese university students learning English, based on a regularly updated learner model. The system is special as it features both aural and visual input, which contributes to saliency, and, possibly, better attainment.

In [30], an ICALL system called Your Verbal Zone (YVZ) is described, which is used to support Turkish students' English vocabulary learning. YVZ contains a morphological analyzer which is able to find the root of a morphologically complex word and return its base form together with affixes. It, of course, uses NLP in order to achieve that. In order to further support students, the system contains a built-in, bilingual dictionary, a number of examples related to word use and details of function and meaning of particular affixes.

In [13], the case for WordBricks is argued, an intelligent system supporting the process of writing grammatically correct sentences. The system features a grammar checker and allows students to produce free utterances. This also permits learners to experiment with language and test their own hypotheses on language structures. Feedback generation system is also implemented.

In [31], a program called C-DA, used for improving learners' metacognitive reading strategies is described. The standalone program, also available in the Web browser, keeps track of learner answers to questions, and for each incorrect answer, it initiates the "mediation" mechanism which helps the learner solve the task. The mediation mechanism is designed to offer more implicit help at first, and if the error persists and the learner is unable to provide the correct answer, help gradually becomes more explicit.

An ICALL system called CASTLE is described in [32]. It provides an opportunity for language learners to practice their communicative skills, namely writing, through a number of predetermined role-play scenarios. Upon wrong input and depending on how the error is classified by the diagnosis module, CASTLE takes remedial action in the form of additional grammar exercises to stress certain formal language structures. In the same time, the system keeps an up-to-date student model which holds data concerning student proficiency for a particular topic, data about errors and proneness to commit them, and the estimates of the likely cause, so the system is able to adapt its behavior towards each learner.

A description of a Web Passive Voice Tutor is given in [33]. The system uses stereotype modeling to initialize the student model, applies NLP techniques for intelligent analysis of student solutions to tasks and tailors feedback and advice to each student separately. In addition, it uses the so called link annotation technique to guide the learner through the learning domain by suggesting the most appropriate activity to follow.

I-PETER, as described in [34], is an intelligent system for language learning that allows for three distinct ways of learning: identifying and mending holes in the existing knowledge of the subject matter; improving on the current level of knowledge of a selected part of the domain; selecting and practicing only selected concepts and/or subconcepts of the domain. In each case, the learner needs to give an answer to a particular question, and once it is evaluated by the system, the learner may request detailed theoretical explanation regarding the error. In addition, there is a possibility for the system to fully take charge of the learning process.

A personalized English article recommending system is presented in [35]. This system holds information about the linguistic ability of a learner and selects the most appropriate article to be read next. After reading it, learners are given a vocabulary test consisting of newly-encountered words from the article. Based on their performance on the test, the learner model is updated, linguistic ability recalculated, and a new article is chosen for delivery.

Lastly, we mention a computerized adaptive testing system for Chinese (reading and listening) proficiency [36]. This system offers each learner an individualized test in which the selection of the next test item is done "on-the-fly", and depends on the (correctness of) answers to previously generated test items. After evaluating each answer, the system updates its estimate of learner proficiency. Thus, the system needs to keep a log of the estimated level of proficiency together with all the answers to all the test items previously administered. Test items are generated until a predetermined termination rule is reached (e.g., a sufficient number of items have been given, a certain amount of time has elapsed, etc.).

The examples of software given above clearly reveal that ICALL constitutes a broad field of both research and practice. Systems differ in their focus on skill, level of complexity, degree and manner of employing AI and ITS technologies, way of generating feedback, even learner modeling. One thing they have in common however is that they are usually restricted to a single problem area instead of addressing a variety of issues. Regardless of their differences and possible shortcomings, we should evaluate a piece of software not by what it is capable of doing, but by how well it does what it is intended to do.

V. CONCLUSION

Individualizing language learning experience is certainly facilitated by the maturation of technologies from computer science, in particular AI. These technologies offer new possibilities for developing better and more efficient software that will be available even at a distance and without the presence of a teacher.

In this paper, we have given an overview of ITSs as an example of technology often used within the field of ICALL to individualize the process of language learning and teaching. Development and implementation of language-specific ITSs is not without issues which need particular attention from the development team. Addressing such issues in a systematic way should

improve the overall quality and usability of an ITS, and contribute to a better learning/teaching experience. Some of the ITSs included in our overview have successfully managed to solve certain issues raised in our paper, while other continue to persist.

Given the current state of technology, we maintain that software is not yet capable of fully replacing the language teacher, but is able to do so only to a (significant) degree. Only further developments in AI and related natural language processing technologies will see the goal of full replacement be reached.

Abstract - This paper deals with the problem of checking consistency of automatically generated exam questions in e-learning systems. We focus on the exam questions with the numeric solutions and the automatic evaluation of their answers. Each answer is evaluated as correct if it is within a specified range from the actual correct value. In our paper we check the consistency of exam questions evaluated with this simple method, i.e. are the answers calculated using wrong methods and based on false assumptions always evaluated as incorrect. We made a mutant testing algorithm for identifying inconsistent questions using model checking. At the end we present use cases based on the evaluation of students' answers on our courses Fundamentals of Electrical Engineering and Formal Methods in System Design.

I. INTRODUCTION

Computer aided learning is becoming increasingly popular, and it is already widespread in various areas of formal and informal education. It is used formally from preschools to universities, in continuing education and lifelong learning in corporate environments, as well as informally, e.g. there are many tutorials and self-learning courses available on the Internet. Recently, we have also witnessed the emergence of MOOCs (Massive online open course), a new form of semi-formal education. Most of those computer aided learning systems require objective and fair assessment of acquired knowledge. This is usually achieved using online testing, a cheap and robust way of student evaluation.

But, as e-learning and distance learning systems become more evolved, online testing becomes more complex. Different types of questions are introduced, along with familiar multiple choice and alternative response questions, such as matching type and completion questions or calculation questions with numeric solutions. This increased complexity raises questions about the consistency of the testing systems. Researchers in psychology have studied these problems very extensively with main focus on psychological testing in education, psychiatry, medicine, military and corporate field of human resources. Test reliability is the overall consistency of a test. A test is said to have a high reliability (*precision*) if it produces similar results under consistent conditions [1,2].

In our paper we will focus on a specific kind of questions – calculation questions with numeric solutions. Uploaded solutions are evaluated and accepted as correct if they are in a predefined range from the correct solutions. Using a combination of techniques and methods of mutation testing and model checking we will present an approach for checking consistency of the calculation questions. We will present an analysis of results based on example calculation questions from the course Fundamentals of Electrical Engineering obtained from our In-house developed e-learning system *WebOE* [3]. We will show how to use these results to provide students more meaningful feedback information. And finally, we will give some practical advices to increase consistency of calculation questions.

II. RELATED WORK

As we noted earlier researchers in the field of psychology are responsible for developing the theoretical foundations for describing and solving some of the general problems discussed in this paper. In the field of teaching engineering and computing a number of researchers try to detect various students' misconceptions by analyzing and studying online test and homework results. They try to overcome those misconceptions by introducing new, specific examples and tutorials in advanced e-learning systems or ITSs (Intelligent tutoring systems). Consequently, the e-learning systems can become highly personalized and better adapted to abilities and needs of each individual student [4,5].

Also, software testing and model checking are highly developed fields of computing with many useful concepts and developed methods which can be transferred and used in other areas, such as education.

Methods from system security testing can also be useful in our area. For example penetration testing which tries to detect and avoid security breaches in IT systems can be a good analogy to our problem [6]. Here we try to detect faults in a test system when a false positive answer is awarded points.

III. MUTATION TESTING AND MODEL CHECKING

A. Mutation Testing

Mutation testing is a method for software testing proposed in the 1970s (R. Lipton, DeMillo, Hamlet), and recently it has become very popular in the various areas of software testing [7].

This method is based on the little, simple faults which are deliberately inserted into program code. Those faults are very similar to the errors that the programmers make accidentally.

Technically (Fig. 1), method generates program *mutants* (*P'*), set of copies of the original program *P*, but each with some simple syntactic changes. Also, a set of carefully selected test input data set *T* is created to check original program and its mutants [7].

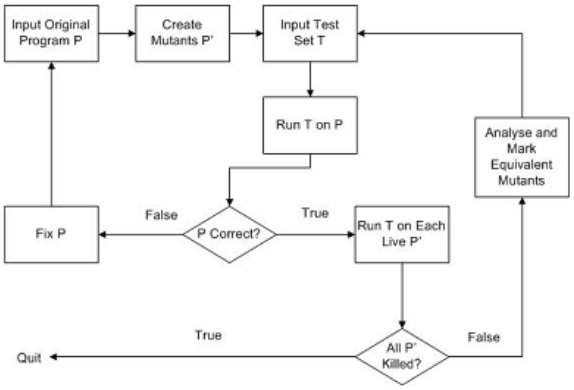

Figure 1. Basic process of mutation testing analysis [6]

If the original program passes input test then all the mutants are executed with the same test input data. If any mutant's result is different from the result of the original program then the mutant is *killed* (removed). All the mutants which give the same results as the original program have *survived*.

In the next iteration of the mutant testing a new test input data is created and original program and surviving mutants are executed with it. If mutants give different results to original program they are also *killed* and the process continues. It is important to know that some of the mutants can never be killed. Those mutants are called *equivalent mutants*, and it is also impossible to find all of them.

The mutation testing method generates also the *Mutation Score* (MS). This is the ratio of the killed mutants over the total number of non-equivalent mutants.

It must be noted that the thorough mutation testing is very computationally expensive for complex systems but it is very useful in determining new test data.

B. *Model checking*

Model checking is a method of automated checking if a model of a system meets given specifications. The most important task of model checking is to test that that the system will not stall or crash [8].

Model checking is widely used in the verification of the distributed software systems, such as network protocols. One of the most important tools in this field is SPIN. It is a tool for verifying the correctness of distributed software. It was developed by G.J. Holzmann and the Bell Labs in the 1980s.

Software models are described in special C-like language, *Promela* (Process Meta Language). *Promela* can model non-determinism in distributed software or automata. Specific temporal properties can be described in *Promela* using *Linear temporal logic* (LTL) which is transformed into Büchi automata [8].

SPIN can also serve as a simulator which gives one of the possible execution paths of the system. Also, it is very useful that it allows mixing *Promela* code with the ANSI-C code which will be extensively used in our questions consistency checking method [9].

Using SPIN's auxiliary *Modex* tool it is also possible to convert ANSI-C program code to *Promela* and to generate program verifier with SPIN [9].

IV. PROPOSED METHOD OF CHECKING CALCULATION QUESTION CONSISTENCY

We will deal with the calculation questions which require one, two or three numeric solutions. The answer to this question is evaluated as correct, and awarded points if and only if all the requested solutions are acceptable. Solutions are acceptable if they are in a predefined range (usually ± 5 %) from the correct solutions.

We based our method on the actual data from the *WebOE* e-learning system on the freshman year course Fundamentals of Electrical Engineering. In this case these questions are homework assignments but the same analysis can be applied to exam or online test questions. Each student gets one of the questions from the set of all questions for a certain homework assignment. Input parameters (usually 4 to 6), and also sometimes the figures (usually electrical circuit) are randomized so that each student gets unique input data (Fig. 2). During a semester there are 10 homework assignments, about 200 different basic questions.

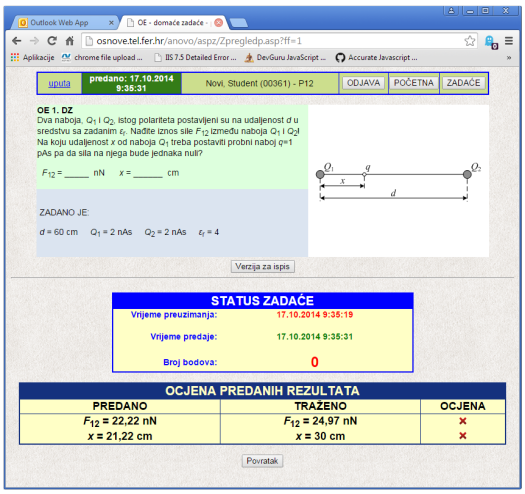

Figure 2. Student interface for homework assignments in *WebOE*

The question is whether a student can solve his/hers assignment in a wrong way (by accident – replacing input parameters or by using flawed algorithms and/or misconceptions), but still get points because the system evaluated their solutions as acceptable (inside 5% from the correct solutions).

Our method of combining concepts from mutation testing and framework of model checking will try to provide answer to that question.

Proposed method is based on the verification of the *mutated solution model*. Each numeric question in the *WebOE* e-learning system has its own unique solution program written in *VBscript*, classic dynamic web page scripting language. Our idea is to translate *VBscript* solution program to ANSI-C code. Then we use *Modex* tool to generate *Promela* process model of the solution program. Afterwards, we mutate the *Promela* process model by copying and slightly changing the solution code. Finally we insert one *assert* command at the end of the mutated *Promela* solution model. In the assertion we state that the all correct and mutated solutions are not overlapping, i.e. all the mutated solutions are outside the range ± 5 % from the correct solutions.

In the last step we use SPIN model checker to generate the verifier of the mutated solution model. The verifier is compiled using standard *gcc* compiler and then executed.

If any of the assertions did not hold then the whole verification process will fail. In that case we get the information where did the error occur and what is the complete path (*trail*) to that error. Also it is possible to find all errors and generate all their corresponding error paths.

It is also possible to automate the process of mutating solution code. Using the concept of expected errors from the mutation testing analysis we have prepared a set of ANSI-C functions which calculate correctly and wrongly (*mutants*) some basic notions from the DC circuit analysis. During the mutation process it is only necessary to copy correct solution and then change one or few function names.

V. RESULTS OVERVIEW AND DISCUSSION

We have run our analysis on a question from the DC circuit analysis as shown in the Fig. 3. The voltage U_{ab} is known as well as all resistor values (R_1, R_2, R_3 and R_4). Students must calculate equivalent resistance R_{ab} and the current I_{ab} through that resistor.

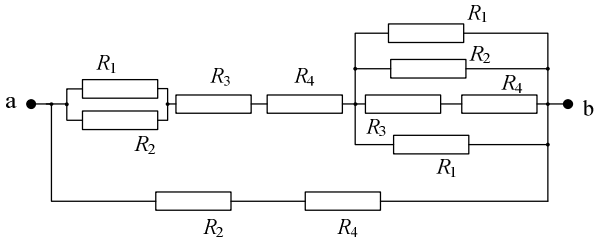

Figure 3. Example – branch of a DC circuit

In the first part of the analysis we have set the values or resistors to: R_1 = 25 Ω, R_2 = 27 Ω, R_3 = 29 Ω and R_4 = 31 Ω, and the voltage U_{ab} is 85 V. Our mutated solution predicts the accidental replacement of the resistor values and the usage of wrong methods for calculating series and parallel resistance, as well as wrong application of the Ohm's law. We have also varied the acceptable range for the correct solutions from ± 1 % to ± 10 %.

Results show us that there were exactly 3888 different solution paths (3887 wrong and of course only 1 correct). We have seen that there are indeed a small number of false positive solution paths – wrong solutions which overlap with the correct solution range and will be therefore awarded points. If the acceptable range is only ± 1 % from the correct solution then there are only 9 such paths (0.23 %). If the acceptable range is the usual ± 5 % from the correct solution then there are 42 false positive paths (1.08 %). We have determined that the number of false positives rises slowly logarithmically with the best-fit function 20.707 ln(x) + 8.2229 (R^2 = 0.9957) where x is the absolute value of acceptable range (1 – 10), as shown in Fig. 4.

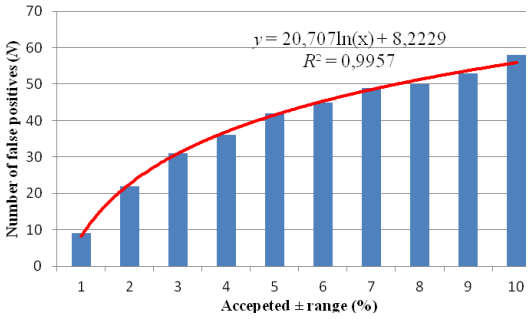

Figure 4. Number of false positives as a function of acceptable solution range

The first part of the analysis was quick (0.01 s and all the false positive solution paths were generated inside 0.4 s) and not very memory demanding (70 MB – most of it for the standard hash table).

In the second part of the analysis we have tried to generate greater number of solution paths. In this case the value of R_1 is chosen non-deterministically between 20 and 29 Ω, also the value of U_{ab} is chosen non-deterministically between 80 and 89 V. Other resistor were fixed at R_2 = 1.08 R_1, R_2 = 1.16 R_1 and R_3 = 1.24 R_1. Also we fixed the acceptable solution range to usual ± 5 %.

Results of the second part of the analysis were in concordance with the results of the first analysis. In total there were 388800 different solution paths (100 correct and 388700 wrong). There were 4170 false positive paths which is 1.07 %. This percentage is almost the same as the corresponding one from the first part of the analysis (1.08 %).

Second part of the analysis was very memory demanding 636 MB, and also time consuming (40.2 s) because of the vast search space (388800 possible paths).

It is evident that the second part of the analysis only has sense when the educator initially defines question's input parameters to better control the percentage of false positive solutions. Unfortunately it is not easy to pick input parameters which will virtually eliminate the possibility of false positives. We can only minimize this possibility by covering most of the known systemic errors. Also we could require four or five solutions, instead of two or three, which would further decrease the possibility that all of them are false positive.

But the first part of the analysis is not very resource demanding and could be a useful addition to any more complex e-learning system. This type of *a posteriori* analysis could be very beneficial feedback information to the students because it could suggest where the error in student's solution occurred. For example, from the numbers the student uploaded the e-learning system could instantly suggest the student that his/hers error was in the wrong application of the Ohm's law.

This method can also be used to generate a list of plausible wrong answers. We could use this information while composing written exams with multiple choice questions, or for devising hybrid type of questions. For example we could offer the correct answer, two or three plausible wrong answers, and one or two random wrong answer together with an input form if a student considers that a correct answer was not offered.

VI. Conclusion and Future Work

In our paper we have presented our method for checking the consistency of calculation exam questions. We have shown that it is hard to achieve total consistency because there will always be some potentially false positive answers. Also we have shown that this method can give valuable instant feedback to students or serve as a method of (semi-)automatically generating plausible wrong answers for multiple choice questions.

Abstract - E-learning is usually accepted as a powerful and important addition to traditional educational programs and Learning Management Systems (LMS) are the key tools that sustain these new educational approaches. Therefore a considerable amount of study and development on both technological and educational issues in e-learning has been going on with outstanding results. In many cases the traditional LMSs are short of flexibility needed for implementing innovative educational models or simply for implementing e-learning strategies of a certain institution. South East Europe University (SEEU) is using in house LMS - Libri for almost a decade. Throughout this period the system has evolved following the trends and the user needs. One of the latest issues that we were dealing was lack of storage for the learning contents. A solution for this problem and several other enhancements were implemented in the new version of the system by integrating the LMS with Google Drive. The aim of this paper is to present the technologies, the implementation challenges and the benefits of this approach.

I. INTRODUCTION

The great interest for original pedagogical-educational practices is a reaction to the community needs for educational change. Such needs come out from the huge request and admission to higher education, the need to raise competitiveness mainly through the raise of the human potential and the necessity to take into account new approaches to learning.

These original innovative practices in education presently are mainly available through e-learning and the most pervasive e-learning tools in higher education currently are the Learning Management Systems. LMS have been present for about two decades in higher education, but yet they are still changing and evolving due to the technological advancements as well as the change in approaches towards teaching and learning in higher education institutions.

The latest reports show that LMSs have their common role, were a few standard features for supporting teaching and learning are yet the most used features [2],[4]. In parallel with their common usage there is a line of new trendy features that are present in current LMSs.

The ability of modern LMSs to integrate multimedia and Web 2.0 tools made a significant impact on instructional design and teaching practice. In particular, Web 2.0 applications may be used to enhance student interaction and collaboration, simulations and serious games are also finding their way into e-learning environment. Finally, a LMS must be adapted by using technologies in order to merge teaching, research, IT, a changing environment as well as financial accountability and managerial models.

Another interesting impact of the Web 2.0 is in finding alternative applications for the traditional LMSs. Actually, some teachers argue that because of evolving Web 2.0 applications, students can be better served by an LMS alternative, a toolbox of web resources that might include social bookmarking tools, document sharing applications, social networking sites, timeline tools, and media options available in the cloud [4].

However as LMS developers we are always looking for the best strategy/way to reach out to the students and engage them. Since Google Drive allows users to store documents in the cloud, share files, version control and edit documents with collaborators, we saw it as a possibility to create meaningful, engaging and accessible environment for all learners including teachers. It also encompasses Google Docs, Sheets and Slides, an office suite that permits collaborative editing of documents, spreadsheets, presentations, drawings, forms as well as version control. In particular, version control is an improvement provided in Google Drive that allows the users to have an overview of all saved versions, download and compare versions, restore any versions anytime without losing previous versions, see who has uploaded different versions and when, etc. On the other hand, Google unveiled Drive for Education with free, unlimited storage, which would at the same time solve our LMS storage problems without any additional cost.

II. USING ONLINE STORAGES FOR E-LEARNING PLATFORMS

When it comes to storing data, cloud storage is quickly becoming the method of choice. Storing files remotely rather than locally boasts an array of advantages for all users. In this part are presented the requirements specification and the system architecture of the new LMS which is build on the concept of using Google Drive as file repository system. In the text below, this new version of the LMS is referred with Libri_v3.

A. *Requirements Specification*

Our LMS requirements specification mainly consisted of the following constraints:

- Use online storages and online calendars
- Rich LMS tools
- Ease of use UI
- Rich statistical/reporting features

The emergence of cloud computing has enabled powerful and low-cost online storages. Accessibility, collaboration, syncing, cost and backup and recovery features are the main advantages when considering online storages as application file repository. Our application will take advantage of using Google Drive as file system repository. Google Drive API [1] offers the tools and client libraries for developing apps that integrate with Drive. Moreover, one of the most famous online calendars is Google Calendar. Google Calendar API [2] offers robust features for managing events in terms of a flexible LMS.

Standard LMS tools include: dropbox, quiz and forum module. The dropbox module enables instructors to arrange assignments delivery within specified time-frame. Since Google Drive is used as file repository system students works will be consumed in Google Drive dedicated folder. The quiz module allows instructors to design course quizzes, mid-term exams or exams. The forum module allows instructors to open class discussions about particular topic. The new version of the LMS could integrate current version's quiz and forum approaches or use third-party solutions.

In order to support ease of use, our tool will leverage the latest technologies for web-based applications: AJAX-driven interface would provide flexible and timely user interaction. Our application's course folders and files interface should be similar to Google Drive UI taking the advantage of user's Google Drive experience. On the other side, the tool should enable course evaluation features and reports e.g. how many times a student has visited a course, most downloaded file, the instructor's time consumed in Libri etc.

B. *System Architecture*

Libri's old version system architecture is based on traditional layered architecture [3]. Because of more concise control of couplings between architecture layers we decided to adopt the onion architecture proposed by Jeffrey Palermo [1] depicted in Fig. 1 and Fig. 2.

[1] https://developers.google.com/drive/

[2] https://developers.google.com/google-apps/calendar/

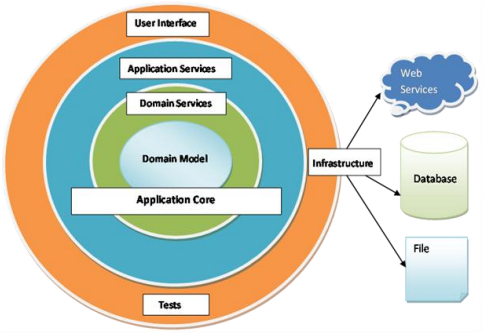

Figure 1. The onion architecture

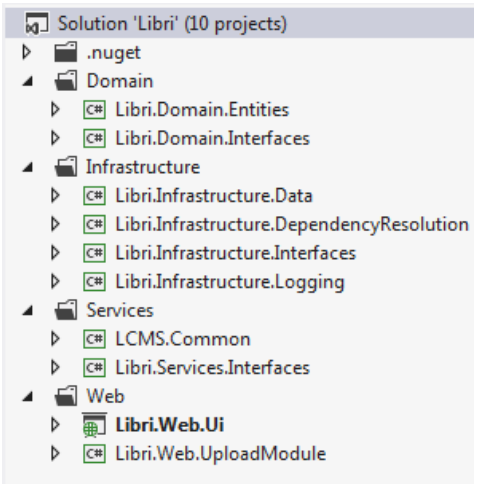

Figure 2. ASP.NET MVC implementation in Libri_v3

The main principle of this architecture is the Inversion of Control (IoC) which inverts the dependencies from lower level layers to higher layers [6].

We adopted the onion architecture implementation presented in [6] and extended it with additional modules as required e.g. logging module. Our *Domain Model* includes classes for membership management, Google interaction classes and LMS entities classes (Libri.Domain.Entities project).

Additionally, in this layer we put the interfaces to repositories (Libri.Domain.Interfaces project). In the Services layer were created two general services: authentication service and LMS service (Libri.Services.Interfaces project) and another service (LCMS.Common project) for integrating other university services. In the Infrastructure layer are placed the repository implementations (Libri.Infrastructure.Data project), dependency resolution module (Libri.Infrastructure.DependencyResolution project) and logging module (Libri.Infrastructure.Logging project). And finally, the UI layer is placed in the outer layers to model application controllers and UI views (Libri.Web.Ui project).

III. Application Design and Implementation

Following the requirements specifications presented above in section II.A, Libri_v3 was developed with the

following technology platform: ASP.NET MVC[3], Entity Framework[4] (EF), SQL Server, Google Drive API[5] and Calendar API, JavaScript, AJAX and jQuery[6]. Model View Controller (MVC) software architectural pattern was chosen because it clearly distinguishes between domain classes, business logic and user interface. Two MVC areas were defined to separate the application's administrator actions versus other user ones. EF code-first approach was adopted for flexible management of database model. Google Drive SDK offers client libraries for different platforms including the .NET[7] client library implemented in Libri_v3. JavaScript, AJAX and jQuery has been leveraged for client-side programming.

The first time a user enters Libri_v3 he is presented with the Google OAuth 2.0[8] pop-up security dialog to permit the user to do Google Drive actions. Google offers different Drive scopes [9] based on the desired app permission level. We have decided to use the drive scope which allows access to all user files. It is the only offered scope which allows course resources management from both Libri app and Drive UI. If the user authenticates our app successfully an OAuth refresh token is received and then registered in our database for performing Drive actions from Libri_v3. In order to support reporting feature requirements it was decided to use application-owned account[10] to store files. A dedicated Drive account is used to deploy all Libri_v3 courses files.

A typical Libri_v3 scenario for sharing course resources consists of the following actions:

- an administrator registers a course, assigns the course instructor and delegates the course assistants and students
- the course appears on course instructor, assistant or student side
- the course instructor (or assistant) uploads a file
- course delegated students preview or download the file

During the first step a folder is created in the Libri_v3's dedicated Drive account and shared with course assistants (edit permission) and course students (view permission). Users (be it instructor, assistant or student) can also get access to course contents by entering course PIN provided by the administrator. Course files and folders are stored in a dedicated folder on Libri dedicated Drive account.

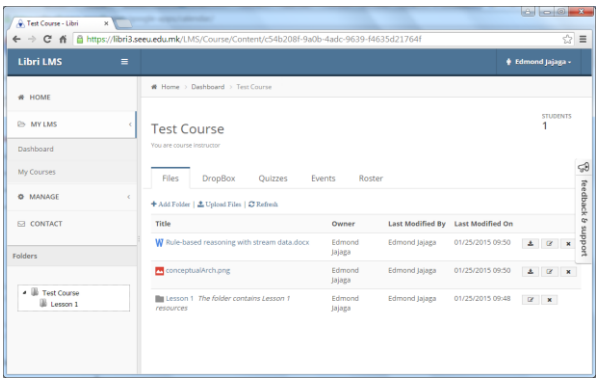

Figure 3. Libri_v3 course view: instructor side

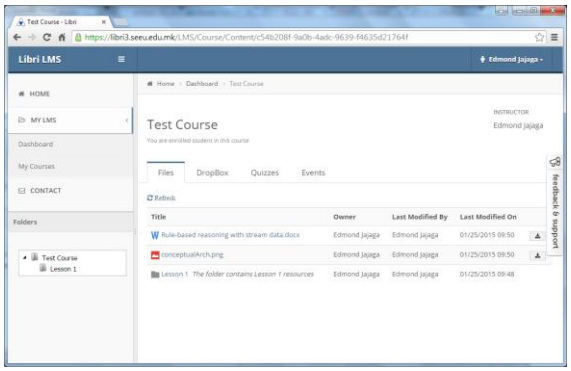

Figure 4. Libri_v3 course view: student side

Thus, each course will have its dedicated folder on Drive which will be eventually shared among users. This allows users to manage course resources through either Libri_v3 or Drive UI. In Fig. 5 is illustrated course contents Drive UI view of the same course presented in Libri_v3 (Fig. 3 and Fig. 4).

IV. FILES MODULE

Fig. 3 represents course instructor Files tab view while the Fig. 4 course students view. Drive API's method retrieveAllFiles[11] is used to get the list of course folder's resources. Before getting the list of resources the request query is modified to include only resources with parent folder ID as the course Drive resource ID:

request.Q = "'" + parentId + "' in parents and trashed=false";

An instructor can create a folder or upload a file in the current folder and can also do CRUD operations over folders/files. On the other side, a student has the option to open a folder or preview/download files which is supported by Google Drive. Enabling file preview is one of the key improvements over Libri previous version. A student would rather preview the file then download it to his/her local machine. Another improvement is the integration of a jQuery-based [12] multiple file upload feature which was absent in the previous version. An instructor or course assistant can upload multiple files

[11] https://developers.google.com/drive/v2/reference/files/list
[12] https://blueimp.github.io/jQuery-File-Upload/

immediately. Each file upload is done through Drive API's method insertFile[13].

A. *Dropbox module.*

After creating a course in Libri_v3 a Drive folder containing two subfolders are automatically created. Namely, a folder for deploying lessons' files (Files) and a folder containing dropbox files (DropBox). A newly published dropbox will result in new folder in the DropBox folder. It will eventually contain student solved assignments. On the student side, active dropboxes will be listed on the dropbox tab and the student is available to upload his/her works.

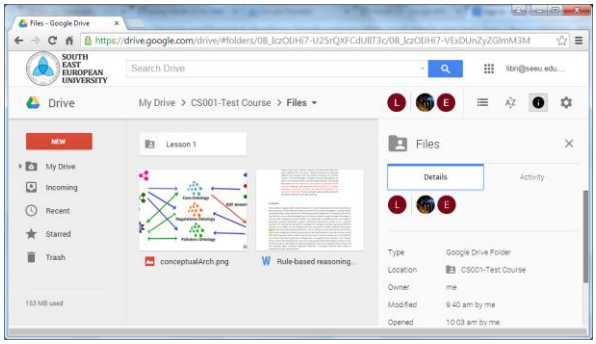

Figure 5. Libri_v3 course view: Google Drive view

Finally, the instructor or course assistant can view the students work on a particular dropbox, grade it and/or add a comment.

Dropbox time to open and close is saved in the database coupled with the dropbox Google resource ID. Moreover, for each student assignment delivery the folder's Google ID is stored in the database for grading purposes.

B. *Google Calendar Events module.*

Another Libri_v3 improvement is using Google Calendars. An instructor or course assistant can create new event e.g. first mid-term exam. By default, Google send reminders about events hence students will be additionally reminded to not miss the exam. The Calendar API method CreateEvent[14] is used to publish new event on Google. Again, as in dropbox module, time information (start and end event date) together with Google event ID is stored in our database. The list of attendees is consisted from the instructor, course assistants and students. For statistical and reporting features purposes a dedicated calendar ID is specified for all Libri_v3 events.

C. *Quiz module.*

The quiz module of Libri previous version was integrated into MVC platform. It offers definition of four kinds of questions: multiple choice, multiple response, true/false and free text answer [5]. The module was improved with support of HTML encoding of question title and the possibility to place images on it.

[14] https://developers.google.com/google-apps/calendar/v3/reference/events/insert

V. CONCLUSION AND FUTURE WORKS

One of the main difficulties in Learning Management Systems (LMS) is how to maintain the balance between learning and management. The primary aim of LMSs was to assist educators to manage learning. As a result of this way of thinking, mostly were promoted features such as managing content, roster students, and similar. There are numerous research studies and reports from the early period of LMS use that explore and raise the importance of the management functions of an LMS. As time goes by the accent of research is more in student experiences, assessment and efficiency of the tools. On the other hand, the storage problem is becoming a key concern especially after an LMS is in use for a longer period. Using online storages is a proven way for solving storage problem in general. In this paper we presented the experience of using online storage for an LMS.

The forum module and reporting features are subject to ongoing developments. The system will be further on enhanced based on continuous users' evaluation and feedback.

Abstract - **The purpose and aim of this paper on the perceptions of career development is to confirm or refute the main hypothesis that a career relates to personal goals rather than the goals of an employer or an organization based on the conducted research (using survey, N = 396). A major limiting factor in the research was the fact that respondents had no work experience, which reinforces the conclusion that it is necessary to strengthen the institutional and organizational support in the personal career development during education. Research methods used for the purpose of this paper include survey, statistical method, the Mann - Whitney test, comparison and compilation method, and descriptive method. The research results show the distribution of opinions on the role of an organisation in an individual's career development. Respondents believe that a career relates to personal goals, which confirms the hypothesis. It is therefore necessary to draw pupils' and students' attention to the importance of managing their careers, but also bringing it in line with the organization's goals.**

I. Introduction

We live in a chaotic transition period in a new era defined by global competition, widespread change, rapid flow of information and communication and an increasing complexity of jobs. Global competition has changed the "rules of the game" and the key to competition is no longer in the economy of scale, low prices and cheap labour, but in new technologies and innovations that create added-value products and services. Such products and services have a relatively small share of material components (raw materials, energy, raw labour, etc.), and a large proportion of inbuilt knowledge that adds new value to raw materials and capital base of the product. The code of conduct in the new economy has changed. Access to capital is no longer important, but rather access to information. Creating value refers to the creation of new knowledge and exploiting its value. The most important asset is intellectual property that has no physical characteristics. [3]

II. Career Development

Knowledge has become a product. The key to a successful business is in its ability to increase its market value and to grow continuously. In order to achieve their objectives in the knowledge economy, companies must be able to:

1. Produce - products and/or services applying knowledge adequately within the appropriate structures and processes that will facilitate the cheapest and most efficient way to deliver their products and services to the customer.
2. Respond to changes - The key to survival in the market for all companies is a quick and timely adaptation to market changes occurring in the environment.
3. Predict -Predict possible changes in the market and respond to market trends.
4. Find new ways - to pursue goals and gain profits successfully by acquiring and imparting knowledge to all employees about existing and new products, services and customers by researching and analyzing the market and customer loyalty.
5. Learn - Consider more efficient ways to change in accordance witheconomic, technological and other challenges in the environment.
6. Sustain the business –by creating a new and positive perspective through the ability to develop ways to revitalize and update knowledge and skills of the existing labour force and attract new and innovative employees. [7]

The pace of change in the next ten years will depend on changes in technology, globalization, demographic and other factors that will affect the organizational structure and culture. Modern labour markets need more, not less security; however, the security we are talking about is no longer job security. It includes the security of finding a new job and income security, in other words, the ability to retain roughly similar income after losing a job through unemployment benefits. Job security is developed through integrated policies that increase the employability of workers. [8] The employability of an individual should be increasedthrough three systems: the system of preparation for employment (professional orientation), system of employment agencies and lifelong learning as thefundamental model, and system of active policy measures through subsidized employment, retraining, additional training, and activation of the unemployed. The world of work is subject to constant change. Completely new structures and work areas are created. Entirely new occupations are starting to emerge; traditional ones disappear or change, and the world of

work is changing from day to day. As a result, the choice of occupation and education has become increasingly difficult. To know the world of work means to get to know different occupations, their main features, requirements, conditions and employment prospects. [9] Therefore, our current choice of occupation or education does not necessarily have to be set for life, but rather changes during different life stages. Many authors started to explore the issue of major changes in the nature of careers extensively in the 1990s; however, the issue is far from being fully explored. The predominant opinion is that a traditional career in an organization, which in itself used to be a hierarchical progression (climbing the career ladder) and was geared towards the planned organization's goals, no longer exists. Career development concept, rather than the job concept, provides an organization not only with better employees but individuals with much broader knowledge and skills. [1]

In this way, the competitive ability of the organization is developed. Career development ensures successful achievement of goals of both the organization and the individual. The simplest way to explain the difference between a job and a career is by defining job as something a person does in the workplace in order to get paid, whereas career means a fruitful research activity that brings pleasure. Career is a process that takes place almost the whole life – it does not start with employment or end with retirement. It practically starts in the first grade of primary school, and lasts even after the retirement, for as long as a person is active. Responsibility for career management is divided between an individual and the organization. From the standpoint of an individual, career development is a personal experienceand does not have to be connected to a single organization. However, the provision of help and support from the organization is of crucial importance in this process. [5]

Donald Super emphasizes the importance of the development of self-concept. According to Super, self-concept changes over time and develops as a result of experience. As such, career development is lifelong. Career is interpreted as a process of development and implementation of self-concept. [4] When self-concept becomes real and stable, professional choices and behaviours stabilize. People choose occupations that allow them to express their self-concept. Work represents pleasure and is linked to the stage in which people are able to express and implement self-concept. Super argues that professional preferences and competencies change with time and experience. He developed the concept of vocational maturity, which may or may not correspond to chronological age. The principles of Super's theory are shown in Figure 1. [2]

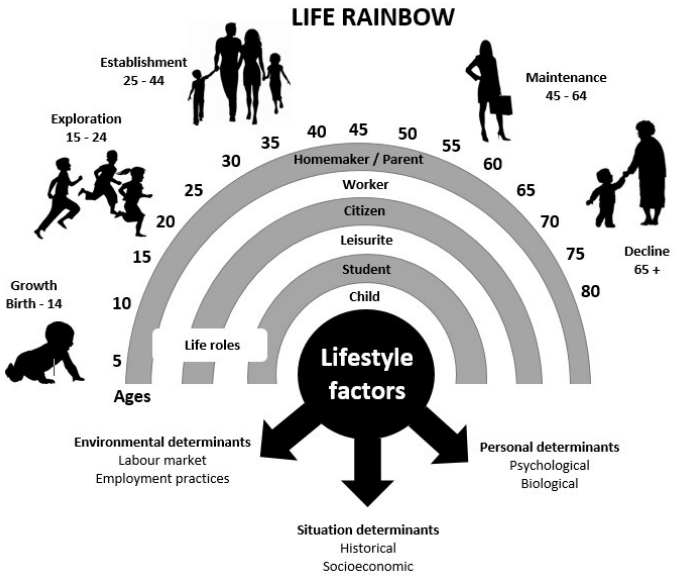

Figure 1 Donald Super's career model

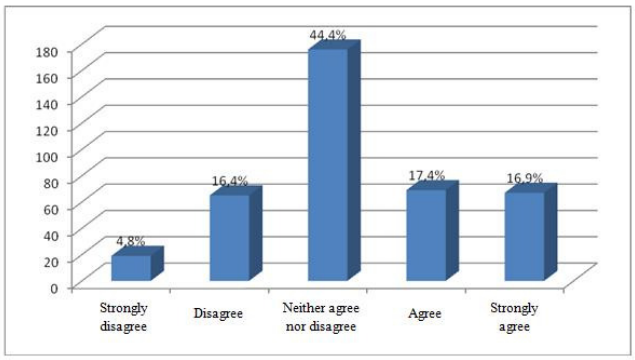
Career development includes career planning, development of potential career paths, training and professional development activities, job promotion, formal human resource policies, job promotion criteria, staff evaluation, counselling and mentoring. Whereas career planning is a process dominated by an individual, the term career management is primarily associated with an organization. Career should be the subject of attention of both an individual and the organization he/she works for in equal measure. With a view to facilitate personal development and achievement of goals by means of career development planning, an organization facilitates the realization of personal goals aimed at achieving organisational goals. In this way, the career has both a subjective and an objective dimension. Subjective dimension refers to the attitudes, interests and motives of individuals, whereas the objective dimension refers to the organization's conditions, the structure of work posts, job promotion criteria, etc. It is essential to develop strategies for personal career development in order to eliminate the identified shortcomings and take advantages in achievingone's goals. [6]

III. SURVEY ABOUT PRECEPTION OF CAREER DEVELOPMENT

According to the survey into perceptions of career development conducted on a sample of 396 respondents (final-year students in secondary schools and universities) from Croatia, less than half of respondents (44. 4%) said they partially agreed with the statement that a career relates to personal goals rather than to employer's or organization's goals. Very few strongly agreed (4.8%) with this statement, while 16.9% of the respondents believe that the career is a personal matter. [2] Graph 1 shows the distribution of respondents' opinions.

Graph 1: Distribution of respondents' opinions on the role of an organisation in the development of an individual's career



Source: Authors

If we look at the difference in opinions between genders, the Mann-Whitney test showed no statistically significant difference between male (n = 209) and female (n = 191) respondents in relation to personal career goals: N = 396, U = 16819.5, Z = -1.64, p = 0.1. Such responses may be the result of lack of experience in young people, which reaffirms the necessity to strengthen institutional and organizational support in career development of individuals during their education.

Development of technology and the integration of IT and digital communications into business will continue for some time and the most sought after professions will be systems analysts, designers and computer programmers, web developers, consultants, IT managers, and hardware engineers. In addition to these, as the technology develops, new professions will appear such as: a digital architect (who designs virtual buildings for advertisers to market their products and services), avatar design-security consultant (who designs, creates and protects the virtual you);in the field of advanced manufacturing: a mechatronical engineer (who combines mechanical engineering and electronics in computer-controlled manufacturing systems), metal skin consultant(who manufactures self-healing composite materials for use on ships, aircrafts and spacecraft), a personal bot mechanic (who will repair and tune-up domestic assistants who work 24/7), powered exoskeleton engineer (whodesigns robots thatprotect people working indangerousenvironments, simplicity consultant (who simplifies and streamlines business processes, technologies and branding in an organization), LocaPreneur(who takes over and improves local products that are losing market in competition with large corporations). As the awareness of environmental protection increases, new occupations will develop such as: traceability manager (who examines global supply chain and checks for suppliers of organic products), hydrogen fuel station manager(whohas both scientific expertise and retail skills), uranium recycler(who converts bomb-grade uranium from warheads into low-enriched uranium for use in nuclear power plants), geomicrobiologist (who pieces together bits of geology, environmental science and microbiology with a view to clean up pollution). Food production will be based on ecological principles and the following occupations will appear: organic farmer (agricultural entrepreneur as skilled in genetics as in marketing), and a personal food shopper(whorecommends daily allowance targets for nutritional balance). The next area most likely to grow is the health sector. An increasing number of jobs in healthcare is directly related to the aging of population - people live longer and the proportion of ageing population is increasingly growing and as a result there is a growing need for medical and social care. In addition to traditional occupations in the health sector such as doctors, medical technicians, physical therapists, etc., new professions will develop such as experimental therapist (who connects patients with new treatments and navigates them through the maze of patient services), home companion-caretaker (who enables elderly people to stay in their homes and live with dignity). The development of nanotechnology and biotechnology will create the following professions: bioinformationist(scientist who marries genetic information with drug development and clinical techniques). Changes will occur in the education sector as well. As education becomes a necessity for any job and the traditional approach to learning is increasingly being replaced by online learning, new education institutions will emerge on the market offering their educational content which will create a new profession: online education broker (tailors a bespoke learning package for the client, dovetailing relevant modules from courses and syllabuses around the world). [10] Finally, there is a mismatch between new jobs that will be created over the next ten years and skills that current and prospective employees have, because in most countries, education systems are rigid and do not follow the global economy trends in sufficient measure. In addition to basic and highly technical knowledge, new skills for new jobs that employees will be required to have are primarily as follows:

Instrumental skills and competencies: capacity for analysis and synthesis, organization and planning; basic general knowledge, oral and written communication in the mother tongue, knowledge of foreign language, elementary computing skills, management skills, problem solving, decision-making;

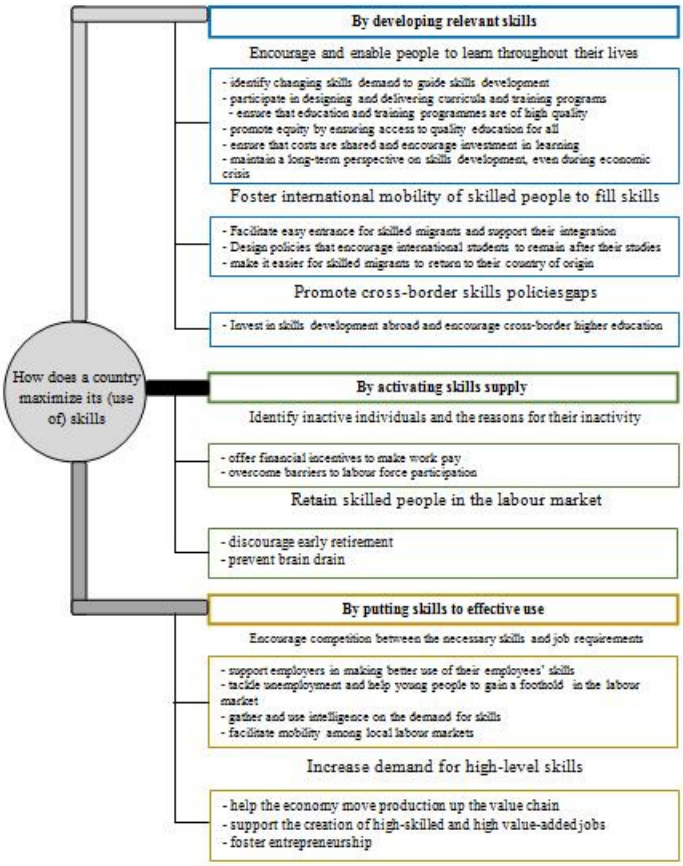
Interpersonal skills and competencies: critical and self-critical abilities, teamwork, ability to work in an interdisciplinary team, ability to communicate effectively with experts in other fields, appreciation for diversity and multiculturality, commitment to work-related ethics;

Systematic skills and competencies: capacity for applying knowledge in practice, research skills,capacity to learn, capacity to adapt to new situations, capacity for generating new ideas, leadership, ability to work on their own; project management, initiative, entrepreneurial spirit, concern for quality and the environment, success-oriented.

Recently, the European Union has launched a number of initiatives aimed at supporting the development of skills of citizens as well as improving education and professional training systems in order for them to be able to respond to the needs of the economy and society better. These initiatives include: the European framework for key competences, the European Qualifications Framework, Strategic framework for European cooperation in education and training and the New Skills for new Jobs initiative. [1]

The latest initiative aims to promote better forecasting of future skills needs of the labour market through better cooperation between the world of work and education. The existing difference between formally acquired skills and competencies and the needs of the labour market will not disappear; on the contrary, it will become even larger. When it comes to the future and strategies for professional development and career advancement, all citizens, regardless whether they are at the beginning or end of their careers, whether they are highly qualified or have only basic skills, will have to upgrade their skills continuously. Acquiring formal qualifications still remains vital for employment; however, informally acquired skills will be recognized as a mechanism that will allow individuals to have their qualifications officially recognised. Upon accession to the European Union as its 28th Member State on 1st July 2013, Croatia will adopt the programmeunder the "Europe 2020 Strategy"[1] which provides guidelines for the development of the European Union by 2020 aimed at overcoming the current economic crisis, the development of a competitive economy based on knowledge with a high level of employment. The strategy also contains recommendations highlighted by working team experts as preconditions for achieving the set priorities (Figure 2). [11]

Figure 2 Preconditions for achieving the priorities inmatching the labour market needs and developing HR skills



Source: OECD Skills Strategy, adapted by authors

One of the aims is the modernization of the education system and investing in the development of competencies and skills, and the use of creative potential of its citizens. What will happen on the European labour market? An individual looking for a job will not have a lot of information about the jobs that are offered on the labour market, and employers who want to fill a vacancy will not have a lot of information about an individual, so both sides will mobilise their resources to find a job, i.e., select the desired candidate. This will create an imbalance between unemployment and vacancies. Europe needs not only skills but the right skills matched to the nature of work and the ability to forecast future changes in the labour market because "one cannot do today's job with yesterday's methods and expect progress tomorrow" (unknown author).

IV. Final Considerations and Suggestions for Improvement

The research has shown that young people increasingly find that their career is closely linked to the employer. The respondents highlighted the attitude of support in career development that is expected from the employer. Career development through the formal education system should be harmonized with the labor market and the requirements of a particular economy, taking into consideration personality traits, knowledge, abilities, skills and aspirations of individuals, as well as the needs of future employers.

It is highly likely that the above-mentioned activities and constant mentoring of the attendees will result in a promising professional future for the business economics graduates who are entering the labor market.

That also implies the importance of the increasing awareness of lifelong career development for every individual that will arrive in the labour market after education, but also the employer's awareness of the importance of employee's career and the realization of quality human resources in his business system.

On the basis of presented research results analysis project activities can be defined even further with an aim to derive direct and indirect benefits from the project.

Direct benefits relate to competitiveness in labour market, additional practical knowledge as well as new approach to knowledge, technologies and information.

Indirect benefits imply decline of unemployment rate, increase of self-employment rate and recognition of the situation in the environment through the interaction with the attendees.

Throughout mentioned activities and constant mentoring of the attendees the more quality promising professional future for the economists that are arriving in the labour market is foreseen.

The Implementation of QR Codes in the Educational Process

M. Filipović Tretinjak*
*School of Electrical Engineering (Elektrotehnička škola), Zagreb, Croatia
martinafilipovic.tretinjak@gmail.com

Abstract - Quick Response (QR) codes are two-dimensional (2-D) barcodes that can contain information such as URL links (e.g. a link to YouTube video, website link) and text (e.g. contact details, product details). These square pattern codes consist of black modules on a white background. QR code generator is software that stores data (e.g. URL link, text, Google maps location) into a QR code. This encoded data can be decoded by scanning the QR code symbol with a mobile device that is equipped with a camera and a QR code reader software. QR codes have a number of purposes; they are mostly used in manufacturing (e.g. product traceability, process control, inventory and equipment management), warehousing and logistics (e.g. item tracking), retailing (e.g. sales management), healthcare (e.g. medical records management, patient identification, equipment and device tracking), transportation (e.g. ticketing and boarding passes), office automation (e.g. document management), marketing and advertising (e.g. mobile marketing, electronic tickets, coupons, payments). This paper will describe various methods for the implementation of QR codes in the educational process. Experience from the School of Electrical Engineering in Zagreb shows that QR codes supports both independent and collaborative learning and can create an interactive learning environment.

I. INTRODUCTION

The QR code was developed in 1994 at DENSO Wave Incorporated (then a division of DENSO Corporation). In 2000, the QR code was established as an international standard (ISO Standard 18004) by the International Organization for Standardization (ISO).

Since 1994, QR codes have gained wide acceptance in various industries such as manufacturing (e.g. product traceability, process control, inventory and equipment management), warehousing and logistics (e.g. item tracking), retailing (e.g. sales management), healthcare (e.g. medical records management, patient identification, equipment and device tracking), transportation (e.g. ticketing and boarding passes), office automation (e.g. document management), marketing and advertising (e.g. mobile marketing, electronic tickets, coupons, payments). With the rapid growth of smartphones and tablets, QR codes made their way into the educational process.

A. Definition and main fetaures of QR codes

Quick Response (QR) codes are two-dimensional (2-D) barcodes that can contain all types of data, such as numeric and alphabetic characters, Kanji, Kana, Hiragana, symbols, binary and control codes. Up to 7,089 characters can be encoded in one code. These square pattern codes consist of black modules on a white background.

The main features of QR codes are: high capacity data storage, small printout size, Kanji and Kana character set capability, dirt and damage resistant (QR codes have an error correction capability), readable from any direction in 360 degrees and with a structured appending feature. One QR code can be divided into up to 16 smaller QR symbols. Information stored in multiple QR code symbols can be reconstructed as a single data symbol.

B. Types of QR codes

There are different types of QR codes: QR code Model 1 and Model 2, Micro QR codes, iQR codes, SQRC and LogoQ.

Model 1 is the original QR code. The largest version of Model 1 is 14 (73 x73 modules); this version can store up to 1,167 numerals. Model 2 is an improvement on Model 1. The largest version of Model 2 is 40 (177 x 177 modules); this version can encode up to 7,089 numerals.

Due to its major feature (one position detection pattern, the regular QR code has three detection patterns located at the three corners of a symbol), the configuration of the Micro QR code allows printing in areas even smaller than the QR code. This type of code has four variations, M1 to M4. Data capacity varies for each version. Maximum data capacity for the Micro QR version 4 code is 35 numerals.

Although SQRC is a type of the QR code that has reading restriction function (e.g. can be used to store private information.), this functionality does not guarantee that the coded data is secure. It looks the same as the regular QR code.

LogoQ is a new type of the QR code that can incorporate different design features such as illustrations, letters and logos.

In this research the QR code Model 2 was used.

II. GENERATING AND READING QR CODES

Because the DENSO Wave Incorporated (the inventor of the QR Code and owner of the QR Code trademark) has allowed the patents for the QR code to be freely available to the public there are many websites that feature online QR code generators or downloadable code-generating software. Because such software is not certified by the ISO, the created QR codes may not be readable by all devices or the reading quality may be reduced. In order to avoid such problems, only code-generating software compliant with ISO Standard 18004 should be used.

A. Generating QR codes

QRdraw Ad and QRmaker Ad are DENSO Wave QR codes generation programs. The QRdraw Ad software can be used for generating QR codes on the computer. QRmaker Ad can be used to create a QR code while developing application programs with programming languages such as Microsoft VisualBasic.

QR codes that were used in this research were generated with online QR code generators such as keremerkan.net (http://keremerkan.net/qr-code-and-2d-code-generator/), Snap.vu (http://snap.vu/) and with QR Code Generator YKART, a mobile application downloaded from Google Play (https://play.google.com/store).

After creating an account or downloading an application, the creation of QR codes can start. First choose the content type (Text, URL, Email, Phone number, Contact, Geolocation and SMS), then input the content and press generate button to create the QR code image. Download the QR code and the symbol is ready for printing.

When using Snap.vu, the content document embedded in a QR code can be changed and managed at any time.

B. Reading QR codes

In order to use a QR code scanner software, your mobile device must have a built-in camera. Students download the appropriate QR code scanner on their smartphones and tablets. They mainly used the QR Code Reader Scan Inc. mobile application downloaded from Google Play.

The application is very easy to use. To scan a QR code, start the application and point the camera at the code. There is no need to take a photo or press a button, QR Code Reader will automatically recognize any QR code.

If the QR code contains a website URL, you will automatically be taken to the site. For codes that contain text, the text is immediately seen. For formats such as phone numbers, email addresses, or contact info, you will be prompted to take appropriate action.

III. IMPLEMENTATION OF QR CODES

Various methods of implementing QR codes in the classroom:

A. Adding QR codes to books and printed material

Place printed QR codes in a text book or append them to additional printed lecture material. Students scanning QR codes are taken to the lesson-related materials (e.g. videos on YouTube, SchoolTube, TedEd and KhanAcademy, web pages that contain more information on the topic presented in class, such as Pinterest). To avoid students losing the given QR codes, print them on stickers.

B. Adding QR codes to assignments or worksheets

Add QR codes to assignments or worksheets to allow students to access needed guided instructions. After completing the assignment or worksheet, students can use the QR code to check their answers.

Teachers can visually confirm when students are checking their work. QR codes can also help teachers to keep track of students' individual progress.

C. Adding QR codes to course websites

Add QR codes to your course website. QR codes can contain the teacher's contact information, links to other webpages relevant for the course, information on the course learning outcomes and grading system.

D. Placing QR codes on a classroom wall

To save space on your classroom wall, instead of placing lots of printouts, put QR codes to give students announcements, assignments or instructions.

Different subjects can use different QR code colors. Given that different teachers use the same classrooms, colored QR codes are an easy way to keep the course materials organized.

E. Using QR codes as digital portfolios for students

At the beginning of the school year, assign a QR code to each student. This QR code can contain links to the student's work done over the school year. In this way, parents have an opportunity to monitor the child's progress.

F. Creating a QR code treasure hunt

Create a QR code treasure hunt in which students have to retrieve clues from QR codes placed around the classroom in order to solve an assignment problem.

IV. SEARCH RESULTS

Research was conducted for two months on twenty-three 16 and 17 year old students. Participants were students from the vocational education program: Computer system electronic technician (experimental curriculum). Research was conducted during the course "Introduction to databases", which already has in-class computer-based activities.

Figure 1 shows the research results of the students' feedback on learning with QR codes. Most of the interviewed students (92%) agreed that activities with QR codes made learning interesting and helped them to achieve the intended learning outcomes. Only some of the interviewed students (8%) claimed that they prefer class activities that don't include QR codes.

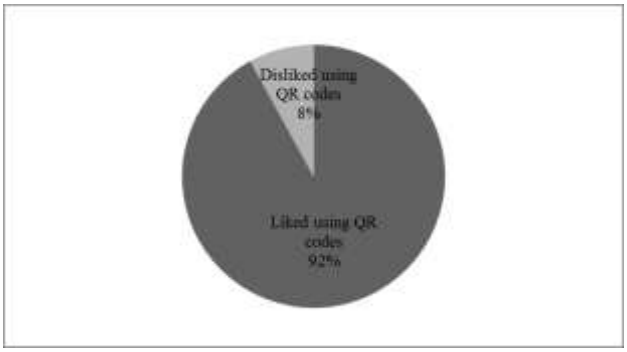

Figure 1. Students' feedback on learning with QR codes

Figure 2 shows the research results of the students' feedback on the use of QR codes. Students (98%) claimed that the use of QR codes was easy once the appropriate software was installed on their mobile device and that they learned new things about phone use. For some students (2%) the use of QR codes was difficult. The reason they gave was that they had to learn other things (for example how to choose and install appropriate software) before they can use QR codes and that reading from mobile device's display was difficult.

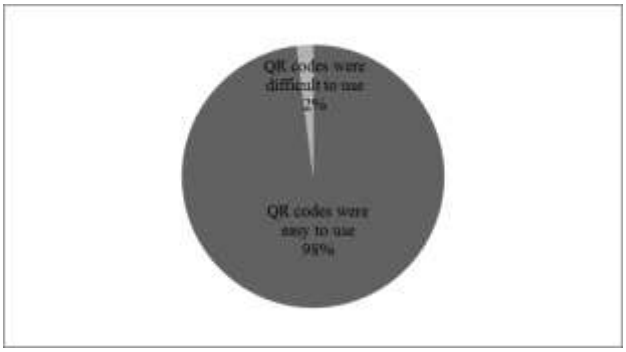

Figure 2. Students' feedback on the use of QR codes

V. CONCLUSION

Teachers are not always willing to accept new technologies. Because of their simplicity and efficiency, QR codes are becoming a popular tool in the educational process. Activities that include QR codes can help create engagement in a lesson, but also need to be implemented in a proper way.

Experience from the School of Electrical Engineering in Zagreb shows that QR codes support both independent and collaborative learning and can create an interactive learning environment.

Computers and Internet in Active Learning

A. Bednjanec *, M. Filipović Tretinjak ** and M. Tretinjak***
* School of Electrical Engineering (Elektrotehnička škola), Zagreb, Croatia
** School of Electrical Engineering (Elektrotehnička škola), Zagreb, Croatia
*** School of Electrical Engineering (Elektrotehnička škola), Zagreb, Croatia
andrea.bednjanec@gmail.com; martinafilipovic.tretinjak@gmail.com; mario.tretinjak@gmail.com

Summary - Active learning has the greatest effect on learners' achievements, pleasure, full understanding and correcting misunderstandings. In the classroom and at home computers and the internet support creativity and provide to teacher many design options of active learning. A teacher can respond to individual errors, errors common to the group or class to help students improve their competences. Students learn actively with greater efficiency in acquiring skills. Active learning improves results and promotes professional development of both, student and teacher.

I. INTRODUCTION

Learner - centered education also known as student - centered learning encompasses methods of teaching that shift the focus of instruction from the teacher to the student. It requires students to be active, responsible participants in their own learning. Student - centered learning emphasizes each student's abilities, interests, learning styles. The teacher is placed as a facilitator of learning for individuals rather than for the class as a whole. In the last decade there has been a growing interest in stimulating the motivation to achieve greater competence of students. Active learning teaching methods has attracted much attention from research teams. The term "active learning" has never been precisely defined in educational literature [1]. Authors [1], [2], [3], [4], [5], [6] and many others describe general characteristics commonly associated with the use of strategies promoting active learning in the classroom. Students are involved in more than listening. Less attention is placed on transmitting information and more on developing students' skills. Students are engaged in activities and greater emphasis is placed on exploration of their own attitudes and values. In this way students are involved in higher-order thinking (analysis, synthesis, evaluation).

This research is built on existing knowledge in the fields of active learning. Its purpose is to develop a framework of effective teaching in vocational education. We explored which active learning teaching methods can help students to stay motivated when they feel difficulties in acquiring the topics to learn, achieve better exam and skill results and make learning and practicing easier. Most mentioned methods require computers with access to internet in the classroom. Our research, focused on learner - centered activities, is made in the School of Electrical Engineering and it is based on the subjects that already have in-class computer based activities such as: computer networking and internet technologies, computer science, system software and technical documentation.

In the first part of our research we checked the depth of the motivation of students to acquire vocational competences. In the second part of our research we compared effectiveness of active-learning methods involving completely individual work of students,work in pairs and work in groups. After that we compared our experinces with guided exercises and e-learning.

II. MOTIVATION

The first study was conducted by surveying one hundred and twenty successful vocational students of the first, second, third and fourth grade in order to find out how they feel about the subject matter and expectations. They recounted all the competencies that are expected, and as a part of research had to choose between three options what motivates them in learning or add their, fourth.

Our findings suggest two parallel motivations that mostly drive student achievement: to improve their knowledge and competencies and to prove that competencies to others. Results are given on Figure 1.

We concluded that our test group is motivated enough to acquire competences and appropriate to compare the effect of active learning.

Authors [1], [2], [3], [4], [5], [6] indicate that different modern teaching techniques can help students achieve better exam results requiring students to 'make their own meaning' and developing their own concept of what they are learning.

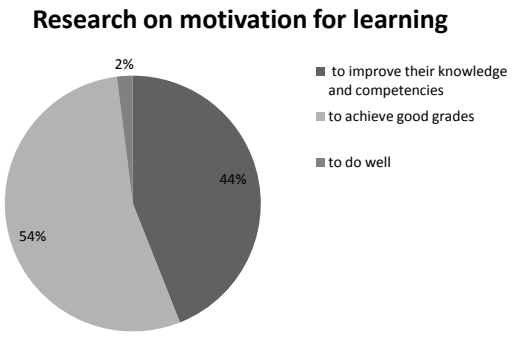

Figure 1. Research on motivation for learning

III. THE CHOICE OF TEACHING METHODS

Sometimes, students expire problems with understanding of new lectures or new topics. Sometimes it is difficult to find appropriate active learning methods that match to teenage vocational students. At the vocational education level, appropriate instructional activities are necessary to facilitate learning. Our experiments were carried out during the school-year to find out which level of cooperation in teaching is the most appropriate to vocational student and teacher. The author´s attention was focused only on the level of completed task, not on their quality details.

A. Active-learning methods involving completely individual work of students

Using active methods of learning involving completely independent work the best results are achieved in learning simple educational content, training of different skills or repetition and systematization of known content. Students made graphic organizers, questions and answers. Only part of the group is able to independently finish exploring brand new or well-known but complicated course content. The main advantages and disadvantages of the active-learning methods involving individual work of students are given in Table 1. Only between 70%-90% of students usually is able to complete tasks, depending on the educational group.

TABLE 1. THE ADVANTAGES AND DISADVANTAGES ACTIVE-LEARNING METHODS INVOLVING COMPLETELY INDIVIDUAL WORK OF STUDENTS

		Advantages		Disadvantages
Individual work of students	**Teacher**	Can detect the level of achievement of each student; Can help each student to those facilities that are needed;	**Teacher**	Needs to motivate students; Needs time and Concentration for individual work with every student;
	Students	Develop critical thinking; Learn and examine material at their own speed; The possibility of individual help from teacher;	**Students**	Lack of direct communication with colleagues; Spend more time on the computer and Internet; Loss of concentration;

B. Active-learning methods involving work in pairs

Using active methods of involving work in pairs, students make graphic organizers, questions and answers, simulation exercises, etc.). Only between 80%-90% of students is usually able to complete tasks, depending on the educational group.

The best results are achieved in repetition and systematization of known content. The main advantages and disadvantages of the active-learning methods involving individual work of students are given in Table 2.

TABLE 2. THE ADVANTAGES AND DISADVANTAGES ACTIVE-LEARNING METHODS INVOLVING WORK IN PAIRS

		Advantages		Disadvantages
Work of studentsin pairs	**Teacher**	Activates less good learners to do tasks; Can help each student to those facilities that are needed; Activates less good learners to do tasks and to contribute;	**Teacher**	Needs to motivate students; Needs time and concentration for individual work with every member of the pairs; Can´t detect the level of contribution or even achievement of each student pecisly; Can help each student to those facilities that are needed only if both of students in pair ask for help;
	Students	Develop critical thinking; Learn and examine material at their own speed; The possibility of individual help from teacher and from colleague; Can´t detect the level of contribution or even achievement of each student pecisly: To activate less good learners to do tasks and to contribute: More interesting especially if pairs are changed;	**Students**	Spend more time on the computer and internet; Loss of concentration Possibility to stay passive and to not to achieve goals;

C. Active-learning methods involving work in small groups

Using active methods of learning involving work in small groups the best results are achieved in practicing skills and repetition and systematization of known content. Only between 70%-80% of students usually is able to complete tasks, depending on the educational group.

Problems are how to grade contribution to the work of each student and how to help each student facilitating the task. The main advantages and disadvantages of the active-learning methods involving individual work of students are given in Table 3.

It has been found that learners motivated to achieve good grades prefer individual work and work in pairs. They choose work in groups only if they have influence on selecting members of the group.

TABLE 3. THE ADVANTAGES AND DISADVANTAGES ACTIVE-LEARNING METHODS INVOLVING WORK IN SMALL GROUPS

		Advantages		Disadvantages
Work of studentsinsmall groups	Teacher	Has not need to activate students;	Teacher	Can´t detect the level of achievement of each student Has to moderate a way of work of some groups Doesn´t know what kind of help each student needs May have problem to finish the exercises in time
	Students	Develop critical thinking; The possibility of individual help from teacher and from colleagues; More interesting especially if groups a changed;	Students	Spend more time on the computer and internet; Should be adapted to work in a group rate in learning and examining materials; Possibility to stay passive and leave the work unfinished;

D. Guided exercises and e-learning

Previous studies indicate that the best results in the mastering of teaching content that can be very complicated to part of students achieved by combining the workout and various forms of e-learning. This gave good results, when the students first encounter with some skills they need to adopt and practice, especially when that skills are also based on the knowledge that is needed to be adopted on the hours of theoretical classes.

Some students often for various reasons do not study the theoretical content on time, so there are problems with the application of knowledge to acquire skills. These students usually do not dare to ask teachers or colleagues for help, and the problems build on each other.

Some students try to always overcome all the theoretical contents conscientiously and on time, but in the application of this knowledge feel difficulties with part of the material. In this way they are thus spared the bad feeling that something could not be successfully designed on the basis of their work. Part of this group of students is subject to de-motivation and withdrawal from work when they run into difficulties that at the moment seem insurmountable.

Students that all the theoretical knowledge acquire in time and successfully apply them in practical skills guided exercise will also be useful. Curricula content will be practiced in controlled conditions and will have the opportunity to correct errors which may come with your own research. This mode brings them security. Such exercises are performed so that the time is adjusted to the slowest student. Each student has the opportunity to ask the teacher for any problem what complicates progress and there is no a single problem undetected. This mode raises solidarity of students. Those students who are quick to work and turn to themselves by helping others slower colleagues achieve a higher level of knowledge and skills and are rewarded grades.

The exercises take place in the time span of two hours. Guided exercise typically lasts for one hour, followed by students in the various e-learning materials that teachers are preparing for the opportunity there, or were referred for independent research on the internet.

E-learning materials are available to them at home, too, as well as numerous quizzes and educational games that are based on knowledge and skills.

Performing such exercises in combination with e-learning ensures that 100% of students complete the exercise, successfully overcome solving problems for the first time, gain self-confidence and gain the will to continue further independent learning. During the entire exercise students are actively taught, first with the help of teacher later independently. Such a mode is in the beginning for the teacher rather hard, because he must be very well prepared for practice in all groups and must prepare enough materials for e-learning but it is certainly worth of student achievements.

.

IV. CONCLUSION

On the part of vocational students overcome the more difficult teaching content is discouraging. By selecting appropriate teaching methods the teacher should act preventively to loss of motivation. Experience from the School of Electrical Engineering in Zagreb indicates that good results can be achieved by a combination of guided exercises in which the teacher helps overcome the teaching contents and different forms of e-learning.

Project teaching – is it achievable without the school library

Denis Vincek
Osnovna škola Ante Kovačića (Primary school)
Vladimira Nazora 1, HR-49250 Zlatar, Croatia
Phone: +385-49-466 832 +385-98-223 746 Fax: +385-49-466 370
E-mail: denis.vincek7@gmail.com

Abstract - Project teaching is one of the forms for achieving the learning outcomes in a student-directed teaching. The study conducted among the students in a Croatian elementary school from grades six to eight provided the data on information literacy and its role in problem solving in project teaching and the extent to which information technology (computers and printers the children have at home) represents an inhibiting factor for solving the information problem. A competent school librarian teaches the students how to achieve information literacy, which is necessary to efficiently participate in every school project – from raising awareness of information need to presenting the project itself – and information technology offered by the school library, which is crucial for materializing every school project as it is present in all six steps of the so-called Big 6 model, which turn the didactic triangle into a square – are a proof that the school library is an inevitable factor in a student-directed teaching, that is, in realization of every project.

I. INTRODUCTION

When discussing student-oriented teaching strategies aimed, the teaching experts of today put a special emphasis on project teaching and project learning [1].

As a part of almost every project, the students have to find and/or print certain information that can be found online. This includes visual or textual content as elements of the posters representing the end-product of the students working on the project. In addition, the teachers assign certain projects to be done at home so information technology can represent an aggravating factor for solving the project task.

The first hypothesis, that is, the first aim of this work is to prove that the school library and the information technology at its disposal represents a crucial prerequisite for the execution of project teaching – not only in terms of achieving the project task by phases but for its presentation, which includes activities up to the creation of the poster.

The second hypothesis that this work will attempt to prove is that the process of spreading information literacy being conducted in school libraries among sixth- and seventh-grade students increases the capability of identifying and locating the source of information, finding the information and evaluating it, which is a prerequisite for a successful execution of every episode of project teaching.

II. THEORETICAL OVERVIEW

A. Why project teaching and project learning

According to Matijević and Radovanović [1], project teaching is a very favourable form of teaching as the acquired knowledge is not just formal, as is the case with didactic materialism, but it is also factual, conceptual, procedural and metacognitive, that is, we can grade it according to Bloom's taxonomy of objectives. In addition, the students also acquire competencies from the affective domain, such as kindness, empathy, tolerance, proneness to team-work, communicability, punctuality and honesty.

Working in groups also breaks the monotony of learning, develops the sense of togetherness and solidarity among them, strengthens social cohesion and emphasises educational moment – the students create something together, they are more motivated, and in a more positive emotional climate in the class (that is, in the library), every student in the group can choose the task that fits him or her better.

Unlike the "old school" in which the teachers demonstrate and the students passively watch, the students in the student-oriented teaching "solve problems on their own, explore, analyze, discuss, evaluate, construct" – in other words, they take the role of the subject.

B. School library in HNOS and NOK[1]

Taking NOK into consideration, one has to ask the question what the teachers can and have to do and where the school librarians fit into in this picture. NOK takes the children as the starting point but its aim is not to teach them but to make them capable of learning and developing skills necessary to master information important for their lives [2].

The library and the librarian are here given a recognizable task and role. They represent a place that

[1] Croatian National Educational Standard and National Curriculum

has to contribute to the creation of an environment favourable for successful education.

One can clearly see from the educational objectives stated in HNOS that the school library and its features represent a place essential for every school project and is ideal for its execution [3].

There are numerous reasons why this is the case [4]: the students are more easily motivated to work in the library; the students can be approached individually through adaptation of the tasks to their aptitudes and capabilities; it allows and reinforces the creativity of students; it has the technology for finding the necessary information, their processing and presentation; it has a system of evaluation different from classic grading and the results are visible through effective presentations or displays; the students experience a certain form of public affirmation (public performances, media).

Of course, the prerequisite for this to be achieved – organizationally speaking, through support for the sources of knowledge and through professional research guidance and realizing set objectives – is a competent librarian.

C. Previous research

If we look at the first out of three competences for teachers and librarians [5] stated by Domović (working with information, technology and knowledge), one can clearly see that the school librarians have a lot to offer in term of information through the scope of the Library Education programme by making the students information literate [6].

This is particularly important as almost all objectives in project teaching are related to problem-solving, and so project teaching can often be identified with problem teaching. Here, the library represents the central hub [7] of information of the school, not only in terms of reference collections, that is, the classical sources of knowledge, but in terms of computers with an Internet connection, that is, the sources we reach by means of modern technology.

The librarians are there to teach the students how to find, evaluate, use and present the information by using the so-called Big6 model, for instance [8]. But the importance of information technology located in the school library is also highlighted by Domović.

The role of the library in the educational process was investigated by Lovrinčević in her analysis of 10-year activity of the high school library of the High School for Construction and Engineering in Osijek [9]. She emphasizes that the school library is an absolute necessity in the process of finding the way for students to become the "subjects" and making education not something happening around them but something they take part in, which are the exact traits highlighted by the student-oriented teaching and project teaching.

The results obtained by Lovrinčević are particularly prominent in indirect use of the school library, that is, in project teaching, or as the author puts it, in "classes with problem-related approach" in which the students work individually, in pairs, or in groups and use the library for research and finding the answer in form of a photograph, text etc.

In this vein, Shaw stated that, among other things, the programme objectives of the school library include [10] acquiring a whole array of educational technologies to enable searching, acquiring materials, creating original works, organizing data, solving problems, helping and organizing interdisciplinary learning and helping students in the process of learning and making their own works. Among those aims, we can see the elements of project learning.

Diana Oberg, whose career took a path from being a school librarian to being a university teacher, emphasizes [11] the importance of acquiring information literacy as a means for initiating the creation of the school project. While information literacy in Croatia is introduced in higher elementary school grades, Oberg emphasizes that it is necessary to start this process as soon as possible and that it is necessary to clearly state that the person in charge of teaching information literacy is the school librarian.

Lovrinčević, an expert in information sciences, also emphasizes that project teaching is actually guided exploratory learning, characterized by carefully planned and well-monitored work of school librarians and teachers and their students who explore the acquired knowledge according to Bloom's taxonomy.

This is actually the learning style of Carol Kuhlthau, American professor of Information and Communication Sciences [12], who states that project learning is the form of learning in which the librarian guides the students through the resources available at the school library all the while teaching them about information literacy. Ruth Small emphasizes [13] that once the students master information literacy via school library, they will not have only acquired the skills to solve the problem but will have become intellectually curious persons in the sense that exploratory behaviour will be something that they are constantly attracted to, which is a quality necessary for successful project learning.

It is also worth mentioning that in her PhD thesis from 2006, Lovrinčević, a professor at the University of Osijek, mentioned [12] new programmes, new ways of teaching, new teaching resources and aids and "trained teaching staff", but it is only five years later that Matijević and Radovanović revisit this topic and start systematically using the term student-oriented teaching, which includes project teaching among other things [1]. While the latter talk about project teaching without even mentioning the school library, Lovrinčević offered the solution in 2006 in which the school librarians are supposed to be the leaders in this new concept and the school libraries the places which carry the crucial changes in school.

Keith Curry Lance from the Colorado State Library also wrote about the influence of the libraries in terms of information literacy and technology that a library has at its disposal [14], emphasizing the cooperation between the librarian and all elements of the educational process.

In his example of class correlation between American History and American Literature in the Eaglecrest High School in Aurora, Colorado, Lance concludes: "Students are taught the research process, including accessing and using both primary and secondary sources. My students' ability to access library books and other materials and to use information appropriately in their papers is very evident in the quality of their work" [14]. In terms of technology, the studies have shown better results and student accomplishments in those schools where various databases are available, and this becomes particularly prominent when those databases can be accessed online from home.

Curry uses the example of Becky Hickox from the Silverton High School to describe a successful project on the topic of health, which started with the librarian teaching the students how to use search engines and then databases.

When it comes to the role of school libraries in increasing student accomplishments in project teaching, Michele Lonsdale from the Australian Council for Educational Research emphasizes [15] the proliferation of information, mostly online, and uses this to prove the role of school libraries and librarians in the students' accomplishments. According to her, the library is not just a source of information but a centre in which the librarian teaches the students to locate, use and evaluate the information, which gives the library a special role in the acquisition of information literacy as it creates a community of those ready for lifelong learning.

Lonsdale describes the library as a place in which, according to her, "content-based education" is transformed into "outcomes-based education". In other words, the main focus is no longer on the teaching content that the students have to acquire, and the students become the subject in the didactic triangle, as discussed by Poljak [16], in which they show what they have learned, which is precisely the student-based teaching. And this is all achievable in the library, says Lonsdale, as the librarians are more focussed on their users and their needs, and less on the library itself.

These results were confirmed by a study [17] of the effect of school libraries conducted in 22 American states and one Canadian province from 1993 to 2011. Kachel states that school libraries undoubtedly have a positive effect on students' accomplishments as they teach their students the skills of the 21st century and promote successfulness.

III. METHODOLOGY

For the purpose of this research, the "distribute and collect" questionnaire [18] was used. It consisted of 14 questions and was filled out by the students of grades sixth to eighth from the Ante Kovačić Elementary school in Zlatar in June 2014.

The research included only the mentioned grades as orientation research in the form of teacher interviews showed that project teaching is applied only from sixth grade onward, while it is seldom employed in lower grades.

The questionnaire was divided into two parts. The questions in one part were used to gain insight into information literacy of the students and its role in problem-solving in project teaching, while the questions from the second part were used to find out to which extent information technology (computers and printers the students have at home) represents an aggravating factor in solving the information problems.

IV. RESULTS AND DISCUSSION

A convenience sample was selected for the purpose of this research. The questionnaire was filled out by 151 students: 59 sixth-graders, 50 seventh-graders, and 42 eighth-graders (everyone present at school at the time the research was being conducted).

The research showed that all students have a computer with an Internet connection at home, but not everyone has a printer (Fig. 1).

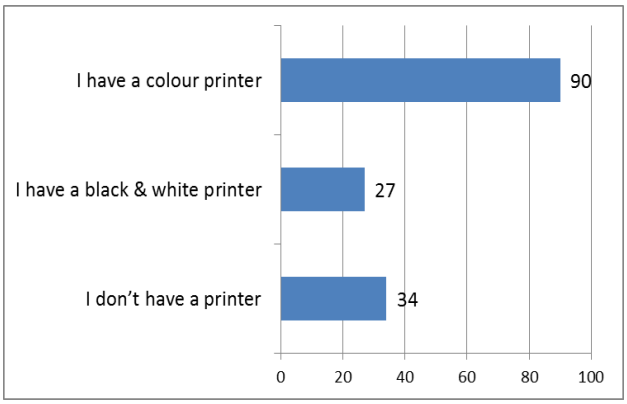

Figure 1. Distribution of students according to the fact whether they have a printer at home

As much as 93 per cent of participants stated that they had been asked to find certain data (text and/or photographs) in the scope of a project in their education up to that point. Two thirds of participants had done that at home (Fig. 2).

However, the question Where did you print the results you got? yielded some unexpected answers. Only one half of participants did this at home (Fig. 3).

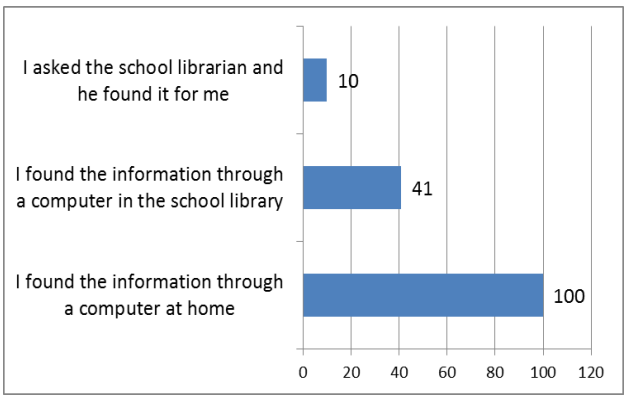

Figure 2. How the students found information for school project

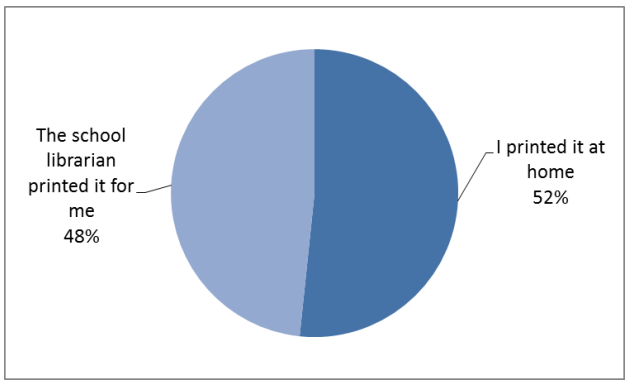

Figure 3. Where the students printed the information found for the school project they took part in

Even though all students have a computer with an Internet connection at home and could find the information for their school project from home, as much as 51 students, that is, one third of participants did so at school, in the school library to be precise. If we compare that to the question whether they have a printer at home, one can clearly see that all students that do not have a printer of any kind at home search for information (and print them) at school (individually or with the help of the school librarian) along with more than half of students that said they had a black and white printer at home.

However, out of 100 students that stated they find the information from home – and 90 of them have a colour printer at home – only 78 (out of 151) printed the information (texts and/or photographs) at home, while the remaining students asked the school librarian to print the necessary information at the library, along with those students that found the information they looked for in the school library. The following can be deduced from this: the students who use the school library to search for and print the information they need for presenting their projects are the students that do not have a printer at home or just have a black and white printer at home, while some of the students that have a colour printer at home (12) do not do the printing at home, possibly for the purpose of saving toner and/or ink.

Considering the fact that a majority of students have black and white printers, they were asked whether their teachers require the presentation materials to be printed in colour or not (Fig. 4).

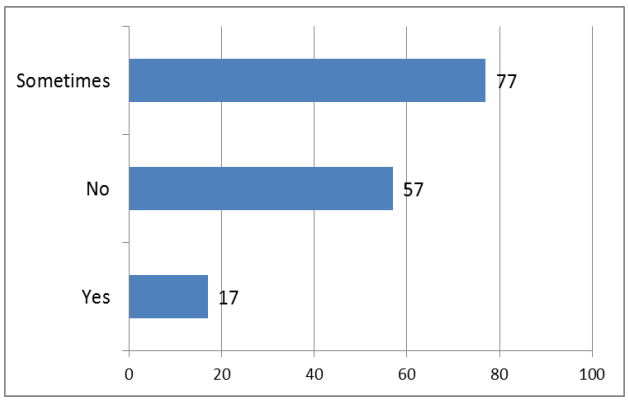

Figure 4. Do the teachers ask that the content used for project posters be printed in colour

TABLE 1. PERCENTAGE OF STUDENTS THAT ALWAYS FIND THE INFORMATION THEY ARE SEARCHING FOR DISTRIBUTED ACCORDING TO GRADES

Grade / Percentage of students that always find the information	**6th grade**	**7th grade**	**8th grade**
	44%	50%	60%

While 38 per cent participants gave a clear answer that the printed content does not necessarily have to be in colour, as much as 51 per cent said that the teachers require this from time to time. Such a high figure supports the view that the students hope their work will be given a higher grade if it is printed in colour, which is why they perform their entire task from finding information to printing at the school library.

When it comes for the skills of finding the information, 75 students said that in most cases they find the text and/or photograph they are looking for, while 76 said they always find it. However, if we distribute them according to grades, we can note that the percentage of students that always find the information they search for increases from sixth to eighth grade (Table 1).

The participants had to state whether they read the information they get before printing. As much as 92 per cent of them said that they do, but it is still unthinkable that there are 12 students who do not do that. The author of this paper notices this as soon as the students bring a Word document with parts underlined with blue (hyperlinks to other websites that were not removed) or with footnote markings left next to words.

However, the number of students that read and correct those mistakes before printing increases from the sixth to eighth grade (Table 2).

TABLE 2. NUMBER OF STUDENTS THAT DO NOT READ THE INFORMATION THEY FIND BEFORE PRINTING DISTRIBUTED ACCORDING TO GRADES

Grade / Number of students that do not read the text before printing	**6th grade**	**7th grade**	**8th grade**
	6	5	1

TABLE 3. NUMBER OF STUDENTS AND THE INTERNET SEARCH ENGINE USED TO FIND THE SOLUTION TO THEIR INFORMATION PROBLEM

Grade / Search engine	**6th grade**	**7th grade**	**8th grade**
Google	29	30	33
Google Chrome	19	6	5
Wikipedia	6	6	2
Mozilla Firefox	3	1	2
Internet Explorer	1	3	0
The student did not provide an answer	1	4	0

The only open-choice question the students were given in the questionnaire was naming the Internet search engine they used for finding the information they needed. Table 3 shows the answers the students provided.

The table clearly show that the only search engine the students use is Google, but among the answers provided, they also stated three Internet browsers and even Wikipedia, the free encyclopaedia. However, it is worth noting that the number of students that provided a correct answer to this question, i.e. who named the internet search engine, increases from sixth to eighth grade (Table 4).

TABLE 4. PERCENTAGE OF STUDENTS WHO STATED THE (CORRECT) NAME OF THE SEARCH ENGINE USED TO FIND THE INFORMATION DISTRIBUTED ACCORDING TO GRADES

Grade / Percentage of students that gave a correct answer to this question (by naming the Internet search engine)	**6th grade**	**7th grade**	**8th grade**
	49%	60%	79%

As far as the sources of information go, Wikipedia still holds the top spot (Fig. 5).

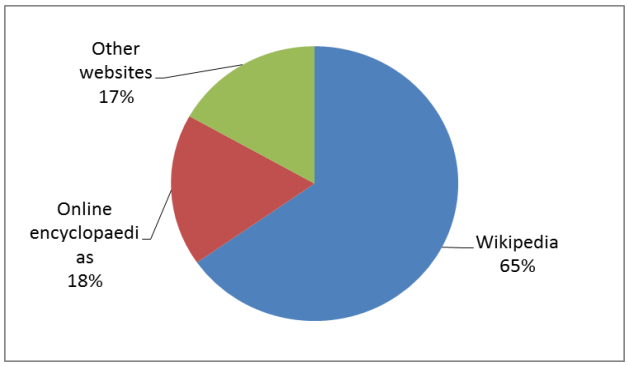

Figure 5. The online sources the students from sixth to eighth grade used to find information for their projects

However, looking from the sixth to eighth grade, the number of students who prefer Wikipedia as a source of information is in a slight decline (Table 5).

TABLE 5. PERCENTAGE OF STUDENTS THAT LOOK FOR THE INFORMATION MOSTLY ON WIKIPEDIA DISTRIBUTED ACCORDING TO GRADES

Grade / Percentage of students that look for the information on Wikipedia	**6th grade**	**7th grade**	**8th grade**
	76%	64%	59%

The percentage of students using the so-called "copy-paste" method for executing their projects is admittedly not so high as for using Wikipedia to gather information. As much as 67 students (44 per cent) still use this procedure, although a slight decline can also be noted for this from the sixth to eighth grade (Table 6).

TABLE 6. PERCENTAGE OF STUDENTS USING THE COPY/PASTE METHOD DISTRIBUTED ACCORDING TO GRADES

Grade / Percentage of students using the copy/paste method	**6th grade**	**7th grade**	**8th grade**
	46%	46%	40%

V. CONCLUSION

This research has provided the following insights for students from grades six to eight:

1. Not all students have a printer at home that they need for printing photographs or textual content necessary for creating the posters for finalizing their project tasks.

2. The students that do not have a printer of any kind at home and a portion of students that have a printer at home (black and white or colour printer) use the computers at the school library to find the information necessary for project learning. This can be affected by three factors:

a) the teachers ask that the results be printed in colour or the inclination to conserve the (black) ink cartridges from their personal printers makes the students perform their entire project tasks at the school library

b) the inclination to conserve the (colour) ink cartridges from their personal printers makes the students perform their entire project tasks at the school library

c) the students need the help of the school librarian for solving their project task

This proves the first hypothesis that the execution of the project task is impossible without information technology in the library, both in the stages of project learning and in the finalization stages, which implies the creation of the posters. In other words, the possibility of conducting project teaching without the cooperation with the school library is dubious to say the least.

As far as the second hypothesis is concerned, the following has been established:

3. The number of students who always find the information they need for solving the project (information) problem increases from the sixth to eighth grade

4. The percentage of students that do not read the information they find before printing them for the project poster decreases from the sixth to eighth grade

5. The number of students who use Wikipedia as their primary source of information decreases from the sixth to eighth grade

6. The number of students who use the copy/paste method in creation of their project poster decreases from the sixth to eighth grade

This confirms the second hypothesis. During the observed three-year period, the students' capability to identify the sources of information and choosing the best one has increased (the share of Wikipedia as the top source has decreased) as has the percentage of locating

and finding information. Reducing the employment of copy/paste method and reading the information before publishing them is nothing else but information evaluation, all of which is a proof of acquiring the information literacy skills. It is a result of intense process of acquiring information literacy conducted in the scope of the school librarian's curriculum, especially through the programme of Library Education, which is given more classes in the school library from the sixth to eighth grade, but also through correlation of other school subjects with the school library. Just like the first hypothesis, this proves that there can be no (satisfactory) project teaching without the school library.

Surely, the concept of the National Curriculum will bring many novelties in the scope of all participants in the educational processes, that is, it will make sure that this role, which has largely been outlined before, finally comes to fruition.

In this paper, this can be emphasized on the example of planning and realizing topics which involve several classes as a means of bringing together educational areas and classes into a cohesive unit. Even though the correlation between classes should have been achieved by now as it is, the author's experience shows this has so far been avoided in both the second and even more prominently in the third educational cycle of acquiring basic student competences. The curriculum of the school librarian has so far included correlation and project teaching is ideal for it, but the librarians seldom "entered the classroom" as the subject teachers (unlike class teachers) are unwilling to "give up their classes", as they tend to say.

The school library represents a crucial bond for achieving fundamental competences of lifelong learning and cross-curricular content as a part of the National Curriculum. The conditions for that are: a competent school librarian, cooperation, information technology, and various library resources [19].

All of this was shown by the study presented here. The cooperation with the students; a competent school librarian who provides the students of the upper elementary school grades with information literacy skills, necessary for them to efficiently participate in every school project and realize its problem tasks – from realizing their information needs to presenting the project itself – and the information technology offered by the school library, without which the school project is impossible as it is present in each of the six steps of the Big 6 model, thus turning the didactic triangle into a didactic square. All of this proves that the school library is an integral factor in student-oriented teaching, that is, in realization of every school project.

Benefits of using interactive whiteboards at Kajzerica elementary school

Igor Rukljač, Martina Draženović
Kajzerica elementary school, Zagreb, Croatia
Kajzerica elementary school, Zagreb, Croatia
irukljac@gmail.com, martina.drazenovic@gmail.com

Abstract - Interactive whiteboards are powerful teaching tools. In elementary school Kajzerica we are proud to benefit from interactive whiteboards and endless possibilities to create and manage our classes. Potential applications of interactive whiteboard are: using web-based resources in whole-class teaching, showing video clips to help explain concepts, manipulating text and practising handwriting, saving notes written on the board for future use, quick and seamless revision. After implementing interactive whiteboards into our classrooms, students feel more involved and therefore their motivation for the class is higher. Since the beginning of the school year, we have advanced our classes, recreating them and exploring numerous possibilities to benefit our students and encouraging them to do more. This research will show how students and teachers benefit from interactive whiteboards in our school and how we recreated particular classes using an interactive whiteboard.

I. INTRODUCTION

Introduction of interactive whiteboards into classes has enriched students' and teachers' lives. Both teachers and students do more research, constructing and interacting. Using interactive whiteboard helps teachers to explain complex and abstract concepts more efficiently and it makes them more flexible for building various class materials. Many of our teachers saw interactive whiteboards as a teaching method or technique rather than an aid in teaching or a part of an equipment. The ability to dynamically manipulate and annotate objects and the enhanced presentation of a certain matter is what differentiates classical teaching from teaching with an interactive whiteboard. We embraced digital culture and the fact that is very important in our students' lives so it is to be expected that we adjust our classes to the digital age. Our students do not expect that we continue to use chalk and green board because it becomes too abstract for them. They live in a digital age where their attention is not focused on only one thing, but it is dispersed into several things. We had to adapt.

II. TECHNICAL CHARACTERISTICS OF INTERACTIVE WHITEBOARD

There are two very distinct kinds of interactive whiteboards: The first is a "virtual" electronic version of a dry-wipe board on a computer that facilitates learners in a virtual classroom to view what an instructor, presenter, teacher or fellow learner writes or draws. It is also called an electronic whiteboard and can be found in conferencing and data-allotment systems. The second type is a huge physical display panel that can operate as an ordinary whiteboard, a projector screen, an electronic copy board or as a computer projector screen on which the computer image can be controlled by touching or writing on the surface of the panel instead of using a mouse or keyboard [1].

We use the second kind of interactive whiteboard in our school. Every classroom in our school has one laptop, projector, interactive whiteboard and Internet connection so technical prerequisites are satisfied.

III. INTERACTIVE TEACHING

Interactive teaching methods are an effective way to connect with students used to constant stimulation.

Teachers use higher order questioning and students' active contributions are valued as they test their developing understanding against collective meaning [2]. Interactive teaching encourages and expects learners to participate, use questions to stimulate discussion, emphasizing the value of answers, giving participants hands-on experience and using teaching aids to gain and retain attention.Students are revived from their passivity of merely listening to a lecture and instead become attentive and engaged [3]. These techniques are often perceived as "fun", yet they are frequently more effective than lectures at enabling student learning. Telling is not teaching, nor is listening learning. We must engage participants in learning activities that lead to a higher level of understanding and result in the participants ability to apply what he learned. Interactive teaching is a two-way process of active participant engagement with each other, the facilitator, and the content [4].

IV. METHODOLOGY

A. Method

The qualitative descriptive research method was employed to investigate the perceptions of teachers regarding teaching with an interactive whiteboard. Data was collected from teachers via interview where we divided our teachers into two groups; the first group was the teachers who are teaching from first to fourth grade, and the second group was the teachers who teach from fifth to eighth grade.

B. Participants

Participants are the teachers of our school. A total of 29 teachers were interviewed for this research. The first group of teachers had 14 members, while the second one had 15 members. Only several teachers had previous experience with interactive whiteboards. The majority of

teaching staff started using an interactive whiteboard at the beginning of the school year (September, 2014). The average age of our teaching staff is 40 years old. 86% of our teaching staff hold Master (mag. prim. Educ. or mag. Educ.).

C. Sample question from the research

1. Would you rather work in classic classroom or modern one?
2. Do you use ICT in your classroom?
3. Do you think you can benefit from ICT in order to improve your class?
4. Do you think that workshop helped you with using interactive whiteboard in your class?
5. Do you have to reorganize the way you teach your classes now when you are using interactive whiteboard?
6. Do you think you have to do the research on how to improve using interactive whiteboards in order to benefit the students you teach?
7. Do you think we should organize more workshops for using interactive whiteboard in class?

C. Analysis

The first group of teachers were the ones that teach from the first through fourth grade, while the second group were the teachers that teach from fifth through eight grade. The second group of teachers has one or two subject that they teach in higher classes, while the first group has to teach around 10 different subjects.

Since the first group of teachers had to incorporate interactive whiteboards into 10 different subjects, which means they had to do more research and practice than the second group [5]. Both groups had previos experience with implementing ICT in their classes (using computer or laptop for presentations, videos or educational games).

At the beginning of the school year, the school had organized an educational workshop for our teaching staff where our teachers learned how to use interactive whiteboards. We found out during interviews that teachers had to reorganize their classes in order to incorporate interactive whiteboard into a class curriculum. This action compelled them to do research and to extend their knowledge about using information and communication technology in the class [6].

D. Results

Results of this research compared with the results of Türel and Johnson's research are very similar. The interactive whiteboard has allowed our teachers several instructional strategies; highlighting, coloring, flipping back and forth to review previous content providing reviewing techniques better understanding, using pictures for discussion and brainstorming, collaborative writing, shared reading, peer-teaching, and collaborative problem solving, hiding and revealing, drag and drop, and matching items activities, observing different media which is essential for visual learners, accommodating lower ability and special needs, finding hidden part of a picture with spotlight or screen-shade, capturing screenshots from web pages synchronously and manipulating them, correcting mistakes in the materials and playing games [7]. Using interactive whiteboard had also given us a chance to save paper since we didn't need to print exercises and distribute them to our students so it gave us environmental benefit as well.

Students have increased their independence from the teacher as well as learning outcomes. They can vividly learn from their mistakes and they are enabled to construct and evaluate by themselves which results in higher motivation and engagement into class curriculum. We try to see students as subjects of our educational process rather than objects. With interactive whiteboards the classic frontal approach is fully replaced by interaction between teachers and students. This way we were able to change class dynamics and encourage students to actively participate in class.

Both groups of teachers have succesfully implemented interactive whiteboard in their classes.

V. EXAMPLES OF GOOD PRACTICE

A. Computer science

Teaching Computer science was elevated in several ways. Students are able to use interactive whiteboards to their full extent. We are able to combine matter from several subjects very easily (for example Mathematics, the English language and Arts are correlationing when learning and creating spreadsheets) so that the learning outcomes would be visible in every subject and not just one (in this case Computer science), which results in coherence of the syllabus.

We managed to raise the dynamics by encouraging students to be more independent and constructive in their learning outcomes with the constant support of the teacher. All of Computer science classes in Kajzerica elementary school are visible in the private student access network where they can upload and submit their notes and findings and later present it to the whole class. Some of students' works can already be seen on the school's website

B. 1st grade Croatian language

In the first grade elementary school, students learn to recognize and write letters. They become more familiar with the surroundings they live in and they are taught to express themselves.

Using interactive whiteboard has enabled teachers to combine several resources to make classes fun and creative. One teacher has created an exercise with letters of the alphabet on the far left of the screen, in the middle is the picture starting with that specific letter and on the right is the soud of that letter. The teacher would mix the pictures and the students had to match the specific letter with the picture and the recorded sound of that letter. This exercise enabled them to use information and communication technology methodically from the early age which resulted in increment of self confidence and creative thinking. Later on, they would be able to draw an object into the given box whose first letter starts with the letter in question and then to write the whole word.

C. Geography

Our Geography teacher has completely replaced textbook maps with Google Earth. While explaining the position and basic characteristic of individual countries or continent, she would point her hand to the two dimensional paper world map and the students would remember her action and do the same. Now, she launches this application and uses the interactive whiteboard so students can interact with the globe and approximate the country in question. Furthermore, they can change views and see satellite images, maps and real life footage. She can copy the screen of the footage using interactive whiteboard tools and then modify the picture, as well as flip several pictures in question for repetition and better understanding. This allows students to develop critical thinking and to compare the characteristics of several countries very vividly.

D. Foreign language (English and German language)

Teaching foreign language becomes more interesting and creative using the interactive whiteboard. Similar to the first grade example, students need to match the sounds of letters in a foreign language with the picture of the letter in question. Later they match the sound of the word with the word in question.

Older students can learn to assemble sentences in foreign languages very easily using the interactive whiteboard. The following exercise has several components: recorded sound of words in a foreign language, written words in Croatian language, written words in a foreign language, constructed sentence in Croatian language and the gaps for constructing the sentence in a foreign language. In the early stage, the teacher reproduces recorded sound of the sentence in a foreign language (the answer) so that the student needs to recognize and match the words with the sound and fill in the gaps with written words in a foreign language to construct the sentence. Later on, the recorded sound of the sentence in a foreign language becomes redundant and the students need to construct the sentence on their own.

E. Chemistry

Teaching Chemistry is difficult without visual component. Although presentations can be considered good and interesting, students cannot interact with it, nor adjust it to their satisfaction. Interactive whiteboards enable students to create molecules on their own, to connect the atoms using right connection and to see the differences in object motion. This gives us better insight to the student's understanding of the topic.

VI. Conclusion

Introducing interactive whiteboard gave our school the following benefits: increment of digital competencies of our teaching staff, our students are more motivated and proactive, our teachers have many more resources to create an interesting and fun classes, interaction between teachers and students is more dynamic and we have begun to collect materials to create our e- learning database.

Interactive Teaching with Socrative

M. Filipović Tretinjak*, A. Bednjanec* and M. Tretinjak*
*School of Electrical Engineering (Elektrotehnička škola), Zagreb, Croatia
martinafilipovic.tretinjak@gmail.com; andrea.bednjanec@gmail.com; mario.tretinjak@gmail.com

Abstract – Interactive teaching methods promote a learning environment that leads to achieving the expected learning outcomes through encouraging student participation. Socrative student and Socrative teacher are applications that enable teachers to implement an engaging class environment through educational exercises and games that can be used on any web enabled devices, such as smartphones, tablets, laptops and desktops. Experience from the School of Electrical Engineering in Zagreb shows that Socrative supports both independent and collaborative learning and can create an interactive learning environment.

I. INTRODUCTION

Interactive teaching methods encourage students to participate in class activities, use questions to stimulate discussions, measure student understanding. Each class activity enables students to deepen their learning and achieve the planned learning outcomes. Interactive teaching supports a student-centered approach in the learning process. The advantages and disadvantages of the interactive teaching with Socrative are given in Table 2 below.

TABLE I. THE ADVANTAGES AND DISADVANTAGES OF THE INTERACTIVE TEACHING WITH SOCRATIVE

		Advantages	Disadvantages	
Interactive Teaching with Socrative	**Teacher**	can easily check the students' understanding (e.g. Exit ticket), can create games to track the students' performance while playing (e.g. Space race), have automatically-graded multiple choice quizzes, can monitor the students' progress via Excel or Google spreadsheet, can have up to 50 students loged in at one time per room, have access to the Socrative account from different mobile devices	**Teacher**	needs to have access to the required technology, needs to have access to a computer and internet, needs time to collect and create the necessary learning materials
	Students	are involved in various activities through the use of technology, comprehend better, become more interested in course topics, develop critical thinking, have access to the Socrative from different mobile devices	**Students**	need to have access to a computer and internet, spend more time on the computer

Socrative is a free smart student response system that enables teachers to engage students in the learning process with a series of educational activities via any web enabled devices such as a smartphone, tablet, laptop or desktop. By using Socrative, teachers can immediately collect feedback from students as well as monitor their progress and help them to become self-evaluators of their work.

To be able to use Socrative, a teacher needs to create an account, students then access the Socrative virtual room by using a unique room code that is provided to them by the teacher. After logging in, students can be involved in various activities such as quizzes and answering quick questions.

II. SETTING UP A SOCRATIVE TEACHER ACCOUNT

A Socrative teacher account can be setup either through a web browser on laptops and desktops or on the Socrative teacher application on any web enabled mobile device such as a smartphone or tablet. Currently, Socrative allows one classroom per account. If additional rooms are required, the teacher needs to create and manage additional Socrative teacher accounts.

Students don't need to create a separate account or login credentials. Socrative teacher and Socrative student accounts are free for use.

A. Creating an account - using a web browser

A Socrative teacher account can be setup through a web browser, including Firefox, Chrome, Safari and Internet Explorer (http://b.socrative.com/login/teacher/). After entering email and password you will enter the Socrative site (Dashboard) where you will receive a unique Room Code (e.g. ROOM: f306d0a7), which students will use to access the created activities.

B. Creating an account - using the Socrative teacher application

A Socrative teacher account can also be registered through the Socrative teacher application (http://www.socrative.com/apps.php to download the application) via a smartphone or tablet.

After downloading and installing the Socrative teacher app, start the application, enter email and password and enter the Socrative site (Dashboard) where you will receive a unique room code (e.g. ROOM: f306d0a7), which students will use to enter a virtual room and access the created activities.

III. LOGGING IN TO SOCRATIVE

Teachers log in to Socrative by using their created teacher accounts (http://b.socrative.com/login/teacher/ and enter email and password) via a web browser or the installed Socrative teacher application. Teachers that have a Google email account can log in by using the "Sign in with Google" button.

Students can log in to Socrative by using a web browser or the installed Socrative student application. To access the teacher's virtual room, students need to enter the room code (given by the teacher) and then select the "Join Room" button. After logging in, students can access various activities.

IV. ACTIVITIES

Students learn through their participation during the lesson. Educational quizzes can help stimulate interest and promote further learning or can be used as an assessment tools.

Each activity below provides students with opportunities to deepen their learning. To teachers these activities can provide feedback about the students' learning.

After logging in to Socrative, teachers can start different activities such as: start a quiz, run a space race, run an exit ticket, run quick questions (e.g. multiple choice and true/false quick questions, short answer quick questions).

Within Socrative, only one activity can be active at the same time and this activity will stay open until the teacher selects finish or chooses to start another activity.

Teachers can see the activity results through an opened browser or application. Even if the teacher chooses to shut down his/her computer, the activity stays opened. To end the currently running activity, the teacher needs to press the button Finish.

A. Start a quiz

At the beginning of the lesson students individually or as a team can take a quiz about the class topic they have already learned. The teacher estimates the students' comprehensions of the topic and gaps in understanding.

Quizzes like evaluation exercises can contain multiple choice questions, short answers or can be a combination of the two. Teachers can create a new quiz, import a quiz from another teacher, import a quiz from Excel and access quiz reports through the Dashboard (main screen in Socrative) using Manage Quizzes button.

When importing a quiz from an Excel file, teachers need to download the Excel template first, populate it with quiz question and answers according to the template headings and save it to a computer with a unique name (e.g. SOC-XXXXXX). A quiz can then be imported into Socrative as an Excel file.

When starting a quiz, teachers have three options to choose from: Student Paced – Immediate Feedback, Student Paced – Navigation or Teacher Paced.

When using the Student Paced – Immediate Feedback quiz type, students receive immediate right/wrong feedback and explanations after answering each question. Students answer questions in a particular order and cannot skip them or change their answers. Teachers are able to monitor the students' progress via the Live Results Table.

When using the Student Paced – Student Navigation quiz type, students have the ability to edit questions, skip questions and navigate the quiz in their own way. Once they've completed the activity they can submit the entire assessment. Teachers are able to monitor the students' progress via the Live Results Table.

When using the Teacher Paced quiz type, teachers are able to control the flow of questions. Teachers can send one question at a time and visualize the responses as they happen. Teachers can also skip and revisit certain questions.

Additional quiz settings allow teachers to disable student names and randomize the order of questions or answers.

B. Run a Space Race

Quizzes can be deployed as a fast-paced rocket race game. Students are engaged in fun exercises that track their performance while they're playing. This Socrative feature allows students to work in pairs or small groups in order to answer the quiz questions.

Teachers can choose the number of teams (there can be up to 20 teams), team colors can be automatically assigned or selected by students. Each correct answer moves a rocket across the screen. The team of students that have answered the most questions correctly will win the space race.

Before activating the Space race quiz, students need to be divided into teams, while only one person from each team needs to be logged into Socrative. The teams need to choose a team name before the game is started.

There can be teams that believe they have no chance of winning so they quit the game. If that happens, each student needs to submit his/her answers on a piece of paper after the game to help them get back into a good mindset.

If there is a small number of students (up to 14) in a class, students can participate in the space race separately.

C. Run an Exit Ticket

Exit tickets are quizzes that are mainly used to check the students' understanding at the end of a class. Exit tickets provide students with an opportunity to reflect on what they have learned, to analyze their learning efforts.

For teachers, Exit tickets provide feedback on an instructional strategy used during a lesson. It is an easy way to gather the students' responses, access level of mastered learning outcomes and their interests. Based on the data collected, teachers can at the beginning of the next lesson clarify small misunderstandings and adjust the pace for further lessons.

Here are some examples of Exit ticket questions:

- Name one important thing you learned in the class today.
- Write/ask one question about the content of today's lesson - something that has left you puzzled.
- What questions do you still have about today's lecture?
- I used the blackboard extensively today. Were its organization and content helpful in your learning? Why or why not?
- Which of the readings you did for the today's class was most helpful in preparing you for the lesson? Why?
- We did a concept map activity in the class today. Was this a useful learning activity for you? Why or why not?

D. Quick question activities - "Right now" polling

Quick question activities enable teachers to do a quick pool during the lesson. Pool questions can be asked aloud, but it is much better to give students a paper copy of the questions. If a classroom is equipped with a projector, questions can be projected on the screen.

Teacher can ask a question with the option Short answer and students then give their answer. After students have answered a question, the teacher uses the option Start Vote. The class can then vote on their favorite responses.

V. REPORTS

Reports are used to keep students activity results. After students have completed the activity, the teacher needs to press the Finish button and the Report pop-up window will open. From the Report pop-up window, various report types can be selected, such as the Whole Class Excel, Individual Student(s) PDF or Question Specific PDF.

To download a selected report to the computer, select the Download option. Because the download option is not available on tablets or smartphones, the report can be received via email and Google Drive or can be viewed in the live results Chart (option View Chart). To get reports sent to the Google Drive, the email associated with your account must be a Google Domain email address and you must log in via Google Single-Sign-On.

Then select the report you want (Whole Class Excel, Individual Student(s) PDF or Question Specific PDF) by clicking the grayed-out OFF and toggling it to ON. To collect all the data in one spreadsheet, it is best to use the Whole Class Excel report. The Individual Student(s) PDF refers to the report with a completely graded quiz for each student. The Question Specific PDF report shows response data for each question in a full quiz format. To receive the selected report, click the Submit button.

To access all previously created reports, go to the Dashboard and click on the Manage Quizzes button.

VI. SEARCH RESULTS

Research was conducted for two months on seventy-four students from 17 to 18 years of age. Participants were students who attended subjects from the vocational education program: Computer system electronic technician. Research was conducted during courses that already have in-class computer-based activities.

Students already use different platforms such as Edmodo (https://www.edmodo.com/) and Zondle (https://www.zondle.com/publicPagesv2/). They always like to participate in various activities that can be carried out through the use of smartphones, tablets, laptops and desktops.

Figure 1 shows the research results of the students' feedback on using Socrative. Most of the interviewed students (82%) liked using Socrative and claimed that Socrative gave them a better insight into what they have learned.

A small number of interviewed students (18%) didn't like participating in Socrative activities. They explained that this was because there was too much emphasis on technology. They would rather participate in activities that include working with printed materials and textbooks.

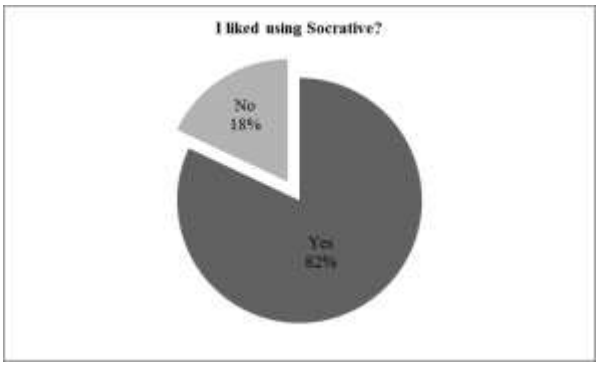

Figure 2. Students' feedback on using Socrative

Figure 2 shows that the 83% of the high school students agreed that Socrative activities were an interesting new way to learn. A small number of interviewed students (17%) didn't like using Socrative. They said they would rather use Edmodo learning platform.

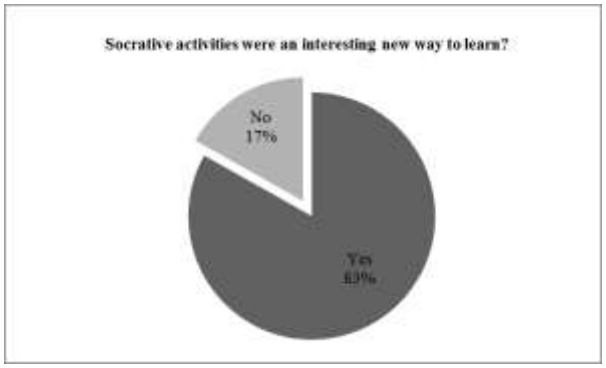

Figure 1. Students' feedback on using Socrative

Here are some examples on what student wrote about Socrative:

- *"The Socrative activities were fun!*"
- *"It was nice to learn in a different way."*
- *"I think that it was a totally useless activity."*
- *"Space race got me motivated to learn more and it was fun.*"
- *"I would rather use my textbook and printed materials."*
- *"I have learned a lot."*
- *"Space race is my favorite class activity."*

VII. CONCLUSION

Students perceive and assimilate information in different ways. Socrative allows the implementation of the interactive learning environment in which students repeat core information and practice basic skills through various games.

Quizzes throughout the lesson can help teachers assess the effectiveness of their instruction, as well as student understanding of the concepts taught.

Socrative allows teachers to engage and assess their students through the educational activities on tablets, laptops and smartphones. Through the use of real time questioning and instant result aggregation, teachers can easily evaluate the effectiveness of their instruction and the students' current level of understanding.

Experience from the School of Electrical Engineering in Zagreb shows that the use of Socrative increases student participation during class and provides instant feedback (to both the students and the teacher) on the achieved learning outcomes, thus creating an interactive learning environment.

Using cloud computing in Stjepan Benceković elementary school

Branka Smolković Cerovski, Martina Draženović
Stjepan Benceković elementary school, Zagreb, Croatia
Stjepan Benceković elementary school, Zagreb, Croatia
brankasc@gmail.com, martina.drazenovic@gmail.com

Abstract - Cloud computing means storing and accessing data and programs over the Internet instead of your computer's hard drive. By introducing cloud computing in 2012, the school has managed to ease access and sharing, enhance collaboration between teachers and school management and was able to adopt and consummate another digital competence in order to benefit our school curriculum. Another crucial benefit from implementing cloud technology to our school is saving money. Stjepan Benceković elementary school is a small school with very limited resources and it is very important to us to explore and use technology in order to save money and time. This paper will show how did we implemented cloud computing, how much money has been saved and how did cloud computing evolve school curriculum.

I. INTRODUCTION

Stjepan Benceković elementary school introduced cloud storage in 2012. It changed the way pedagogical documentation is stored, it enhanced collaboration between teaching and administrative staff and it opened the door for many more possibilities in order to increase digital competencies of teaching and administrative staff and to enhance students' learning outcomes.

II. SCHOOL'S CHARACTERISTICS

Stjepan Benceković elementary school is a small school with limited resources. It is not self sustainable and is almost fully dependent of Zagreb city educational office. The building is very old and it is not very well equipped. It has a total of 6 classrooms and a gym. Class is organized in two shifts.

Technical characteristics of the school are not at all satisfying; our computers (30) are 10 years old on average and the Internet connection has not been set in every classroom. Every projector that school possesses doesn't function properly or it doesn't function at all.

Despite the disadvantages, the school is very active in various projects (over 20 in the past 2 years), it constantly develops their curriculum and innovates, annually publishes school newspaper and cares about the community.

III. CLOUD STORAGE

Cloud storage is a way to save information to the web. Cloud computing services are online services which store this information in a safe and secure location online; they offer a quicker, easier and safer backup than conventional methods of file storage.

Using cloud computing, you can access your files and programs from any computer anywhere in the world; all you need is an internet connection.

IV. IMPLEMENTATION PROCESS

A. *The idea*

At first, the school management started using Skydrive (today's OneDrive) to store various school documentation which later evolved into the idea to store school documentation and resources and making it transparent for the whole teaching and administrative staff without using paper in any way.

B. *Pedagogical documentation in Croatian elementary schools*

Pedagogical documentation in Croatian elementary school consists of: school curriculum, school's annual work program, school's annual subject program, school's annual civil program plan, school's monthly subject program, various certificates of development of teaching and administrative staff, calender of written tests, various laws and regulations. The school had to print out everything listed above which would consist of thousands of sheets of paper every year.

C. *Tools*

We are using Microsoft technology since the Croatian Mistry of science, education and science closed the deal that all Croatian schools have benefited from Microsoft technology which includes operating systems and Microsoft Office tools.

The school is now using Microsoft OneDrive and Office 365. We have 15 GB of storage at our disposal.

D. *Workshop – learning how to use cloud storage*

The school management organized workshop for all teaching and administrative staff in order to learn how to use cloud storage. In the beginning of the school year

2013/2014 the whole teaching and administrative staff was using OneDrive to store school's documents.

The workshop consisted of several parts: introduction, managing workspace, uploading and downloading files, creating folders and sharing folders and/or files.

V. FINANCIAL BACKGROUND

School's financial resources are very limited. The educational office of the city of Zagreb endorsed around 1700,00 kn monthly for office material which contained of paper, printing toners, pens and other.

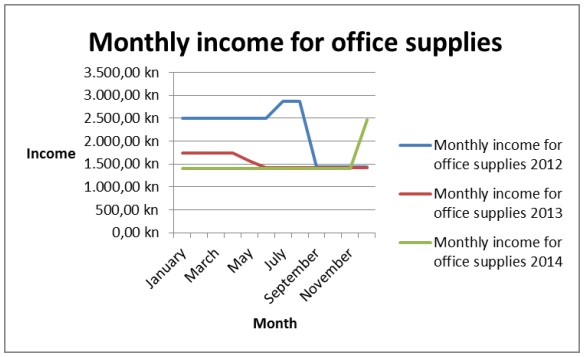

Figure 1. School's monthly income for office supplies

From Figure 1. we can see the decrement of income throughout out the years. The average monthly income in 2012 for office material was 2208,67 kn, in 2013 it was 1540,17 kn and in 2014 it was 1495,33 kn.

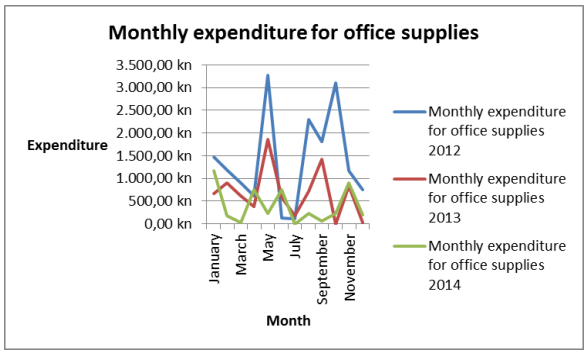

Figure 2. School's monthly expenditure for office supplies

Analyzing Figure 2. we can see that monthly expenditure in 2012 is significantly bigger than 2013 and 2014. Average monthly expenditure for office supplies in 2012 was 1405,64 kn, in 2013 it was 682,36 kn and in 2014 it was 391,82 kn.

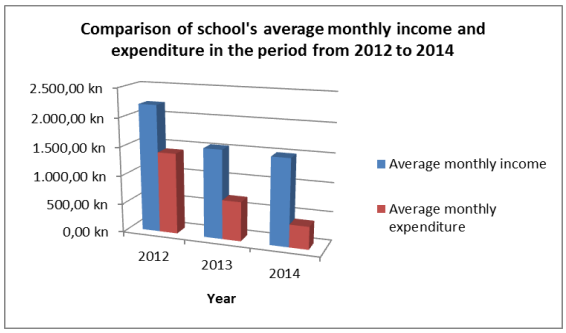

Figure 3. Comparison of school's monthly income and expenditure in the peroid from 2012 to 2014

Figure 3. shows significant decrement of income and expenditure for office supplies in 2014. It also shows that the difference between income and expenditure, despite decrement of the income, becomes bigger every year. In 2012 it was 803,03 kn, in 2013 it was 857,81 kn and in 2014 it was 1103,51 kn. This is the direct consequence of implementing cloud storage in school because we downsized the need for using paper, pens, printing toners and other office supplies.

VI. RESULTS OF IMPLEMENTATION PROCESS

A. *Increasing digital competencies of teaching and administrative staff and improving collaboration*

By implementing OneDrive and introducing Microsoft Office 365 tools in general into our school, we developed and increased digital competences of our teaching and administrative staff. We improved collaboration between our staff by sharing resources and now we can see more clearly the collaboration between subjects (through individual subject plans) and how it has been done.

B. *Saving money*

Since the school has very limited resources, we are very eager to save money, however we can, but the imperative was that our students don't suffer in this process. Now we can direct the money we saved for student's projects and needs which we had to decline in the past because we had no resources to endorse them.

C. *Transparency*

The whole school documentation became transparent, which enormously helped our teaching staff. We can see how our school curriculum develops during the school year, what other teachers do with their students and how they present their matter so that we can correlate easier and efficiently.

D. *Care for the environment*

Saving paper shows our care for the environment which is very important for our school since it is a part of our curriculum to awake our students to care for the nature in general and to educate others to care following their example.

E. *Future plans*

In the future we have plans to save enough money so that every classroom could have Internet access which would propel us to develop our e - learning model. We believe that it would influence student's motivation in class and that it would make them more proactive.

VII. CONCLUSION

Implementing cloud storage had many benefits for our school; it increased digital competencies and care for the environment, saved money and made us more determined to try to implement more components of information and communication technology in order to benefit our students and grant them the conditions in which they can all progress.

Project-based learning : Students (and teachers) as authors / co-authors of interactive multimedia educational content (Space Teacher)

Krunoslav Bedi
School of Civil Engineering, Art and Craft Čakovec
Športska 1, HR-40000 Čakovec, Croatia
bedi.krunoslav@gmail.com

Abstract - SPACE TEACHER is a project of an interactive and educational multimedia CD / DVD. The aim of this paper is to present the extracurricular activities of an IT group of secondary school students who have developed a multimedia CD / DVD over the period of three years. The project was based on the knowledge acquired in geography classes (teaching unit: the Earth and the solar system).

The purpose of this paper is to examine the students' attitudes towards acquiring knowledge in extracurricular activities as well as development and implementation of educational and interactive multimedia content in school and their future job. This particular educational and interactive multimedia CD / DVD promotes multimedia and e-learning.

Keywords: multimedia, constructivism, e-learning, extracurricular activities, interaction, interactive multimedia educational content, CD/DVD

* In 2011, the application "Space Teacher" was presented at the national competition Info kup – Rabac – 2012. The trailer of the game can be accessed via – http://www.youtube.com/watch?v=qVCNUEoBw4k

I. INTRODUCTION

Widespread usage of computers and the media has created conditions for higher quality innovation of educational and teaching processes. Everyday life media presence is not only important from the aspect of communication but also from a social and educational one.

The digital era encourages new ways of mass communication. The digitalization process started on a global level has wiped out the borders. In such circumstances new media use affects identity. Aspects of authorship and co-authorship interweave in a public communication space. New media begin to merge with the existing cultural convention of the teacher as the unambiguous author of educational content. Time has shown that everyone, even the students themselves, can be authors / co-authors.

Learners must develop their thinking processes such as reasoning, creative and analytical thinking, systematical problem solving as well as computer skills[6].

Students are able to apply their technical knowledge, acquire practical skills in programming, get involved into team processes and understand in some cases even so called soft factors in project management[4].

However, nothing can replace the teacher and their role in the educational process. It is every teacher's wish that their students do not only have good studying results, but also enjoy studying[8].

Project-based learning provides students with opportunities to pursue their own interests and questions, make decisions about finding answers and solve problems. In the classroom, project-based learning provides many unique opportunities for teachers to build relationships with students. Shared student work includes documentation of the learning process as well as the student's final projects with other teachers, parents, mentors, and the business community who all have a stake in the students' education[3].

II. MULTIMEDIA TEACHING AND CONTRUCTIVIST APPROACH TO LEARNING

Multimedia material is generally defined as the use of a combination of media forms, such as pictures and words, or animation and sound[5].

Multimedia contents combine text, image, sound, animation and videos previously used in various ways although recently a multimedia computer is commonly used to play multimedia files whereas CD-ROM or the Internet provide means of data storage[2].

The term multimedia classroom has been coined just recently. The entire system of multimedia teaching is being build up with the sole purpose of functionally and technically integrating different and numerous media into the educational process. Of course, the need for modern teaching should be accompanied by trained teachers.

Maximizing multimedia applications is the best practice of the contemporary educational system with various measures used to obtain the available knowledge and reference materials. Knowledge is therefore not limited to just one source. Indirectly, it provides a new way for educators and students to find additional teaching and learning materials. Paperbacks are not convenient for browsing and do not have the advantage of various information presented in audio-visual and high impact graphics[7].

The researchers, on the one hand, constantly raise the question of the impact of new technologies on educating, learning and teaching, while on the other hand the question of participants' willingness to accept new IT technologies comes up. Both issues are immensely significant and topical for the teaching process.

However, the most significant change in the framework of developing new creativity is no longer produced by the established media publishers. For example, the most watched clips and videos are not and need not be made by professionals. They are individual works of anonymous people, new media users (the Internet, primarily).

The focus of this research is on the constructivist approach, as it is considered that the solutions necessary for change in contemporary schools can be found within it.

The constructivist teaching-learning approach which has been worded widely in educational settings in recent years focuses on students taking responsibility of their own learning while constructing their own versions of knowledge [9].

The assumption derived from the constructivist approach is that students can construct knowledge from their own experience and in such an educational process the question *what* do children learn transforms into *how*. Constructivism as a theoretical concept perceives building knowledge as a personal-based experiential process making acquiring knowledge unique for each individual. Emphasis is put on students selecting and processing information individually as well as generating hypotheses and decision-making based on their own mental models (cognitive structures, schemata) organizing personal experience. According to constructivism, the instructor should encourage students to discover the principles and laws of the contents learned on their own while previously transforming the information they need into a form tailored to the level of their acquired knowledge[1].

The goal of a contemporary school is to prepare students for life and use of modern technologies. Various forms of educational software are increasingly being used as sources of knowledge in everyday educational process. With an indispensable source of knowledge at hand students may have a different role in class.

III. EXTRACURRICULAR ACTIVITIES - DEVELOPMENT ENVIRONMENT

Apart from mandatory pedagogical work, extracurricular activities (groups) have an important role in the educational process. The aim of such activities, that is, each group is (or should be) students' personal development and spending quality leisure time.

The results of extracurricular student activities (IT group) are presented in this paper. The students have independently used the knowledge acquired during the three years of schooling and created a multimedia interactive CD / DVD, which can be used in secondary school geography classes.

In such an environment, teaching problem-based learning requires big changes in teachers' usual roles[10].

Along with their own experience, students used the subject curriculum of geography. The geography teacher was also at their disposal as an advisor.Implementation schedule was designed by the students themselves, keeping in mind the objectives of the curriculum as well as previous experience and knowledge.

It is worth mentioning that problem-content structuring is significant for the study of natural phenomena and the development of an interactive multimedia CD / DVD which entices students' curiosity and intellectual activities.

Research activities were crucial in the development of the CD / DVD. While planning the curriculum topics an integrated thematic approach demanded subject correlation and incorporating other curricula. In addition to learning about basic concepts, the aim of the interactive multimedia CD / DVD was developing curiosity, interest and ability to actively explore the environment as well as perception of people, phenomena and environmental processes while at the same time using all previously acquired IT knowledge in the making of the CD / DVD.

One of the background objectives of educational, interactive and multimedia DVD is primarily game-based

education. A multimedia DVD provides plenty of information about the universe and our solar system. Knowledge can be tested in a quiz. In addition to games Space Teacher includes a music player, a puzzle, as well as a photo and video gallery.

IV. STUDENT COMMENTS

... "Our personal experience from elementary school, primarily geography classes, brought this idea to mind. The subject teacher is in a difficult situation when they need to clarify the size and properties of the universe to the students.

It has been proven that the majority of environmental information is received through the eyes (visual) - a picture speaks a thousand words. A major problem in describing the universe is that it is unthinkably large and very difficult to show visually.

The universe is ultimately so large that its size exceeds the limits of human imagination. These limits make portraying the universe and its fundamental components in a consistent and non-abstract manner very difficult. This non-abstract project aims for multimedia effects on its users, expanding the boundaries of their imagination as well as showing and explaining the universe and its fundamental components in detail.

Educational, multimedia DVD was created with the goal of closely presenting geography to students, allowing them to learn both theoretical and practical subject material more easily and accurately. The focus of our educational and interactive DVD is on multimedia and e-learning.

The process of creating the application was not easy at all. Time spent on preparation and completion of the project confirms this fact. A whole year has passed from the initial to the final product stage, which indicates just how much time was devoted to research and development of the product so that it would be better and more convenient ... "

V. PACE TEACHER

The multimedia interactive CD / DVD starts with an introductory film (trailer) which is actually an application instruction manual. The trailer offers an application overview making further use much easier – the user learns how to use the application and solve problem tasks. The start menu was made with the aim of greater convenience and simplicity of use. Planets are the main elements of the menu. When the user moves the mouse cursor over any of the planets, the application automatically opens an additional window offering relevant educational content on the respective planet. At the bottom of the menu there is a practical musical player and the fun part of the multimedia CD / DVD consists of the following submenus: Picture Gallery, Puzzle, Quiz, Video gallery, Solar system, The universe, Black holes and Shoot The Moon (game).

A number of applications were used in the making of Space Teacher and supporting documents: Adobe Flash CS3 Professional, Adobe Premiere Pro CS3, Adobe Photoshop CS3, Adobe After Effects CS3, Adobe Illustrator CS3, Microsoft Word 2007, Camtasia Studio 7 (Picture 1).

VI. RESEARCH METHODS

The purpose of this survey was to determine the amount of multimedia content and effects that secondary school children may include in their extracurricular work and measure their satisfaction in such work. The focus of such acquired knowledge is on identifying the activities that can contribute to the improvement of teaching process in future work assignments / projects.

A questionnaire with eight questions was conducted on 109 students undergoing education for occupations web designer and media technician in the field of multimedia. First- to fourth-grade students participated. Students expressed their opinions on Likert scale where mark 1 stands for strongly disagreeing with the above statement, 2 disagreeing with the statement, 3 undecided, 4 agreeing with the statement and 5 strongly agreeing with the statement.

VII. RESEARCH RESULTS

The opinions of the students after they had taken part in the activities of the project of making a multimedia interactive DVD entitled Space Teacher:

Table 1. The opinions of students

I think that….	
…I have mastered a satisfactory level of knowledge and skills of creating multimedia applications.	
Mean	Std. Dev
4.333	1.019
…I have mastered a satisfactory level of practical skills required for getting a job in the production sector of economy.	
4.521	0.988
…I have mastered the use of (Adobe® CS4 Photoshop, Adobe® Flash CS4, Adobe® Premiere Pro® CS4 v4.0, Adobe® After Effects® CS4 v9.0. Cinema 4D®, 3D Studio Max etc.), the applications similar to those used in the production sector of economy.	
3.903	1.112
…I can successfully take part in all the stages of planning and developing of a multimedia application.	
4.001	1.433
…I can successfully cooperate in a team work.	
4.153	1.105
…my knowledge and skills level in the area of planning and organizing resources (time, space, material, equipment) needed for fulfilling activities are satisfactory.	
3.539	1.303
…I do have the skills of finding and using the relevant information for challenging multimedia problems.	
4.166	1.403
…I do have the skills for a creative solving of multimedia problems.	
4.278	1.129

Results show a high percentage of students in the field of multimedia (Mean = 4.333, Std.Dev = 1.019). Their perception of possibility of employment in the field is equally high (Mean = 4.521, Std.Dev = 0.988). As for multimedia tools: Adobe® CS4 Photoshop, Adobe® Flash CS4, Adobe® Premiere Pro® CS4 v4.0, Adobe® After Effects® CS4 v9.0. Cinema 4D®, 3D Studio Max, students' attitudes are even higher (PB3 Mean = 3.903,Std.Dev = 1.112). Other factors also show that students engaging in this type of work appreciate activities more when concrete assignement are involved.

VIII. CONCLUSION

As far as school is concerned, experts agree that the student must be in the center of the teaching process. In such circumstances, students using new IT technologies should be given the opportunity to develop their skills (and responsibility). In addition to developing their learning methods through specific educational forms, students should be given the choice of learning materials.

Regardless of instructions arising from a particular subject's curriculum it will (only?) be possible in specific extracurricular activities.

Knowledge acquired in this way is personal, with success in practice. This knowledge is a form of preparation for a dynamic world in which school is no longer an isolated, closed and rigid but rather a flexible and multidisciplinary institution.

At the same time, maintenance and development of this type of education will result in greater appreciation of the teacher and their work. It is the teachers themselves who represent the society for which the school prepares its students.

bedi.krunoslav@gmail.com

Abstract - The aim of this paper is to present the possibilities and ways of secondary school teaching provided by new information and communications technology with the growing trends of mobile device development taken into account.

The process of making a mobile device application is illustrated with student projects "MY CAR" and „MOBILE WEB BANKING". The purpose of this paper is to examine the extent and range of mobile applications use among student population.

Keywords: mobile applications, smartphone, learning, project-based classroom

* In 2012, application "Moj Auto" (My car) was presented and won the 3rd Prize at Info kup – Primošten – 2012. The trailer of the game can be accessed via – http://www.youtube.com/watch?v=ArNzj0CgTXY

* In 2012, application "MWB - Mobile Web Banking" was presented and won the 6th Prize at Info kup – Primošten 2012. The trailer of the game can be accessed via – https://www.youtube.com/watch?v=PpGJX_Vx1KU

I. INTRODUCTION

Mobile applications are types of application software designed for use on smartphones, tablet computers and other mobile devices.

As mobile devices and wireless technologies continue to rapidly grow and significantly advance, Web services technology recognizes mobile computing as an area to which it should expand. When combing smart mobile devices and Web services; i.e. running a Web service on a mobile device, one can greatly increase the functionality of mobile devices to interact with its environment. This makes a wide range of new functionalities and features possible especially in the field of ubiquitous computing[5].

Competition and conditions on mobile device market have resulted in a great improvement in computer power and possibilities they offer. In this paper two types of mobile devices are examined more closely; smartphones and tablet computers.

These devices can have a multicore processor, large RAM, full HD screens and built-in peripherals such as high-quality cameras. Nowadays, separate graphic chips in mobile devices are not uncommon. Simultaneously, operating systems for such devices have been improved, making programming easier and faster.

However, measuring student's attitudes towards new modes of learning interaction and Information Seeking in technology-pervasive learning environments is of particular interest to educators and learning technologists who seek to leverage the power of ICT for effective teaching and learning[3].These types of devices are most commonly used by younger population, more precisely, people engaging in a new form of information processing.

Classroom use of web applications has several advantages, such as involving students in learning activities and interactions along with facilitating learning reflection and presentation. Furthermore, a significant advantage is that the web applications have been widely used by most students in daily life. Therefore, the proposed approach could delight the majority of participants in using the web applications in a new and meaningful way [1].

Mobile applications are surely the drivers of communicational development. The market embraces everything that is innovative, useful and reasonably priced, regardless of whether it is made by a large manufacturer or an innovative individual. The most important things are a good idea and knowledge needed for its technical implementation so that global success and earnings can be achieved with a minimal investment. ☺

Students bring these technology anywhere, at anytime for their daily affairs. Educators should look upon this phenomenon as an opportunity though indeed it is a challenge as well. The concept of 'anytime' and 'anyplace' of mobile learning should be utilized in enhancing the pedagogical activities in delivering lessons[2].

There are two phases in the process of developing mobile device applications. The first and most essential one is selecting an operating system or platform on which the application will run, followed by defining the appropriate technology for its development. There is a large number of incompatible operating systems for mobile devices today (Android, Apple (iOS), BlackBerry, Nokia (Symbian), Windows Phone / Windows Mobile ...) therefore each developed application is not guaranteed to work on each of these devices.

Learning through mobile devices has enhanced a lot with the advent of pervasive computing technologies. In this age of progress and great change, we tend to easily adapt to the technologies and pedagogies that emerge [6].

II. MOBILE APPLICATION VS. MOBILE WEBSITES

Mobile apps have many advantages over mobile websites and are much easier to use. For example, an average well-made mobile application provides a much better user experience than the best mobile website. However, the costs associated with the development of mobile applications still remain an issue.

The development of mobile applications is usually more demanding (and more expensive) than the process of developing an equivalent multi-platform mobile website.

Mobile applications are better in terms of functionality and user experience while mobile websites development costs are lower. The main feature of mobile application development is difficult switching of the application to another platform which demands a new programme code.

With the number of mobile applications on the market increasing, it is evident that the field is very promising and offers many opportunities.

All mobile application developers who design and upload applications on mobile stores (Ovi Store, App Store, Android Market, Windows Marketplace ...) share an equal chance of success. If you have good programming skills, innovative spirit and are willing to invest some effort, you can create high-quality applications for a large number of users.

Therefore, the well-known web applications could be a potential new way to engage the instructors and students in meaningful teaching and learning activities [1].

III. PROJECT APPLICATIONS (STUDENT WORK UNDER MENTOR SUPERVISON) „MOBILE WEB BANKING" AND „MOJ AUTO" („MY CAR")

A. „Mobile Web Banking" - „MWB"

Fast pace and different lifestyle of the contemporary man accompanied by a rapid technical and technological development result in uncertainty and necessity to change the way of doing business in all financial institutions, including banks. MWB application provides the opportunity for establishing stronger relationships with customers and increasing bank revenue while reducing operating costs at the same time. This type of doing business has great potential and banks are facing a great challenge. If the possibilities of mobile technology are used completely, mobile banking could soon become a major channel for banking services distribution, even more popular than Internet banking. Mobile banking has great potential and it already offers the same possibilities as electronic banking. Additionally, the number of mobile phone users worldwide is increasing, with accompanying services becoming more extensive and easier to operate.

MWB is based on the majority of modern desktop, smartphone and tablet platforms.

Options offered by MWB applications:

1. System login, application is blocked after three failed attempts
2. Accounts overview
3. Daily transactions overview
4. Search all accounts
5. Option of fixed-term depositing
6. Cards overview
7. Loans overview
8. Transfers between accounts
9. Creating payment orders
10. Collective orders
11. Bank statements
12. Creating special reports
13. Automatic exchange rates update
14. Locating the nearest bank branch and directions to the branch or an ATM
15. Application design personalisation
16. Portrait and landscape view mode

In addition, older browsers are supported with a cross-platform solution.

Technologies used:

Server page

- ASP.NET 4.0 / C#
- MS SQL
- XML

Tools

Project developing is oriented towards Microsoft development tools:

- Microsoft Visual Studio 2010
- Microsoft Expression Studio

Client page

- HTML5
- CSS3
- jQuery Mobile
- Ajax
- JavaScript

Operating systems

B. „MY CAR“

Mobile learning aplication is made for educational purposes only. It is also convenient for the automobile industry, the public sector and driving schools. The application offers a marketing opportunity with advertising space given to a particular sector which uses it. It provides an overview of driving schools by county, offers choice and overview of over 60 car companies, notes, laws and road signs overview, knowledge quiz and, of course, fun. Users might also be interested in the opportunity to save their own notes and send them via email or social networks.

The application can be categorized as part of the latest and most effective market communication channels. When compared to traditional communication channels, the user is offered a greater degree of interactivity, wider scope, choice and range of information, as well as fun.

On the other hand, advertisers are offered a new, direct and more attractive communication channel. This is why smartphones are the foundation of the future, with mobile applications i.e. apps being the most contributing factor to a sharp rise of the smartphone market and the rise of the mobile revolution.

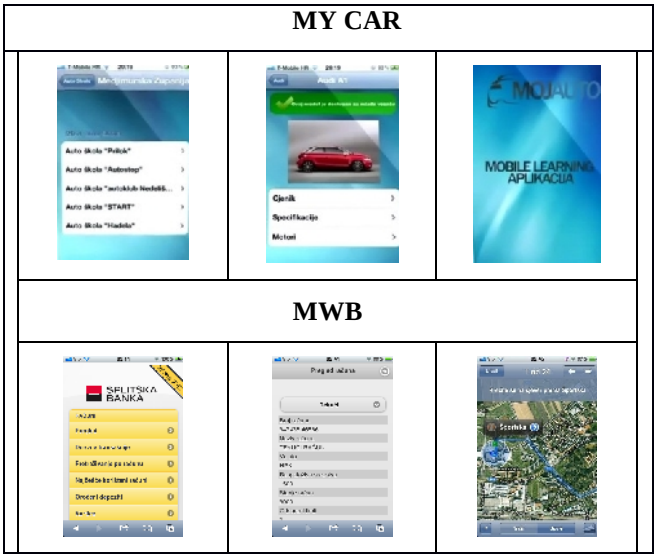
Following software was used in the making of iPhone application - xCode and Objective-C as well as Microsoft Visual Studio 2010, Cienma 4D, 3D Studio Max, Adobe CS4 Premiere, Adobe CS4 Photoshop, Adobe CS4 Illustrator and Adobe CS4 After Effects.

Two students (third and fourth grade respectively) made the applications **„Mobile Web Banking“ (MWB) and „My car“** under mentor supervision. A wide range of software normally used throughout the four-year course was implemented. For the implementation of this web-designer/media technician course all of the necessary software has been provided by the Ministry of Education and Sports of the Republic of Croatia. The work itself was team-organized as it had been proven as far more efficient.

One of the students did the programming and the other visual designing (MWB), while for the purpose of the application "My car" one student did both the programming and the designing. The students worked on the projects in their optional courses with the key role of the coordinator assigned to the mentor, i.e. the optional subject teacher, who is also the author of this paper.

Teaching mode and adapt to the constructivist learning theory in the multimedia network environment, can be summarized as follows: to students as the center, in the whole teaching process, the teacher as organisers, teacher, help and service providers, use of multimedia network environment resources through cooperative learning, students give full play to one’s own initiative, enthusiasm and entrepreneurial spirit, and make students the effective ways to achieve the goal of construction of realization, which means they have learned. In this model, the students are of positive significance constructer knowledge[7].

C. *Examples of application wallpapers*



IV. RESEARCH METHODS

In order to obtain relevant data, a research involving a sample of 303 students (first, second, third and fourth grade respectively) was conducted.

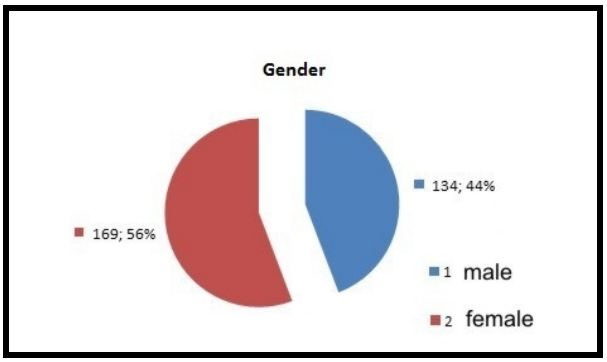
All of the students involved attend the following vocational programmes in School of Civil Engineering, Art and Craft Čakovec: media technician, web-designer, interior architecture designer and ceramics designer. The research was conducted by survey.

The survey sample included both sexes, 134 male and 169 female students. The students were given the possibility to withdraw at all times, to participate or decline participation, therefore one can assume that the obtained data is relevant.

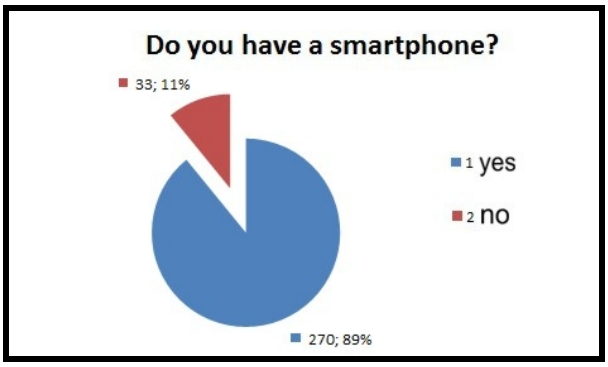
The aim of the survey was to get feedback on the following:

- do students own a mobile device
- using mobile devices for Internet access
- monthly Internet traffic and expenses paid for accessing the Internet via mobile device
- operating systems used on mobile devices
- mobile applications use
- number of mobile applications installed
- expenses paid for using a mobile application
- most commonly used mobile applications

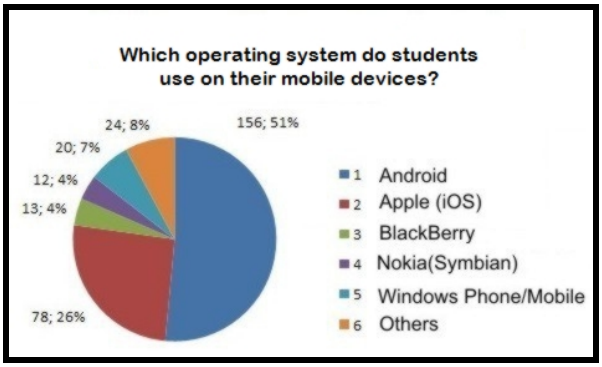
V. RESEARCH RESULTS



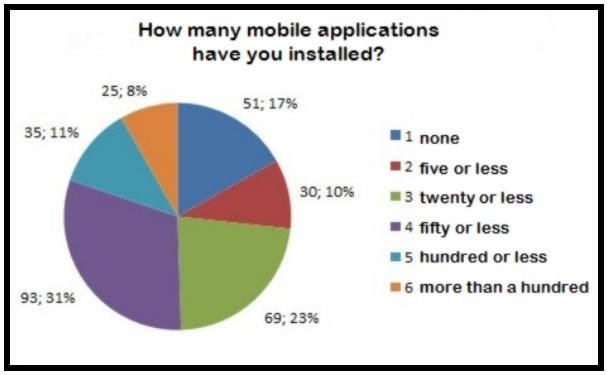
Graph 1. The number and percentage of students participating in the survey



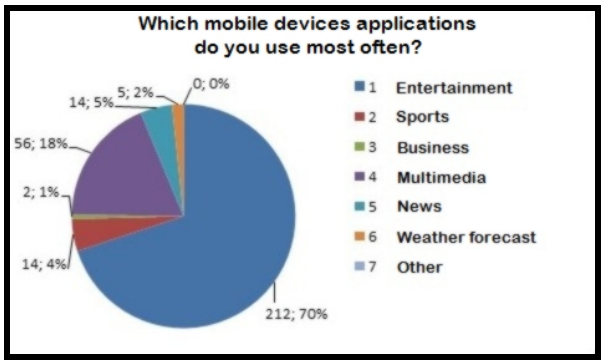
Graph 2. Do you own a smartphone?



Graph 3. Operating systems used on students' mobile devices



Graph 4 Number of mobile applications installed



Graph 5 Types of mobile device applications used

Statistical data show that the majority of students own a mobile device - 89%, and more than a half of them – 51% use Android operating system.

In addition, the data show that only 17% of students have not installed a mobile application while most of them, 83%, have already installed it. This confirms that most students already possess the knowledge needed for installing applications on mobile devices. The data confirm the assumption about the type of content installed - 70% entertainment, sports 4% and 18% multimedia features.

VI. CONCLUSION

Contemporary users are supposedly more devoted to web than mobile applications. Is investing in mobile applications a sensible move? By downloading mobile applications on their mobile phone, the user chooses to follow a particular service, which is probably the most important reason why companies create mobile applications of their own.

However, the user can have full access to a particular content just by entering a short website address, which is undeniably easier. They can enter just about any address and not opt for brand loyalty (as is the case with mobile applications).

The number of mobile applications available, as well as the number of users, are likely to increase in the future. Mobile applications have potential in several areas such as games, recreation applications, various readers and editors, etc.

The number of mobile applications which can be used offline will presumably increase while web applications will continue to dominate online.

The rapid developments of apps have shifted the way information delivered especially in educational field to adapt with the current technology and to be used in teaching and learning[4].

As for mobile applications and mobile websites, if we take all of the previously mentioned advantages, disadvantages and differences in mobile devices into account, it is necessary to adjust web applications to the mobile platform which would enable easier use for both programmers and other users.

Of course, a number of procedures need to be made. Obviously, capacity is the biggest drawback of mobile devices. Although they are closing in on desktop computers every day, mobile devices are still somewhat weaker and therefore not capable of running and processing data as fast as standard personal computers.

e-mail: frane.urem@vus.hr, kresimir.fertalj@fer.hr, bsupe@vus.hr

Abstract - Quality assurance in higher education implies different student surveys that examine teaching, learning environments and educational outcomes. It is crucial to convince students that survey is fully anonymous because it is an essential prerequisite for getting the right answers from students about teaching process.The application of information technology enables further progress in the anonymous survey but the problem of student perceptions about the actual anonymity of participants still remains. This paper presents the recommendations of other authors to achieve that goal and conducting experience in student surveys at Polytechnic of Šibenik.

I. INTRODUCTION

The quality strategy at Polytechnic of Šibenik [1] (as in most higher education institutions in the Republic of Croatia) is defined with formal structure which consists of three independent bodies: Committee for quality assurance, Committee for internal evaluation of the quality assurance system and Committee for the implementation and processing of student surveys.

This form of organization arises from regulatory authorities in the field of higher education in Croatia, such as Ministry of science, education and sports of the Republic of Croatia (MZOS) [2] and Agency for science and higher education (AZVO) [3], but also from the quality systems which are applied in higher education institutions like standards and guidelines for quality assurance in the European higher education area (ESG) [4] or ISO 9001 [5].

Particularly important part for the quality strategy is a Committee for the implementation and processing of student surveys (in the rest of the text Committee) which (among others) implements teacher evaluation survey which evaluates the work of teachers from the perspective of students. The objective of this survey is assessment of teachers' work in a particular course. The results of this survey enable the separation of teachers who have been assessed as the best and worst from a student perspective. In the survey, students can share their observations about what's good and / or is not well in the work of teachers, and the questionnaire also contains standard parts on the quality of the work and observations of teachers and students services. At Polytechnic of Šibenik this surveys for a long period have been conducted on paper forms whose processing and subsequent analysis was prolonged and subject to errors due to rewriting the results because there was no possibility of automatic processing by optical readers. All that time Committee is particularly emphasized the problem of insufficient response of students to such surveys. In the meantime, Committee had some discussions with student representatives about that issue and the problem of student perceptions about the actual anonymity in existing survey procedure appeared as the main cause. The Committee acknowledged previously mentioned problem and proposed survey solution that would be as close as possible to the actual vote elections because it is assumed that improvement of student perceptions of the actual anonymity in survey will also increase survey response rate. It is also accepted the need for simpler and faster processing of the survey results and online survey method is suggested.

This paper presents the results achieved with online survey solution that is implemented according to the aforementioned recommendations by the Committee for quality assurance.

II. DEFINITIONS

According to [6] survey is defined as study where researcher collects data by asking people questions. Anonymous surveys do not record either the name of the respondent or the name of any institution that the respondent represents [6].

For anonymous online survey following rules must be applied [7], [8], [9]:

- respondent should not provide explicit contact information (like email, telephone ...)
- survey website settings must exclude the collection of online respondent's email address
- survey website settings must exclude the capture of online respondent's IP address

The above recommendations for the case of totally anonymous online survey mean that no link (technically: foreign key relationship) is available between survey invitations (for an example https link sent with an e-mail to respondent) and the responses. That can be in conflict with one major problem: *How to be sure that one respondent takes the online survey only once?*

III. METHODOLOGY

If the Committee for the implementation and processing of student surveys wants to avoid fraud and make sure that one person can take the online survey only once, then some kind of tracking system must be

implemented that will recognize that respondent has already took the survey. There are many technical solutions for this issue where online survey invitation is realized with an e-mail message witch contains authorization link or token number for anonymous survey but the problem is how to convince respondent that received authorization will not be linked with his survey answers and e-mail address later.

It may sound irrational, but respondent in this situation can only believe the Committee on their word because he doesn't have a full access to the technical system or proper technical knowledge for review. The main challenge is how to establish trust between two entities (Committee – student) in a way that does not compromise respondent's interest for anonymity. Therefore it is good to design a methodology closest to real voting experienced by respondents on the actual elections (parliamentary, presidential, local ...). That methodology is obliged to provide the following elements:

1. Personally voting and the principle of immediacy (there is no representative of the respondents, Committee determines that the respondents has the right to participate in survey because he is on the list of potential respondents - student is enrolled in the course for which the survey is carried out)
2. The online survey content
3. The method how respondents express their opinion in online survey (for an example one answer selection for a particular question)
4. Time (duration) for the online survey
5. Securing peace and order during online survey
6. Location with computers where online survey would be filled

The first and most important element from this methodology at the Polytechnic in Šibenik is applied with *LimeSurvey* system [8] unique functionality called "dummy token". With this functionality Committee can generate the total number of tokens according to the number of students registered on a specific course before the survey. Every token is printed on separate paper and placed in a sealed box that opens in front of students just before survey starts. Students get printed token from the box and completing survey unlocked with printed code. Since the token drawing is a random process there is no way to connect students and their survey responses in any way.

The entire process of surveying formally is described as follows in two major steps:

1. Survey preparation
   - Student office is delivered number of students enrolled for the course to be used for survey
   - One token for every enrolled student is generated and printed
   - Survey content is made
   - Survey date and time for specific course is defined by the Committee and posted on web and e-learning system

2. Survey conduction
   - Students and Committee members enter the computer room at the previously determined date and time
   - System administrator opens the survey
   - Students get printed token from the box, open survey with token and completing survey
   - System administrator closes the survey and printing report for Committee
   - The Committee determines the number of used tokens and closes unused tokens in the envelope
   - Students and Committee members leave the computer room

IV. CASE STUDY

The teacher evaluation surveys at Polytechnic of Šibenik were conducted by paper-pencil method until academic year 2013/2014. According to available data for the academic years 2010/2011, 2011/2012 and 2012/2013, the stable response for organized surveys (which did not exceed 25% of the total number of potential respondents) is shown in Table 1.

The student response was acceptable but Committee was not satisfied with the existing situation. Displayed turnout on student surveys for the mentioned period is not specifically analyzed, but it is certainly considered that probable reasons were that presence in the survey is not mandatory and the survey is generally conducted within the last week of classes when the students' attendance at lectures is significantly less. The same conditions were present during online survey and according to the comparison shown in Table 2 response in the online survey was significantly higher.

Therefore, subsequently research on possible additional reasons is conducted. A random sample of 78 third year students of 247 who certainly had the opportunity to meet the survey in both ways is questioned and results are presented in Table 3.

The results from the Table 3 indicate the possible different reasons for the worse turnout in the previous surveys. Among other things, it is evident that students easier express a worse opinion in new survey methodology about teachers' work in a particular course because they are obviously feel anonymous during survey and they are considered that manipulation of the survey results at new system is more severe.

TABLE I.. RECORDED STUDENT RESPONSE FOR PAPER-PENCIL SURVEYS

Academic year	**2010/2011**	**2011/2012**	**2012/2013**
Survey response	22,52%	18,20%	21,55%

TABLE II. COMPARISON OF THE SURVEY RESPONSE FOR BOTH METHODS

N	Study program	Method: paper-pencil	Method: online	Comp.
		Academic year 2012/2013	Academic year 2013/2014	
		Number of processed survey questionnaires	Number of processed survey questionnaires	INDEX III / IV (%)
I	II	III	IV	V
1.	Management	1048	1550	147,90%
2.	Administration	340	588	172,94%
3.	Transport and traffic	405	651	160,74%
TOTAL		1793	2964	165,31%

TABLE III. SUBSEQUENT RESEARCH RESULTS ON STUDENT CONFIDENCE FOR BOTH SURVEY METHODS

Question	Answers	
	Yes	No
The new online survey is complicated to use than previous paper-pencil methodology	8,97%	91,03%
My impression is that manipulation with results in the new methodology is possible	3,85%	96,15%
My impression is that manipulation with results in the old methodology was possible	94,87%	5,13%
I freely expressed a poor opinion about teachers in the old survey methodology	6,41%	93,59%
I want reintroduction of the old survey methodology	8,97%	91,03%

If more students believed the new survey methodology then more respondents who give lower grades to teachers are included and certain number of teachers will have lower grades. This hypothesis is further validated by subsequent analysis of the survey results for all undergraduate degree programs and presented in Table 4. Before the analysis, the results are considered only for the courses that:

- surveyed with both methodologies, with more than ten students
- held the same teachers for both methodologies
- recorded higher response in new methodology

According to the results from the Table 4 it is clear that significant number of considered courses have achieved worse results for the case of increased response in online survey. Although such results cannot be statistically processed, Committee also found that students are given quite sharp and direct final comments (enabled as text box with free entry) about teacher's work, in the online survey.

TABLE IV. INDICATORS OF INCREASED RESPONSE OF STUDENTS WHO GIVE LOWER MARKS AFTER NEW SURVEY METHODOLOGY IMPLEMENTATION IN ACADEMIC YEAR 2013/2014

	I	II	III	IV
Study program	Total number of cosidered courses	Number of courses with a worse grade	**Index II/I [%]**	Number of courses with a better or the same grade
Management	23	17	**73,91%**	6
Administration	9	7	**77,78%**	2
Transport and traffic	13	9	**69,23%**	4
TOTAL	45	33	**73,33%**	12

V. CONCLUSION

According to the available and processed results presented in a case study, implemented online methodology has proved to be a better solution for teacher evaluation surveys at Polytechnic of Šibenik. Both previously established objectives have been met because survey response is increased and post processing of the survey results is simplified. The Committee for the implementation and processing of student surveys is obviously well assumed that student perception of the actual anonymity in survey was the problem in a past. The result was more sincere and freely answering to survey questions. Also online survey is not sufficient in itself and it was justified to pay attention on the implementation methodology details like real voting experience (authorized place where online survey can be filled on computer and avoiding of authorization token delivery to the students by e-mail message).

Abstract - Based on two previous studies how teachers and pupils generally evaluate the introduction of ICT in Visual Arts education in primary schools in Croatia, this follow-up research investigates what methods and computer programs were actually introduced in classrooms.

A survey was carried out into how pupils evaluate pros and cons of using such programs and whether that improves their learning process in Visual Arts.

I. INTRODUCTION

Program for primary school subject Visual arts was defined in Croatian Curriculum for Elementary Schools by Ministry of Science, Education and Sports in the year 2006 and it emphasizes the importance of research-based learning and creation process. Nowadays, such learning process is impossible without the utilization of information and communication technologies as well as informatics.

Curriculum contents encourage visual curiosity, openness towards new experiences, sensitivity to problems as well as originality in problem solving by artistic and technical means. Also, they encourage the development of all degrees of divergent thinking in the areas of visual and artistic upbringing and education. [1]

By active inclusion of pupils in teaching and learning process that is also at the same time a communication processes, their creativity is encouraged which is in harmony with goals of all teachings as well as the teaching in the Visual Arts.

Contemporary, effective as well as efficient teaching and learning implies the utilization of various methods, by technology adopted means and aids, but it also demands flexible and creative teacher.

All of this needs some "new teachers" in a school because without them none of these innovations or changes can be realized successfully, anyway. That person, besides well-known professional and pedagogical knowledge, skills and abilities, should certainly possess mediator's dexterity between cultures and prosocial link between people (pupils). Concisely, such teachers should be the persons for intercultural dialogue. [2]

With teaching as well as learning strategy directed towards pupil and with cultural change of teaching practice teachers are becoming intermediaries in the beginning of the dialogue and in the communication process between pupils and contemporary learning and teaching means as well as aids.

Computers and didactically developed materials are directly reflecting on teaching and learning through rationalization and optimization of time spent in pupils' learning process. Such learning can be easier, faster and more productive what is in harmony with fast changes in contemporary society.

Life and work in contemporary society of fast changes and fierce competition requires new knowledge, skills abilities, values and attitudes i.e. new individual's competences that put the emphasis on the development of innovativeness, creativity, problem solving, development of critical thinking, enterprise, computer literacy as well as social and other competences. [3]

Accordingly, for active and creative relationship with surroundings as well as for development of visual perception and visual thinking competence, teaching and learning practice needs the foundation that will also lead to the formation of pupils' visual and artistic speech.

Teaching and learning in Visual Arts is based on literal observation, exploration of immediate surroundings and artwork, creative processing of information, research, encouragement of cognitive processes as well as on valorization. Visual and artistic speech is developed by the reorganization of internal relationships between visual signs and meanings in personal experience of creative processes. It is formed by observation, research, artistic creation and by application of knowledge on visual as well as on artistic elements and their relationships. [4]

Visual experience is transformed into relevant information that is appropriate for further processing, while utilization of computers in teaching and learning favors visual representation of data. Solving visual problems and encouraging visual curiosity is presumption for the activation of creative process in pupils.

Expression through creative process contributes to wholesome child's development: multiple intelligences, creative and symbolic thinking, expressive and practical forming abilities as well as personality. In addition, it encourages self-confidence, spontaneity and will for free research, it develops attention, concentration, sensitivity to measure and cyclic patterns plus it enhances the ability for self-expression and critical thinking. [1]

Former experiences of many Visual Arts teachers related to preparation and formation of didactic materials show that all teaching and learning themes and contents from the afore mentioned Curriculum are much more acceptable for pupils if they are presented in a way that is close to their everyday activities and to work on the computer.

By utilizing presentation software and computer program Paint, every teacher can very efficiently and quickly switch from one teaching stage to another, while not losing the essentials such as time articulation and class dynamics.

Equally, all available contents in Visual Arts that can be found on website created by Miroslav Huzjak's (who is both author and performer) (http://likovna-kultura.ufzg.hr, Likovna kultura – metodički centar, Faculty of Teacher Education in Zagreb) are suitable for utilization and formation with Paint.

There is almost no teaching unit where Paint could not be utilized with a purpose of easier explanation and understanding of keywords, processes and in pupil's practical work. Paint is fully utilizable in Visual Arts teaching and learning.

II. Implementation and Utilization of Computer Programs in Teaching and Learning Visual Arts

There are many ways in which computer program Paint can be implemented and utilized in teaching and learning Visual Arts. However, besides everything previously mentioned, there are 2 instances in which Paint is especially suitable:

1) it is useful for teacher during the preparation of presentations in presentation software and afterwards during their demonstrations

and

2) it is useful for pupil who can draw in this program during research phase or during practical work phase.

Examples in Paint and presentation software that teacher utilizes in various teaching units are presented in 4 subheadings below.

A. Example from 5th (fifth) grade

Plane – Static and dynamic planes

Key terms: static/dynamic, graphic, cardboard print, high print, matrix, impress, graphical sheet

Teacher can draw work phases in a process of creating cardboard images in order to demonstrate the procedure.

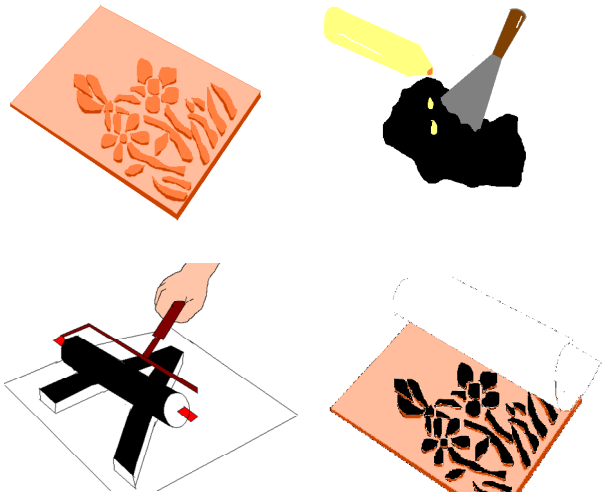

Figure 1. Graphical representation of example from 5th (fifth) grade

B. Example from 6th (sixth) grade

Color – Local color, color grading

Key terms: local color, harmony (harmony of colors), tonal gradation

Using prepared photography that is copied inside Paint in order to cut out the details in which tonal gradation is visible.

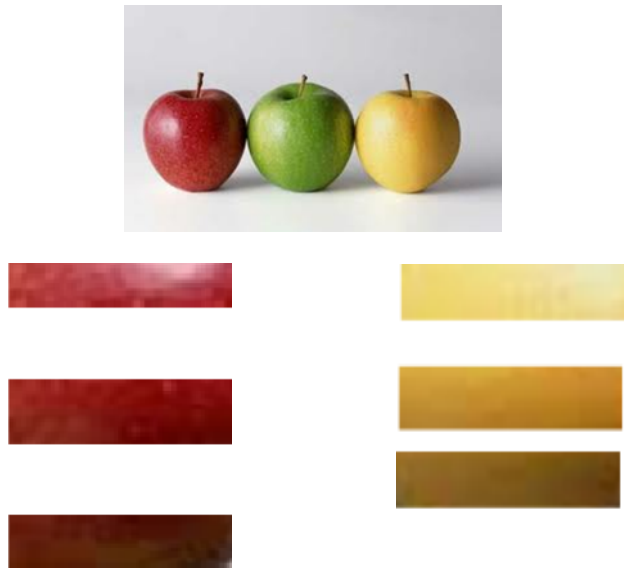

Figure 2. Graphical representation of example from 6th (sixth) grade

C. *Example from 7th (seventh) grade*

Linear perspective

Key terms: linear perspective, standpoint, eye relief, horizon, observation angle, field of vision

Using prepared photography that is copied inside Paint and drawing on the photography. This is pupil's work in the exploration of directions.

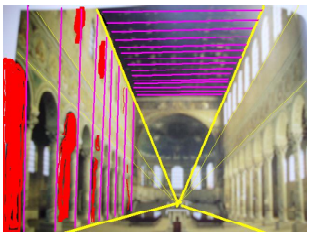

Figure 3. Graphical representation of example from 7th (seventh) grade

D. *Example from 8th (eighth) grade*

Harmony of shapes

Key terms: horizontal, vertical, diagonal, circular/oval, pyramidal composition

Using predefined geometrical shapes in Paint with a purpose to create layout so that various kinds of compositions can be formed.

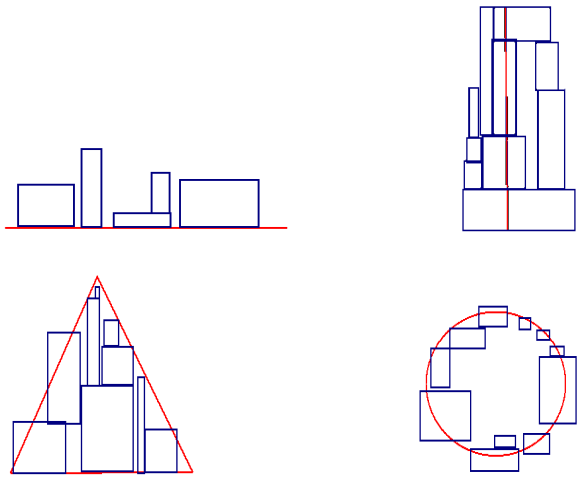

Figure 4. Graphical representation of example from 8th (eighth) grade

III. SURVEY INTO COMPUTER PROGRAMS IN TEACHING AND LEARNING VISUAL ARTS

Especially for research conducted in this paper the completely new and original survey was carried out. Briefly, in this comprehensive survey pupils were able to evaluate pros and cons of using computer programs in teaching and learning Visual Arts.

This survey was carried out in primary school Zamet in Rijeka, Croatia, Europe on a representative sample of pupils from 5th to 8th grade. Additionally, both male and female pupils were answering the same questions because this survey was carefully, specially and properly prepared as well as created in order to completely and adequately cover both genders.

Survey consisted from a total of 24 questions, whereas 1 question was considering pupils' gender, 1 question was considering pupils' grade, 20 questions were classical Likert scale questions considering pupils' evaluation (5 being the highest grade and 1 being the lowest grade), while 1 question was open type question considering pupils' evaluation.

Furthermore, questions considering pupils' gender and grades were analysed and represented as numbers and percentages, Likert scale questions considering pupils' evaluation were analysed and represented as 2 statistical measures i.e. mean and standard deviation, along with open type question considering pupils' evaluation that was represented in a form of the most numerous and the most representative groups of answers.

Notably, all tabular representations of data in answers 1-21 and 23-24 are not tables by Mipro standard, because data represented in them cannot be reduced to font size 8.

1. Pupils' gender

GENDER	M	F	Σ
n	39	53	92
%	42,39%	57,61%	100,00%

The majority of total number and percentage of pupils who participated in this survey were female.

2. Pupils' grade

GENDER	M		F		Σ	
GRADE	n	%	n	%	n	%
5th GRADE	12	44,44%	15	55,56%	27	100,00%
6th GRADE	14	46,67%	16	53,33%	30	100,00%
7th GRADE	7	38,89%	11	61,11%	18	100,00%
8th GRADE	6	35,29%	11	64,71%	17	100,00%

Even though number of pupils varies from grade to grade, it is evident that females represent majority in each of the classes that participated in this survey.

3. Evaluate your motivation to utilise Paint in class.

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	3,62	1,32	3,67	1,17	3,64	1,25

Such motivation values are actually quite high for primarily school pupils. It is observable that males have slightly lower motivation, but that is probably because they consider other types of software (games, advanced programs, etc.) more challenging and therefore somewhat more motivating.

4. Evaluate your knowledge of Paint.

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	4,35	1,00	3,96	1,04	4,16	1,02

These quite high values for both males and females are actually encouraging for teachers who plan to implement and utilize Paint in teaching and learning Visual Arts. Also, the lowest standard deviation implies that differences among the pupils are minimal and that is just another plus in the same regard.

5. Evaluate the value of Paint in class.

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	3,66	1,49	3,56	1,11	3,61	1,30

The explanation for those values can be the same like in 3rd question (3.), but somewhat higher standard deviation among the males implies that differences in opinion are even more emphasized. Overall, this is also a very encouraging set of values in the context of this paper.

6. To which extent would you like Paint to be implemented in class?

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	3,67	1,31	3,35	1,25	3,51	1,28

Similar to 3rd question (3.) and 5th question (5.) these values are definitely in favor of ideas promoted in this paper, despite the subtle differences in opinions as it is represent by standard deviation values.

7. Implementation of Paint in class would make the creation of Visual Arts exercises easier for me.

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	3,55	1,34	3,41	1,48	3,48	1,41

With values similar to those in 6th question (6.), despite a tad higher standard deviation values for females this question essentially implies the same conclusion.

8. Implementation of Paint would make class more interesting.

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	3,69	1,52	3,36	1,38	3,52	1,45

Instantly observable difference in mean values between males and females in this question only suggests what is traditionally well-known and accepted i.e. females are (in general) more inclined towards Visual Arts and therefore they need less incentive such as computer programs in this regard.

9. Evaluate the former level of Paint utilisation in class.

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	2,81	1,69	2,63	1,41	2,72	1,55

Even though the former level of Paint utilisation in class was fairly low within drawn sample, this is the exact issue that this paper aims to address and, consequently, promote so that Visual Arts classes could become even more interesting and rewarding for the future generations.

10. How often does your teacher utilise Paint while teaching new subject matter?

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	2,13	1,54	2,15	1,26	2,14	1,40

Almost the lowest mean values and rather high standard deviation values implies why this paper is aiming to be(come) one of the essential incentives for Visual Arts teachers in this respect.

11. To which extent would you like your teacher to utilise Paint for while teaching new subject matter?

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	3,42	1,46	3,57	1,36	3,49	1,41

Larger than average mean values and standard deviation values in this question definitely show that pupils are interested in the proposed idea, but there are obviously some differences in opinions that should be sorted out.

12. How often does your teacher demonstrate way of applying computer programs for drawing and painting in class?

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	2,55	1,60	3,06	1,59	2,81	1,60

Similar to 9th question (9.) and 10th (10.) question, values for this question shows that there is a lot of space for additions and improvements in this regard.

13. How often did you utilise Paint for freehand drawing in class?

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	2,50	1,55	2,25	1,28	2,37	1,41

Even lower values than the ones in the previous question just increasingly emphasize everything previously written.

14. How often did you utilise predefined shapes from Paint (rectangles, ovals, stars, ….) in class?

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	2,46	1,50	2,07	1,27	2,26	1,39

Predefined shapes are often very handy and convenient for pupils. Therefore, their usages should be properly taught as well as learned in Visual Arts to a larger extent. Rather high standard deviation values in males show that differences within the sample are rather high in this specific regard.

15. Painting on a computer screen is something that I consider interesting.

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	3,50	1,36	2,92	1,51	3,21	1,43

Conclusion in this question is actually quite similar to the one on the 8th question (8.), but even greater difference in mean values and remarkably high standard deviation values imply that differences within this sample should be taken into account very carefully.

16. Paint enables me to enjoy drawing and painting.

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	3,32	1,60	3,13	1,45	3,22	1,52

All values in this question are somewhere in the region between 8th question (8.) and 15th question (15.) what leads to conclusions in the specific region which is actually a combination of those two.

17. Utilisation of tools from Paint speeds up my process of producing artistic idea.

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	3,39	1,07	3,06	1,27	3,22	1,17

With fairly larger than average mean values and low to average standard deviation values, this question actually leaves some valuable space for improvements in both teaching and learning.

18. Color palette in Paint provides me with wider selection of hues than the ones that we physically mix on a palette.

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	3,65	1,34	3,45	1,36	3,55	1,35

Higher than average mean values and standard deviation values show that pupils essentially appreciate what Paint has to offer them. However, once again, differences in opinions should be taken seriously and, therefore, approached carefully.

19. By adding text to a picture we would enrich the production of ideas in graphical design.

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	3,53	1,50	3,31	1,30	3,42	1,40

With only slightly lower values than in the previous question i.e. 18th question (18.), explanation is essentially the same, but it can be concluded that pupils value Paint's text capabilities as, more or less, mediocre ones.

20. I consider font selection as acceptable in production of graphical design exercises.

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	3,41	1,24	3,15	1,26	3,28	1,25

In accordance with previous 2 questions i.e. 18th question (18.) and 19th question (19.), Paint's font selection is approximately in the same rank according to these pupils' opinions.

21. How do you evaluate teacher's support in utilisation of Paint for doing your homeworks?

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	3,29	1,61	2,46	1,60	2,87	1,60

Surprisingly low mean values and almost the highest standard deviation values imply that there is a lot of space for improvements, equalizations and innovation. Moreover, because homeworks are the important part of learning process in primary schools, these values are even more significant and motivating.

22. What are the most common problems that happened to you during the utilisation of Paint in class?

The most numerous and the most representative groups of answers (formed with the help of keywords) that were given by pupils are presented in the list below.

NO ANSWER (EMPTY BOX)	*29 out of 92*	*= 31,53%*
no problems	*10 out of 92*	*= 10,87%*
when whole screen is painted	*8 out of 92*	*= 8,70%*
when something is deleted	*3 out of 92*	*= 3,26%*
color spillover	*2 out of 92*	*= 2,17%*
eraser is too small	*2 out of 92*	*= 2,17%*
hard to draw straight lines	*2 out of 92*	*= 2,17%*
when mouse stops	*2 out of 92*	*= 2,17%*
OTHERS (1 ANSWER)	*34 out of 92*	*= 36,96%*

23. By utilising Paint Visual Arts problems have become clearer to me.

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	2,71	1,66	2,79	1,52	2,75	1,59

Significantly lower mean values and pretty close standard deviation values in comparison with the 21st question (21.) signify, once again, room for desired, considerable and genuine improvements.

24. Would you participate in further researches related to the introduction of Paint in class?

GRADE	5th to 8th		5th to 8th		5th to 8th	
MEAN & ST. DEV	MEAN	ST. DEV.	MEAN	ST. DEV.	MEAN	ST. DEV.
VALUES	3,40	1,57	2,98	1,44	3,19	1,51

Such values were pretty much expected, especially because it is not sensible to expect from a sample of elementary school pupils to be seriously and greatly interested in participation in further researches. It is mainly because at least a certain number of them cannot be fully aware of the importance and the implications that research like this one can have on future generations, particularly if it is properly disseminated and continued. However, significantly lower interest by females is something that was somewhat unexpected.

General remarks regarding the conducted survey:

- the lowest mean value was 2,07
- the highest mean value was 4,35
- the average mean value was 3,21
- the lowest standard deviation value was 1,00
- the highest deviation value was 1,69
- the average deviation value was 1,35
- this survey and its encouraging results will definitely be the incentives for a number of new surveys by the same authors in the coming years

IV. CONCLUSION

Computer program Paint is fully utilisable for teaching and learning in Visual Arts. There are literarily no teaching units where Paint could be utilised with a purpose of easier explanation and understating of key terms and processes of practical work, but also in the practical work itself.

Pupils occasionally utilise Paint i.e. when they express a wish for it or if they estimate that they could better realise their idea in Paint. Paint has also proven to be a good program for pupils with difficulties, especially the ones with graphomotoric disorders because they feel safer (when working) in Paint, whereas they usually successfully realise the (given) theme (in the class). Paint is also good for hyperactive pupils because this program can calm them and it requires concentration as well as persistency from them.

In addition to all of these (and numerous other) cognitions, observations and experiences throughout the years, authors have recently carried out completely new and original survey 24-question survey in primary school Zamet in Rijeka, Croatia, Europe on 92 pupils from 5th to 8th grade. Results of this survey, which were elaborated in detail under the separate heading of this paper, were absolutely and distinctly positive, encouraging and motivating for authors. It is so, mainly because they have definitely proven that computer program Paint alone and in the combination with other computer programs is something that pupils value, appreciate and (slowly, but surely) require as the welcome novelty and addition in their teaching and learning process.

Finally, this very survey and its afore mentioned results are definitely the incentive for a number of new surveys by the same authors in the coming years. That way authors will able to gather more data on issues presented in this paper as well as to disseminate, direct and expand this (and other related) research in directions that will be of most interest and benefit as well as for prosperity of future generations.

E-Learning of Students in Course „Fundamentals of Engineering Design“ Using the System of Evaluation and Maintaining the Quality of Education and Scientific Research

L. I. Baltova
Technical University of Sofia/ Department of Fundamentals and Technical Means of Design, Sofia, Bulgaria
lbaltova@tu-sofia.bg

Abstract - This paper presents the organization of education in the course “Fundamentals of Engineering Design” in the Department of Fundamentals and Technical Means of Design, the Faculty of Mechanical Engineering at the Technical University of Sofia.

In the paper are shown helpful applications developed in the Department which presents good practices for training students using System of Evaluation and Maintaining the Quality of Education and Scientific Research as measures to be applied to increase the knowledge and motivation and reducing the impact of risks identified during the training of the students.

I. INTRODUCTION

The Department of Fundamentals and Technical Means of Design, the Faculty of Mechanical Engineering at the Technical University of Sofia has developed varieties of assignments and test-papers that are used to control the level of acquired of knowledge in the training of First-year students at the course “Fundamentals of Engineering Design”.

According to Baltova (2013) [7] the potential risks are analyzed that were identified during training the students and measures are shown to reduce their influence: a risk of loss of interest in the subject, a risk the information presented in the tasks to be out of the date, a risk of incorrect terms of the tasks, a risk of inaccuracy in the difficulty of the tasks, a risk of incorrectness in the methodical arrangement of tasks, a risk of incorrectness of deadlines for implementation of tasks, a risk of lack of motivation of teachers and students, a risk of unsuccessful realization of the students in their specialty after graduation. In order the students to be able to increase their knowledge and motivation the annual assessment of each student is composed by summing the points obtained from all course tasks and tests made during the two semesters of the academic year. Each semester they make four course tasks and four control work and each task is described in [8]:

At First semester – the first is Electrical Circuits; the second is Heuristics I (develop Morphological Analysis and Synthesis, the Focus Objects, Denial of Signs, Empathy – the goal is to find original ideas to change the appearance, to add an additional function or to propose another realization of a function of the object); the third is Design of Parts and Mechanical Assemblies (design of bracket and fundament for internal and external assembly of signal lamp in the technical environment); the fourth is Design of Electrical Compounds for Volumetric Assembly (design of wire bundle connecting the devices in a car, according to the scheme of the compounds and assignment instructions).

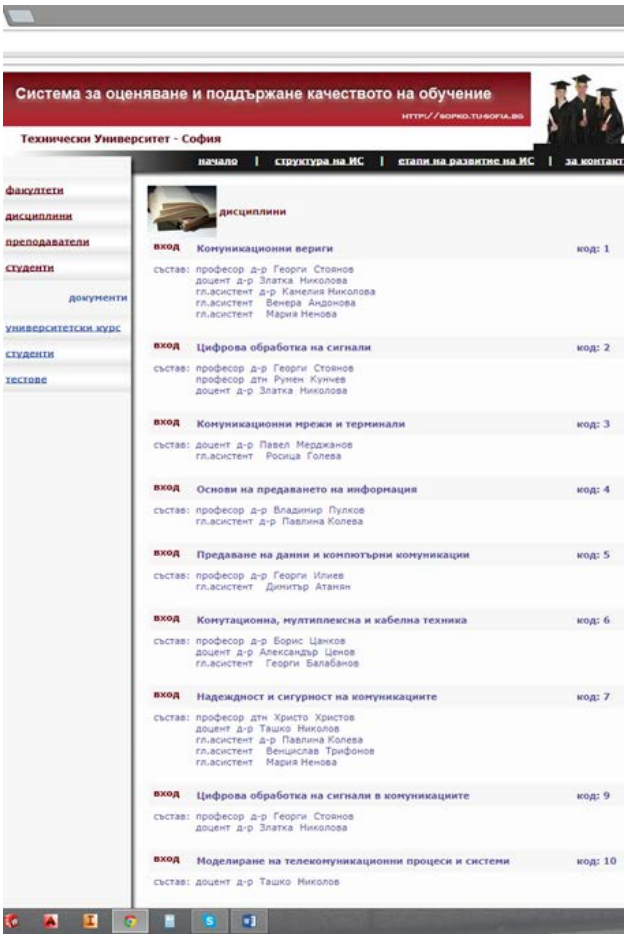

Figure 1. Login the System SEMQESR

At Second semester the students make next course tasks: the first of them is Engineering Analysis of Device (Structural analysis – the outlines of assign part and interaction with neighbouring parts of the device are determined; Constructive analysis – the graphic symbol and lettering in electrical scheme are determined, engineering effects, order of assembling, possible reasons for the failure of the device; Functional-Value analysis – the major and basic functions are determined, the value of parts that it participate in respective function as it looking for expensive function with greater costs than the significance and make a constructive modification in order to improve the quality and reducing the price of this function and of the electrical device; Dimensional analysis – the type of assemblies specified in the drawings of the General type are analyzed and the limit deviations of the dimensions of the parts involved in the assemblies presented graphically are determined and making a choice of smoothly cylindrical compound); the second is Heuristics II (Total analogy, Synectica, Modification of an Idea); the third is Design of Electro-Technical Devices (design of assembly units of relay – group of contacts, an electromagnet, base and lid); the fourth is Design of electronic device (at a specified principle electrical scheme design Printed Circuit Board - PCB and the box is designed for fixing and protecting the PCB).

In the Department have been developed variants of assignments for control work used at the end of each semester to review the acquire knowledge of students gained from the completion of course tasks.

The students redraw drawing of a part that is given by the assistant using AutoCAD. They draw assembling units consist of two parts by nature that are given by the assistant and they have to show the drawing of the assembled unit using SolidWorks. They draw PCB-design from electrical scheme that is given by the assistant using CADStar. They make graphical handmade control work. They answer in written to theoretical questions on the topics of lectures and in one of the tests we used for System of Evaluation and Maintaining the Quality of Education and Scientific Research (SEMQESR). This system is on the web site of the Technical University of Sofia.

In [1] are shown the tests developed in the Department are: 1. Fundamental of design; 2. Engineering analysis of the product; 3. Design of electrical compounds for printed circuit board (PCB Design); 4. Electrical schemes; 5. Mechanical assembly in the design on a technical object. Draw of designed technical object; 6. Dimension, roughness and threading in the design of technical object; 7. Design of parts, assemblies and electrical compounds for volumetric installation.

Assistants have developed over 48 questions for each test. When a student starts test the system generate 12 questions randomly and change the locations of the correct answers, which prevents mechanical learning of correct answers and stimulate thinking and rapid decision-making based on accumulated knowledge.

Each test can be used as: a trainer without timing (in the initial solving students seek answers to particular questions in lectures, guide and textbook that takes time); a trainer with timing (the control work is examination test which is with time registration necessary the students to have preliminary preparation to be able to respond quickly); examiner test (done in the computer room and the assistant generates a special code).

Figure 2. Login for student registration

According to E. Gerganov [4] the tests should cover the topics that are taught during the semester in tasks and lecture. The questions contain graphic and/or descriptive sections and four answers only one of them is correct. From a methodological point of view it is very important in the process of training the student to be able quickly to choose the correct answers and for that the response time is in conformity with the difficulty and scope of the explanatory part of the question. Students receive points for each correct answer, and in the end the system shows the final assessment depending on the ratio between a number of questions with correct answers compared to the total number of questions: for Excellent – 90 ÷ 120 points, for Very good – 72 ÷89 points, for Good – 54 ÷71 points, for Satisfied – 36 ÷ 53 points and less - Fail.

The beginning of work in SEMQESR is a click to the button “entry” with the specific number 65 for the course shows to fig. 1.

Students must be registered for the course by clicking the "registration" button to access the tests shown in fig. 2. In fig. 3 students fill in their personal data. After that the registered students must be confirmed by the assistant leading laboratory in order to activate their registration and set the period of activity of the registration as shown in fig.4.

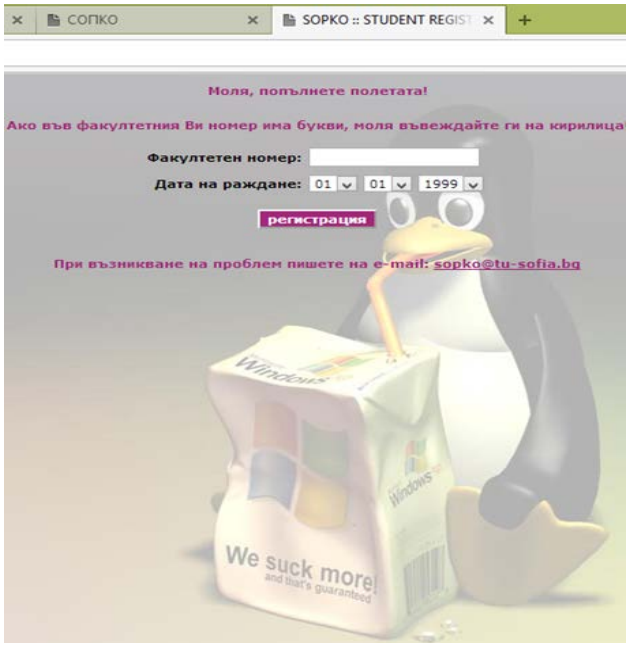

Figure 3. Process of student registration

After the successful start each registered student has access to the tests and other useful additions according to R. Pranchov, H. Hristov (2006) [3] and [2] by which we aim to help the students and to increase their knowledge and motivation: “Most Common Mistakes” in course tasks are shown in fig. 5; “Frequently Asked Questions” in the submission of each course task are shown in fig. 6; the questionnaires for each semester including the topics taught in the lectures are shown in fig. 7; consultation hours and teachers e-mail; dates of examinations; etc..

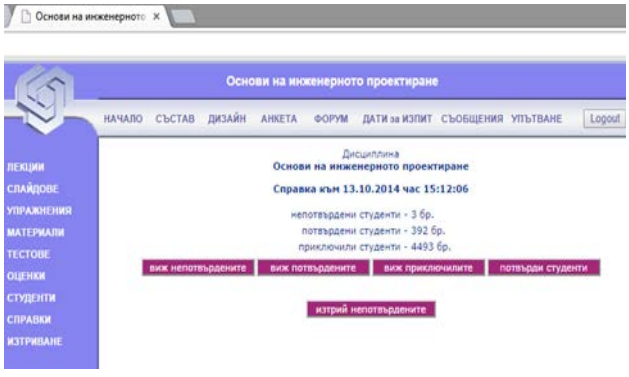

Figure 4. Confirm of students

The annex "Most Common Mistakes" describes errors that students make in the completion of each of the course task most frequently are shown in fig. 5. They are published in the paragraph "Materials" in SEMQESR.

The utility is expressed in that the questions of the students related to the performance of the course tasks became more specific and shown drafts became more correct and we achieved an increase in knowledge of students with.

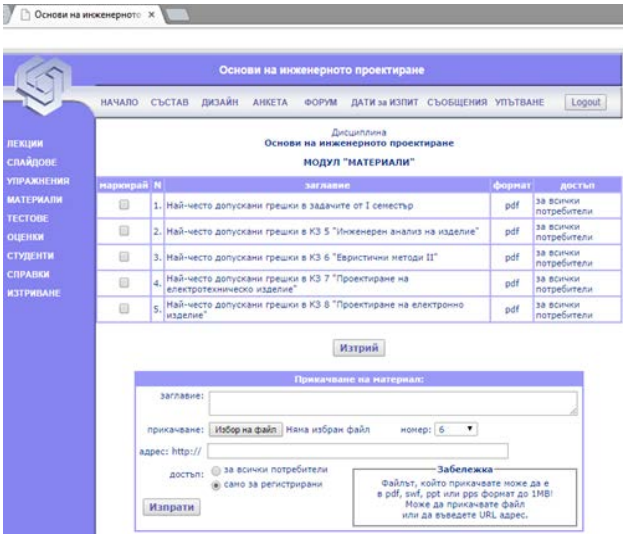

Figure 5. “Most Common Mistakes”

Students could check draft of course task before showing it during assistants’ consultation hours. Students must correctly eliminate the errors that have been discussed with the assistant and submitted the course task within the due time with maximum points if they fail to make the proper correction or does not respect the time of submission obtained points are reduced. Submission of course task occurs during consultation hours of assistants and then the manner of the implementation of the course discussed with each student.

In the annex "Frequently Asked Questions" are described the questions that assistant asks students in the submission of each course task and they are shown in fig. 6. They are published in the "Exercises" in SEMQESR.

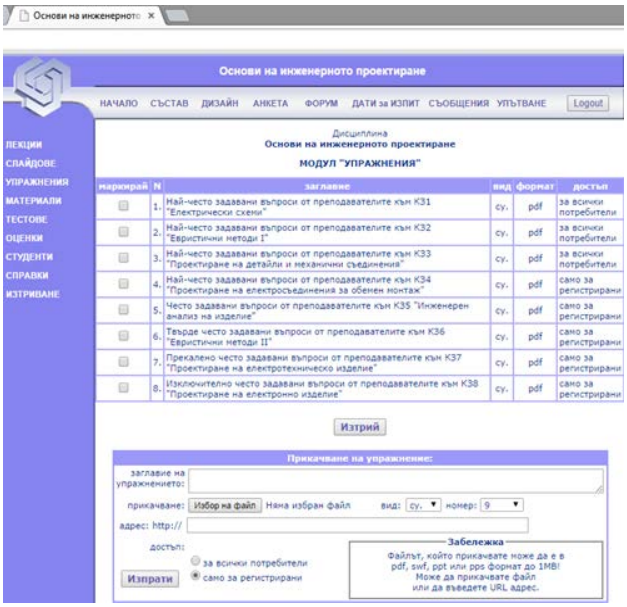

Figure 6. “Frequently Asked Questions”

This application focuses on the most important questions of the course tasks that help students to prepare for defense of each of them for the submit of course task during the consultation hours of the assistants if they fail to respond to the questions obtained points are reduced.

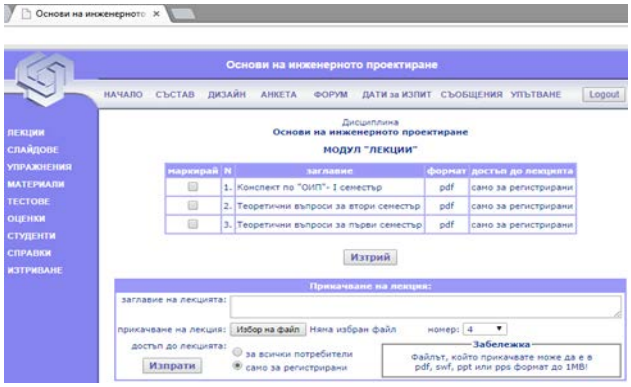

Figure 7. Questionnaires with the topics on the lectures

Fig. 8 shows the means how the introduction of a question from a respective test by teachers is organized and fig. 9 shows how the same question of the same test looks when it is resolved by the student.

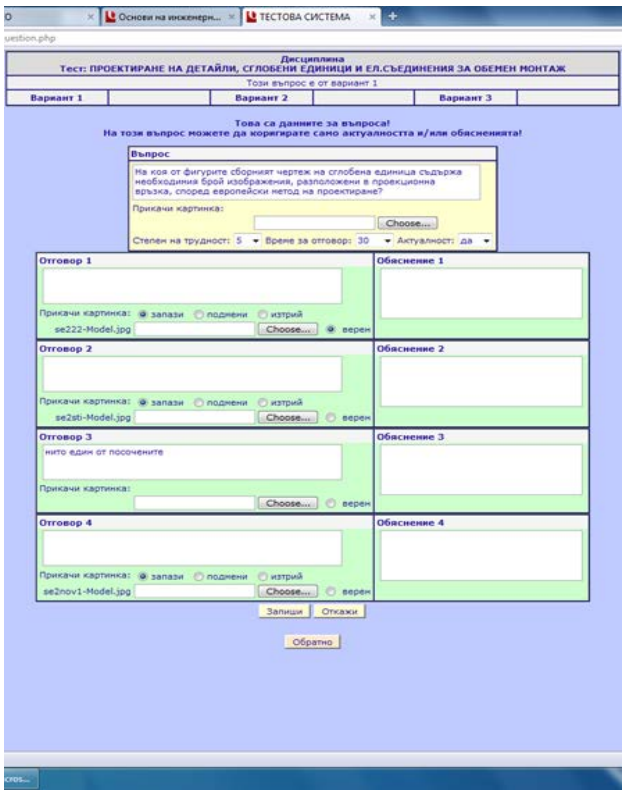

Figure 8. Developing a question by the teacher

In fig. 10 is shown the possibility to change the content of question of the test in order to clarify and update the explanatory part or change drawing in the graphic part to change the difficulty. If necessary corrections they have to be made at the beginning of the semester and any corrections are inadmissible after activation of test.

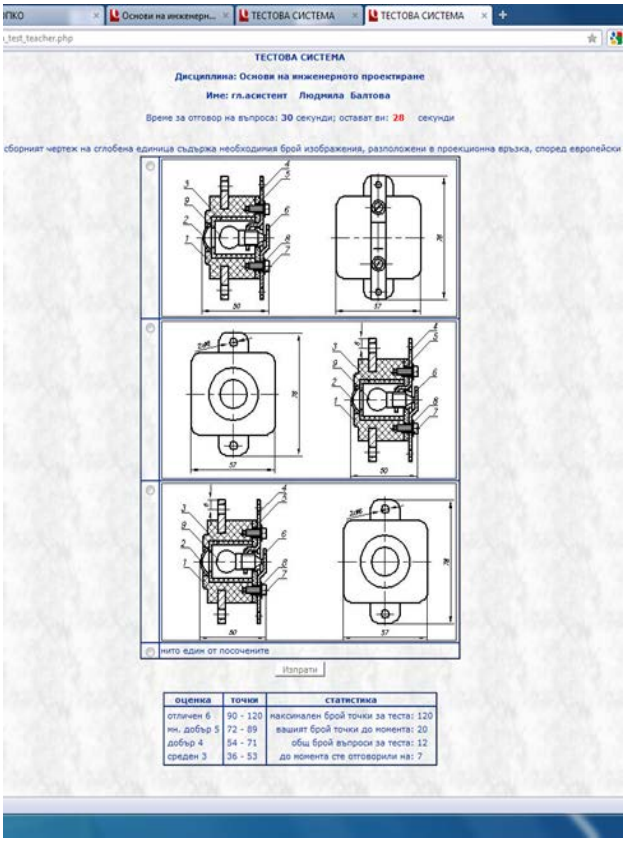

Figure 9. Solve a question of student

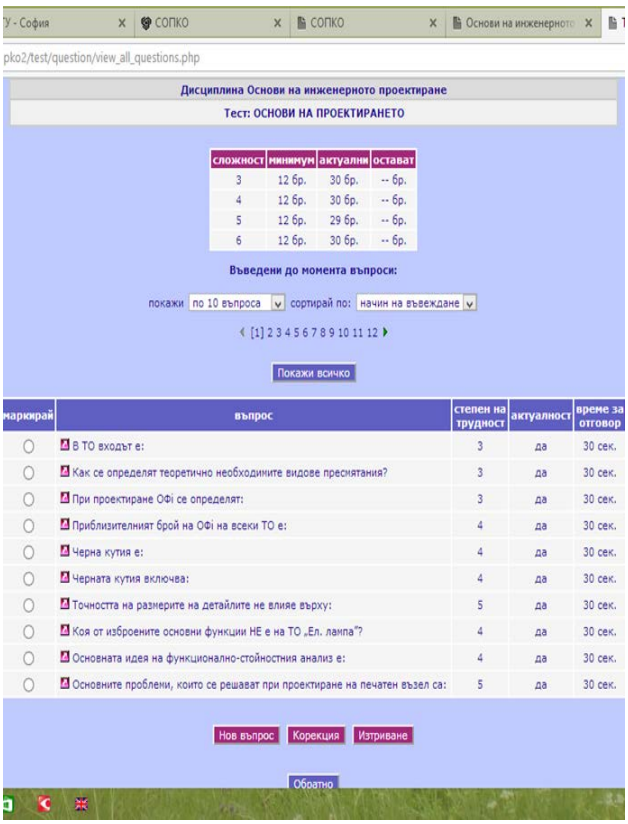

Figure 10. Ability to change the content of question

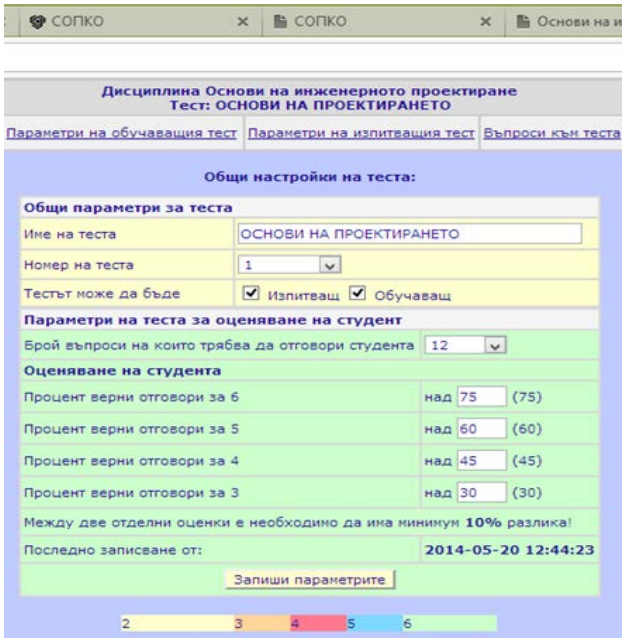

Figure 11. General settings on the test

In [5] and [6] are presented the conditions for the formation of graphic and descriptive parts of the questions in different courses respectively on “Fundamentals of Design and CAD” for mechanical Engineer and the “Basics of Design” for the specialty 'Industrial Engineering'. It is shown how to present erroneous graphical part so that students can quickly identify errors and quickly click on the correct answers. The results of the tests are shown and analyzed there.

In the general settings of the test shown in fig. 11 it is possible the type of test to be set: teaching test without timing, teaching test with time registration or test examiner.

Another possibility is to set which tests to be active during the relevant semester as within the first semester are active the four of them and within the second semester are active other three. The activity of each of the tests is related to the course tasks that students made during the semester.

Other possibility is in assessing the student in the system to set different percentages to the number of correct answers to various assessments and it is necessary to have minimum 10% difference between two separate assessments: for Excellent – over 75%, for Very good – over 60%, for Good – over 45%, for Satisfied – over 30% and less than 30% - Fail.

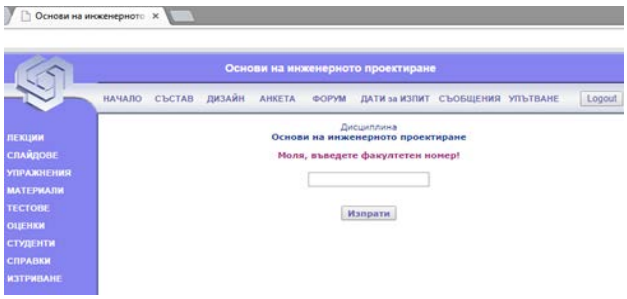

Figure 12. Statistical information of the results

At any time each registered student and assistant could make reference about the results in solving tests by introducing student’s faculty number shown in fig. 12.

II. Conclusion

This paper presents the organization of education in the subject “Fundamentals of Engineering Design” in the Department of Fundamentals and Technical Means of Design at the Faculty of Mechanical Engineering at the Technical University of Sofia.

The paper shows the tests and supporting annexes “Most Common Mistakes” in course tasks and “Most Frequently Asked Questions” in the submission of each course task developed at the Department representing the best practices for teaching students using the System of Evaluation and Maintaining the Quality of Education and Scientific Research as measures to be applied to reduce the impact of the risks identified during the training of students and to increase the knowledge and motivation.

The developments in mobile learning and its application in the higher education including libraries

Radovan Vrana
Department for information and communication sciences,
Faculty of humanities and social sciences, University of Zagreb, Zagreb, Croatia
rvrana@ffzg.hr

Abstract – As technological devices become more present in education, more researchers and educators are looking into different aspects of technology enhanced learning. Most recently, focus in technology enhanced learning is put on use of mobile devices i.e. mobile learning or m-learning. Mobile learning promotes concept of anytime anywhere learning which is important for students who frequently change places of learning and need access to the learning material as they move from one place to another. Such concept of learning is possible because more and more students have some type of a mobile device and mobile devices are mostly cheap, portable and flexible, have no start-up time, and require virtually no maintenance. While the mobile technology seems to be very attractive to students and usable in the learning process, there are also problems which burden further development of mobile learning or at least they are not helping its development: technological problems and obsolesce, lack of digital content made for use on mobile devices, lack of training of proper use of mobile devices in the learning process etc. Most of these and similar problems could be overcome if universities put more effort in adoption of mobile technologies among students and teaching staff.

I. INTRODUCTION

"Mobile and communication technologies are increasingly impacting the lives of individuals and are a major factor in helping reshape our culture and societies" [1]. As technological devices become more present in education [2],[3] more researchers are looking into different aspects of technology enhanced learning. Most recently, focus in technology enhanced learning is put on use of mobile devices i.e. mobile learning or m-learning. Mobile learning is learning delivered or supported solely or mainly by mobile technologies [4]. Mobile technologies enable people to be mobile and yet accessible [5].

The mobile technology i.e. mobile devices "(…) are generally defined as units small enough to carry around in a pocket, falling into the categories of PDAs (personal digital assistants), mobile phones, and personal media players" [2]. Mobile learning and mobile devices are directly connected as mobile learning is hardly possible without use of some kind of a mobile device. Therefore, mobile learning if often described as "the intersection of mobile computing and e-learning which offers: accessible resources wherever you are, strong search capabilities, rich interaction, powerful support for effective learning, and performance-based assessment, e-learning independent of location in time or space" [6] i.e. anytime and anywhere learning. Anytime anywhere learning is central to the concept of mobile learning. For Martin and Ertzberger [7] mobile devices open "(…) the door for a new kind of learning and performance support in the field, providing anytime and anywhere access to information, processes, and communication". For Tatar, Roschelle, Vahey and Penuel [8] "Mobile learning holds the promise of offering frequent, integral access to applications that support learning anywhere, anytime". Generally speaking, mobile learning is important in education for achieving academic goals while its final goal is helping the development of the knowledge society [3].

In the education sector, mobile technologies are becoming crucial because they "(…) can provide frequent and comprehensive access to systems and applications that support formal and informal learning" [9]. Mobile learning is present in higher education institutions as mobile devices have become ubiquitous at universities [10]. This widespread use of mobile devices has become possible because they are cheap, portable and flexible, have no start-up time, and require virtually no maintenance [8]. As a result, use of mobile phones and other mobile devices that allow data collection anywhere and anytime has become a routine [1].

Based on these facts and the current educational practice in higher education institutions, mobile learning seems to be generally attractive, especially to younger generations of students during their daily education related activities, it remains to be seen how strong it will influence programs of study and individual courses at universities. This paper will discuss potentials of use of mobile learning in higher education based on characteristics of mobile learning.

II. MOBILE LEARNING

Mobile learning is defined as "any sort of learning that happens when the learner is not in a fixed, predetermined location, or learning that happens when the learner takes advantage of the learning opportunities offered by mobile technologies" [11]. According to Brown and Metcalf [12] "mobile learning (commonly referred to as m-learning) as all "knowledge in the hand." It includes the use of mobile/handheld devices to perform any of the following: deliver education/learning; foster communications / collaboration; conduct assessments / evaluations; provide access to performance support/knowledge. Mobile learning uses the benefits of smaller and faster computing which enables learning anywhere and anytime [13].

Mobile learning comes in several "flavors". In their chapter on learning design with mobile and wireless technologies, Kukulska-Hulme and Traxler [14] enumerated categories of mobile learning with description for each category:

- "Technology-driven mobile learning – some specific technological innovation is deployed in an academic setting to demonstrate technical feasibility and pedagogic possibility
- Miniature but portable e-learning – mobile, wireless and handheld technologies are used to re-enact approaches and solutions already used in 'conventional' e-learning, perhaps porting some e-learning technology such as a VLE to these technologies or perhaps merely using mobile technologies as flexible replacements for static desktop technologies
- Connected classroom learning – the same technologies are used in classroom settings to support collaborative learning, perhaps connected to other classroom technologies such as interactive whiteboards
- Informal, personalized, situated mobile learning - the same technologies are enhanced with additional functionality, for example location-awareness or video-capture, and deployed to deliver educational experiences that would otherwise be difficult or impossible
- Mobile training/performance support - the technologies are used to improve the productivity and efficiency of mobile workers by delivering information and support just-in-time and in context for their immediate priorities
- Remote/rural/development mobile learning - the technologies are used to address environmental and infrastructural challenges to delivering and supporting education where "conventional" e-learning technologies would fail, often troubling accepted developmental or evolutionary paradigms".

Cheon, Lee, Crooks and Song [10] offered another view on mobile learning in which mobile learning facilitates four type of learning: individualized learning, situated learning, collaborative learning, and informal learning, which is excellent for a rather new technology. Each type of learning can benefit from use of mobile technologies; however, mobile technologies are not available to all students in all type of learning, so the actual use of mobile technologies depends of individual student's financial abilities to acquire a mobile device and knowledge to use it properly for learning. Finally, Lippincot [15] investigated the influence of mobile technologies on higher education and suggested that mobile devices with compelling new features and wireless connectivity are almost ubiquitously available and that we may be on the verge of a revolutionary phase of mobile device impact on higher education and libraries.

III. BENEFITS OF MOBILE LEARNING

Popularity of mobile devices and increased use and reliance on broadband networks have marked the beginning of a new era of education. Everyone wants to benefit from fast access to the internet and digital content available online for learning, both formal and informal. Some of the most obvious and direct benefits of mobile learning are equal-opportunity access, ubiquitous connectivity, multigenerational users and uses, expanded services for mobile workers and enhanced access to services for mobile learners" [16]. As mobile learning is becoming more popular, its benefits become more visible: cost savings, ubiquitous communications, study aids, and location-based services [10]. Mobile learning offers expansion in terms of the learners' experiences with an emphasis on device ownership, informality, movement and context [14]. Additionally, Klopfer, Squire and Jenkins [17] singled out features of mobile devices that can further enhance quality of mobile learning:

- Portability – students can take the mobile device to different sites and move around within a site
- Social interactivity - students can exchange data and collaborate with other students face to face
- Context sensitivity - students can gather data unique to their current location, environment, and time, including both real and simulated data
- Connectivity - students can use mobile devices to connect their handhelds to data collection devices, other handhelds, and to a common network that creates a true shared environment
- Individuality - mobile devices can provide students unique opportunity of scaffolding that is customized to the individual's path of investigation.

"Mobile learning can enhance and support more traditional learning modes, making it more portable and accessible. Mobile devices can also serve as powerful data collection tools and cab also facilitate the capture of user created content [12]. Mobile learning depends of access to

digital content. This access is made possible by wireless mobile and wifi networks at universities. However, it should be pointed out that the quality of digital content used in education can vary and in such cases university libraries could play an important role of facilitator to quality content for learning.

By using their mobile devices, students can learn at any time and at any place; they can learn as if they are in a real classroom environment; the learning environment is equipped with sensors and other tiny devices embedded in learning objects; mobile devices are capable to identify the current context and other learning objects of the students so the students are provided with services according to his/her context and situation; the communication between students and instructors has become more ubiquitous [1].

Mobile learning supports individual learning as well as collaboration learning [18] which makes it applicable in different learning environments and situations. Mobile devices can be used in laboratories to gather and control data; in field trips mobile devices can be used to collect pictorial and textual data; in distance learning mobile devices support the delivery of synchronous and asynchronous learning while in informal settings the devices support incidental and accidental learning [18]. The current versatility of use of mobile devices suggests that possibilities of their use will only increase in near future. These are the most observable benefits at the moment and this list could be expanded with new features of new generations of mobile devices.

IV. DOWNSIDES OF MOBILE LEARNING

In addition to benefits, mobile learning has met some obstacles. From the technological point of view, mobile devices are different according to their specifications and usability (limited memory, screen size, battery life, storage space, and backlighting making use over long periods uncomfortable, formats such as Adobe Flash are not always supported and PDF or graphics may not display clearly on the screens, input methods are often not user-friendly), the lifecycle of the devices (with each new mobile device, users must continuously learn how to use it and may not have time to exploit the full functionality of the particular device), the diversity and lack of standards in this area, cost could be an issue for users, especially because of the rapidly changing technology and short lifecycle of the devices [2],[19].

Some authors like Keough [20] think that there are serious reasons why mobile learning will not work: it is technology driven; we know too little about what mobile devices are used for; we know too little about learning relationships/networks or the transactional analysis of mobile relationships; it will not change entrenched institutionalized education models; it relies on nascent consumer technology: mobile devices are inherently dissatisfying by never quite meeting every promised need for the consumer; there are no standards to overcome cultural differences; there is lack a bobigogy i.e. teaching and learning models.

As it was previously mentioned, mobile learning depends on quality information resources. Publishers and libraries should provide access to information and support all learners in use of educational and other types of information resources regardless of differences of mobile devices they own and differences in data formats or how much technical support students get in their use of such devices [2]. Part of the problems with content can be solved by libraries and their digital collections. Many libraries already have Web sites adapted for access by mobile devices so the digital content in library collections could be used in the learning process.

V. LIBRARIES AND MOBILE LEARNING

In the system of higher education, libraries have an important role of facilitator to printed and digital knowledge necessary for research and teaching. More frequently than ever, libraries are adopting mobile technologies to provide new and innovative services, as well as introducing ways for users to incorporate library services into their daily lives [21]. Today, libraries offer a variety of services. Some of them include: including mobile library websites and MOPACs (Mobile OPACs), mobile collections, mobile library instruction, mobile databases, mobile library tours, mobile learning, library SMS notifications, mobile library circulation, QR codes, access to services etc. [21]. Furthermore, mobile devices can be used in libraries for the following activities: voice and video calling, sending and receiving e-mail, SMS text messaging, searching the internet, searching databases of scholarly information, organizing citations, accessing a course management system, reading or listening to books and articles, taking photos, playing videos, making videos, setting an alarm clock, using a GPS navigation system and playing games, reading, watching, listening to, and producing digital content that will have the most impact on libraries [15]. Some of these activities are more related to the learning process than other. In libraries which are part of higher education institutions students can use rich digital resources in digital libraries for instruction, assessment, and professional development [22]. In combination with mobile technologies, students can study when they want to or need to and transport their learning materials [22] with them. Mobile technologies help students not only in using the already created digital content but as an instrument for creation of digital content [15].

With proliferation of use of mobile devices "(…) libraries must now decide how much time and funding they should devote to the development and support of academic library resources in formats that can be accessed on such devices" [2]. Once again, libraries can prove the values of their services because they have already traditionally served as a public good, providing resources and services to all, including those who could not afford to purchase some types of content or services on their own [15]. In case of mobile learning and other services related to use of mobile technologies, libraries are unable to equip every library user with and adequate device. It is therefore

highly unlikely that libraries would buy smartphones to its users, but many of them do offer tablets for use in library premises accompanied by the digital content. This is a major step forward towards popularization of use of mobile devices in libraries as well as use of digital content. Libraries would be hardly useful without librarians. The role of librarians can be very interesting and innovative. "Librarians might encourage, through contests or other means, student development of apps that make library content and services more useful for specific groups of users" [15]. They are not only knowledge managers. They are also promoters of new technologies that can be used in libraries and in academic institutions for research and teaching. As a result, many libraries in the world have embraced mobile technologies and support mobile learning.

VI. DEVEOPLMENTS AND CHALLENGES OF MOBILE LEARNING

While there are many aspects of mobile learning that are already known to scientist and professional involved in research and implementation of mobile learning, there are still some issues that remain unresolved or unknown due to the novelty of technology used in this type of e-learning. Conole [23] wrote about organizational aspects of e-learning which can be applicable to mobile learning as well. Theses aspects should be taken into account for mobile learning to be successful: 1.) understanding of how stakeholders (academics, support staff, administrators, senior managers and students) currently work 2.) mechanism and procedures for developing shared knowledge banks of expertise and information 3.) outline of roles and responsibilities for mobile learning activities? management, technical, research, dissemination, evaluation, training 4.) What are the different views of e-learning and its role? academics vs support staff 5.) how are institutions dividing roles and responsibilities for mobile learning and how much training and support are staff getting.

Other problems related to mobile learning and libraries are: the growing quantity but not all content of library holdings is prepared and adapted for use on mobile devices. In addition to lack of digital content in libraries made for use on mobile devices, there is also a lack of digital repositories with educational materials. Furthermore, teaching staff is not equipped and trained for use of mobile devices in the teaching process, there is a lack of standards for evaluation of use of mobile devices in teaching etc.

Implementation of mobile learning is a complex endeavor and many factors must be taken into account if educators and technology developers want it to be successful [24]: context: gathering and utilizing contextual information may clash with the learner's wish for anonymity and privacy; mobility: the ability to link to activities in the outside world also provides students with the capability to 'escape' the classroom and engage in activities that do not correspond with either the teacher's agenda or the curriculum.; learning over time: effective tools are needed for the recording, organization and retrieval of (mobile) learning experiences; informality: students may abandon their use of certain technologies if they perceive their social networks to be under attack; ownership: students want to own and control their personal technology, but this presents a challenge when they bring it in to the classroom.

When speaking about mobile learning, it is almost impossible not to mention social networks and learning management systems [25]. Students at the Faculty of humanities and social sciences (in Zagreb, Croatia) are using social networks in search of the learning material and for communication with other students and teachers while learning management system is used for access to the learning material created by teachers and students at this Faculty [25]. Since social networks are well adapted to access on mobile devices, everyday educational practice demonstrates that every communication between students and teachers on social networks is well accepted by students who use their mobile phones for communication related to the learning process as well for informal communication with family and friends [25]. The latest version of the learning management system Moodle which is called Omega at the Faculty of humanities and social sciences is also accessible on mobile phones and tablets and it is used in the learning process on daily basis. This helps students to stay in touch with the latest announcements or published content related to courses they enrolled in the academic year. The problem is the course related content which is not made to fit the small screens on smartphones or smaller tablets but is made for desktop PCs and laptops. This is one of the frequent problems related to mobile learning in an environment which is not fully adapted for implementation of mobile learning. Furthermore, the lesson plans must include students who own mobile devices as well as students who don't own mobile devices or their mobile device is too old to access and display course content properly if at all. To enable use the course content more extensively on mobile devices in future, content creators will have to produce several versions of content which will be displayable on various devices.

VII. CONCLUSION

In the educational sector, mobile technologies are being introduced into the learning process more and more frequently and are becoming important for its development. More specifically, mobile phones can expand educational access and they can support instruction, administration and professional development [27]. The results of research conducted in 2012 [25] suggest that mobile devices are already present in the learning process in higher education in Croatia. Generally speaking, mobile technologies open the door for a new

kind of learning in which students can learn at any time and at any place. As technological devices become more present in education, more researchers are looking into different aspects of technology enhanced learning. Most recently, focus in technology enhanced learning is put on use of mobile devices i.e. mobile learning or m-learning. Current versatility of use of mobile devices in learning suggests that the possibilities of their future use will only increase as mobile devices become more feature rich and as new types of digital content becomes available and usable on mobile devices. Further implementation of mobile technologies in the learning process would probably result in better learning materials and systems [26] and this will in the focus of future research. Use of mobile devices in education represent a challenge because it is difficult to predict what the next generation of mobile devices will bring from the technological and pedagogical point of view. In addition to students who are keen on using mobile devices, libraries are also adopting mobile technologies more frequently than ever to provide new and innovative services, as well as to introduce new ways for users to incorporate library services into their daily lives With proliferation of use of mobile devices libraries must now decide how much time and funding they should devote to the development and support of academic library resources in formats that can be accessed on mobile devices. While there are many aspects of mobile learning that are already known to scientist and professional involved in research and implementation of mobile learning, there are still some issues that remain unresolved or unknown due to the novelty of technology used in this type of learning.

Open science, open access and open educational resources: challenges and opportunities

Radovan Vrana
Faculty of Humanities and Social Sciences, University of Zagreb, Zagreb, Croatia
rvrana@ffzg.hr

Abstract – This paper discusses the concept of openness in general and its implementation in access to research and teaching material used in academic institutions. Though idea of openness i.e. open science and open access to information sources is not new, it is still not universally accepted and it is not understood equally in all parts of the world. The greatest benefits of open access can be observed in academic activities i.e. in research and teaching at academic institutions. However, open access is not understood and presented equally everywhere. There are differences in openness and rights of users in access and use of scientific and educational materials in open access digital repositories. While the number of open access digital repositories increases there are many questions waiting to be answered from quality of content, roles in management of open access information resources, responsibility for maintenance of digital information resources, financing of digital information resources, quality of scientific and educational digital resources etc.

I. INTRODUCTION

The access to internet has become a human right [1] and an essential tool in science and education. Inability to access textbooks, presentations, journal articles, conference papers, books, reports and other digital publications on the internet for any reason, creates a phenomenon called digital divide. The term digital divide was coined in 1990s, and it distinguishes people who have access to information and communication technology from those who don't [2]. Inability to use information and communication technology results in inability to access information resources too. While one part of the world has access to the great variety of paid information resources while the other part depends mostly on free of charge information resources available on the internet.

In both cases, members of educational sector (in this paper the focus is on higher education community) are interested in materials that already incorporate content with a specific didactical or pedagogical approach. These materials are often referred to as digital learning materials [3] and are becoming increasingly significant in education globally. Digital learning materials are available for access on various personal, corporate and institutional Web pages on the internet as well as in digital repositories [4] including open sources digital repositories. Open access means that information resources are digital, online, free of charge, and free of most copyright and licensing restrictions" [5]. In the last 20 years, open access initiative has played an important role in dissemination of scientific and educational material as it offers easy access to the peer reviewed journal articles, book, conference papers and other types of information resources usually found in academic institutions' libraries [6]. This initiative supports the idea of open science which is gaining on popularity as open access information resources grow in number and become more available.

Open access has gained good reputation because it has potential to reach "(…) a larger potential readership and thus establish the premises for potentially greater impact" [6]. Open access information resources are becoming more extensively used in research and teaching in higher education institutions in Croatia as a replacement for fee based information resources [7]. As a result, more members of academic community in Croatia and people outside of it are getting acquainted with open access initiative and benefits it could bring to their professional and personal lives. This paper will have focus on open access, open science and open educational resources and their role in science and teaching.

II. OPEN SCIENCE

Open science is "(…) the idea that scientific knowledge of all kinds should be openly shared as early as is practical in the discovery process" [8]. It is also "The conduction of science in a way that others can collaborate and contribute, where research data, lab notes and other research processes are freely available, with terms that allow reuse, redistribution and reproduction of the research" [9]. Open science can be described by its four fundamental goals: 1. transparency in experimental methodology, observation, and collection of data, 2. public availability and reusability of scientific data, 3. public accessibility and transparency of scientific communication and 4.using web-based tools to facilitate scientific collaboration [10]. Similar view on open science was offered by Smith [11]: open science should be related to transparency of the scientific methods, observations, data collection, data access, communication, collaboration and research tools. "Instead of limiting the sharing of the practice of science to publication of selected results, the entire scientific process should be exposed to potential users, collaborators and extenders of the work" [11]. The benefits of open science include sharing of knowledge, especially the knowledge that is publicly funded and the ability to use and re-use the results of scientific research including research data for the purpose of new research and teaching not only in higher education

institutions but elsewhere where quality information resources are needed. In addition to benefits, open science is also meeting some challenges, related frequently to the funding of scientific research in private sector where research results are not always published or publicly announced until such time when these research results can produce some profit to the company which financed it. Open science is greatly depending on open science information resources which create opportunities for facilitating publishing and access to human knowledge. As a result the idea of open science started to spread globally including proliferation of open access information resources as its most prominent manifestation.

III. OPEN ACCESS

Fee based (paid) information resources have become one of the major barriers in work of the higher education institutions in the world, primarily because of the high annual scientific journal subscription rates which are far too expensive for many libraries at universities [12]. Students, teaching staff and researchers need ubiquitous daily access to information resources which must satisfy the following characteristics: they must be free of charge, they must have peer reviewed content and be easily accessible, they must use common file formats readable on many electronic devices etc. As financial conditions at universities and in academic libraries around the world deteriorated, the open access initiative became more and more attractive to facilitate the access to scientific information resources used for research and teaching. Open access to scientific information resources such as scientific journal articles means they are freely available on the public internet, with permission to any users to read, download, copy, distribute, print, search, or link to the full texts of these articles, crawl them for indexing, pass them as data to software, or use them for any other lawful purpose, without financial, legal, or technical barriers other than those inseparable from gaining access to the internet itself [13]. In its document on open access and Horizon 2020 projects, European Commission points out that definitions of open access "(…) describe "access" in the context of open access as including not only basic elements such as the right to read, download and print, but also the right to copy, distribute, search, link, crawl, and mine" [14]. For Sawant [15] "The open access literature is digital, online, free of charge, and free of most copyright and licensing restrictions". For Björk [16] open access "means that a reader of a scientific publication can read it over the Internet, print it out and even further distribute it for non-commercial purposes without any payments or restrictions". All these definitions aim to describe open access as extensively as possible to make this initiative more acceptable to the scientific community and general public.

Open access is sometimes understood and defined very idealistically not taking into account many conceptual, financial, technical and legal factors which determine the degree of access and use in open access information resources. In real life, the understanding of open access depends on the level of openness governed by different access policies and licenses. Wiley [17] too pointed out that openness in open access is determined by licenses which state the degree of access or rights to use content that is considered open. In such situations users have little or no doubt what they can do with this information resource. Openness of digital information resources could be measured by the following rights a user of the content is granted [17]: 1. reuse – the right to reuse the content in its unaltered / verbatim form, 2. revise – the right to adapt, adjust, modify, or alter the content itself, 3. remix – the right to combine the original or revised content with other content to create something new, 4. redistribute – the right to make and share copies of the original content, your revisions, or your remixes with others.

In spite of sometimes different approaches to understandings of the open access initiative, the global academic community has accepted open access information resources as relevant for research and teaching. They participate in enlarging the quantity of open access information resources by self-archiving of already published scientific journal articles, conference papers, books, reports etc. in digital repositories. Today, more than 60% of journals already allow authors to self-archive content that has been peer-reviewed and accepted for publication [18]. Another way of participation is publishing of scientific works in open access journals or digital repositories thus starting new generations of journals committed to free and unrestricted access to scientific and professional information [19].

Definitions of open access indicate that the mainstream idea of open access focuses mostly on access to scientific information i.e. peer-reviewed scientific journal articles and scientific research data [20]. In addition to scientific content, a growing quantity of open access information resources include educational materials accessible with little or no restrictions which is very important for more stronger acceptance of open access in higher education.

Open access offers many opportunities and benefits to the general public, such as greater access to research outputs without the often prohibitive costs associated with the traditional publishing industry; no requirement for passwords or other forms of authentication; greater access to academic research funding for those researchers, academic and professional, who work outside academia; ensuring that those who actually provide the money for publicly-funded research (i.e. tax-payers) have access to the outputs they have funded" [21]. Researchers can benefit from open access in the following ways: their articles are freely accessible online; the authors hold copyright for their work and grant anyone the right to reproduce and disseminate the article, provided that it is correctly cited; a copy of the full text of each open access article is permanently archived in an digital repository separate from the journal; authors are assured that their work is disseminated to the widest possible audience, the widespread availability of articles will enhance literature searching; the results of publicly funded research will be accessible to all interested readers and not just those with access to a library with a subscription; a country's economy will not influence its scientists' ability to access articles [22].

While there are many benefits of open access, this initiative is not without challenges inherited from the still existing fee based system of scientific communication [23]. Quite frequently, open access publications are mimicking printed fee based scientific publications. Consequently, open access publications are suffering from similar problems as printed publications: costs related problem during the process of publication of journal articles (this problem is known as the article processing charge which is usually paid by authors themselves or their academic institutions); online articles can be as short or long, however, many articles are still limited in length (similar to printed journal articles); online journal issues are still limited in number of articles while they can contain as many or few articles as the editors wish etc. In spite of the problems, open access introduced many advantages over the existing system of scientific publishing and communication thus enabling easier access to scientific and educational material used for research and teaching [24].

Although there are still many challenges ahead of it, open access initiative has already gained significant popularity resulting in over 3900 open access digital repositories available to the internet users in academic institutions and outside of them [25].

IV. OPEN EDUCATIONAL RESOURCES

Realization of idea of open educational resources started to develop more rapidly a decade after open access initiative was born, somewhere after 2001 when MIT's started the OpenCourseWare initiative, which was followed by hundreds of universities worldwide collaborating in the advancement of open educational resources. Organizations like UNESCO, World Bank, OECD, the Commonwealth of Learning and the European Union also supported the development of open educational resources [26].

Most generally, educational materials that are available on the internet with little or no restrictions are usually referred to as open educational resources or OER. Open educational resources can be further defined as "(…) materials used to support education that may be freely accessed, reused, modified and shared by anyone" [27]. According to UNESCO, open educational resources are "(…) technology-enabled, open provision of educational resources, for consultation, use and adaptation by a community of users for non-commercial purposes. They are typically made freely available over the Web or the Internet. Their principal use is by teachers and educational institutions to support course development, but they can also be used directly by students in their daily academic activities. Open educational resources include learning objects such as lecture material, references and readings, simulations, experiments and demonstrations, as well as syllabi, curricula and teachers' guides" [28]. According to Van Acker, Frederik, Vermeulen, Kreijns, Lutgerink and van Buuren [3] open educational resources include "(…) full courses, course materials, modules, textbooks, videos, tests, software, and any other tools, materials or techniques used to support access to different kinds of knowledge. The complexity of the open educational resources may vary from very simple (e.g., a single video clip or a single illustration) to rather complex (e.g., comprising a series of lessons)". The main motive for sharing educational materials can be different for everyone included in this process. Van Acker, Frederik, Vermeulen, Kreijns, Lutgerink and van Buuren [3] suggested that altruism is a very reasonable factor for sharing open educational resources.

Open educational resources offer benefits and opportunities for teachers such as use of openly licensed materials, license educator's own open educational resources so others can use it, promotion of teachers' work to a global audience and benefits for students such as provision of supplemental learning materials for courses, making decision what classes to enroll in and be better prepared for classes [29]. Open educational resources provide a great opportunity for "(…) reducing the cost of expanding quality education" [30]. Most important benefit of open educational resources is access to educational materials with little or no obstacles very similarly to open access.

Like open science and open access, open educational resources are also facing a number of challenges. In their report "A Review of the Open Educational Resources (OER) Movement: Achievements, Challenges, and New Opportunities", Atkins, Brown and Hammond [30] presented a number of challenges that should be resolved in order for Open educational resources to remain available to users: sustainability (connected mostly to long term funding), curation and preservation of access (relying on proper infrastructure for curating and preserving access), object granularity and format diversity (the size of the digital objects that can be individually tagged, referenced, found, and re-used under appropriated attached terms and conditions – the possibility that even the smallest part of an digital object is identified and used), intellectual property issues (material that is intended for publishing on the internet must be checked for any content that could potentially break copyright laws), content quality assessment and enhancement (by providing open community review). Furthermore, open educational resources suffer from: missing components that require additional work, different degree of completeness of content, non existing appropriate academic peer review, missing learning objectives, problems with licensing, if open educational resources are not created or edited with developed with reuse in mind, there may be internal references that are meaningful within the original course context but make little sense in the new context, re-purposing of online material previously used or updated but without version numbering, learning material can contain old URLs or references etc. [26]. All these challenges can be overcome in time but only if there is general agreement about standards which would describe better what open educational resources should look like and how they could be used.

V. DIGITAL REPOSITORIES AND OPEN ACCESS

A digital repository in an academic institution is a set of services that a university offers to the members of its community for the management and dissemination of digital materials created by the institution and its

community members. It is most essentially an organizational commitment to the stewardship of these digital materials, including long-term preservation where appropriate, as well as organization and access or distribution [32]. Digital repositories offer a wide range of access opportunities such as remote access, 24-hour access, and multiple users for single sources, of course, all in open access.

Digital repositories have an important role in preservation and access to scientific and educational material, making other internet information resources less relevant for research and education [33], [34], [35], [36]. They serve universities to systematically organize the Web-based scientific and educational material produced by the faculty [16]. Digital repositories can contain e-prints of scientific papers, research data, but also e-learning materials and other forms of institutional intellectual outputs, which are generally not published or preserved elsewhere [37]. Digital repositories in higher education institutions could store: course information, teaching and learning materials, student admission data, student academic record, resource information that can be shared across departments, research output, research projects content, academic staff and expertise information, accreditation data etc. [38]. As a result, digital repositories are helping to manage and capture all or almost all intellectual assets in an academic institution making them more visible and available to users as part of information strategies of academic institutions [38]. In addition to content stored locally, digital repositories also provide link lists to freely available educational resources on the internet which are not stored in the digital repository of an academic institution [16] thus expanding access to scientific and educational materials.

Digital repositories represent most concrete opportunity for researchers and teachers to store and use different types of material but they are also meeting challenges similar to those of open science and open access initiative. Their development is facing an opposition in academic institution which can lead to situations where the quality of digital content stored in digital repositories may vary creating extraordinary problems for the digital repository if it wants to preserve these materials [39].

VI. CONCLUSION

In the era of economic crisis, access to scientific and educational resources without restrictions is particularly important. It is essential for almost all activities in academic institutions. Since the advent of the open access idea, it has gone through many changes including the transformation from somewhat idealistic notion of unlimited and fee free access to all information resources to more realistic approach which includes systematic care for creation, access and use of quality information resources for research and teaching. During the last two decades, many new digital forms of knowledge have appeared and publishers and academic institutions have started finding mutual language in agreeing upon most important factors that would enable academic institutions to publish and/or access articles, books and educational material without so many financial and legal restrictions and enable researchers and students to access and use wide range of content with as little limitations as possible. However, the ideas of open science and open access are still not universally accepted and there are many challenges in their development such as: international legal restrictions including digital rights management, diverse and sometimes murky business models of open access publishing and access to published materials, new formats of digital content that are still not accepted or there are problems in their use, problems of peer review for authors trying to publish their papers in open access, evaluation of quality of open access information resources is still undeveloped and questionable, article processing charge has become a major problem in open access publishing, inaccessibility of computer and other electronic devices for access to open access resources, inability to access the internet etc.

Open education resources are a special case. A sufficient amount of open educational resources should become available supported by a sufficiently large community to share digital learning materials for open educational resources to become successful [3]. As more students gain access to the internet, more open educational resources will be needed. Higher education institutions can contribute to the amount of digital educational resources by providing incentives for teachers to deposit their educational resources in digital repositories. They should also have written strategies and policies regarding preservation and use of education materials in digital format. Educational institutions could have and important influence on governments for wider introduction of digital educational resources in general and open educational resources in particular as well as introduction and implementation of digital technologies in education.

The emerging strategy of social network analysis: an overview of indicators, concepts and implications

Anita Papić*
* Faculty of humanities and social sciences/Department of information sciences, Osijek, Croatia
apapic@ffos.hr

Abstract - This paper describes an emerging strategy called social network analysis (SNA) and points out some of its possible implications. SNA is an interdisciplinary technique developed under many influences and the most important ones came from mathematics and computer science. Mathematical graph theory is used for modelling social networks and it is a starting point for many of the most fundamental ideas of SNA. The paper gives an overview of main concepts of SNA such as local centrality (degree), betweenness, global centrality (closeness), density and centralization. Also, the mathematical notation of the most important indicators of SNA are presented in the paper. The main research question was to determine the prevalence of SNA in scholarly publications in last decade across different scientific areas and different geographical areas. According to obtained empirical data the usage of SNA strategy in scholarly publications has ascending pathway.

I. INTRODUCTION

This paper gives theoretical insight into a strategy called social network analysis (SNA) and points out some of its possible implications. The origins of SNA dates from Moreno's sociograms and the sociometric star – person who held a position of great popularity and leadership [11]. A sociogram helps to visualize the channels through which information could flow from one person to another and through which one individual could influence another. SNA is an interdisciplinary technique developed under many influences and the most important ones coming from mathematics and computer science. In informetrics, information scientists study citation and co-citation networks, collaboration structures and other forms of social interaction networks and underlying any network lies a graph [7]. Mathematical graph theory is used for modelling social networks and it is a starting point for many of the most fundamental ideas of SNA so terms of simple graph, directed graph, weighted graph etc. are described. Decomposing networks into their constituent sub-groups leads to terms as cliques, clusters, or blocks namely to so called groups in front and groups in back [12]. A clique describes a particular configuration of informal interpersonal relations. The concept of point centrality originated in the sociometric concept of the star [13]. Furthermore, a family of point centrality measures consists of: local centrality (degree), betweenness and global centrality (closeness). The concepts of density and centralization refer to differing aspects of the overall compactness of a graph. Density describes the general level of cohesion in a graph and centralization describes the extent to which this cohesion is organized around particular focal points. Centralization and density are important complementary measures. Density plays a powerful role in the comparative study of social networks.

The great mathematician Leonhard Euler (1707-1783) considers as the person who grounded the graph theory because he solved till then unsolved problem of Konigsberg's bridges in year 1736 [3]. In honor to Euler the tour in which we pass through every edge once till we return to the starting point is called Euler's tour. Konigsberg was in 18 century town in Russia and through the town passed two little rivers of the river Pregel surrounding the island Kneiphof. At the river were seven bridges which connected four parts of the town separated by the river. The problem was is it possible to make a walk through the town starting at one part of the town, encompassing all seven bridges just once and ending in a starting point. Euler solved that problem in a way that he firstly made a model shown at the Fig. 1 which we today call a graph.

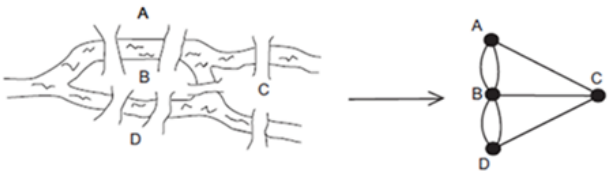

Fig. 1. Konigsberg's bridges [9]

Graph G is ordered triple G = (V(G), E(G), φ_G) consists of un empty set V=V(G), which elements are vertices of G, set E = E(G), which elements are edges of G and incidence function φ_G which every edge of G connects not ordered couple (not necessarily different) vertices of G [2]. The most used combinatorial structure is a graph. The simplicity of this structure enables that a lots of practical problems can be modeled in terms of graphs. The graphs are mathematical abstraction of different problems from real world and on them we can implement

all proven theoretical facts. Although, foundations of graph theory have their roots in 18 century this mathematical discipline as theory begins to develop in second half of 20 century. The actuality of graph theory can be seen in many of today's open problems. Namely, problems in graph theory can be very simple to formulate them but sometimes these problems are very difficult to be solved. The approach with graph theory is useful for modeling and explaining also the social phenomenon. Some applications of graphs are for example: (a) in different scientific areas and different disciplines especially in informatics and applied mathematics, (b) for representation of real network configurations for example road maps, electrical circuits etc., (c) for representation of abstract objects such as databases, project's activities etc., (d) for representation of social relationships and organization's hierarchies etc.

At the following figures it can be seen some classifications of graphs. Simple graphs don't consist loops not multiple edges. Some examples of simple graphs are shown at Fig. 2.

Fig. 2. Some examples of simple graphs [9]

Multigraphs allow multiple edges but do not allow loops. Some examples of multigraphs are shown at Fig. 3.

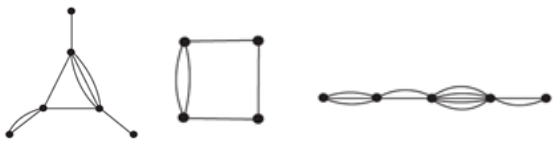

Fig. 3. Some examples of multigraphs [9]

Pseudographs are (multi)graphs which allow (multiple) loops. Some examples of pseudographs are shown at Fig. 4.

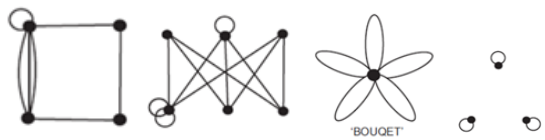

Fig. 4. Some examples of pseudographs [9]

Some examples of special graphs are shown at Fig. 5.

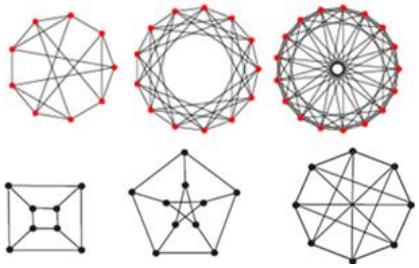

Fig. 5. Some examples of special graphs [9]

Digraph or directed graph is ordered triple (V(D), A(D), φ_D) which consists of un empty set V(D) of vertices, set A(D) of arcs (or directed edges) and incidence function φ_D which every arc *a* connects ordered couple (not necessary different) vertices *u*, *v* which *a* connects [2]. Vertex *u* is the starting vertex and vertex *v* is the ending vertex of *a*. Namely, digraph is the graph which edges have direction. Some examples of digraphs are shown at Fig. 6.

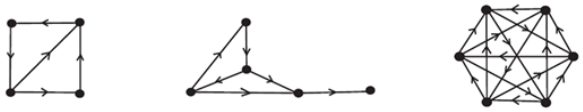

Fig. 6. Some examples of digraphs [8]

Weighted graph is graph in which every edge e is connected to not negative number *ω(e)*, which we call the weight of edge e. Directed and undirected graphs can be weighted. Un weighted graphs can be considered as weighted graph if all edges have the same weight for example 1. The main domain of weighted graphs implementation is in area of optimization. The shortest path between two vertices in weighted graph we consider the path with the lowest weight. The psychiatrist Jacob Moreno is considered the person who grounded the area of social networks because he published foundations of sociometrics which later becomes famous as social network analysis – SNA in his book *Who shall survive?* [11]. Social networks can be represented by graphs. The nodes represent social entities (actors): people, groups, organizations, countries etc. The edges represent relationships or connections between actors: communications, coauthorship, business or political relationships etc. In cases of directed connections we use directed graphs and in cases of measurable connections we use weighted graphs. Fig. 7 shows two same graphs: (a) un weighted and (b) weighted.

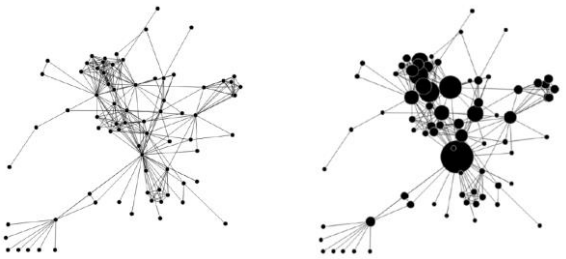

Fig. 7. Visualisation of actor's interactions in Victor Hugo's LES MISERABLES [4]

Information visualization is the area of graphical representation of information or infographics. Infographics uses computer supported tools for exploration of huge amounts of abstract data. Fig. 8 shows an example of infographics Greg Kolb's "New maps of influence – 10 visualisations of the social graph".

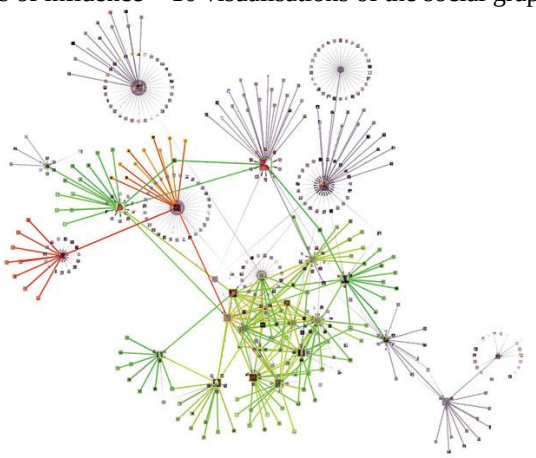

Fig. 8. Greg Kolb's "New maps of influence – 10 visualisations of the social graph" [5]

II. AN OVERVIEW OF MAIN CONCEPTS OF SNA

A. *Local centrality (degree)*

Local centrality or degree centrality is number of connections which this specific node posses namely the number of edges neighbour with that node. The formula for local centrality or degree centrality

$$d_i = \frac{\sum_j a_{ij}}{(n-1)}$$

where a_{ij} shows (not)existance of connection between node *i* and node *j* in a way that $a_{ij}=1$ if exists connection between node *i* and node *j*, while $a_{ij}=0$ if does not exist connection between node *i* and node *j*,where *n* is number of nodes [10].

B. *Betweenness*

Betweenness centrality is defined as number which shows how many times a node needs specific node to come to another node namely this is number of shortest paths which pass through certain node. Betweenness centrality measures the level till the node enables a flow in a graph. The formula of betweenness centrality is

$$b_i = \sum_{j,k \wedge i \neq j \neq k} \frac{g_{jik}}{g_{jk}} \Big/ \frac{(n-1)(n-2)}{2}$$

where g_{jk} is number of the shortest paths from node *j* to node *k*, g_{jik} is number of the shortest paths from node *j* to node *k* which pass through node *i*, where *n* is number of nodes [10].

C. *Global centrality (closeness)*

Global centrality or closeness centrality is equal to total distance in a graph, of this specific node from all other nodes. The formula of global centrality or closeness centrality

$$c_i = \frac{(n-1)}{\sum_j e_{ij}}$$

where e_{ij} is number of connections in the shortest path from node *i* to node *j*, where *n* is number of nodes [10].

D. *Density*

Density describes the general level of graph's cohesion. The formula of density is

$$\frac{l}{n(n-1)/2}$$

where *n* is number of nodes and where *l* is number of edges [10] .

E. *Other indicators*

- the clique is a subgraph in which every node is in connection to all other nodes of that subgraph;
- the claster is an area of greather cohesion in a graph;
- the diameter is the longest path in a graph;
- the radius is distance from the focus of graph till the most distant nodes of the graph's centar [10].

III. METHOD

For the purpose of conducting research in this paper scientific method of content analysis was selected. Content analysis is flexible research method and it can be qualitative or quantitative but also within it can be used combination of these two methods. Namely, in this paper was used quantitative content analysis of data obtained from Web of Science database according to searching strategy: "social network analysis" OR SNA.

Content analysis is research method which objectively and systematically describes written, verbal or visual communication [1]. Krippendorff describes content analysis as research method for derivation of repeatable and valid conclusions from text within its context [6]. Content analysis helps to determine presence of certain words, phrases or concepts within text or collections of texts. Texts can be from books, speeches, interviews, essays, historical documents, scientific articles, pictures, web pages, databases etc.

Content analysis can be implemented to any written or other form of human communication and that's why in recent decade it is often used in marketing, cultural studies, journalism, sociology, politics, psychology, cognitive science, economy, information sciences etc.

IV. INTERPRETATION OF RESULTS

The main research question was to determine the prevalence of SNA in scholarly publications in last decade across different scientific areas and different geographical areas. In this paper was used quantitative content analysis of data obtained from Web of Science database according to searching strategy: "social network analysis" OR SNA. Table 1 shows list of authors whose papers dealt with social network analysis such as Park H. W., Wang L., Latkin C. A. etc.

According to obtained empirical data the usage of SNA strategy in scholarly publications has ascending pathway.

V. CONCLUSION

SNA is an interdisciplinary technique developed under many influences and the most important ones coming from mathematics and computer science. Mathematical graph theory is used for modelling social networks and it is a starting point for many of the most fundamental ideas of SNA. The paper gives an overview of main concepts of SNA such as local centrality (degree), betweenness, global centrality (closeness), density and centralization. Also, the mathematical notation of the most important indicators of SNA are presented in the paper. The main research question was to determine the prevalence of SNA in scholarly publications in last decade across different scientific areas and different geographical areas. According to obtained empirical data the usage of SNA strategy in scholarly publications has ascending pathway. Also, the wider use of SNA as multidisciplinary approach is encouraged to uncover the power located in the networks that structure society.

Abstract - The 21st century has been marked by the media which have a significant influence on adult population. This paper analyzes the effects of the media on the youngest population in Croatia. The entire research is oriented empirically on the random sample of two age categories of children. The first age category includes children at the age of 4 to 7, and the other one children at the age of 8 to 11. A special analysis was performed on positive media influence with quantitative data on the statistical sample. Negative media effects were studied on the same sample as well. As the media influence children's personality formation, the research has shown it is necessary to control their use of the media in order to get proper education.

Key words: media, children, media influence, research on media influence

I. INTRODUCTION

This paper discusses relations between the media and children, as well as its role in their everyday life. Nowadays, every new generation of children grows up surrounded by new media, different from the media that influenced the previous generation, which leads to the conclusion that impact of the media on children is inconsistent, it changes with each generation. That implies the necessity for more frequent conducting research on the media influence on children.

The media are an endless source of information and play an important role in forming people's opinions, and children's opinions as well. The media are mainly mentioned in a negative context, and have been considered the cause of alienation in society since the sudden development of technology. Today we have smart phones, android operating system, iPhone, iPad, tablets and similar devices. People spend more time with their devices than socializing with other people. It is reflected in the family, and in this context, children are a part of the social-media era. The media is the dominant feature of the 21st century. This fact leads to some sort of alienation, creates isolation, and obliterates any form of conversation.

In this regard, special emphasis of this paper is in exploring and presenting behaviour of different age groups under the influence of the media. The tasks are:

(a) to determine which types of media children are most interested in,

(b) to describe the media content ,

(c) to define time spent with the preferred medium, and

(d) to perceive the difference between younger children's perception of the media and older children's perception of the same.

The media tend to form people's opinions, therefore it is important to comprehend the way it happens with children as they are more susceptible to negative influences than adults. They accept information from the media at conscious and subconscious level and such information definitely has influence in creating of their interactions and comprehension in future society.

For this research we used a survey, which is a quantitative form of research, and also one of the most popular methods. Quantitative research focuses on figures, thus being a kind of research on which statistical analysis is based. One of the basic characteristics of quantitative research is a set of identical questions for all respondents [2].

Besides, it should be kept in mind that the value of the survey is limited. The obtained information depend on the sincerity of the respondents and their ability to respond to questions.

We defined the goal, set the hypotheses, determined the sample size and compiled the questionnaire of 26 questions. The survey was conducted in writing and online, using polydaddy.com.

II. RESEARCH PROBLEM

The main problem of this research is to examine the role of the media in children's everyday life and state what type of media they use and prefer (newspapers, radio, television or the Internet).

As it was stated, media can influence opinion formation, and children are more susceptible to media influences than adults. They consciously or subconsciously absorb information from the media, and such influence will have an impact on their future personality and their future judgement.

Three hypotheses were set:

The first hypotesis (H1)

- Children use the media (newspapers, radio, television and the Internet) on a daily basis, but under control of their families, friends or other people; they read articles, literature, watch programs and shows and use the Internet in accordance with their age.

The second hypotesis (H2)

- Children use the media (newspapers, radio, television and the Internet) on a daily basis, often without the control of their families, friends or other people; they read articles, literature, watch programs and shows, and use the Internet in accordance with their age.

The third hypotesis (H3)

- Children use the media (newspapers, radio, television and the Internet) on a daily basis, without any control of their families, friends or other people; they read articles, literature, watch programs and shows, and use the Internet in a way which is inappropriate for their age.

III. RESEARCH INSTRUMENT - QUESTIONAIRRE

The instrument used in this research was a questionnaire consisting of 26 questions, arranged in five groups:

- General questions (age, gender, parents' employment and occupation, using of media)
- Questions about the print media
- Questions about the radio
- Questions about television
- Questions about the Internet

The questionnaire was designed using: multiple choice answers, dichotomous questions (Yes or No answers), and open format questions (without predetermined set of responses). There was a paper edition, as well as an on-line questionnaire.

Data are presented in tables and graphs using absolute and relative number of incidences, the arithmetic mean with standard deviation, and the range of values. Difference analysis between the observed groups was performed by the chi-square test with the Yates's correction for small samples, and Fisher's exact test. As the level of statistical significance of differences, we used 95% of confidence interval or the value of the tests with $p<0.05$.

The analysis was performed using the statistical package for sociological research – IBM SPSS Statistics v 21.0 (Chicago, Illinois, the USA).

IV. RESEARCH PROCEDURE

Respondents were informed about the anonymous character of the survey. The questions were explained to younger respondents, and the questionairre with that group was conducted by asking each of them individual questions and sub-questions. Children used their own flow of speech. Their answers were recorded and interpreted.

The downsides of the survey were: low response rates to the online survey, answering survey questions by parents who were persistently trying to make an impression with erudite responses unlike responses of a child, and children's incomprehension of the term "print medium". Respondents did not consider that reading comics is reading the media, but in subsequent responses they answered what they read and use, and what they are interested in. This information is considered in further analysis of results.

The positive side was the fact that online respondents were not part of a group or an assembly that would give the same answers to questions as it would occur in an educational group, or class at school, where all the children know each other, socialize, have the same interests and fancy same things.

V. RESEARCH RESULTS

The research results started with answers to general questions. It was necessary to determine social characteristics: children's age, gender, parents' employment and parents' occupation. The following results are divided by type of media, starting with the print media, followed by the radio, television and the Internet. Each medium has 5 compulsory questions. Each question is shown individually as follows, in the same order as in the survey.

Question: How old are you?

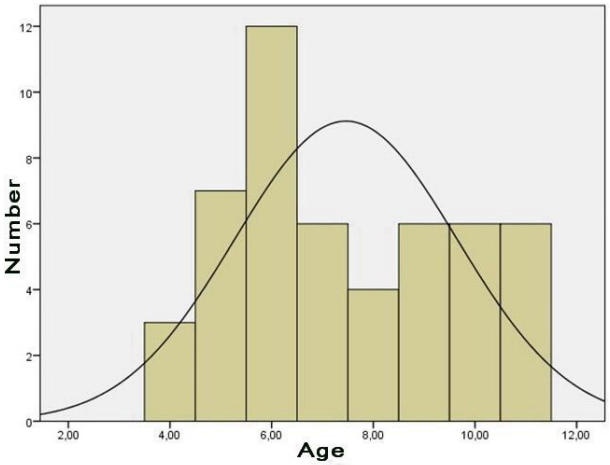

Figure 1. Age of respondents chart

The sample included 50 children aged 4 to 11, with a mean age of 7.5 ± 2.2. The respondents were divided into two groups on the basis of their age, in order to prove the hypothesis: children who can not read or who have just learned to read, aged 4 to 7 (28 or 56.0% of the total sample), and children who have already mastered reading and writing, aged 8 to 11 (22 or 44.0% of the total sample).

This research explores which media are used by children, which content they prefer in these media, how

much time they spend with the media, and what are the circumstances when they do it regarding their age, meaning if they are alone or accompanied by friends or under the supervision of parents. Media included in this research are print media, radio, television and the Internet.

Fifty respondents participated in the research "Children's Interest in the Media", including 56% male and 44% female children. Subjects were divided into two groups (aged 4-7 and 8-11) depending on their ability to read and write. For the purposes of this research, social characteristics were also determined. The results have shown that children live in families with both parents employed and mostly highly educated.

VI. TELEVISION AND THE INTERNET

Of all media included in this research, most commonly used were television and the internet (100.0%). The research explores what programmes and shows respondents prefer, who decides about the content, who they watch television with, and how much time they spend watching it. Children generally watch children's programmes, series, sports and music programme on television, while computer is mainly used for games. Older children show increased interest in YouTube and social networks. They use both media on a daily basis. The analysis results show that television is still more prevalent (around 10%), thus confirming its dominance. Regarding control of using or forbidding to use television or internet, the data show that parents influence in a large percentage on selection of television programmes in both groups. There is a significant difference between age groups, namely, older subjects watch television mostly alone (59.1%) and use the Internet alone (40.9%). They choose the contents on the Internet mostly themselves (90.0%).

Question: I usually watch TV

TABLE I. THE WAY OF WATCHING TELEVISION

Age		4-7 years	8-11 years	Total
With parents	N	23	5	28
	%	82,1	22,7	56,0
Alone	N	3	13	16
	%	10,7	59,1	32,0
With friends/peers	N	2	4	6
	%	7,1	18,2	12,0
Total	N	28	22	50
	%	56,0	44,0	100,0

$\chi 2=12,542$; $p=0,024$

Table I shows important questions: who respondents watch television with, whether they do it alone, in company of their parents, or perhaps with peers or friends. As it can be seen from Table I, there is statistically significant difference of younger respondents watching television mostly in the company of their parents (82.1%) whereas older respondents watch it alone (59.1%). Older children are expected to watch television alone.

Question: I usually use the Internet

TABLE II. THE WAY OF USING THE INTERNET

Age		4-7 years	8-11 years	Total
With parents	N	20	8	28
	%	71,4	36,4	56,0
Alone	N	7	9	16
	%	25,0	40,9	32,0
With friends/peers	N	1	5	6
	%	3,6	22,7	12,0
Total	N	28	22	50
	%	56,0	44,0	100,0

$\chi 2=25,421$; $p=0,001$

Table II shows the way respondents use the Internet, alone or under some form of supervision (parents) or with company (friends, peers). With a statistically significant difference, younger respondents use the Internet more in the company of their parents (71.4%), while older use it more independently (40.9%) or in the company of friends and peers (22.7%). It can be concluded that there is a substantial exposure to this medium and that parents believe that children should learn to use computers as early as possible. It can be assumed that a computer is an ordinary part of the household, just like a television set.

The first hypothesis, which suggests that children use the media every day, but under supervision of family, friends or other people, and that they read articles and literature, watch programmes and shows, and use the Internet in accordance with their age, has not been confirmed for both groups regarding television and the Internet, as these results indicate. The second hypothesis, which suggests that children use the media on a daily basis without supervision of family, friends or other people, and that they read articles and literature, watch programmes and shows and use the Internet in accordance with their age has not been confirmed for the younger age group, because they are still under supervision of adults who influence their choice. In the older group hypothesis was partially confirmed as subjects use television on a daily basis and mostly by themselves, although the

selection of programmes is not entirely theirs. As for the Internet, the hypothesis is also partly confirmed because the respondents choose themselves what to search / visit on the Internet on a daily basis (90%), and they mostly use it alone, unlike the younger group of respondents. The third hypothesis, which suggests that children use the media on a daily basis without guidance from family, friends or other people, and their reading articles and literature, watching programmes and shows, and using the Internet is not in accordance with their age, has not been confirmed for television and the Internet in the younger age group. Respondents are still subjected to adult supervision, although they use media on a daily basis and watch programmes that are not tailored to their needs. The hypothesis is confirmed for the older group, though.

VII. PRINT MEDIA

Concerning print media and radio the results were a bit different. In the younger group print media are read by 85.5%, while in the older age group 100.0% of respondents read them. The younger age group mainly read the media which suit their age, while older respondents read newspapers as well. Also the younger age group stated they prefer sports and informative content, while the older group showed increased interest in sports. In younger age group parents influence the selection of the content, while the older age respondents select the content mainly themselves and lend from the library as well.

Table III shows the type of print media that respondents most commonly used. As expected, there was statistically significant difference between age groups regarding the print media they read ($p < 0.01$), and we observe that most children read media in accordance with their age, although there are a few who read inappropriate contents. Certain number of respondents in older group (22.7%) read Slobodna Dalmacija (which can be assumed as their parents' influence), while the younger age group read the print media intended for their age with the exception of comics (8.3%).

Older age group read print media every day (54.5%) or more than twice a week (27.3%), while in the younger age group 25% read on a daily basis and 25% read more than twice a week. It may be observed that the first hypothesis is confirmative for the younger age group, taking into account their age. They read media designed for their age, their parents help them choose the type and content, and most of them read print media on a daily basis or more than twice a week. Therefore, the other two hypotheses are unconfirmed for this age group. As for the older age group, the first hypothesis is unconfirmed because children choose themselves what they want to read. Although parents are those who buy the print media, there is no such a parental control as with younger age group. Moreover, respondents of this group are interested in reading newspapers and magazines that are not appropriate to their age and and they use print media on a daily basis (54.5%). Although there are a few of them who are interested in inappropriate print media (assuming these are older participants in the group), most of them read books (probably for book reports, considering they are grades 1-5 of primary school), which confirms the second hypothesis. If there had been more inappropriate content for their age, then the third hypothesis would have been confirmed for the print media.

Question: What print media do you read?

TABLE III. PRINT MEDIA THAT SUBJECTS READ

VIII. RADIO

We wanted to learn whether the respondents listen to the radio, which radio shows they listen to, who helps

them selecting radio shows, whether they listen to the radio alone and how much time they spend listening to it.

Question: I usually listen to the radio

TABLE IV. THE WAY OF LISTENING TO THE RADIO

Age		4-7 years	8-11 years	Total
With parents	N	16	5	21
	%	94,1	27,8	60,0
Alone	N	1	9	10
	%	5,9	50,0	28,6
With friends/peers	N	0	4	4
	%	0,0	22,2	11,4
Total	N	17	18	35
	%	60,7	81,8	100,0

$\chi 2=18,2574$; $p=0,001$

Table IV shows whether respondents listen to the radio alone or accompanied by their parents, friends or someone else. Similar to using print media, young children mostly listen to the radio in the company of their parents (94.1%), whereas older children tend to listen to the radio alone (50%), with statistically significant difference between the observed age groups. One can assume that the radio is mostly listened to as a secondary activity while something else is being done, which means that music is preferable content.

Related to the younger age group, 60% of respondents listen to the radio, out of who 94% listen to the radio in the company of their parents, the content being mostly music. 58% of respondents listen to the radio on a daily basis and their parents choose what to listen (70%). In older age group, 81% of respondents listen to the radio, most of the time alone (50%), the content being music and sports, but also cultural and news programmes. 44% of them choose for themselves what to listen and 50% of respondents listen to the radio on a daily basis. The above shows that the first hypothesis is confirmed for the younger age group for everything assumed in the hypothesis: children use the media every day, but under supervision of family, friends or other people, they also consume the contents in accordance with their age. In older age group, the first hypothesis was not confirmed because there was a significant difference between their responses and those of younger age group. The facts that they mostly listen to the radio alone, choose for themselves what to listen, and listen to the radio on a daily basis, confirmed the second hypothesis that children use the media on a daily basis but without supervision of a family, friends or other people, and consume the contents in accordance with their age. The contents they referred to were mostly music and some cultural and news programmes, but not enough to confirm the third hypothesis which suggests that children use the media every day, but without control of a family, friends or other people, and read articles or literature, watch programmes and shows and use the Internet content which is not in accordance with their age.

The observed differences between these two age groups were in the control of their use of media, the time spent using the media, and their preferences concerning content. The results have revealed that as children get older, parents have less influence on their children's use of the media. In the younger group parents still have a certain influence, which changes as their children start school where environment takes over and begins its influence.

IX. CONLUSION

It can be concluded that sociological characteristics did not play an important role in this research, although family environment and family relationships should be explored more meticulously in order to reveal a significant impact of the media and media relations. This is a consequence of the lack of research on parents' education and their role as educators. The research did not confirm the incorrect assumption of highly negative impact of the media. It was concluded that much younger children start using the media, especially the Internet, which was unexpected at that early age. The scope of effects the media will have on children, depends primarily on their usage. Children should be adequately educated and guided for using the media, and this is primarily responsibility of parents, then schools which still show inadequate concern about the media, and finally the rest of society, especially those who create media products.

Modeling and analysis of the polyhedral pyramid structures by method of modified traveling salesman problem (TSP)

Abstract

In this paper we discuss the features and benefits of usage the concepts of polyhedral pyramidal structure in design and analysis of flexible and adaptive organizational structures. Pyramidal polyhedra are considered as a network consisting of nodes and flows where nodes correspond to points of polyhedra, and edges correspond to flows. In this concept flows include all possible links between the points of polyhedra. Polyhedral pyramid structure is considered from the perspective of the possibilities for flexible and adaptive connecting between nodes with the possibilities of achieving more combinations that generate optimum solutions, related to optimal organizational structure. In considering of dynamic potential of pyramidal polyhedral structure uses a modified method of traveling salesman problem (TSP).

1. Introduction

This paper analyzes advantages and possibilities of use of the concepts of polyhedral pyramid in designing and analyzing flexible and adaptive organizational structures.

A regular polyhedron is an angular geometric shape whose all sides (surfaces) are made up of congruent regular polygons. A regular polygon is a planar figure with all sides (edges) and all angles congruent.

In this paper, we discuss the pyramidal polyhedron as a network that consists of nodes and flows, wherein the nodes correspond to the points in polyhedron and the polyhedron edges correspond to the flows. The flows indicate all the possible links between the polyhedron points. This means that the analysis of polyhedral structures covers both the edges that represent external links and internal links such as diagonals of the base and height of a polyhedron.

In this way, with the above mentioned attributes of regular polyhedra describing static features (points, nodes), we create the conditions for addition of a new attribute that is related to the flows (distances) between the points (nodes) of the polyhedra and indicates a dynamic aspect of their structures.

In considering flows as dynamic features of polyhedral pyramid structures we use a modified method of traveling salesman problem. From the viewpoint of combinatorial optimization, Travelling Salesman Problem (TSP) can be formulated as a given set of **n** cities (nodes, polyhedron points) C and pairwise distances $\mathbf{d_{ij}}$ between the nodes to be the tours from city **i** to city **j**. TSP is to find the best possible way of visiting all the cities exactly once, starting from a given city, determining a route whose total length is minimal. When applied to polyhedral pyramid structures, optimal solution is the minimum sum of all the lengths (distances) between the points.

In practice, Travelling Salesman Problem is focused on a single optimal solution and refers mainly to models with a large number of nodes and flows. In this paper, the models of polyhedral pyramid structure are restricted to a limited number of nodes, where the focus is not on a single optimal solution, but the ability to achieve a larger number of optimal solutions (combinations).

Based on the above, a research hypothesis can be formulated: "The number of optimal solutions and the share of optimal solutions in the total number of permutations (all possible combinations of solutions) in the calculation of flows between the network nodes is an important indicator of flexibility and adaptability of the organizational structure of a certain type of pyramidal polyhedron."

Flexibility and adaptability of transportation networks can be achieved by optimizing routes for the movement of vehicles between a starting point and a certain number of destinations. The most important operational decision related to transportation in a supply chain is the routing and scheduling of delivers. An analogy can be made between transportation network and polyhedral structure which implies that the number of optimal solutions may be considered a factor of flexibility and adaptability of polyhedral structures.

In this context, we have identifed two indicators of flexibility and adaptability of polyhedral structures from the viewpoint of the traveling salesman problem: 1) NO - Number of optimal solutions (NO) and 2) Flexibility Coefficient of Polyhedral Structure (FCPS), which is calculated as the ratio of the number of optimal solutions (NO) and the total number of possible values calculated (NT).

Methodological frame of use of Visual Basic as a development tool in the visual modelling of exhaustive search algorithm in VBA for Excel can serve as an incentive in creating new highly sophisticated algorithms, which will enable us to compute multiple optimal solutions [6].

2. Travelling Salesman Problem (TSP)

Travelling Salesman Problem (TSP) can be formulated in the following way: TSP, is to find the best possible route based on given criteria, where minimum distance between cities or minimum travelling cost are the most commonly used optimization criteria. TSP, is to visit all the cities and return to the starting point under the condition of visiting each city only once. The travelling salesman problem (TSP) is one of the most studied problems in management science. Optimal approaches to solving travelling salesman problems are based on mathematical programming. But in reality, most TSP problems are not solved optimally. When the problem is so large that an optimal solution is impossible to obtain, or when approximate solutions are good enough, heuristics are applied. Two commonly used heuristics for the travelling salesman problem are the nearest neighbour procedure and the Clark and Wright savings heuristic [3].

In terms of combinatorial optimization, the Travelling Salesman Problem (TSP) can be formulated in the following way: Given a list of ***n*** cities C and distance $\mathbf{d_{ij}}$ from city ***i*** to city ***j***; TSP, is to find the best possible way of visiting all the cities by visiting each city only once finding minimum total travel distance. In analogy to the above definition, the following formulations are valid: 1) Travel distance or distance between cities is symmetric: (1) $d_{ij} = d_{ji}$; 2) Final list of cities is defined as incoming variable by the formula C = (c_1 … c_n), while distance matrix containing distance between city c_i and city c_j for each pair i,j is defined by $d(c_i,c_j)$. In view of the fact that distance matrix is symmetric, the following equation is valid: $c_{ij} = c_{ji}$; 3) Permutations or in other words all permuted relations that can be achieved for a given number of cities are computed as resulting variables. Permutations p(1), …, p(n) in the list 1, …, n are calculated and compared to give the minimum sum [1], [4].

It follows from the above, that the following equation can represent the travelling salesman problem [1]:

$$\sum_{1 \le i \le n-1} d(c_{\pi(i)}, c_{\pi(i+1)}) + d(c_{\pi(n)}, c_{\pi(1)})$$

Above equation is the sum of length of routes that begin in city $c_{p(i),\ i=1}$ visiting each city in defined pattern ($c_{p(i),}$ $c_{p(i+1)}$) and returning to the starting point $c_{p(1)}$. This algorithm gives travel distance for all possible routes and finds the shortest route. In addition, the number of possible routes is the factorial of *n* cities, or number of permutations of *n* elements.

3. Square Pyramid Model in Generating Multiple Optimal Solutions

Model of a square pyramid base allow us to demonstrate and analyze possibilities of generating a large number of optimal solutions that have equal or similar values [7]. The base of a square pyramid is a square having equal sides and equal angles. The base of a square pyramid is also made of diagonals that intersect at right-angles. The intersection of diagonals is the central node of the base that is equally distant from all other nodes. Square Pyramid Model is described in the Figure 4. The nodes and arcs have been marked up according to the Figure 1. Table 1 describes an example of use of the square pyramid model in resolving and analyzing the travelling salesman problem.

Figure 1 is an example of use of the square pyramid model in resolving and analyzing the travelling salesman problem. Table 2 shows input data and the solution obtained in VBA for Excel [5]. The cell range K1:O5 contains transportation route lengths (arcs) that correspond to the dimensions indicated in the pyramid diagram in the Figure 4. The cell range J1:J24 offers all possible solutions, which have been categorized from the lowest to the highest. The Table 2shows that there are 8 optimal solutions which result in equal minimum values of the total transportation route (22). Considering the matrix from the cell range K1:O5 is symmetric, it follows that the model has generated 4 optimal solutions. Figure 2 is a graphical display of optimal solutions for the square pyramid model [7].

Square Pyramid Model in Generating Multiple Optimal Solutions is presented in the form of a video animation [8] that has been placed on the website **www.infosustav.com/video/squarepyramid.mp4**

4. Analysis of the polyhedral structure by usage the method Traveling Salesman Problem (TSP) in the case of pyramidal octahedron

An n-gonal bipyramid or dipyramid is a polyhedron formed by joining an n-gonal pyramid and its mirror image base-to-base. The referenced n-gon in the name of the bipyramids is not an external face but an internal one, existing on the primary symmetry plane which connects the two pyramid halves. The face-transitive bipyramids are the dual polyhedra of the uniform prisms. A bipyramid can be projected on a sphere or globe as n equally spaced lines of longitude going from pole to pole, and bisected by a line around the equator. Bipyramid faces, projected as spherical triangles, represent the fundamental domains in the dihedral symmetry. The tetragonal bipyramid with identical edges, or regular octahedron, counts among

the Platonic solids. The regular octahedron is a special case of tetragonal bipyramuid [2].

A comparison of the two constructions of pyramidal octahedron is shown in Figure 3 and Figure 4. The first construction was shown in Figure 3 and second construction of pyramidal octahedron was shown in Figure 4.

The Figure 3 depicts a regular octahedron with all edges equal. As can be seen, there are 12 equal edges: AB, AD, BC, CD, AE, BE, CE, DE, AF, BF, CF and DF. On the right side of Table 2 are distances between the points, based on which it can be concluded that all the edges are equal. On the left side of Table 2 are calculations of the total relation length (route) between all of the points of the regular octahedron made by method of traveling salesman problem.

The table 2. shows that the calculated total number of all the possible permutations of points is 720, and the total number of optimal solutions is 16. The flexibility coefficient of polyhedral structure (FCPS) of a regular octahedron is calculated as the ratio of the number of equal values of the optimal solutions (NO) and the total number of all possible solutions (NT). In our case, the generic equation FCPS = NO/NT for regular octahedron is 16/720. FCPS = 16/720 = 2.22%

Figure 4 depicts a polyhedral structure of a modified regular octahedron. The specificity of the modified octahedron as shown in the figure is that the lengths of the base edges differ from the values (lengths) of the lateral edges, and the values of the base diagonals of the base are equal to the values of the lateral edges.

On the right side of Table 3 are distances between the points based on which it can be concluded that the values (length) of the lateral edges of AE, BE, CE, DE, AF, BF, CF and DF are equal to the values of the diagonals of the base of AD and BC. On the left side of Table 3 are calculations of the total relation length (total route) between all of the points of the octahedron made by method of traveling salesman problem (TSP).

The table indicates that the total number of all the possible permutations of points is 720, and the calculated number of optimal solutions is 96. The flexibility coefficient of polyhedral structure (FCPS) of a regular octahedron can be calculated as the ratio of the number of equal values of the optimal solutions (NO) and the total number of all possible solutions (NT). In our case, the generic equation FCPS = NO/NT for regular octahedron is 96/720. FCPS = 96/720 = 13.33%

5. Conclusion

Using the method of traveling salesman problem (TSP) based on the exhaustive search algorithm, and a graphical modeling in spreadsheet interface, we have analyzed flexibility and adaptability of tetragonal bipyramid (pyramidal octahedron) structures. Flexibility and adaptability were analyzed through the comparison of the flexibility coefficients of the two tetragonal bipyramid models constructed.

The first structure represents a regular octahedron with the lateral edges equal to the base edges. The second structure is an octahedron with the lateral edges equal to the diagonals of the base, but different from the base edges. A comparative analysis of the results reveals that the flexibility coefficient of the second model constructed (13.3%) is six times greater than the flexibility coefficient of the first model constructed (2.2%).

The reason for such a large difference in favor of the second model constructed may be relationship between internal and external links. In the first model, all external links (edges) are equal, but there is no equivalence between external and internal links (flows). This means that there is equivalence between external dimensions (links), but there is no equivalence between external and internal links. In the second model, we observe equivalence between external and internal links, which means that structure flexibility applies not only to the outer part (surface area), but the entire area (volume) of the pyramidal octahedron.

Geometric programming in designing of mental models on the example of strategic thinking between synergies competition and cooperation

Abstract

In this paper we consider the mental models in context of encouraging innovative and creative development and shift in strategic thinking. Mental models encourage multiperspectival approach to the process of representing imagination in strategic thinkng. Visual designing of mental models can show how a new way of thinking may works in different contexts and situations. Geometric programming is considered in the function of mental models designing. The model of lemniscate is used in visualization and modeling of synergies between competition and cooperation in business in the context of strategic thinking.

1. Introduction

Mental models can serve as a useful tool to develop, integrate and achieve synergies among constructive and innovative concepts and ideas while fostering creativity, innovation and freedom of expression. Using mental models can be achieved a number of positive effects, such as [3]:

- Storing information systematically and comprehensively in long-term memory, not cram the information;
- Organizing client information;
- Finding inspiring and effective solutions to each business problem;
- Preparing meetings and organizing business activities;
- Delivering concise, clear and interesting presentations;
- Developing a business plan;
- Organizing conferences and business meetings;
- Improving workspace;
- Optimizing and improving their business.

The Introduction is the first part of this paper. In the second part of this paper, titled 'Mental models and programming', we define and describe mental models and discuss the features and advantages of programming within the context of abstract thinking and shaping mental models. In the third part of this paper, titled 'Competition and cooperation", the concepts of competition and cooperation are analyzed by comparative and complementary methods, and the concept of coopetitive model is considered in the context of linking and achieving synergy between competition and cooperation. In the fourth part, titled 'Designing a mental model of synergy between competition and cooperation', we define elements of a mental model and describe a geometric model for linking and acheiving synergy between competition and cooperation, we define and analyze how flows of elements of mental models are linked, and describe a complete mental model process for achievement of synergy between competition and cooperation. The Conclusion is a brief summary of the paper's major points.

2. Mental models and programming

A context for learning programming in mental model development will facilitate improvement of personal metacognitive skills and development of abstract thinking also in areas outside programming.

In the development of programming skills is very important to recognize mental models of basic programming concepts held by his/her students. Learning programming involves construction of viable mental models of basic programming concepts. To improve mental models it is suggested such an approach to teaching programming that emphasizes constructivism, not objectivism. The assumption is that many of students, before enrolling in introductory computer programming courses have already deeply rooted ideas about some computer concepts such as assigning command. Constructivism claims that traditional teaching approach which is based on teaching lessons and textbooks is too passive and is not doing enough to challenge pre-defined ideas and assist students in the development of viable mental models [1]. Constructivism advocates active construction of

students' knowledge by combining experience with existing cognitive structures.

Teaching strategy that specifically challenges existing ideas is Festinger's cognitive conflict strategy. This strategy may encourage developers of mental models to use programming in their understanding thus promoting improvement of non-viable models. The cognitive conflict strategy is one of the key teaching strategies based on constructivism, and developed on the assumption that the prior knowledge and current beliefs might affect the way students acquire new knowledge and construct new cognitive structures. Cognitive conflict is a state in which the developer perceives a gap between his/her cognitive structure and external conditions, or between parts of his/her cognitive structure. A learning model that integrates cognitive conflict strategy with visualizing algorithms proved to be effective for improving the interest and involvement in constructing viable mental models [1] .

Constructivism claims that traditional teaching approach which is based on teaching lessons and textbooks is too passive and is not doing enough to challenge pre-defined ideas and assist students in the development of viable mental models. On the other hand, constructivism argues that developer actively construct their knowledge combining experimental work with existing cognitive structures [1].

The key teaching strategy is based on constructive perspective of cognitive conflict, which clearly challenges existing ideas to encourage mental model developers to recognize errors in their understanding and push them to improve their non-viable models. Cognitive conflict by itself may not be sufficient to achieve changes in non-viable models. The developer of mental model must be supported in the process of creating viable models; the concepts should be delivered in a manner and style to allow for true constructivism of dependent models.

3. Coopetitive model

Linguistically speaking *coopetition* is neologism coined to describe cooperative competition, which are two well known and often used words in economic terminology: *cooperation* and *competiton*. The development of information systems contributed to the emergence of a new paradigm in which information, networking and time are key factors that influence running a business. Information is richer in quality and quantity which encourages collaboration between market participants. The world-wide connectivity between individual networks via Internet, Intranet or Extranet eases barriers to trade for new competitors attempting to enter the market and is fostering global hyper competition. The ability to quickly access market data reduces the asymmetry of information between the active and potential (new) market match participants in which process the ability to sense and respond quickly to market changes emerges as a necessity. As a result, companies are facing a high level of competition in the market where new rivals appear overnight in unexpected places or, until recently, stable markets. This change in business dynamics promotes collaborative value creation in the coopetition model which is more necessary than ever [2].

In a model of balancing and sinergy between competition and cooperation, a business system is discussed by considering how each one integrates into the overall relevant environment which includes potential and active business partners. It is important to analyze business environment as a network in which the company functions in which process a good starting position for business is being sought. The strategic use of information systems extends the concept of customer orientation in such a way that the company is simultaneously working with customers and suppliers on the principle of interaction and joint creativity. In this process the totality of business networks and relationships that include relationships with suppliers and third-party service providers is considered.

In contemporary business paradigms, business entities are only part of the ecosystem in which they must develop if they want to survive, because the economy also consists of unpredictable organisms in constantly changing environment. In such an environment business organizations should have a range of different relationship types in their portfolio that can change at different time points from competition, through coexistence to cooperation, or simultaneous existence of both - competition and cooperation.

Coopetitive approach, therefore, is based on the belief that the organization can be successful through synergy between cooperation and competition with the others at the same time. It is important that the company recognizes that customers, suppliers, distributors, competitors and other organizations are equal associates and partners in the process of value creation. Establishing and maintaining relationships with customers and partners is a philosophy or strategy that is vitally important for competitive progress and economic development.

4. Object oriented program Visual Basic for Application (VBA) in geometric programming and designing mental model of synergy between competition and cooperation

In geometric programming and designing mental model of synergy between competition and cooperation program was used object oriented program Visual Basic for Application (VBA) in Excel spreadsheet interface.

Object oriented programming for graphical modeling encourages integration and interaction of computer programming and graphical modeling knowledge, where psychomotor skills needed in traditional hand drawing and modeling are replaced with programming skills. Visual Basic for Excel as an object-oriented visual programming language used for integrated graphical modeling and programming [5]

enabling us to better understand and visualize the process of geometric modeling. The usage of programming language VBA in geometric programming and designing mental model of synergy betweeen competition and cooperation can be presented on the example of creating lemniscate. Program for drawing a lemniscate by using VBA in spreadsheet interface is shown in Figure 1. In the right part of figure 1 are shown the coordinates of lemniscate.

The entire process of the designing and development of mental models using VBA program and geometric programming is presented in the form of a video animation [6] that has been placed on the website

www.infosustav.com/video/mentalmodel1.mp4

According to video animation can be presented methodological framework of designing a mental model of synergy between competition and cooperation, which is described in the next section.

4. Designing the mental model of synergy between competition and cooperation

In designing the mental model of synergy between competition and cooperation has been proposed a methodological framework:

1. Defining the elements of a mental model
2. Designing a geometric model for linking and acheiving synergy between competition and cooperation,
3. Defining and analyzing how flows of elements of mental models are linked,
4. Analyzing and interpretation a complete mental model process for achievement of synergy between competition and cooperation

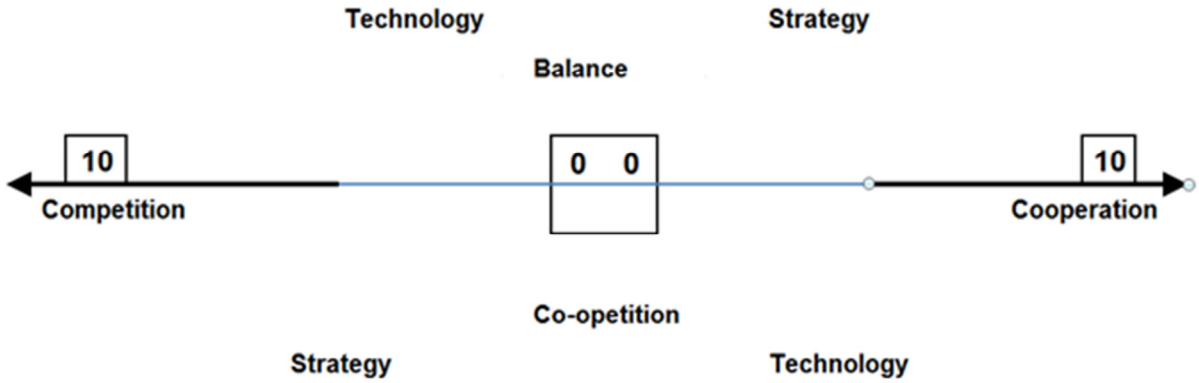
4.1. Elements of a mental model of synergy between competition and cooperation

The first step proposes basic elements of a mental model of synergy between competition and cooperation: strategy, technology, competition, cooperation, balance, coopetition and rating scale. The elements have been positioned virtually using a rating scale. At the center of the rating scale 0 represents centre of gravity that virtually maintains the balance

10 to 10. The model also shows the range of a competition rating scale of -10 to 0, and the range of a cooperation rating scale of 0 to 10. The range of the

and cooperation in a business system.

Figure 1. Elements of mental model



Source: Authors

The model reveals mutually conflicting features of contrariety and complementarity between competition and cooperation. Coopetition indicates that there exists a synergistic interaction between competition and cooperation. A strategy shapes concepts and methods of implementation, development, use and maintenance of competition and cooperation. The elements of mental models will be briefly described below.

Business **strategy** includes objectives with respect to products, services and markets for a certain strategic business unit, and points to the future activities of the company in specific sectors.Functional strategies focus on maximizing resource efficiency and integrating functional activities to facilitate the implemenation of corporate and business strategies.After selecting a strategy on how a company endeavors to accomplish set goals, the company can proceed to the next stage of preparing procedures, programs, projects and tactical plans required to implement the strategy.

Technology can be defined as the totality of knowledge, methods, techniques and tools used in the manufacturing process, a means to transform inputs into outputs and knowledge on how to do something. Technology may have a positive influence on competitive advantage, if it has a significant role in determining the relative cost position or during differentiation. Since technology is included in each value added activity and is involved in the process of

between competition and cooperation. A score of -10 on the left side of the rating scale in the model indicates the maximum orientation towards competition, while a score of 10 on the right side of the rating scale indicates the maximum orientation towards cooperation. According to the model presented in Figure 1, and the foregoing, it can be seen that the range of the rating scale of synergies between competition and cooperation has been estimated from -

rating scale also marks a value domain. The Figure 1 depicts a mental model of synergy between competition

integrating such activities, it may have a powerful effect on cost and differentiation. Technology may have a positive influence on cost or differentiation if it has an influence on cost drivers or value added activity drivers. Technology used in value added activity is often the result of other drivers, such as volume, timing, or interrelationship.

Competition can be defined as a capability for creating differential advantage that competition was not able to copy, and described as a set of unique features of a company and its products perceived as significant and superior to competitive ones in the target market.

Cooperation as a foundation of interorganizational relationships in markets, may be defined as a coordinated joint action of two or more companies or their specific functions aimed at improving business relationships, and solving identical or similar tasks and common issues, while its goal is to improve company's position in the market, or any market segment. Economically speaking, cooperation is defined as joint work of independent companies by their free will with the intention of, with only partial abandonment of discretion, achieving a higher level of accomplishment of common goals, but in the case of independent actions.

Coopetition is based on the balance and synergy between cooperation and competition

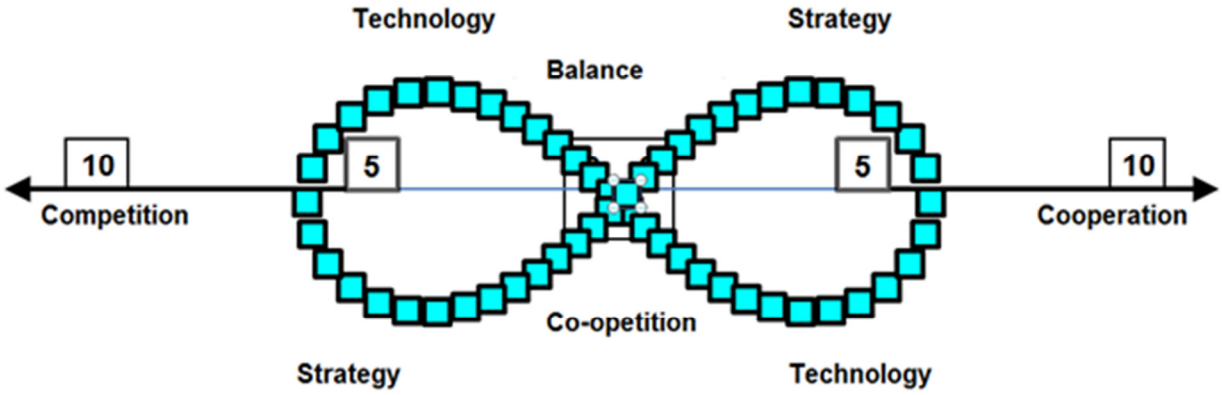
4.2. Lemniscate as a geometric form of the achievement of synergy between competition and cooperation

A lemniscate like model (having a shape of an algebraic curve) offers a useful visual representation of the state and trends in complex phenomena [4]. Scheme 1 depicts the lemniscate as a model of dynamic balance between competition and cooperation. The focus is on visualization of the possibilities and ways of connecting key components in achieving synergy and balance between competition and cooperation. In the example, the arrows mark and indicate the intertwined flows such as: conceptual, mental, process and information. Strategies and technologies have been included in the model as key determinants in achieving balance and synergistic relationship.

A lemniscate can be obtained as the inverse transform of a hyperbola, with the inversion circle centered at the center of the hyperbola. The length of an arc of a lemniscate is expressed by elliptic integrals, as was discovered in the eighteenth century. Around 1800, Carl Fridriech Gauss studied elliptic functions, which are inverse of these integrals (his work was not published at the time, but it was alluded to in the notes of Gaussian Disquisitiones Arithmeticae). A lattice network has a special shape, proportional to the Gaussian integers. For this reason, a case of elliptic functions with complex multiplication in some sources is called the lemniscate case [4].

Figure 2 depicts Lemniscate as a geometric model of linking and acheving synergies between competition and cooperation.

Figure 2. Lemniscate as a geometric model of linking and acheving synergies between competition and cooperation



Source: Authors

A score of 5 on the rating scale is an example of defining a level of cooperation at a given level of competition. For example, based on the level of competition as estimated it is possible to decide on the level of cooperation required to maintain a balance and synergy between competition and cooperation and achieve a given level of competition that involves the development and integration of strategy and technology.

As can be seen in the scheme, only the horizontal axis, which is specified by competition and cooperation, has been defined. The vertical axis has not been explicitly defined, but may be represented as another dimension of a model of synergy between competition and cooperation. For example, the diagram's vertical axis can be specified by strategy and technology.

The vertical axis may also include multiple dimensions which can be analyzed by comparative methods and related to the primary (reference) dimension of the synergy between competition and cooperation, which is shown on the horizontal axis. Vertical dimension can be made of control and executive subsystems which can be positioned in the upper part of the vertical axis.

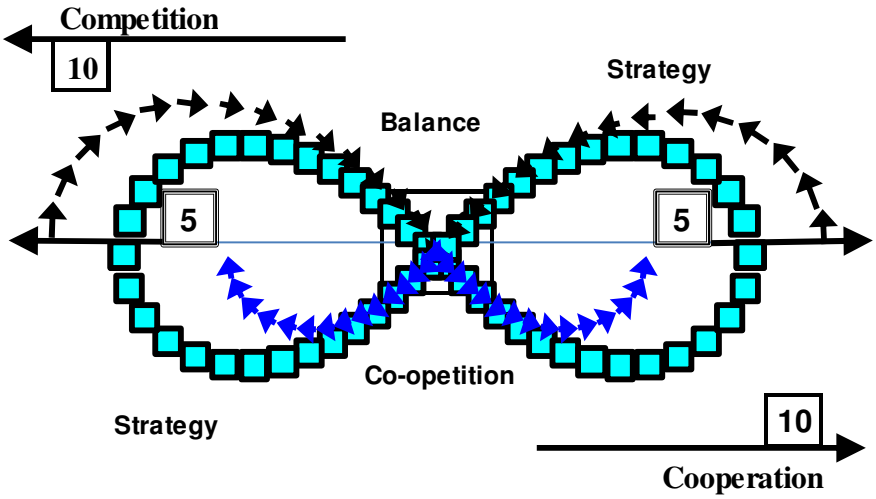
As can be seen in the present mental model in Figure 2, strategy and technology are changing their vertical position in relation to the horizontal axis position.

4.3. Flows in a model of synergy between competition and cooperation

Figure 3 depicts the flows in the model of synergy between competition and cooperation. External flows indicating processes and activities between the business system and environment as well as processes and changes in the relevant business environment, are marked in black color. On the other hand, internal flows indicating processes and activities within the business system are marked in blue color.

The model depicted by the Figure 3 illustrates the process of generating internal and external flows, and their integration. As can be seen, internal flows are generated within the business system, while external flows are generated within the business environment.

Figure 3 The flows in the model of synergy between competition and cooperation



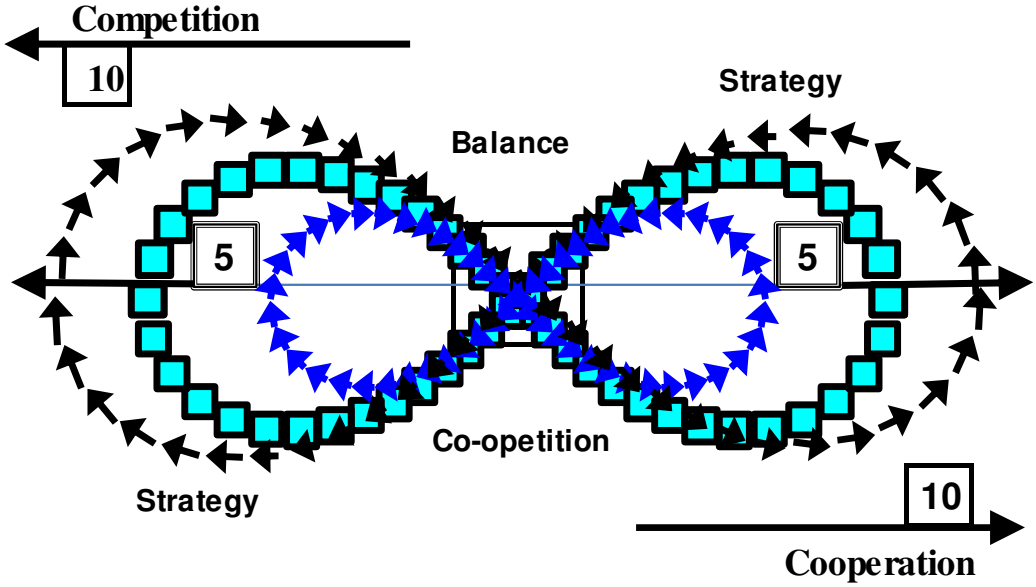
Source: Authors

4.4. The entire model of synergy between competition and cooperation

The flows show dynamic relationships among the elements of the model based on iterative and incremental development and give an image that reflects a coopetition model. The traditional system, which is characterized by vertical relationships in which competition and cooperation are mostly separate categories can be displayed by linear relationships. In a coopetition model, business organizations should have a range of different relationship types in their portfolio that can change at different time points from competition, through coexistence to cooperation, or simultaneous existence of both - competition and cooperation.

Flows are generated and developed simultaneously. The model in Figure 3 shows internal and external flows that are linked and intertwined in the centre of gravity of the model of synergy between competition and cooperation

Figure 4 The entire model of synergy between competition and cooperation



Source: Authors

In this context, the flows indicate dynamic relationships and a continuous interweaving of the model's basic elements: strategy, technology, business system, environment, competition and cooperation.

As can be seen, the lemniscate shows a geometric model of synergistic relationship between competition and cooperation, wherein arrows indicate non-linear internal and external flows that follow the path of lemniscate shape with some deviation.

5. Conclusion

Mental models can serve as a useful tool to develop, integrate and achieve synergies among constructive and innovative concepts and ideas while fostering creativity, innovation and freedom of expression. A context for learning programming in mental model development will facilitate improvement of personal metacognitive skills and development of abstract thinking also in areas outside programming.

In designing the mental model of synergy between competition and cooperation has been proposed a methodological framework:

1. Defining the elements of a mental model
2. Designing a geometric model for linking and acheiving synergy between competition and cooperation,
3. Defining and analyzing how flows of elements of mental models are linked,
4. Analyzing and interpretation a complete mental model process for achievement of synergy between competition and cooperation.

Presented mental model reveals mutually conflicting features of contrariety and complementarity between competition and cooperation.

Coopetition indicates that there exists a synergistic interaction between competition and cooperation. Proposed mental model may generates ideas, concepts and methods of implementation, development, use and maintenance of balance and sinergy between competition and cooperation.

The presented results are part of the University of Rijeka Research project No. 13.02.1.2.02

Abstract - Options represent the right to buy or to sell a specific number of underlying assets (stocks, indexes, commodities etc.) at a given price in a predetermined period of time.

To analyze the value of options the Black and Scholes model will be presented and special spreadsheets will be developed using only "plain vanilla" Excel, i.e. its basic financial functions, for call and put options in the case of stocks which are paying or not paying dividends.

The reason for using only "plain vanilla" Excel is a better portability of such spreadsheets for students at faculties of economics and in the public sector on different platforms or computers with various operating systems.

I. INTRODUCTION

In financial courses at universities educational software is important for students not only to better understand fixed income securities, like bonds or equity securities, like stocks, but also to especially recognize possible profits and immense risks being immanent to derivatives like options.

Valuation of options was a tricky issue until the development of the famous Black and Scholes model which required a lot of computation. Therefore, in this paper the authors are presenting the Black and Scholes model for valuation of call and put options for stocks without and with payments of dividends. Instead of using Visual Basic for Applications (VBA) script language, in order to obtain better portability on other computers and operating systems in the future, so called "plain vanilla" Excel spreadsheets containing only ordinary financial and statistical functions were programmed.

It has also to be pointed out that students at universities and especially at faculties of economics or business schools are usually familiar with Excel, a lot of good textbooks exist, so the time for learning such models and adopting them should be a relative short one. [1], [10], [11]

II. THE BASICS OF INVESTMENTS IN OPTIONS

In case of investing in stocks an option is the contract that provides the right to buy or to sell a specific amount of stocks at a predetermined price (called exercise price) during a given period of time. Options are available for different sorts of securities, currencies, interest rates or market indexes. The two major types of options are so called call and put options.

A call option is a contract that gives the holder the right to buy a given number of stocks of a security (in the USA normally 100 stocks per unit) at a predetermined price, i.e. the exercise price. The buyer of the call option pays the writer or seller a premium. The writer of the call option agrees and has the obligation to sell the given number of stocks of the underlying security at the exercise price within the predetermined time period.

A put option is a contract that gives its holder the right to sell a given number of stocks of a security (normally 100 stocks per unit) at a given price, the so called exercise price. The buyer of the put option pays the writer or seller a premium and the writer of the put option agrees to buy the given number of stocks of the underlying security at the exercise price within the predetermined time period.

The option's premium is influenced by many factors. It is affected positively by market value and price volatility of the underlying security, risk-free rate of interest and time to expiration. On the other hand it is affected negatively by the exercise price and security cash dividend. The possibility of gain or loss for an option is directly related to the price volatility of the underlying security, time to expiration and the interest rate. [2], [3], [9]

The most straightforward and commonly used model for valuation of options is the Black - Scholes Option Valuation Model.

III. THE BLACK AND SCHOLES OPTION VALUATION MODEL

The main parts and equations of Black and Scholes option valuation model are presented below.

A. *Call options*

The Black-Scholes model defines the value of an option by applying a specific mathematical calculation of the relationship between the market price of the underlying security, i.e. a stock and the option`s exercise price, time to expiration, interest rate and the price volatility of the underlying stock. The value of a call option can be computed using the Black and Scholes model which consists of three equations: [5]

$$C = SN(d_1) - Xe^{-rT}N(d_2) \quad (1)$$

$$d_1 = (\ln(S/X) + (r + 1/2\sigma^2)T)/\sigma\sqrt{T} \quad (2)$$

$$d_2 = d_1 - \sigma\sqrt{T} \quad (3)$$

where:
C = price of the call option
S = current price of the stock
X = exercise or strike price
r = risk-free rate of interest
T = time (in years) remaining before expiration of the option expressed in decimal form
e = base of the natural logarithm, or 2.71828
$N(d_n)$ = probability that a normally distributed random variable with a mean of 0 and a standard deviation equal to 1 will have a value less than or equal to d
$ln\ ()$ = natural logarithm
σ and σ^2 = standard deviation and variance of the continuously compounded annual rate of return on the stock.

Taking into account the model presented above it can be concluded that the value of call options has a direct relation to the value and the price volatility of the underlying stock, risk-free rate of interest and the time remaining to expiration, but has an inverse relation with the exercise price.

Other properties of call options are the following:

a) The price of a call option C has an upper bound, therefore C is always less than the price S of the stock.
b) The price of a European call option C also has a lower bound, since it is always greater than the current stock price S minus the present value of the exercise price X.
c) The option becomes worthless if the stock is worthless.
d) When the stock price S is very large, the call option value C approaches the stock price less the present value of the exercise price X.

It can be pointed out that a call option becomes more valuable, the higher the stock price, the lower the exercise price, the higher the interest rate, the longer the time to expiration and the greater the volatility or risk of the stock. Another two facts should be mentioned about options. First, the riskier the stock, the greater the standard deviation and therefore the higher the value of the option. So risk seems to be desirable, because more risk provides higher expected option value. Second, the willingness of the investor to bear risk, he could be a risk seeker or risk averse investor, has no impact on the value of the option.

Beside that, it has to be stressed that the Black and Scholes model is based on quite a lot of assumptions such as no cash dividends, no transactions costs or taxes, constant risk-free rate of interest, no penalties for short selling, the stock market operates continuously, the option can be exercised only at expiration date, and so on.

Even with these assumptions, the Black and Scholes model has been found to be the best available predictor of actual options prices. However, biases have been noted. First, the model tends to overvalue so called out-of-the-money call options or options on stock whose current market price is less than the exercise price. It also undervalues so called in-the-money call options or options on stocks whose current price of stock is greater than the exercise price. Second, the model tends to underprice call options on low-variance stocks and overprice call options on high-variance stocks. Nevertheless, it is a better and more robust model than anyone presented earlier.

B. *Put options*

In the case of put options and based on the principle of the put-call parity and assuming that the put and call options are on the same security or stock with the same exercise price and the same time to expiration, the Black and Scholes model can be used to calculate the value of a put option. The put-call parity is the relationship between the values of put and call options when no arbitrating opportunity exists. When the put and call options are in parity which each other, the difference between their prices should be equal to the difference between the present value of their common exercise price and the current market value of the underlying security. [12]

Or put in another way once the value of a call option is known, determining the value of a put option is quite easy. Based on the put-call parity mentioned above, it becomes evident that the value of a call, plus the present value of the exercise price, equals the value of the put plus the market price of the stock. Therefore the value of a put option is equal to: [5]

$$P = -SN(d_1) + Xe^{-rT}N(d_2) \quad (4)$$

where:
P = value of the put option
and the rest of the variables are defined previously.

So, the value of the put option has a direct relation to the exercise price and the volatility of the stock price, but has an inverse relation to the stock price and risk-free interest rate. To the time remaining to expiration there are two possibilities. As time to expiration T increases, normally the value of the put option P increases; but if the stock price S is significantly below the exercise price X, then as time T increases, the value of the put option P decreases.

Other properties of put options are:

a) The price of a put option P is always less than the present value of the exercise price X, which is an upper bound.
b) The price of a put option P is always greater than zero, except at expiration.
c) When the stock price S is very small, the value of the put option P approaches the present value of the exercise price X minus the stock price.

Similar to call options, put options become more valuable the more volatile the price of the underlying security or the stock is. Differently from call options, however, the lower the stock price, the greater the value of a put option.

C. *Options on dividend paying stocks*

In case of cash dividend payment the Black and Scholes models for call and put options for non-dividend paying stocks have to be adopted. Generally speaking, the current market value of the underlying stock minus the present value of cash dividends to be paid prior to expiration, in place of the current market value of the stock in the Black and Scholes model is to be used.

D. *Call options on dividend paying stocks*

For call options the presence of cash dividend tends to reduce the value of a call option, since the option must be exercised for the dividend to be claimed. Under the assumption that only one cash dividend is expected to be paid before expiration of the option, the value of a call option can be calculated as follows: [5]

$$C^* = \left(S - \frac{D}{e^{rT}} \right) N(d_1) - \frac{X}{e^{rT}} N(d_2) \tag{5}$$

where:
C^* = value of a call option on a dividend paying stock
D = dividend in cash that will be paid before the expiration of the option
T = time in years (decimal form) until the dividend is expected to be paid.

The rest of the variables are presented before. This equation differs from the equation for call options for non-dividend paying stocks only in part in which the market price is reduced by the present value of the dividend that is expected to be received before the expiration date of the option. This is so because an option holder does not have a claim on dividends. On the contrary, the holder suffers a loss in value if the stock pays dividends before the call option is exercised. [6]

E. *Put options on dividend paying stocks*

For put options the modified equation is: [5]

$$P^* = C^* + \frac{X}{e^{rT}} - P + \frac{D}{e^{rT}} \tag{6}$$

where:
P^* = value of a put option on a dividend paying stock
and the other variables are discussed previously.

The only changes from the Black and Scholes model for put options on non-dividend paying stocks are: to use the value of a call option on dividend paying stocks C^* and to add the present value of the dividends expected before the option is exercised.

It has to be pointed out that when cash dividends are paid before the put option can be exercised, the value of the put option increases. This is because payment of a cash dividend lowers the market price of a stock and therefore makes the put option more valuable. If there will be more than one dividend payout until expiration of the option, then the last expression in the equation above must be modified to reflect the present value of all dividends to be paid before expiration. [7]

Taking all that into account it can be concluded that the Black and Scholes model is demanding and that it requires the use of computers for fast and effective calculations. Nevertheless, it is crucial for the valuation of options.

IV. EXCEL SPREADSHEETS

For determining the value of call and put options for non-dividend and dividend paying stocks according to the Black and Scholes equations presented above, ordinary or "plain vanilla" Excel spreadsheets were developed applying only standard financial and statistical functions built in Excel. [4] For explanation of the models two examples are presented below. Beside that, two of the authors have already developed two spreadsheets for bond investments and presented it with another coauthor at MIPRO Conference in 2013. [8]

A. *Call and put options on non-dividend paying stocks*

Given the following information about the stock of the "DD" company and the options on the stock, calculate the current value of the call and put options using the Black and Scholes model.

Current market price of the "DD" stock = kn 75.00
Exercise price of the option = kn 60.00
Time remaining to expiration = 5.4 months (0.45 years)
Risk-free rate of interest = 8.0%
Standard deviation of stock return = 0.75
No dividend payment

After typing all the necessary data in the "input data" field of the spreadsheet model (options.xls) the results for call and put options of the company "DD" stock are calculated and displayed in the "output data" field. (Fig. 1)

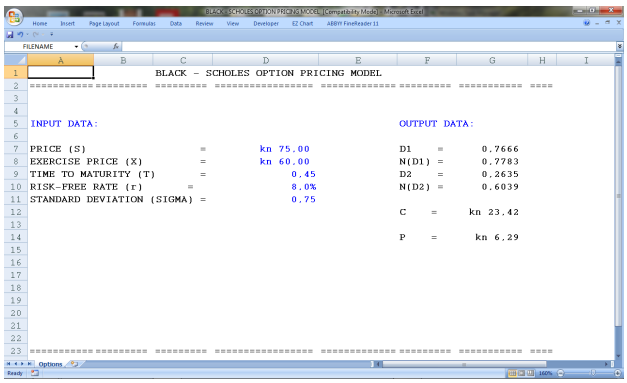

Figure 1. Spreadsheet screenshot for call and put options on non-dividend paying stock

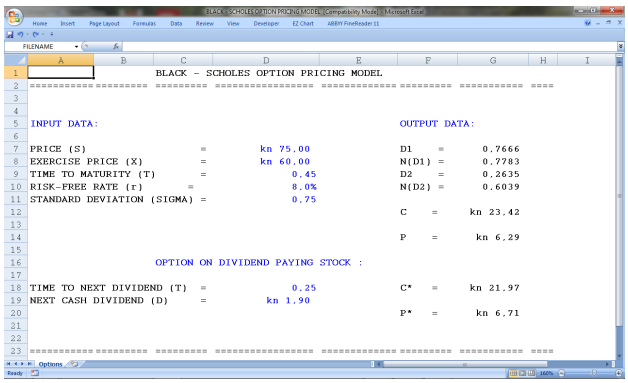

Figure 2. Spreadsheet screenshot for call and put options on dividend paying stock

The results show that the value of the call option is higher and amounts to kn 23.42 and the value of the put option is kn 6.29. So there is a higher risk premium to be paid for buying call options rather than put options on the same stock of "DD" company.

B. Call and put options on dividend paying stocks

Given the same basic information about the stock of the "DD" company and the options on the stock, but this time with payment of dividends, calculate the current value of the call and put options using the Black and Scholes model adapted for dividends.

Current market price of the "DD" stock = kn 75.00
Exercise price of the option = kn 60.00
Time remaining to expiration = 5.4 months (0.45 years)
Risk-free rate of interest = 8.0%
Standard deviation of stock return = 0.75
Next cash dividend = kn 1.90
Time to next dividend = 3 months (0.25 years)

After typing all the necessary data in the "input data" field of the spreadsheet model (options.xls) the results for call and put options of the company "DD" stock are calculated and displayed in the "output data" field for "option on dividend paying stock". (Fig. 2)

Taking into account payment of dividends the results show once again that the value of the call option is higher and amounts to kn 21.97, while the value of the put option is lower and amounts to kn 6.71. Again there is a higher risk premium to be paid for buying call options rather than put options on the same stock of "DD" company paying dividends.

Comparing both call options for the stock without and with payments of dividends it can be concluded that the call option without dividend payment is more expensive because payments of dividends lower the value of that call option. The opposite is true in the case of put options without and with payments of dividends.

V. INSTALLATION OF THE SPREADSHEET

Since all mentioned procedures and calculations are implemented in a single Excel spreadsheet (options.xls) it is only necessary to copy this file in the working directory of the PC where Microsoft Excel program can access them. Of course, installation of the Excel Analysis Toolpak Add-In could help to speed up the programming of some functions.

VI. CONCLUSION

In this paper the valuation of options, both without and with payments of dividends, according to the Black and Scholes model are presented. For this purpose special Excel spreadsheets were developed using only "plain vanilla" Excel, i.e. by implementing standard financial and statistical functions and not relying on Visual Basic for Applications (VBA) script language. The results of options calculations with the Black and Scholes model could make the students more aware of the possible profits, but also of the risks involved in options valuation and investments.

Summary – The computer is becoming more used and prevalent in learning. It is increasingly being used in knowledge transfer and acquisition of knowledge. The textbooks items in the classroom teaching are enriched with CDs. How many pupils in lower grades use a computer for learning new stuff? Do they learn more easily using textbooks or CDs? How much time do pupils spend on the computer to get some information as for learning on the Internet?

The data were obtained by means of a questionnaire in which pupils were anonymously surveyed. The aim of the research is to determine whether pupils use the computer for learning and in which school subjects the most. The data analysis shows that pupils mostly use the computer for the adoption of the content of educational .subjects.

Keywords: classroom teaching, pupils of classroom teaching, computer use, subjects of classroom teaching.

I. INTRODUCTORY REMARKS

A. Introduction

Looking back to the history of education, generations were educated through oral tradition, then by means of a book, and today it is increasingly acquired to use information and communication technology (ICT). Computers and tablet, or educational content in digital form are more and more present in the process of acquiring knowledge. Digital textbooks are enriched with lots of facilities while classic textbook does not have such presentations, videos, games, quizzes and similar materials. They can be used in all stages of the lesson, in any type of lesson from presenting new materials to training and repetition, especially with independent learning. Today the children from an early age get in touch with several digital forms of teaching materials, starting with their first photographs, learning the first songs and enriching their vocabulary through stories and cartoons. That is why it is expected that children grow up using digital forms for the acquisition of new knowledge, disseminate learning perspective and evaluation of acquired knowledge. Before some information and answers to questions were looked for in encyclopedias, lexicons, dictionaries, collections, but today searching for data in digital form by means of a web search is more appropriate.

B. Purpose and objectives of the research

The survey on the use of computers in classrooms was desired to determine the extent to which pupils in lower grades of elementary school use the computer. Its aim was to determine what percentage of pupils in the primary school use computers for learning different subjects and in which the most. Pupils in lower grades have three compulsory subjects (Croatian language, Mathematics, Science), three compulsory subjects (Art, Music, Physical education) and a foreign language. The surveys also want to explore and get to the data of how many pupils of surveyed population use a computer, the Internet and digital content for each of the above mentioned subjects in class teaching. In addition to this one of the goals was also to determine where pupils of the surveyed population in classrooms love more to learn, and how often they learn using the computer.

II. RESEARCH METHODOLOGY

The study was carried out by means of a questionnaire in which pupils of classroom teaching were anonymously surveyed in several schools of Istria County. The study used an interview with a meter survey lists of a total of 14 questions (of which 12 questions with in advance offered YES-NO answers) while in two questions pupils circled in advance offered answers: where they prefer learning from (from textbooks or using the computer); how often they use the computer for learning (every day, often, rarely, never).

In the research, besides these survey methods, other scientific methods such as statistical methods, methods of description, analysis and synthesis are applied. The data were analyzed using MS Excel and statistical method for measuring the central tendency (frequency and percentage).

III. THE RESULTS AND ANALYSIS OF THE RESULTS

The study was conducted in several elementary schools in the Istria county on a sample of 109 pupils from a total of 141 pupils and in the analysis of the results worth mentioning large percentage (p = 0,773) surveyed school pupils. Taking into account that the completed questionnaires returned so many pupils, the rate of return can be considered very satisfactorily. In similar studies it moves in a much smaller percentage. Therefore, the standard error of the proportion is small considering that *n* is large (n> 30). Size arithmetic mean is approximately normally distributed, and therefore, as a rule two sigma, achieved with a probability greater than 0,95 all values within the interval ± two sigma around the middle.[1] Taking into account that nearly four out of five pupils answered the questionnaire, the pattern can be representative as for assessment and can be the basis for making appropriate conclusions concerning the population.

The data analysis has led to results which show that 92,66% of the total number of pupils have a computer at home. Internet access has 89,91% of the total number of surveyed pupils. In addition to this, the survey results indicate that 66,97% pupils use computers for learning. Internet for the purpose of learning used 67,89% of the total number of surveyed pupils. 40,37% of the surveyed pupils use computer for learning Croatian language. 49,54% of the surveyed pupils use the computer for mathematics exam. 69,72% of the surveyed pupils use the computer for learning Science. 26,61% of the surveyed pupils use computer for learning Music. The same number of pupils, or 21,1% of the surveyed pupils use the computer for learning Art and Physical education. Almost three-quarters of the surveyed pupils (73,39%) use computer for learning a foreign language. 79,82% of the surveyed pupils use Internet for the purpose of acquiring new knowledge. Survey data from the first to the twelfth questions are presented in the table format 1. and in the graph in Figure 1.

	Question	Pupils of classroom teaching:		
		YES [%]	NO [%]	∑ [%]
Q1	Do you have a computer at home?	92,66 %	7,34 %	100,00 %
Q2	Do you have an access to the Internet?	89,91 %	10,09 %	100,00 %
Q3	Do you use a computer for learning?	66,97 %	33,03 %	100,00 %
Q4	Do you use the Internet for learning?	67,89 %	32,11 %	100,00 %
Q5	Do you use a computer to learn Croatian language?	40,37 %	59,63 %	100,00 %
Q6	Do you use a computer to solve mathematics tasks?	49,54 %	50,46 %	100,00 %
Q7	Do you use a computer for learning Science?	69,72 %	30,28 %	100,00 %
Q8	Do you use a computer for learning Music?	26,61 %	73,39 %	100,00 %
Q9	Do you use a computer for learning Art?	21,10 %	78,90 %	100,00 %
Q10	Do you use a computer for learning Physical education?	21,10 %	78,90 %	100,00 %
Q11	Do you use a computer for learning a foreign language?	73,39 %	26,61 %	100,00 %
Q12	Do you use the Internet for getting new information?	79,82 %	20,18 %	100,00 %

Table 1. Tabular presentation of the results - answers to the questions 1. – 12.

[1] LJ. Baban, S. Jelinić, M. Lamza-Maronić, K. Ivić, "Primjena Metodologije znanstvenog istraživanja", Ekonomski fakultet Osijek, Osijek, 1993.

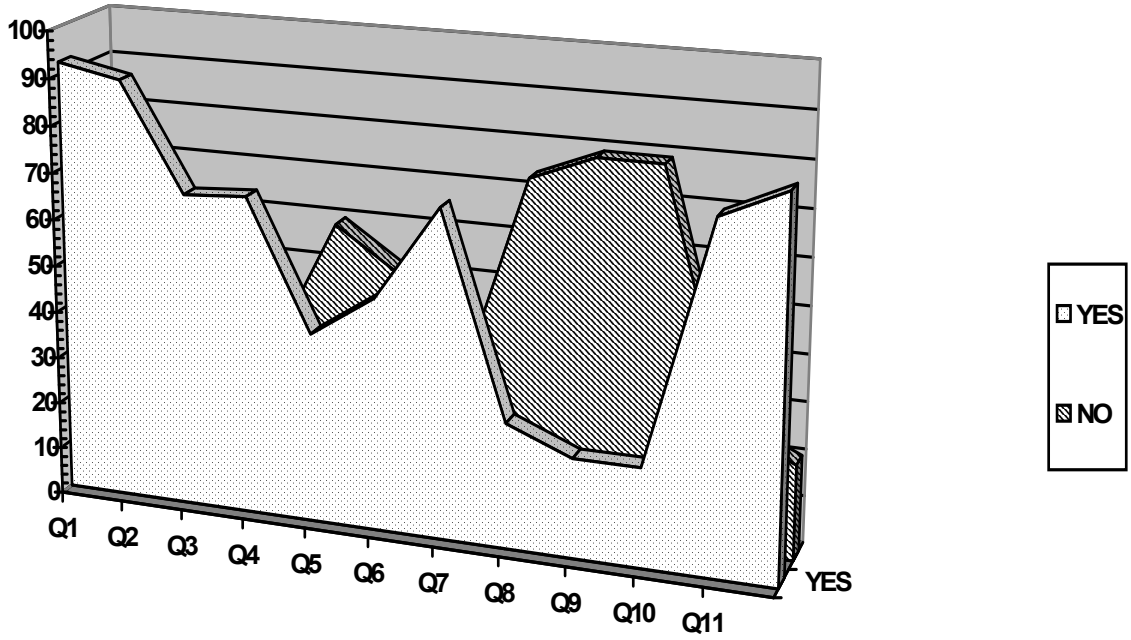

Figure 1.Total positive and negative answers of pupils on the questions (in %)

In addition to 12 questions with in advance offered YES-NO answers in the survey there are two questions: pupils are asked to circle the default answers to questions. The answers to question number 13: "Where do you like to learn from?" were textbook and computer. The order of response is determined by the frequency and intensity displayed in a table format no. 2.

	Question	Order of responses as for intensity and frequency of answers:	Pupils of classroom teaching: [% by frequency of given answers]:
Q13	Where do you like to learn from?	1. Textbook [%]	38,53%
		2. Computer [%]	61,47%

Table 2. Tabular presentation of the answers to the 13th question

As for frequency and intensity and considering the total number of respondents which is displayed in a table format no. 2., 38,53% of pupils like to learn from the textbook while 61,47% of pupils like to learn using the computer.

The answers to question number 14: "How often do you use computer for learning?" were every day, often, rarely and never. The order of response is determined by the frequency and intensity displayed in a table format no. 3.

	Question	Order of responses as for intensity and frequency of answers:	Pupils of classroom teaching: [% by frequency of given answers]:
Q14	How often do you use computer for learning?	1. Every day [%]	15,60%
		2. Often [%]	42,20%
		3. Rarely [%]	25,69%
		4. Never [%]	16,51%

Table 3. Tabular presentation of the results answers to the 14th question in class teaching

As for frequency and intensity and considering the total number of respondents which is displayed in a table format no. 3., 42,2% of surveyed pupils often use computers for learning, 15,6% of surveyed pupils use computer for learning every day, 25,69% of surveyed pupils answered that they rarely use computer for learning and 16,51% of surveyed pupils answered that they never use a computer for learning.

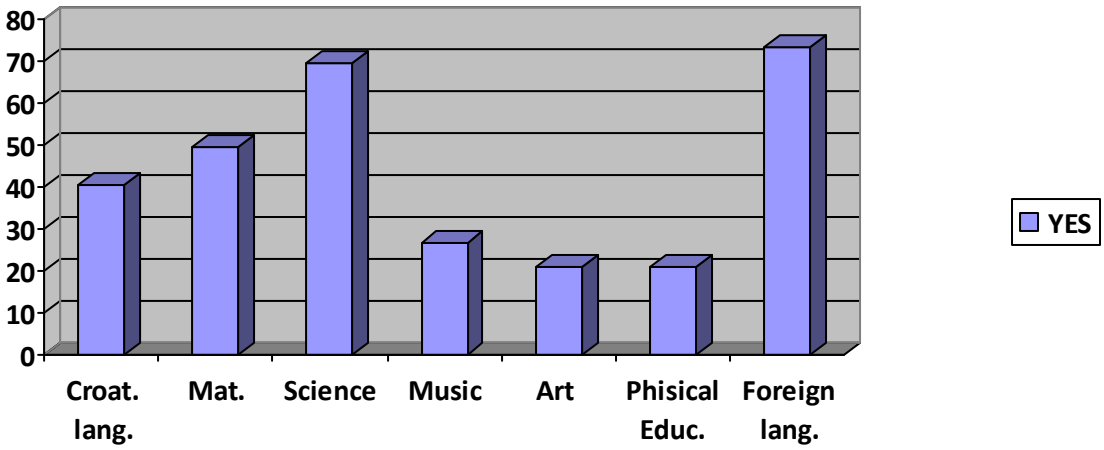

Figure 2. Comparison of positive responses to the questions according to the subjects (in %)

IV. CONCLUSION

The results obtained by processing of the data are shown in the graph in Figure 2 and give answers to the questions what percentage of elementary school pupils use computers for learning different school subjects and in which the most. Pupils mostly use computer and Internet for new knowledge acquisition and learning foreign languages. Slightly less pupils use the computer for learning Science (almost 70% of surveyed population), and then even less (almost half of those surveyed) use the computer for problem solving in mathematics. A little less (about 40% of surveyed pupils) use the computer for learning Croatian language. It is interesting to note that only one of four surveyed pupils uses the computer for learning Music, while every fifth surveyed pupil uses the computer for learning Art and Physical education. The results of the survey prove that today we encounter a computer already at birth, and it becomes an integral part of growing up of a child. The survey confirms that more than three fifths of surveyed populations prefer learning with computers instead learning from textbooks, while the question How often do they use computer for learning responded positively almost 85% of the surveyed pupils.

Abstract - Students experience constant problems in their introductory programming courses. Along with difficulties to cope with abstract programming concepts students tend to experience fear and lack of motivation to learn programming. In order to make programming more interesting and to make programming concepts easier to comprehend an intelligent assistant which enables students to ask question about their programming lessons in a simple and familiar way just as they would ask the lecturer is proposed. In this way the process of getting the right information and answer gets faster and also more interesting and engaging compared to classic approach. Along with getting the desired answer faster this kind of approach increases motivation of students to spend more time in learning programming because of interesting new technology that is used as an aiding tool in their programming education. The results about students' attitude towards such approach and its effect on students' motivation and amount of time spent in learning are presented and discussed.

Keywords **- programming, education, problems, intelligent assistant**

I. INTRODUCTION

Students have been struggling with their programming courses for years. Despite of all efforts that have been made programming is still considered as hard to learn and students experience fear about programming even before they enroll into these courses. Over the years one fact has become a common opinion among both students and teachers of programming courses and this fact is that programming indeed is hard to learn [1; 2; 3; 4; 5]. The fact that various efforts in the area of aiding programming students and especially introductory programming students haven't produced any long-term results asks for more focus on this problem and more research in order to find some sort of usable solution.

The problems that students of programming courses experience come from many different sources and reasons. The solution for these problems includes multiple factors and aspects that need to be considered. These factors can be observed on either teachers' of students' side as well as on the side of programming itself. Teachers are responsible for establishing a sound and effective teaching methodology and this is when talking about programming very challenging task. Beside the fact that the right course of action is not always clear or not clear at all, abstract nature of programming and its concepts requires a lot of effort as well as various technical knowledge and skills in order to produce the right materials in the design and organizational sense that will make programming concepts understandable to students. Teachers also have problems in adapting their lectures to every particular student since students differ in their preferable learning style but also in their advancement speed.

Students on the other hand have responsibility to focus on lectures and actively listen in order to adopt presented matter. Another responsibility of students is to learn and study because all efforts of teachers and all innovative approaches will prove as futile without the cooperation of students and their willingness to learn. Motivation of students to learn is one of major factors that have influence on the success rate of programming courses [6]. It is important for students be aware of importance of programming for their future careers but it is also important for them to know why they enrolled their faculties and programming courses because this general direction and being committed to it has a major effect on subgoals that include learning programming and passing programming courses with good grades.

Programming itself is another factor that contributes to various problems in programming courses. Programming is abstract and that brings a lot of different aspects which need to be incorporated in order to learn programming properly. Because of its abstract nature programming asks for more effort from teachers, more complex methods and techniques of teaching, greater focus of students and different way of learning that asks for prolonged learning rather than learning of a lot in a short time. The reason for this is that programming is not only a knowledge but a skill [7] and a skill requires some time to develop. Students are generally not used to this kind of learning since most of their education included mostly memorization of facts because of different nature of most other school subjects.

Programming is important and new computer experts are needed on a daily basis because of rapid growth of business industry. Improving state regarding programming courses passing rates and quality of students' knowledge and skills is something that needs more attention and more focus. In this paper problems that programming courses experience and reasons of these problems as well as methods of their improvement are presented and

discussed. A new approach that includes the usage of intelligent assistant as a mean of increasing motivation of students to spend time learning programming is proposed and research results about the effectiveness of this kind of approach are presented and elaborated. Some pointers and possible approaches for future research are also mentioned.

II. PROBLEMS IN PROGRAMMING EDUCATION

Failure and dropout rates in programming courses and especially in introductory programming courses have been reported as relatively high throughout the years [8; 9]. Programming courses have simply become something that students are used to struggle with and something that is frequently a reason of dropouts. Research results show that students in many cases don't know how to produce a valid programming code even at the end of introductory programming courses [10].

Programming is abstract and challenging for students. It requires a way of learning and reasoning that is new and not habitual for students. There are three very important factors that influence the results of programming courses:

- Level of developed problem-solving skills
- Students' motivation
- Teachers' efforts

One of key prerequisites for students to learn programming are properly developed problem-solving skills or in other words developed algorithmic way of thinking [11]. It is hard for students to produce a valid programming code if they don't know how to understand and analyze the problem in order to be able to construct its algorithmic solution. Since programming requires prolonged way of learning students have to be committed to the learning process. This requires students to be properly motivated with a clear goal in mind. Knowing why it is important to enroll programming courses and why it is important for students' future career is something that affects students' motivation and needs to be clear.

Many researches have been conducted regarding reasons of problems in programming courses with different results. Hawi [12] has defined 10 casual attributions which have emerged as a result of conducted research among undergraduate students: learning strategy, lack of study, lack of practice, subject difficulty, lack of effort, appropriate teaching method, exam anxiety, cheating, lack of time, and unfair treatment. Gomes and Mendes [13] have identified several possible reasons of problems in programming courses:

- Programming demands a high abstraction level.
- Programming needs a good level of both knowledge and practical problem-solving techniques.
- Programming requires a very practical and intensive study, which is quite different from what is required in many other courses which are more based on theoretical knowledge, implying extensive reading and some memorization.
- Usually teaching cannot be individualized, due to common classes' size.
- Programming is mostly dynamic, but usually taught using static materials.
- Teachers' methodologies many times don't take into consideration students' learning styles. Different students have different learning styles and can have several preferences in the way they learn.
- Programming languages have a very complex syntax with characteristics defined for professional use and not with pedagogical motivations.

Different approaches have been researched in order to try to improve results in programming courses but they have shown variating results. Jenkins [7] proposes several steps that should increase success rate in programming courses:

- Programming should never be taught before the second year of any course
- The language used should be chosen for pedagogic suitability and not because it is popular in industry
- Programming should be taught by those who can teach programming and not by those who can program
- Programming courses should be designed to be flexible to allow different students to learn in different ways
- There should be no summative (continuous) assessment to ease pressure on students
- Departments should acknowledge that programming is difficult and supply adequate support to students

Importance of a proper way of thinking that is needed in order to learn programming is also confirmed by Don Norman who claims that there is a huge gap wide as Grand Canyon between the way of thinking applied by programming novices and the way of thinking that is required by computer in order to perform valid instructions. [14]. Students use many concepts which are used in programming in their everyday life but many of these concepts are mostly unconscious because of great ability of human brain to perform complex tasks and process constraints and conditions is such a speed that one is virtually not aware of it. On the other hand computers need clear boundaries, constraints and conditions in order to produce valid programs that will be robust and usable for different cases and scenarios in some particular area of interest. Students frequently omit different important elements which in the end results in faulty programming code. There is a need to devise new approaches, methods and tools that will promote algorithmic way of thinking and train students in problem-solving skills which will in the end result in better performance during their programming courses. Several summative steps can be

proposed in order to aid students in their programming education [15]:

- Introduce additional programming course prior to introductory programming course that would promote algorithmic way of thinking
- Increase motivation of students for learning programming
- Explain to students that programming is a skill, not merely knowledge
- Introduce elements of constructivism into teaching process
- Introduce learning by example
- Introduce animation and other visualization techniques combined with interaction
- Introduce interactive visual simulations
- Include support for multiple learning styles

Solving problems in programming education is a challenging task that asks for more effort form both teachers and students. Further research is needed in order to improve situation in programming courses which have the main goal to produce new computer experts who are able to write valid computer programs.

III. USING INTELLIGENT ASSISTANT IN PROGRAMMING EDUCATION

When talking about various aiding tools and techniques that are mostly mentioned as means of trying to make programming more understandable and more interesting the most commonly mentioned are various visualization tools and techniques that are aimed at making programming less abstract [16]. These visualization tools and techniques can be either static or dynamic in nature [17]:

- Static:
  - Code lists
  - Flowcharts
  - Diagrams
  - Pictures
- Dynamic:
  - One-way presentations
    - Movies
    - PowerPoint slides
    - Flash animations with sound explanation and music
  - Two-way interactive tools:
    - Executable flowcharts
    - Algorithm animations
    - Program visualizations

Many existing visualization tools have been used in practice such as XTANGO [18], JavaVis [19], JHAVE [20], BlueJ [21], Jeliot3 [22], Raptor [23] and ALVIS LIVE! [24]. Visualization tools have shown to be beneficial to students but another aspect that has proven to be useful for capturing students' attention is interaction [25].

In order to combine visual aspect and interaction into one aiding concept that should promote greater quality of students' programming knowledge an intelligent assistant has been proposed and applied in programming education. Intelligent assistant incorporates elements of visualization, interaction and expert systems as well as segments of artificial intelligence. Intelligent assistant is designed as a system that provides students with a possibility of interaction by using the natural language. Students are able to ask intelligent assistant regular questions just as they would ask their teacher or colleague. Intelligent assistant is developed as an aiding tool and it is web based. It consumes only a small portion of overall screen real estate and it has its own avatar representation. Its main purpose is to capture students' attention with its novelty as a technology, to speed up the process of getting desired information, to increase motivation and the time that students spend in learning programming and to make learning process more interesting. Intelligent assistant supports many different areas of questions, from more general to more specific, for example:

- Who are you?
- How are you?
- What is programming?
- I don't know what is variable.
- What is the difference between for and while loop?

Question and answer from intelligent assistant are shown in Fig. 1.

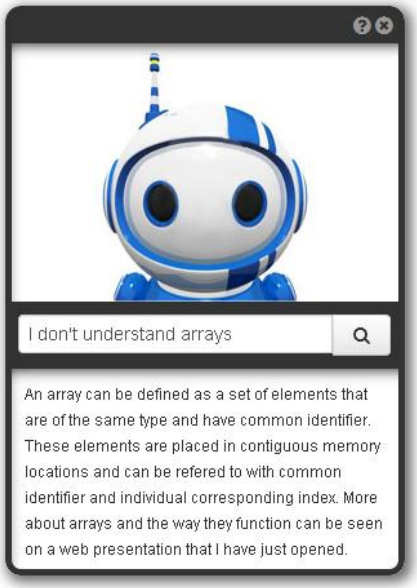

Figure 1. Asking intelligent assistant a question and getting the right response

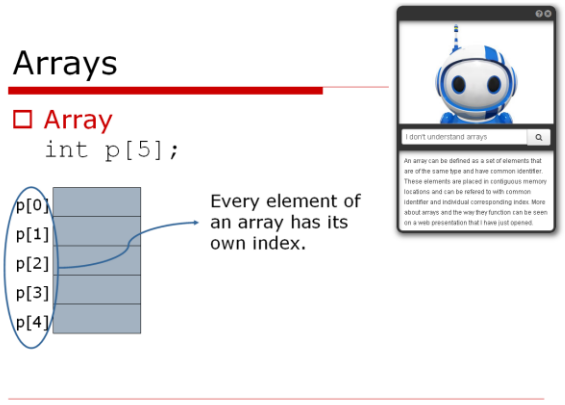

Figure 2. Opening of web presentation as an addition to textual answer to given question

Intelligent assistant supports different variations of the same question. For example, it is possible to ask "What is the difference between for and while loops?" but also "How while and for loops differ?" or "While/for loops difference". There is a large amount of tolerance to various forms of questions incorporated into intelligent assistant in order to provide students with better experience and easier usage that is more natural. Intelligent assistant also supports feature of variations in answers' form so the answers to some particular question are not always of the same form.

Beside answering questions in textual form intelligent assistant has also a feature that enables opening of web pages or web presentations which is shown in Fig. 2. These web resources are complementary to already given answer and they give a deeper insight into area that is related to the asked question. In this way students are able to ask a question regarding any area of programming and they are given instant answer and appropriate web resource is opened where students are able to get a more detailed and clearer visual insight into some particular matter. In this way the process of learning is made quicker and more engaging for students compared to classic presentations and searching for some piece of information among a number of slides.

In the current stage of development intelligent assistant is customized with various knowledge rules by using a simple settings interface where one is able to define a keyword or a set of keywords and their priority as well as one or more forms of essentially the same answer. These forms of answer are presented randomly to make intelligent assistant appear more interesting and less predictable. Every knowledge rule can be paired up with one or more web resources that are presented along with the answer and which can be used to make answer even clearer and explained in more detail.

In order to test how intelligent assistant and its usage influences students' motivation to learn programming, does it make students more willing to learn programming by spending more time since learning becomes more interesting and whether intelligent assistant makes getting the right piece of information quicker a research has been conducted among computer science students who have gone through all lessons of their introductory programming course. This population was chosen in order to get more objective feedback from students who have already gone through some form of more or less classic lectures and learning process so they are able to compare it to learning by using the intelligent assistant. 68 students have participated in this research and they have been given intelligent assistant with support for learning lessons about arrays.

Students also had classic presentations to browse and read but all practice and learning was supported by intelligent assistant. Students have been given intelligent assistant for a week since this is time that is available to students between lessons in classic lectures approach. At the end students were given a questionnaire in order to assess whether intelligent assistant had any impact on mentioned aspects of interest. Results of conducted research are shown in Table I.

TABLE I. RESULTS OF QUESTIONNAIRE RESEARCH

Questionnaire item	Mean	Std. dev.
Intelligent assistant is interesting and engaging learning tool	4,25	0,58
Intelligent assistant makes learning of programming more interesting for me	4,09	0,63
Intelligent assistant makes learning of programming easier for me	4,41	0,82
Intelligent assistant makes me more motivated to learn programming	4,12	0,49
Intelligent assistant makes me willing to spend more time in learning programming	3,82	1,04
I am able to get answers quicker by using intelligent assistant than by using classic presentations search approach	4,53	0,72
I am able to better comprehend programming concepts by using intelligent assistant	3,97	0,87
I prefer classic way of learning compared to using intelligent assistant	1,47	0,42
I think that intelligent assistant would also be beneficial for me in other subjects	4,11	0,73
I would recommend usage of intelligent assistant to my student colleagues	4,34	0,54

The research results have shown that students perceive intelligent assistant as a useful and interesting learning tool and aiding mean. Intelligent assistant has also been reported as a facilitator of more interesting way of learning, easier learning, greater motivation and willingness of students to spend more time in learning of programming. Students have also stated that they prefer this kind of learning over classic learning approach and that this kind of learning promotes better understanding of programming concepts. Students have shown that they perceive intelligent assistant as something that could be useful for them in other areas and subjects and as something that they would recommend to their colleagues.

IV. CONCLUSION

Programming education is faced with reoccurring problems of students that are not able to follow lectures and to do their programming tasks. Students experience fear about programming even before they enroll these courses which is based upon experience of past

generations of students. Abstract nature of programming makes these courses additionally challenging both for teachers and students. In order to try to make programming concepts clearer to students various approaches have been incorporated into programming courses with various success. One of the approaches that has proven to be beneficial in some extent to students was approach that includes visualization tools and techniques. Another valid approach is the one that includes some kind of interaction between students and learning tools.

In this paper an intelligent assistant is proposed as an adding learning technology which combines visualization and interaction and brings more focused and interesting way of learning that promotes greater motivation and increased amount of time that students spend learning programming. In order to assess the effectiveness of proposed intelligent assistant a research has been conducted in which students were given intelligent assistant as a part of their programming education about arrays. Students reported that using intelligent assistant increased their motivation to learn, made learning easier and more interesting which resulted in more time spent learning and in increased understanding of programming concepts. Students also stated that they find intelligent assistant to be also potentially beneficial in other areas. Expanding intelligent assistant's scope regarding programming and further testing of its effectiveness on a larger scale as well as research about other potential areas of its application and expanding intelligent assistant with the ability to create answers from various textual information will be a part of future research.

Abstract – In this paper selected examples of laboratory exercises related to data acquisition systems are described. The examples are realized by using PC and microcontroller-based data acquisition systems. Basic elements of the analog signal conditioning, multiplexing, and analog to digital conversion are shown. The illustrated laboratory exercises can be used in the courses linked with the basis of automatic control systems as well as with programming languages. Because of its simplicity, the presented examples can significantly contribute to better understanding of the planned curriculums.

I. INTRODUCTION

Data acquisition is the process of collecting information that describes physical phenomena [1]. PC and microcontroller-based data acquisition systems have very important role in monitoring and control of the production process parameters. The schematic diagram of data acquisition system is shown in Fig. 1.

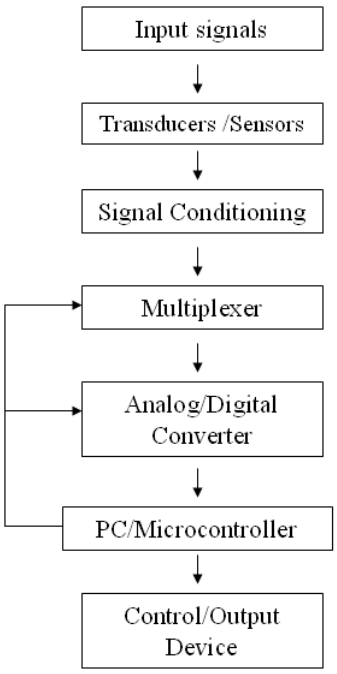

Figure 1. Schematic diagram of data acquisition system

In our examples, the input signal is a physical quantity (temperature, pressure, flow). A transducer or sensor is used to measure the input signal. The multiplexer selects which transducer is sampled at a particular time and directs the proper analog signal to the analog to digital (A/D) converter. The PC or microcontroller controls the multiplexer and A/D converter and receives the digital data from the A/D converter. After that, PC or microcontroller processes the data and sends it to an output device or uses it to control the response of another device. The practical experience that students gain in the laboratory is of particular importance for their understanding of the applicability of theoretical knowledge. Simple, clear, and interesting experiments and exercises are essential to motivate them to expand their knowledge.

Laboratory of Applied Electronics and Computer Science was established at the Institute of Mining and Metallurgy Bor in 2005, as a part of the Industrial Informatics Department [2]. Its primary role is to enable the lab exercises and realization of seminar and diploma papers for students of Computer Science at the Technical Faculty Bor, Serbia. Since the establishment, the laboratory has been used by hundreds of students and professionals. Selected examples of laboratory exercises of microcontroller and PC-based data acquisition systems are presented in the paper. The experiences of students and teachers regarding the work in this laboratory clearly indicate that lab work greatly contributed to a better understanding of the planned educational, professional, as well as the scientific program.

II. DATA ACQUISITION SYSTEMS USED IN LABORATORY EXERCISES

Programmable logic controllers (PLC) are the most popular type of process control computers, used in automation systems. They are controlled by programmed code created on a PC and downloaded to the memory of the controller. Depending on the state of the inputs and results of programmed functions, the controller will activate proper outputs [3]. Flexible solutions for data acquisition and control are also an important tool for measurements in scientific and research laboratories. Very often self-constructed or adapted measuring devices are applied in the laboratories. PLCs are modular devices and this modularity is often used to provide additional

functions, such as an increase the number of available inputs and outputs. In our laboratory exercises we used PLC called MMS [4]. In functional point of view, MMS is an autonomous unit (Fig. 2 and 3). The MMS standard configuration includes CPU module (one-board computer based on MC68HC11E microcontroller with internal eight channels, 8-bit A/D converter), analog input modules (up to 3 modules, each with 20 channels), digital input and output modules (64 + 64 channels), RS232 communication port, LC display and keyboard.

We have developed Supervisory Control And Data Acquisition (SCADA) application for MS Windows. It supports MMS functions in order to perform data transfer as well as to analyze and interpret the results [4]. I/O acquisition modules for PC have been programmed in Pascal, C, or Delphi programming languages. In our experiments, we have used MMS and PC modules (shown in Fig. 4), and measuring equipment, such: digital multimeters, oscilloscopes and signal analyzers.

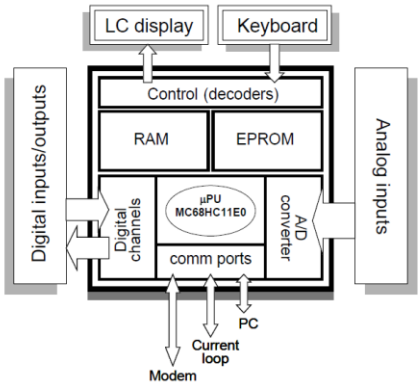

Figure 2. Functional block diagram of MMS

Figure 3. Basic configuration of MMS

Figure 4. Multifunctional data acquisition module for PC

III. LABORATORY EXERCISES

A. Temperature Sensors/Transducers

Transducers convert a physical response or phenomena into an electrical signal, which is proportional to the quantity of the input signal. In most of the lab experiments as sensing elements different types of temperature sensors is used, such as thermocouples, NTC and PTC thermistors (Fig. 5). In the exercise manual students can find basic information about each type of temperature sensors used in the exercise. The goal of this exercise is accomplished by understanding the principle of operation of each type of temperature sensor. Detailed information about the other types of sensors and transducers students can find in the additional literature.

B. Temperature Transmitters/Indicators

In this exercise students learn how to properly connect each given type of temperature sensor on temperature controller or indicator (Fig. 6). In the exercise manual students can find basic information about each type of temperature transmitter or indicator used in the exercise. The educational goal of this exercise is accomplished by fulfilling the technical goal which is setting up a transmitter or indicator parameters to prescribed values.

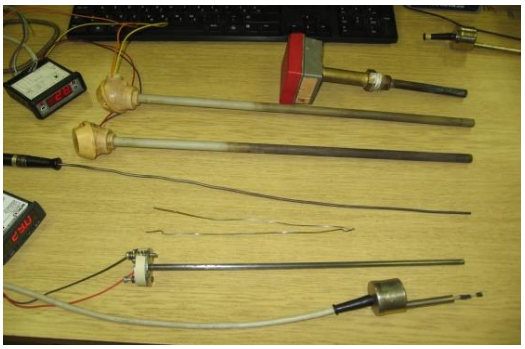

Figure 5. Different type of temperature sensors and transducers

Figure 6. Temperature sensors connected to controllers and indicators

C. Signal conditioning

Signal conditioning is used to modify the output from a sensor/transducer to increase the precision of the measurement. The role of analog signal conditioning is to preserve degradation of the measurement information, despite external influences. This includes signal isolation, amplification, and filtering. In the case, when the control system has no isolated analog inputs, a separate isolator will be needed (shown in Fig. 7).

Figure 7. Loop isolator JK2002. Input 0...4/20mA, output 0...4/20mA (2 separated channels in the same case)

The most of PLC analog input modules provide conversion of high-level signals (such as 0-5 V input to 4-20 mA output) as well as amplification and linearization.

In the exercise manual students can find basic information about the characteristics of MMS analog input modules (shown in Fig. 8). The manual also provides the equations for calculation the required components of the amplifiers. In the first part of the exercise, for a given signal range at the input and required signal range at the output, students determining the missing components of amplifying chain. The aim of this exercise is accomplished by fulfilling the technical goal which is checking the setting of analog channels to required values. The setting is checked in two points (zero and maximum).

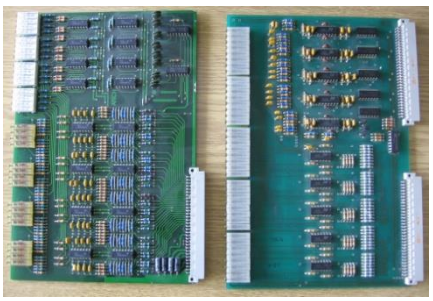

Figure 8. The MMS analog input modules (left – with 16 analog inputs, right – with 20 analog inputs)

Filtering is used to separate desired signals from undesired signals of ‘‘noise.’’ Noise causes the signal to fluctuate, which makes data interpretation very difficult. In the second part of the exercise, for a given level of noise at the input, and desired level of noise at the output of amplifying chain, students determining the components of filters. In the exercise manual, they can find the explanations and equations for the required calculations.

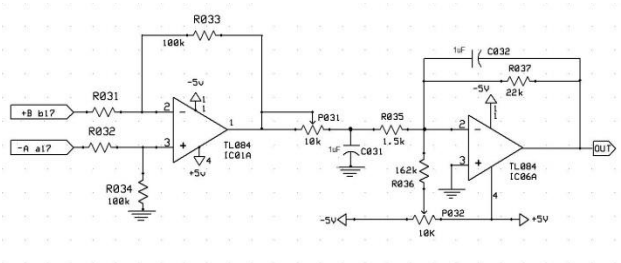

Figure 9. The example of two-stage amplifier (differential amplifier, a passive filter, and inverting amplifier/adder)

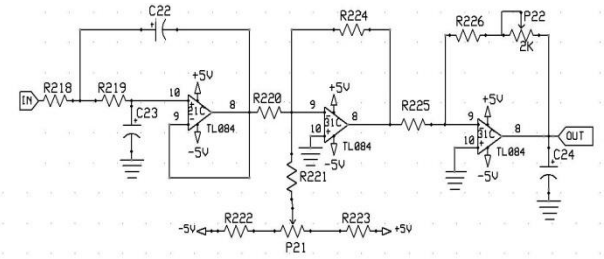

Figure 10. The example of active low-pass filter of the second order, inverting amplifier/adder, and inverting amplifier

The educational goal of this exercise is accomplished by recording the transmission characteristics of the designed filters.

D. Analog multiplexer

The analog multiplexer is a switching device that allows two or more transducers to be connected to one amplifier and one analog to digital converter. Generally, the multiplexer is controlled by acquisition software. The advantage of the multiplexer is that the user does not have to purchase multiple A/D converters if multiple transducers are to be monitored. In this exercise, students learn how to properly connect different types of analog multiplexers/switches (Fig. 11 and 12) and how to control them by acquisition software on MMS and PC.

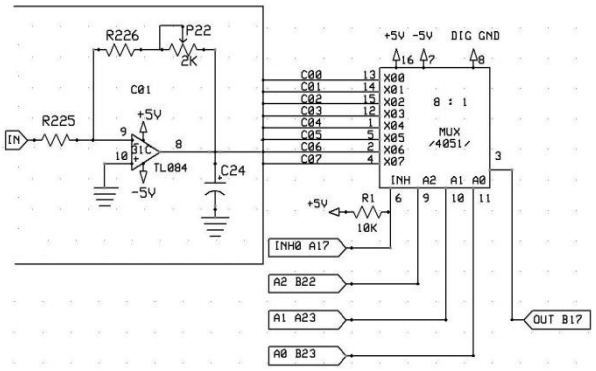

Figure 11. The example of connection the 8-channel analog multiplexer/demultiplexer 74HC4051

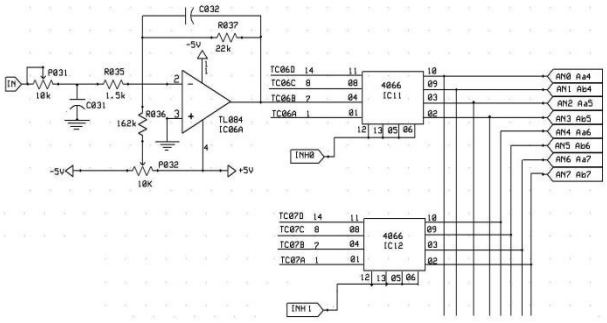

Figure 12. The example of connection the quad bilateral switch CD4066BC

E. Analog toDigital(A/D) converter

The A/D converter is a binary encoder that converts the transducer output into the corresponding binary value which can be further processed. The A/D converter can interface with a PC by direct connection to the internal bus, or through the external communication channels such as the RS-232, USB or Ethernet connection. In the exercise manual students can find basic information about each type of A/D converter used in the exercise.

The program sequence for control the A/D conversion is as follows:

- setting the address of analog channel that will be brought to the input of the A/D converter,
- setting the start of the A/D conversion,
- testing whether the A/D conversion has been completed,
- saving the results of A/D conversion.

The goal of the exercise is accomplished by understanding a short programs written in Turbo Pascal and Turbo C that control the 12-bit A/D converter AD678 (Fig. 13) [2].

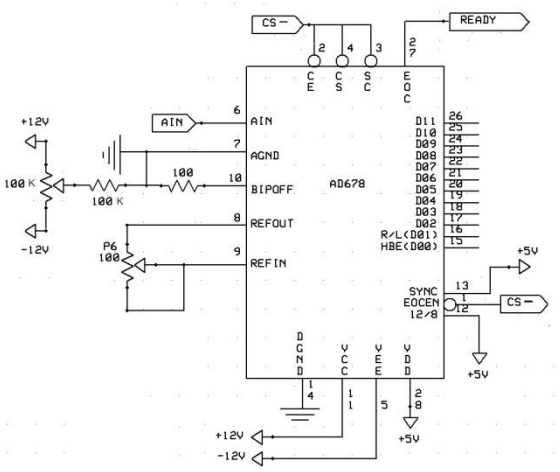

Figure 13. The example of AD678 unipolar input connections with gain and offset trims

F. Data acquisition software

The performance of a data acquisition system is largely dependent on the software controlling the multiplexer, A/D converter, and the output/control devices [1]. The special SCADA real-time application, operating in MS Windows environment (Windows 98/2000/XP), was developed in order to support MMS functions and to perform data transfer, analyses and real-time interpretation of results [4]. It was based on client/server architecture running on both master and remote stations, enabling integration in a complex distributed control and monitoring system. SCADA was developed using Microsoft Visual C++ 6.0 [5]. During the exercise, students learn and practice how to set the monitoring properties of the SCADA application related to the configuration of the input parameters.

Figure 14. The example of data presentation in tabular form in the SCADA application

IV. CONLUSION

The students and teachers experiences regarding the work in this laboratory clearly indicate that it greatly contribute to a better understanding of the planned educational program. In order to labs done correctly some previous knowledge in electronics and electrical engineering are required. It is also necessary that students undertake serious preparations prior performing the exercises. These preparations consist of a detailed study of the instructions for the exercise and recommended literature before coming to the lab. Even though, the majority of students thinks that the exercises are interesting and contribute to a better understanding of the teaching content.

ACKNOWLEDGMENT

This work is supported by a grant from the Ministry of Education, Science and Technological Development of the Republic of Serbia, as a part of the project No. TR33037 “Development and Application of Distributed System for Monitoring and Control of Electrical Energy Consumption for Large Consumers."

Abstract - Programming is a major subject in Computer Science (CS) departments. However, students often face difficulties in the basic programming courses due to several factors that cause these difficulties. The most important reason may be the lack of problem solving abilities that many students show. Learning to code can be made more effective and sustainable if it is perceived as fun by the learner. Code Hunt uses puzzles that players have to explore by means of clues presented as test cases. Players iteratively modify their code to match the functional behavior of secret solutions. The aim of this paper is to present the results of implementation of Code Hunt in learning Java as part of the Object Oriented Programming curriculum. The participants of the research were students of Subotica Tech majoring in computer engineering. The research was conducted over the fall semester in the 2014/2015 academic year.

I. INTRODUCTION

Programming is a complex mental activity that is defined as an abstract process. Understanding and visualizing abstract processes poses a considerable problem for students when learning programming, as well as other fields with similar characteristics. Many students find it frightening, as programming might require thinking in ways of abstraction that has never been practiced before. Learning to code can be made more effective and sustainable if it is perceived as fun by the learner.

Games are an integral component of people's daily lives. Over $20.5 billion was spent on video games by Americans in 2013 [1]. While the games' primary aim is to present entertainment, given how universally applicable they are, games have long-since outgrown their entertainment role. Games are implemented not only to provide entertainment, but also in the fields of defense, education, scientific exploration, health care, emergency management, city planning, engineering, religion, and politics. Apart from entertainment games there are also the so-called serious games whose primary goal is to train, investigate, or advertise.

Code Hunt is a highly effective educational gaming platform that internally leverages fitness values so as to guide the user to successful test/clue generation, furthermore, it also externally provides its users with entertaining learning experiences where search-based test generation is manually emulated. Code Hunt is a new attempt to create a game using serious search-based testing, make it available for a huge group of users, including coders, and especially learning coders [2]. The test cases are constantly changing, since they are built based on the mined data, thus players will enjoy a new experience every time. Learning to code can become increasingly efficient and sustainable if the learner sees it as 'fun' as opposed to 'learning to code'. Code Hunt was launched in May 2014.

II. BACKGROUND-PEX FOR FUN

Code Hunt uses puzzles that players have to explore by means of clues presented as test cases. Code Hunt is based on the test/clue generation of Pex, a white-box test generation tool that uses dynamic symbolic execution.

Pex [3] is an automatic white-box test generation tool for .NET, based on dynamic symbolic execution. This tool is integrated into Microsoft Visual Studio in the form of an add-in. It can generate test inputs which are combined with different unit testing frameworks [4]. Pex have been implemented in classroom teaching at various universities (for example North Carolina State University, University of Illinois at Urbana-Champaign, and University of Texas at Arlington), and also in a variety of tutorials both within Microsoft (such as internal training of Microsoft developers) and outside Microsoft (such as invited tutorials at .NET user groups). Further, the authors of Pex created numerous open source research extensions upon it [5].

One of the most important methodologies that Pex supports is called parameterized unit testing, which broadens the scope of today's industry practice which prefers closed, traditional unit tests (i.e., unit test methods without input parameters) [4].

There are useful characteristics that Pex offers to support for testing. Primarily, there is the option of exploring code and suggesting the tests that should be done. Secondly, assuming that it is a parameterized test, Pex can determine the combination of parameters that has to be tested so as to provide all feasible versions. Lastly, once Code Contracts is being used, Pex uses that information to fine-tune the unit tests that are offered or generated for the user [6].

III. CODE HUNT, AN OVERVIEW

As stated above, Code Hunt is an educational coding game. The play scenario is the following: the student will impersonate the code player, whose task is to detect the missing code fragments. Points are gained by completed level, while extra points are granted for elegant solutions. The game can be implemented for either C# or Java. During the game, the player will make their way to specific sectors and gain knowledge about arithmetic operators, conditional statements, loops, strings, search

algorithms and more. The entire gaming experience has an underlying automated grading engine based on dynamic symbolic execution. The grading engine automatically analyzes the user code and the secret code so that the result table is generated. Most modern browsers including Internet Explorer 9, 10, 11 and recent versions of Chrome and Firefox are suitable for running Code Hunt [2].

Figure 1. The start screen of Code Hunt

Code Hunt resembles most games in the sense that there are sectors and levels. Code is written in an editor window by the player, they use either C# or Java as the programming language.

An initial set of given code examples called puzzles are being displayed in the working area for users (players) to play with. Each puzzle has the main method with the name “Puzzle”. After a puzzle is loaded in the working area, a player could click the “Capture Code” button to compile and run it. After that [2]

(1) the code is sent to a server in the cloud,

(2) the server compiles the code (including an optional Java-to-C# conversion),

(3) the server starts an in-depth analysis of the code, it is compared with the goal algorithm,

(4) the player will then be presented with the results (Figure 2).

Figure 2. The results of the compilation

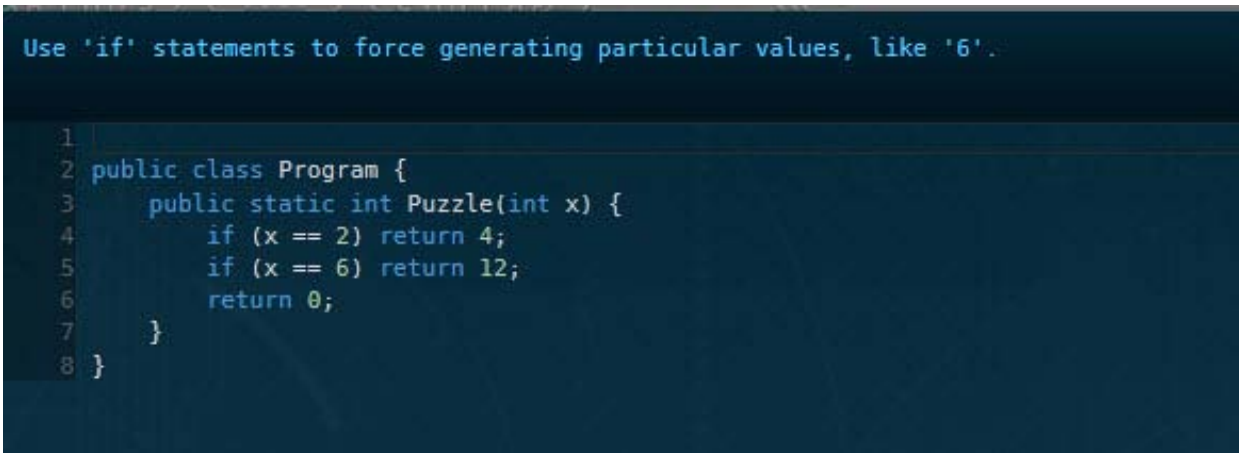

Figure 2.a The secret code

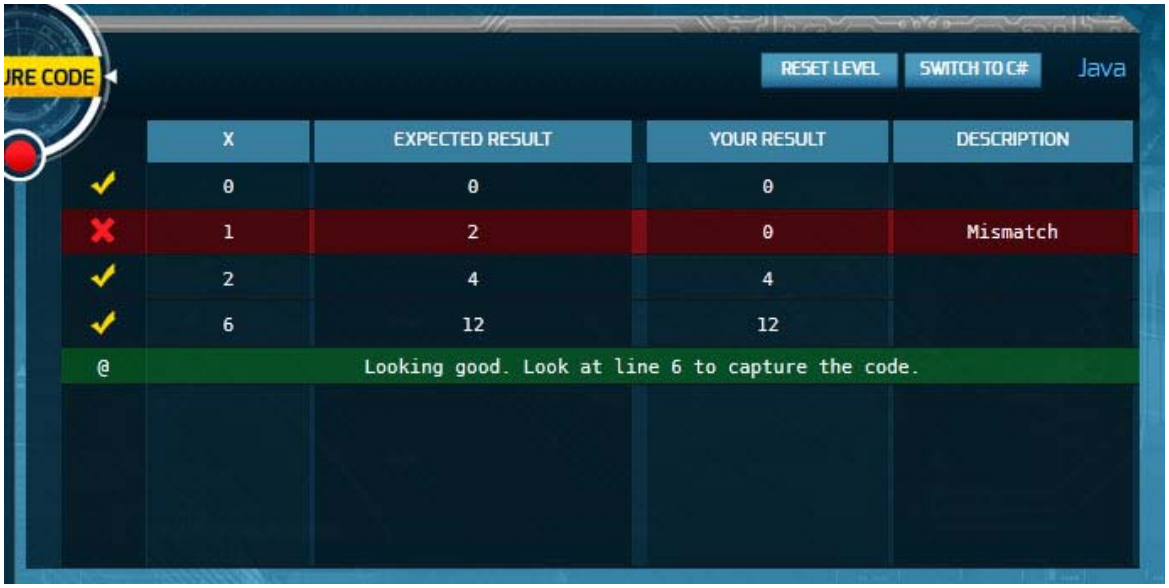

Figure 2.b The result table generated by analyzing the user code and the secret code

The main Puzzle method can take parameters and return values. In order to run such a Puzzle method, someone must provide argument values. Code Hunt automatically finds interesting argument values by analyzing the code. The result will be either a compilation error, with information in the bottom pane, or some mismatches or agreements with the goal algorithm. The code is presented left in Figure 2, while on the right there are the mismatches (red crosses) and agreements (yellow checkmarks).

The player has completed this level successfully if the code has compiled and no mismatches were found, only agreements with the goal algorithm. In the game this is described as the player having “CAPTURED!” the code, here seen in Figure 3.

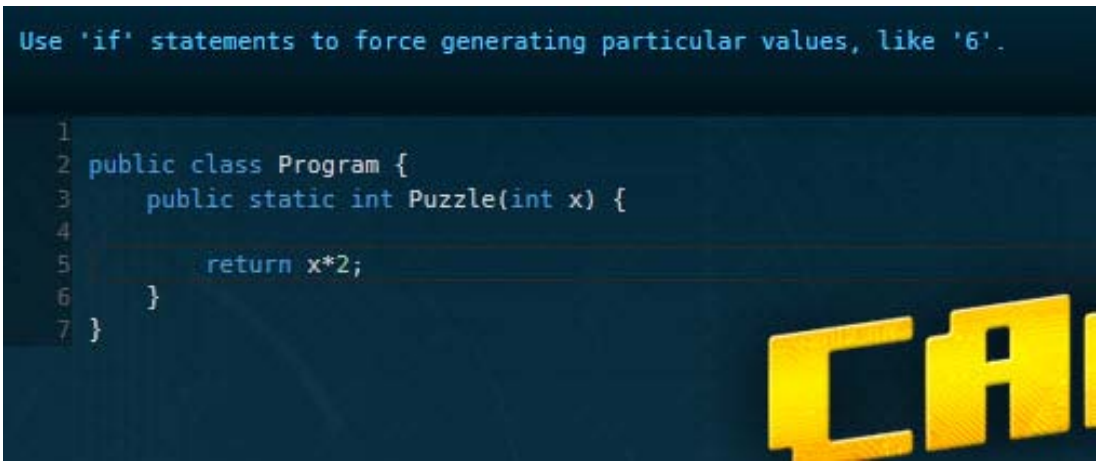

Figure 3. After solving the puzzle, the player receives a score

As a follow-up, each mismatch and agreement with the goal algorithm is returned in the form of a tuple (input, actual result, expected result). In the case when the player's code is in agreement with the goal algorithm, the actual and expected results are identical, while, if a mismatch has occurred, they are different. The player is given a chance to examine the mismatches and figure out how to modify and improve the code so a greater resemblance is achieved with the goal algorithm [2].

Upon the completion of a given level, the player will be prompted to choose a somewhat more difficult level, so as to keep up the flow. Also, all sectors bar the first one are locked as their default setup. Only when the player has completed a satisfactory number of levels in a certain sector does the next sector become unlocked (Figure 4).

Figure 4. The game's sector

IV. RESULTS

The participants of the research were students of Subotica Tech majoring in computer engineering. The research was conducted over the fall semester in the academic year 2014/2015. The sample consists of 52 students from the second year of computer science who attended classes in the subject Object-Oriented Programming II. This course examines object-oriented programming techniques and issues in Java programming language. The student obligations during the semester include passing two midterm exams, doing one home assignment, and completing the final project. From the total numbers of students, 8 were female (15.38%) and 44 male (84.62%) students. Until the end of the semester 4 students had dropped out (they did not attend classes) and did not participate in the research itself.

Students were asked to rate their understanding of various topics that are covered with Code Hunt (arithmetic, loops, conditionals, strings, nested loops, arrays). The scale was from 1 to 5 (1="insufficient", 2="sufficient", 3="good", 4="very good", 5="excellent"). The results are shown in Table 1.

TABLE 1 THE AVERAGE RESULT OF UNDERSTANDING VARIOUS TOPICS

	Average (max of 5.0)
arithmetic	3.71
loops	3.25
conditionals	3.10
strings	3.45
nested loops	3.08
arrays	2.89

As can be seen from the results, students in general were confident in all topics. On the first midterm exam they had an average of 11.23 points out of 15, so it could be concluded that they rated their knowledge and understanding of various topics objectively.

In the second half of the semester students were taught the following topics: classes, objects, encapsulation, virtual functions, inheritance and polymorphism. This was followed by knowledge evaluation. In this test where the students' knowledge was tested, the questions referred to the second part of the semester when CodeHunt was not used in class. In general, students had some difficulties in comprehending and implementing this part of the curriculum. They rated their understanding of topics as shown below, in Table 2. In all categories their knowledge was above "good". On the second midterm exam which

covered these topics they had an average of 7.33 out of 15 points.

TABLE 2 THE AVERAGE RESULT OF UNDERSTANDING OOP TOPICS

	Average (max of 5.0)
classes	2.63
objects	2.54
inheritance	2.47
polymorphism	2.18
virtual functions	2.13

The semester ended with a survey regarding their views on implementing CodeHunt in their studies and if they liked this gaming approach. CodeHunt was used in the first part of the semester. In the second part of the semester the students are quizzed on the following items: classes, objects, encapsulation, virtual functions, inheritance and polymorphism, but the knowledge evaluation was not performed using CodeHunt.

The possible answers were 1=”I hate games”, 2=”it was so-so”, 3=”it was fun”, 4=”it was great“. The value 2.75/5.0 refers to the average grade of 2.75, whereas the maximum was 5.0. The obtained average result of 2.75 indicates that the students liked this way of learning and they marked it as “fun”. Students who played the game, solved an average of 45.7 percent of Code Hunt’s puzzles. The statement “the puzzle aspects of Code Hunt keep me focused on trying to reach solutions,“ showed that the majority of students agreed (“A lot” 37.5% and “Quite a bit” 45.83%) and 16.67% answered “Not at all”. Only 5 students (10.42%) answered that they tried to find an elegant solution and the rest of them (89.58%) replied that they only tried to find a solution that worked (“My solution was a mess but it works”).

V. CONCLUSIONS

There is a considerable difference in learning to code by solving a puzzle and learning to code by writing to a specification. A great number of competitions can be found that have students competing against other students – as well as trying to beat the clock – so that they find a solution matching the given problem. The advantage of this sort of coding is that it simulates real-life situations the students are likely to be up against in their professional lives. Code Hunt is focuses not on the process of learning to code, in fact, it is form of side-effect the problem-solving itself, shown as pattern matching inputs and outputs. The fun part is provided by the challenge of detecting the pattern. Fun has been defined as an indispensable component aimed at increasing the learning efficiency and keeping the students interested in this coding process, which may, at times be seen as tedious and time-consuming process with the result: learning the vital coding skills [2].

Code Hunt is a highly effective educational gaming platform that internally leverages fitness values so as to guide the user to successful test/clue generation furthermore, it also externally provides its users with an entertaining learning experiences where search-based test generation is manually emulated. Code Hunt is a new attempt to create a game using serious search-based testing, make it available for a huge group of users, including coders, and especially learning coders [2]. The test cases are constantly changing, since they are built on the mined data, thus players will enjoy a new experience every time. Learning to code can become increasingly efficient and sustainable if the learner sees it as ‘fun’ as opposed to ‘learning to code’.

thorvat3@tvz.hr; talajbeg@tvz.hr; spredanic@tvz.hr

Abstract - The teaching materials, laboratory exercises, and the whole assessment system of the Personal Computer Applications (PCA) course, in the professional study of Electrical Engineering at the University of Applied Sciences in Zagreb, are based on the Moodle e-learning system. Generally speaking, there are always pros and cons when e-learning is considered. Students have access to all teaching materials, tasks and direct communication with the teacher at all times. On the other hand, if there are problems, it is hard for the teacher to distinguish the exact cause. Students may encounter problems in understanding the materials or in the use of instruments and computer applications; without direct contact, it is virtually impossible for the teacher to motivate them to continue working despite the difficulties. Another challenge for the teacher is detecting which parts of the subject are most interesting to the students and which parts demand more attention and maybe different methodologies. Using blended learning, combining the advantages of both e-learning and person to person teaching / learning, it is possible to achieve a better effect for the mutual benefit. This paper presents the teachers experience and students perception of blended learning as well as assessment system.

I. INTRODUCTION

New IT technologies are being used in education for years, and they are especially characteristic for higher education. Recently, the combination of classical way of education (face-to-face, brick-a-mortar, chalk-and-talk) and e-learning is becoming more and more popular. That combination is often called blended learning, as well as hybrid learning. There are different definitions of blended learning [1], [2], [3], [4], [5], but generally it can be said that it is a combination of classical and technology mediated learning [2]. Speaking from our own experience [6], [7] and definitions mentioned above; it could be said that the phrase „blended learning“ implies a formal educational system that combines on-line and face-to-face lectures (or knowledge transfer in any possible meaning) with assessment system. All this can be achieved by applying different teaching and assessment methods [5], [6], [7], and by different ways of preparing for the exercises, availability and possibilities for practising and learning.

Based on these experiences and models mentioned in the literature, one can distinguish several forms of blended learning. In the first form the teacher, working in person with the students, notices a strong interest or necessity for additional clarifying, and gives customised additional content for each student (in the laboratory or on-line to work at home). In the second form, the students attend lectures and exercises according to the given schedule, while all of the materials are available online in learning management system (LMS). Different construction assignments are given to each student, through LMS, and they need to solve them using prior gained knowledge and online support. And the third form, in which the students prepare for classes from online materials, and the lectures only increase the level of understanding. In that form students do the exercises independently, online, from home. Although the literature mentions several ways of organizing blended learning, the essence are these three forms. Different combinations and use of each individual component of these three ways are also possible. In the PCA course the second method of blended learning organization is mostly used.

II. ORGANIZATION OF THE PCA COURSE USING BLENDED LEARNING ENVIRONMENT

The teaching and assessment system on the PCA (Personal Computers Applications) course, at the professional study of the Electrical engineering at the University of Applied Sciences in Zagreb, are based on the ideas mentioned in previous chapter. Lectures, laboratory and construction exercises on the PCA course are the parts of blended learning environment which consist of general and personalised instructions, practical and individual work for each student.

Since the course is at the beginning of study, it includes general IT and computing concepts, possibilities, and basic work principles of parts and subsystems in a computer. Also, very important part is the practical work with computer applications which can be of great importance to future engineers. Practical work is individual; each student has their own computer, so it is necessary that they come to the exercises well prepared for the current subject. To assure that, they have constant access to the materials for learning and practising (through Moodle e-learning system) and computer applications (use of free or demo software) [6].

Basic use of computers is not easy to present to the participants who come from different backgrounds. They had different availability of information technology and the Internet, thus varying degrees of knowledge. Their previous interest in the subject can not be ignored as well [6]. The personal contact between the students and the teacher helps to detect students' sphere of interest, their motivation and enables teacher to try to encourage and

motivate students. These are the reasons why the PCA course is designed in the blended learning environment.

First part, of the blended learning environment in the PCA course, are the lectures. Materials – slides for the lectures are available, even before the lectures, in Moodle e-learning system. Web links and a list of additional literature with detailed explanations of terminology, work principles etc. are a part of the slides. Lectures are held, face - to - face, in two relatively large groups (around 100 students in each group), where students can actively participate, ask questions and further explanations.

Second part are the laboratory exercises. Materials needed for the preparation before the exercise, are also available through Moodle. The laboratory exercises are held in smaller groups (around 12 students in each group), so each student works on their own computer. At the beginning of the exercise, the teacher explains the goals, purpose and the way the exercise will be done. Then, the work with a certain application is presented, with the emphasis on the most important parts which the students might need in further work. After that, the students practice working with the application on their own, according to the given instructions. The teacher is in the laboratory the whole time, and is available for all the possible questions – for those students who need extra help, and for those who are interested for more advanced uses of the application.

There are also construction exercises, which are the completely individual student work. Students need to write a simple programming code; using all of the previously gained knowledge and skills; using materials available and sharing experiences with their colleagues.

Blended learning environment has, through the years, proved to be the most efficient way for organizing and administering the course, and assessing students' knowledge. Initially, a lot of time is required for the design, preparation and organization of such a system, the creation and adaptation of necessary teaching materials. Details regarding to certain specific features of material preparation, assuring that the computer applications used in the classes are available for the students to practice at home, as well as system administration and system assessment are outlined and described in [6] and [7].

Creating such a system is never quite finished: over the years, occasional corrections are needed – changes in modalities of organization, administration and ways of processing the topics, all based on empirical indicators. Although there is always a need for regular improvements and modernization (it is on the computer, so constant change is normal), the use of blended learning environment after a few years begins to bear benefit: as for the time, and as far for the resources (space, energy consumption, working hours...) and perhaps most importantly - helps students, in the most simple way, gain necessary knowledge and skills. In the next chapter, perceptions of consumers (students) of blended learning will be discussed. That includes a comparison with the conventional lectures and full e-learning system, and their perceptions of the usefulness of this type of organization of teaching and examination system on the PCA course.

III. STUDENTS' EXPERIENCE IN USING BLENDED LEARNING ENVIRONMENT

Students, during their education, encounter different ways the organization of teaching and assessment. How do students perceive this way the organization of teaching and assessment system on the PCA course? What are the good sides and what are not so good sides of this environment? What do they find extremely important and interesting, what they think is not as important or interesting, and what makes them want to work and know more? Quantitative research on this subject was conducted among the students at the PCA course, at the end of the semester in a form of a survey with 11 multiple choice questions – some single answer and some multiple answers, without ranking. The survey was created through Google forms, which ensured anonymity, and the link on it was available for students through Moodle. There are 216 students enrolled in the PCA course, in the academic year 2014./15., and 153 (randomly chosen) of them completed the survey. The questions regarding pure e-learning and chalk and talk were referring to their experiences in general, while the questions regarding blended learning were referring on their experiences on the PCA course. That way, it can be determined how students perceive blended learning on the PCA course in comparison to chalk and talk methods which are still standard in education. The survey was in Croatian language, so it appears in figures shown in this paper, as it is the mother tongue of almost all of the students.

A. *E-learning – pros and cons*

Question regarding the technologies, which do they find most acceptable for learning and most useful way of transmitting / collecting information and knowledge, was chosen as a starting point. Computer with the Internet connection for 76.47% of the responders represents the most useful and most used medium for this particular purpose. Just a little more then one fifth of them (22.88%) considered books and printed materials the most important and most useful for transmitting and collecting knowledge and information. Interestingly, less than 1% considered the same for TV. Based on this result, it is obvious that it is very important for the students, in information gathering and learning, to have a computer available materials and lessons (lectures). Considering the extremely high percentage, this fact can be further used to design more materials to prepare for the lectures and learning.

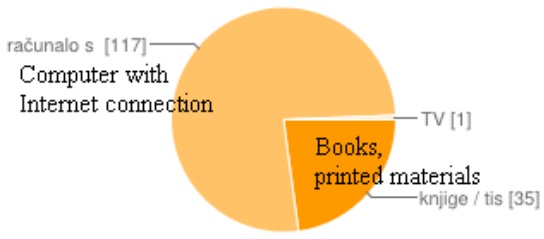

Figure 1 Which technologies do students use for learning?

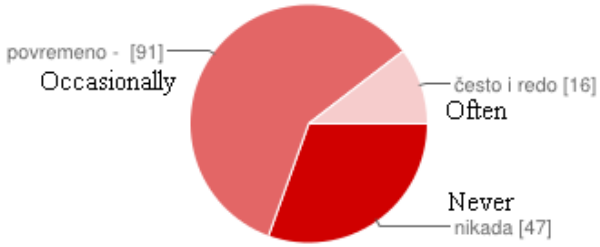

Figure 2 How often did students use pure e-learning?

Therefore, students were asked if they have, and how completely independently and actively, used pure e-learning in any form (lessons, lectures, exercises...). Question considered any subject or area, the important thing was that the materials were only accessible via computer with Internet connection, such as for example: khanacademy.org, tonimilun.com, tesla.carnet.hr or YouTube in terms of tips & tricks how to work with some computer applications. This way of learning is often used by 9.80% of students but 3 times more (30.72%) never used pure e-learning. Pure e - learning was occasionally, therefore rarely, used by 59.48% of responders. Thus, a total of more than 90% of responders never or rarely used computers available materials for independent learning. Seemingly, this is in contrast with the fact that for them almost 77% of them the computer with an Internet connection is the most important and useful access to information and knowledge. However, this is completely independent learning, occasionally or never practised more than 90% of students, and these two data are not to be confused.

As major drawbacks or limitations of pure e-learning system [multiple answers could be checked] those who regularly or occasionally used it (9.80% of them often and 59.48% occasional users, a total of 69.28%) reported the one-way communication (52.29%) and the inability to verify the quantity and quality of learned material (38.56%). Respondents also find sociological component significant, the inability of consultations with fellow students when learning is the limiting factor of e-learning for a third of the population (33.97%). A minority (1.3%) considered material unavailability due to works on the network or slow web link as a big limitation.

However, two-thirds of these students (69.28%) who are periodically or regularly using e-learning system for independent learning, as the biggest advantages of this way of learning lists current and easy access to the requested material (55.56%). The possibility of repeating the lessons (replay) is important to 49.02% of the students. Ability to access materials from anywhere at any time of the day (and night) is considered an advantage for 48.37% of the responders. For a third of respondents (32.68%) it is important that the all of the materials are concentrated in one place - everything needed is accessible within a few clicks.

B. Chalk-and-talk - pros and cons

In a specific time in a specific place, lectures are held ex cathedra, exercises in groups, chalk and black board or marker and white board, tests corrected manually, results available to students in a couple of days. It's hard to keep track of own achievements, especially in several courses with different modes of evaluation, which is not in accordance with the Bologna process in higher education. This is a general and brief factual description of the traditional, classic, way of teaching that still prevails in the professional study programs at the University of applied sciences in Zagreb.

When asked to highlight the most important disadvantages of this, traditional way of teaching organization and assessment system, students have pointed out the murmur and similar distractions in class when the more people are attending the lectures (49.02%). The next greatest shortcoming in students' opinion is that the subjectivity of teachers can affect the grade (48.37%). The fact that they have to come to a specific place at a specific time is a disadvantage for a little more than one third of the population (36.60%), and almost the same percentage (35.29%) feels that the deficiency is the emphasis on aural rather than the visual. Despite the shortcomings, this system of teaching was considered the best for one third of the student population (34.64%) but only if it is performed in small groups.

Of the advantages of the classic ways of organizing teaching and assessment system, students with very high percentage emphasize the interactivity with the teacher (73.20%), therefore, they very highly appreciate and the possibility of direct personal communication with the teacher. Next in significance to them is another sociological component: the possibility of direct and personal communication with their fellow students (59.48%). On the third place in order of importance is also another sociological component: the possibility of the experience transfer (from teachers to the students) in the work or when meeting a certain phenomena (35.29%).

Looking at these results, concerning the classical way of teaching, it can be concluded that it is a way of teaching that fits the students but only if it is a small group. This is concluded on the basis of direct claims of a third of students (34.64%) and based on a high percentage of them who considered direct contact with the teacher (73.20%) and colleagues (59,48%) to be the most important. Of course, this kind of teaching with small groups is not possible to organize in the mandatory courses, especially in first two years of the study where there is a lot of students. Sometimes it is possible to organise classes in this way, for some elective courses in the third year of the study, which enrolled a small number of students.

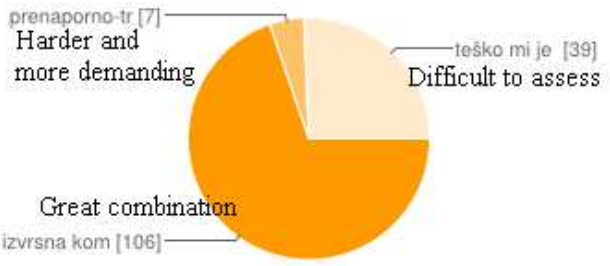

Figure 3 How do students perceive blended learning environment in relation to classic way?

C. *Blended learning*

Comparing the mutual advantages and disadvantages of traditional and e-learning system, it is noted that some benefits of one at the same time disadvantages of another. For example, in the classical way of teaching organization one of the advantages is the interactivity with the teacher and fellow students; while the impossibility of two-way communication is mentioned as a disadvantage in pure e-learning system.

When asked how often they have met with a combination of e-learning and traditional ways of teaching, during their education, regardless of the degree of mutual integration, 7.19% of the respondents answered that it was often. Occasionally (33.99%) or never (58.82%) with such a mode of organization of teaching encountered 92.81% percent of the student population.

How do they, after the entire semester of teaching / learning in blended learning environment, perceive this way the organization in relation to classic way, was the following question. 69,28% of students considered this to be a good combination, while 5.23% estimated blended learning environment harder and more demanding in relation to the classical way of teaching. Quarter of the respondents (25.49%) found it difficult to assess which method is better.

Most of the students (73.20%) highlighted continuous availability of materials and computer applications for learning and practising and all at one place as the most important and most useful characteristic of blended learning system. A large number of respondents (58.17%) considers a direct and personal (eye-to-eye) contact with the teacher as the very significant part. The ability to communicate with the teacher and outside the class schedule or consultation is significant for 44.44% of the students, and almost identical number of them (43.14%) finds direct and personal (eye-to-eye) contact with their colleagues important. Indirect conclusion may be that the social component is one of the key parts in the process of studying and acquiring knowledge and skills.

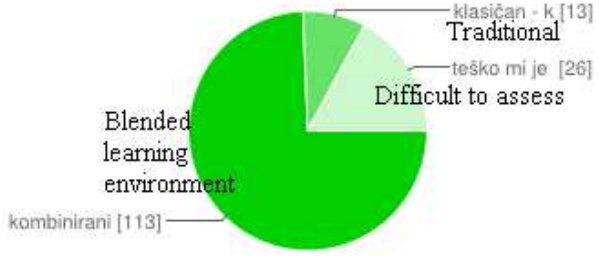

Figure 4 Which manner of organisation motivates students better?

Since the Bologna process requires continuous monitoring of students, the students were asked to evaluate the importance of constant availability of their achievements, but also a plan of lectures and exercises visible in advance so they can plan their tasks and activities. This is, of course, possible to enable only using computers. 55.55% of the respondents considered this important and useful in this kind of organization. For the majority of students, even 83.00%, speed of assessing their tests and the availability of the results as soon as possible is very important and useful.

The attitude of students towards the role and influence of teachers in the evaluation process is particularly interesting: for the 39.87% of them it is an advantage that in tests which are assessed automatically, by the computer, the subjectivity of teachers is eliminated. However, even 47.06% of students considered it important that, despite the fact that the computer evaluates the tests, the teacher can intervene in the assessment at their sole discretion. E.g., if the boundary for the pass is set on 50.00%, the border can be moved to 49.65% by teacher's intervention.

Finally, the study was concluded with a personal impression of students, which manner of class organisation and the assessment system encouraged them to learn more, to achieve better grades and to acquire new skills. Even 73.86% of the population believes it is blended learning environment, compared with 9.15% who thought the traditional manner. Others (16.99%) found it difficult to assess.

IV. CONCLUSION

Blended learning can not be considered as a mere sum of two ways of teaching organization, it can not be regarded as the classic method of teaching with added e-learning component. Or vice versa; e-learning with possible consultations. In the organization, implementation, application and interpretation of blended learning environment is required a holistic approach. Part of the results of the research indicates it, such as the one about the role of computers and teachers in the evaluation process. This research can not be considered exhaustive or final. It has only discovered and opened new questions that deserve to be answered. For example, students (in the part of useful segments in blended learning environment) were asked to assess how important is the ability to communicate with the teacher and outside the class schedule and consultation. This was considered important and useful for 44.44% of students. Without denying that sometimes indeed there is such a need (communication with the teacher outside the class schedule and consultation), one might reasonably ask is this, at least in part, a reflection of students' poor organization of their own time? Or dependence in work and learning when they expect regular incentives by the teacher? To search for answers to these and similar questions, it is needed to carry out extensive research over several generations.

Organisation of the course - lectures, exercises and assessment system is a consequence of the number of students in this course and the subject matter. In the study

of electrical engineering, one of the key segments is the practical work with instruments and a variety of computer applications. This conditions the organization of teaching and assessment system on each professional course. The fact is that the PCA course annually enrols more than 200 students and that they should master practical work with a variety of computer applications. This should be done regardless of their different backgrounds, as for the interests and their own skills to work with computers. Experiences have shown that this type of organization of teaching, exercises and assessment system is very efficient in these situations. The conducted survey confirms this. This regime has been applied for seven years on this course. It would be interesting to accurately calculate and show how much benefit for the institution (University of applied sciences in Zagreb) this brought, how many teaching hours have been saved, as reduced energy consumption.

Results of this study suggest that everything possible in the process of organization of teaching and assessment systems should be organized in the e-learning system. Some of the examples are: preliminary exams and regular exams, records of attendance and other types of administration, materials for attending lectures and preparation for the exercises. Space where students can upload their work (such as seminar papers) should be available as well. Besides the advantages for the teachers, less paperwork being the biggest advantage, the results of research directly indicate the benefits of the online available materials (section III A).Considering that for almost 77% of the respondents computer with an Internet connection is the main way of transmitting information and knowledge, over the next academic years it would be useful to create video clips with instructions for the use of certain tools and software, explanations of some computer terms and procedures. Almost 74% of respondents stated that blended learning encourages them to learn, acquire knowledge and skills and ultimately achieve better-marks which motivates the teachers to continue working and developing in these areas. Research will be repeated in the few next academic years to monitor and compare the results, and after a number of years to make a comparative analysis with a definite conclusion.

Abstract - The aim of this study was to evaluate the efficacy of digital i.e. e-Log Book, to determine the opinions of teachers as direct beneficiaries of Log Book about its efficacy, and based on teachers' opinions gain insight into what can be improved in the e- Log Book. The expected result is not to eject the traditional Log Book from the use, but that information in it can be used more effectively, accessible and optimally well archived.

I. INTRODUCTION

The introduction of new services and software in education is part of the overall IT transformation in society, so that global computerization characteristics are applied to this social issue as well. In the basis for the computerization of education some relevant factors are of social, technical and technological nature [1]. On the basis of the explosive development of microelectronics, information technology telematic networks, space for the introduction of information technology is opened. information systems that increase the power in the disposal and handling of information are hurriedly introduced and developed [2]. In developed educational systems records of students and their achievements are largely digitized, and there are studies that have dealt with the qualitative analysis of their application [3] .

In Serbia, there are a number of software solutions for electronic evaluation of pupil achievement. The most famous is just a project called "Electronic Log Book". The project "Electronic Log Book" is applied in 500 schools (which amounts to about 25% of all elementary and secondary schools in the country), the list of schools-users is a trade secret of the author of the project, but it can be checked indirectly through the server: www.e-ocene.org.

When considering the use of software for the electronic evaluation of the success of pupils outside the Republic of Serbia, there are very similar software solutions. On the Croatian territory there are several software packages under the names: "Electronic directory of schools", "School Log Book" and "SMS System". Total applicability is reduced to about 30 schools across the Croatia [4].

.

II. RESEARCH METHODOLOGY

The aim and tasks of research

The aim of the research was to identify attitudes of teachers regarding the effectiveness of electronic log books in elementary school. In particular, perceive the attitudes of teachers in improving administrative tasks as well as enhanced communication with parents. It will be determine whether there is a statistically significant effect- the length of service of teachers on the attitude about e-Log Book. The ultimate goal of this research is the prediction of the success of the implementation of the electronic Log Book on a broader level and proposed measures for its widely popularizing, even legal regulation of its application.

Research Tasks:

1. Examine whether the members of the teaching staff are aware of the possibilities offered by the e-Log Book.
2. Determine if the e-Log Book facilitates the organization of educational work.
3. Determine what are the advantages of e-Log Book in the organization and management of the school.
4. Determine imperfections of the e-Log Book in the organization and management of schools.
5. Explore whether this software facilitates communication with parents.

Research hypothesis

The main hypothesis of this research project is as follows: Elementary school teachers have a positive attitude about the effectiveness of the implementation of e-Log Book.

Auxiliary hypothesis is: Among teachers with different work experience there is a different degree of acceptance of digital i.e. e-Log Book.

Research variables:

Research variables are the following: the effectiveness of e-Log Book, teacher attitudes, years of service.

Research methods and techniques

Research methods are:

•Theoretical methods,
•Descriptive statistics,
•Determine the frequency, percentage, measures of central tendencies and variability measures.

Statistics reasoning - correlation analysis - to determine the correlation coefficient of the independent and dependent variables.

The research technique is questionnaire.

Scale of assessments that is used is the Likert scale. The survey used the Mann-Whitney test and Kruskal-Wallis test.

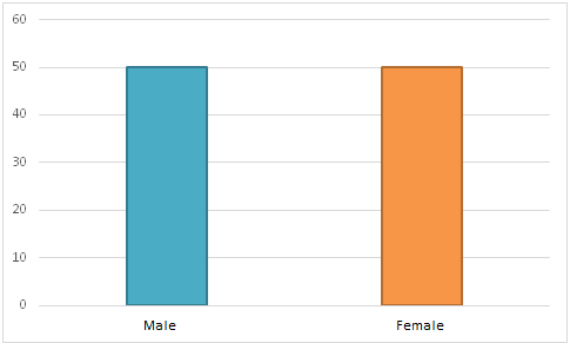
Indicators are written testimonies of teachers on the basis of which will be analyzed for inferring the efficiency of e-Log Book.

Population, location and sample surveys

The experiment was conducted in two elementary schools: Elementary School "Svetozar Markovic Toza" and elementary School "Zarko Zrenjanin" in Novi Sad, within the 2013/2014 school year. The research sample included a total of 100 participants (teachers).

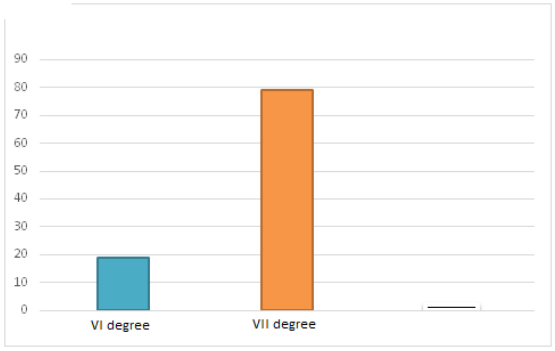
III. RESEARCH RESULTS

The study included 100 patients, with both sexes represented in equal numbers of cases (50 men and 50 women). The results are shown in Graph 1.



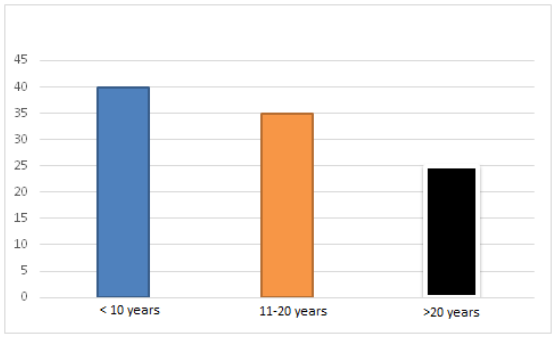
GRAPH 1. THE GENDER STRUCTURE OF THE SAMPLE

In most cases (79%) respondents have seventh or higher level of qualifications, while in a minority of cases (29%) of respondents have higher level of qualifications. In 2% of the respondents did not provide information on the level of educational attainment. The results are shown in Graph no.2.



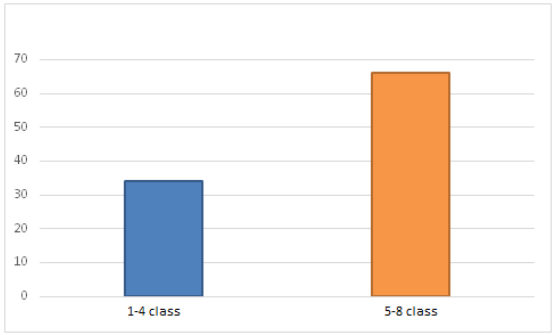
GRAPH 2. STRUCTURE OF THE EDUCATION LEVEL OF RESPONDENTS

In most cases (40%) respondents have up to 10 years of service, then 11 to 20 years of service (35%) and the smallest number of cases over 20 years of service (25%). The results are shown in third Graph.



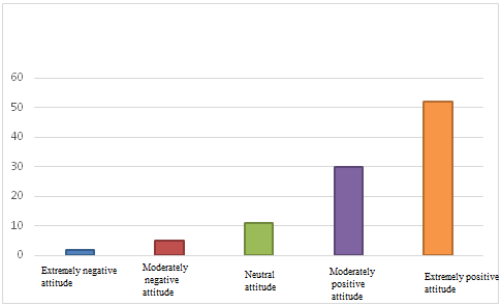
GRAPH 3. STRUCTURE OF RESPONDENTS IN RELATION TO THE YEAR OF SERVICE

In most cases (66%), teachers are from the field of higher grades, while in a minority of cases (36%) of teachers in the area of the lower grades. The results are shown in Graph no.4 in diameter.



GRAPH 4. STRUCTURE OF RESPONDENTS IN RELATION TO THE CURRENT TEACHING AREA

As the assessment of e-Log Book conducted through five-point Likert scale, it can be concluded that 82% of respondents expressed a positive attitude (moderate - 30% of respondents; 52% of respondents strongly) to the efficiency of e-Log Book.

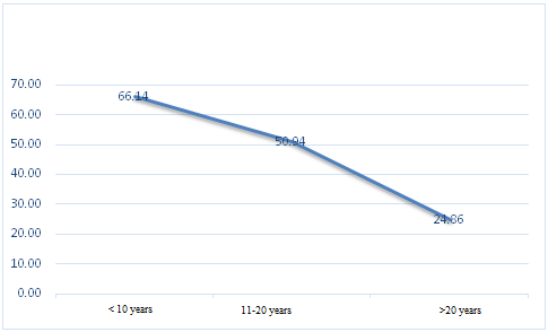


GRAPH 5. STRUCTURE OF THE RESPONSES ON THE EFFECTIVENESS OF THE IMPLEMENTATION OF E-LOG BOOK

In order to test the statistical significance of the observed results, we applied the x^2 goodness of fit test. X^2 test results indicate that the proportion of the distribution of responses obtained in this study is statistically significantly different in relation to the distribution of responses to the same proportions (x^2 (df = 4) = 87.7, $p < 0.001$).

In order to identify differences in the level of all the groups, we applied nonparametric substitute for direct analysis of variance - Kruskal-Wallis test. Results indicate statistically significant differences among all groups (KW (df = 2) = 34.3, $p < 0.001$).

The average rank groups are shown in Graph no.6.



GRAPH 6. DEGREE OF ACCEPTANCE OF E-LOG BOOK IN RELATION TO YEARS OF SERVICE

In order to determine the differences among the groups defined, we applied nonparametric replacement for the T-test for independent samples - Mann-Whitney test. The results of this test show that all three groups are statistically significantly different ($p < 0.01$), which provides teachers with the least seniority show the highest level of acceptance of e-Log Book, and teachers with the most seniority accept the e-book at a minimum. The test results are shown in first Table.

TABLE 1. COMPARISON OF THE GROUPS ACCORDING TO LENGTH OF SERVICE IN THE POSITION OF ACCEPTING E-LOG BOOK

Group*	Ave rank	Group	Average rank	Разлика суме рангова	Mann-Whitney тест	p
I group	43.86	II група	31.30	12.56	465.50	.007
I group	42.78	III група	17.36	25.41	109.00	.000
II group	37.64	III група	20.50	17.14	187.50	.000

** Group I = up to 10 years of service; Group II = from 11 to 20 years of service; Group III = over 20 years of service.*

Appendix 1: Descriptive indicators, measures of central tendency and variability measures for variables: the degree of acceptance of e-Log Book and the degree of efficiency of e-Log Book.

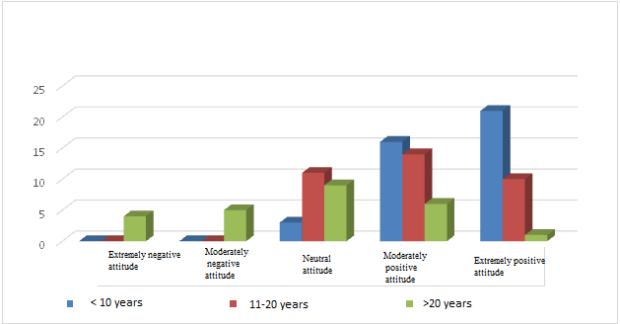
TABLE 2. DESCRIPTIVE INDICATORS, MEASURES OF CENTRAL TENDENCY AND VARIABILITY MEASURES

	Number of respondents	Range of values	Minimum value	Maximum value	Arithmetic middle	Standard deviation	Variance
Efficiency of E-Log Book	100.00	4.00	1.00	5.00	4.25	0.98	.96
Acceptance of E-Log Book	100.00	4.00	1.00	5.00	3.87	1.05	.10

Appendix 2: Frequency and percentage of the degree of acceptance of e-Log Book

TABLE 3. FREQUENCY AND PERCENTAGE OF THE DEGREE OF ACCEPTANCE OF E-LOG BOOK OF TEACHERS WITH DIFFERENT WORK EXPERIENCE

	up to 10 years of service		11 to 20 years of service		Over 20 years of service	
	Frequence	Percent	Frequence	Percent	Frequence	Percent
Extremely negative attitude	0	0.0	0	0.0	4	16.0
Moderately negative attitude	0	0.0	0	0.0	5	20.0
Neutral attitude	3	7.5	11	31.4	9	36.0
Moderately positive attitude	16	40.0	14	40.0	6	24.0
Extremely positive attitude	21	52.5	10	28.6	1	4.0



GRAPH 7. DEGREE OF ACCEPTANCE OF E-LOG BOOK IN RELATION TO YEARS OF SERVICE

Appendix 3: Correlation years of service and questions 3 to 7 (in accordance with the suggestion mentors).

In order to determine the degree of correlation between length of service and monitoring, measurement and evaluation of educational work using the e-Log Book, Spearman's rank correlation coefficient Ro is applied. Results indicate all correlations moderately low (from -0251 to -0319), negative and statistically significant (p <.05). Detailed view of the results is given in Table no.4.

TABLE 4. CORRELATION BETWEEN YEARS OF SERVICE AND VARIOUS ASPECTS OF EDUCATIONAL WORK

	Years of service		
	Spirman Ro coefficient	Level of significance	Sample size
Monitoring of educational - teaching work	-.261	.009	99
Measuring educational - teaching work	-.251	.012	100
Evaluation of educational - teaching work	-.319	.001	99

In order to determine the degree of correlation between length of service and various moguls within the e-Log Book, the Spearman rank correlation coefficient Ro is applied. Results indicate low to moderate correlations (from -0239 to -0.41), negative and statistically significant (p <.05) in the case of Statistics and Teachers modules, while in the case of the remaining modules, correlations are not statistic significant. Detailed view of the results is given in Table 5.

TABLE 5. CORRELATION BETWEEN YEARS OF SERVICE AND DIFFERENT MODULES WITHIN THE E-LOG BOOK

	Years of service		
	Spirman Ro coefficient	Level of significance	Sample size
Administration module	-.083	.415	99
Teaching module	-.410	.000	100
Statistics module	-.239	.017	100
Internet module	.109	.280	100
SMS module	.105	.299	100
Module telephone and answering machine	.097	.336	100

In order to determine the degree of correlation between length of service and improve the organization and management of schools using the e-Log Book, the Spearman rank correlation coefficient Ro is applied. Results indicate all moderate correlation (-0.36 of up to -0365), negative and statistically significant (p <.01). Detailed view of the results is given in Table 6.

TABLE 6. CORRELATION BETWEEN YEARS OF SERVICE AND IMPROVE THE ORGANIZATION AND MANAGEMENT OF SCHOOLS USING THE E-LOG BOOK

	Years of service		
	Spirman Ro coefficient	Level of significance	Sample size
Improvement of the organization	-.365	.000	100
School management	-.360	.000	100

In order to determine the degree of correlation between length of service and various pro-social activities within the school environment Spearman rank correlation coefficient Ro is applied. Results indicate low to moderate correlations (from -0.28 to -0393), negative and statistically significant (p <.01) in the case of creating a positive social climate and improving teaching practice, while in the case of the remaining modules correlations were not statistically significant. Detailed view of the results is given in Table 7.

TABLE 7 CORRELATION BETWEEN YEARS OF SERVICE AND PRO-SOCIAL ACTIVITIES IN THE SCHOOL ENVIRONMENT

	Years of service		
	Spirman Ro coefficient	Level of significance	Sample size
Creating a positive social climate	-.280	.005	100
mprovement of teaching practice	-.393	.000	100
Establishing direct communication with parents	-.186	.064	100
School marketing	-.135	.181	100

In order to determine the degree of correlation between length of service and various interpersonal relationships using the e-Log Book, applied the Spearman rank correlation coefficient Ro. Results indicate low to moderate correlations (from -0235 to -0410), negative and statistically significant (p <.01) in the case of establishing relationships among teachers, teachers and students as well as teachers and parents, while in the case of teacher - Director the correlation was not statistically significant. Detailed view of the results is given in Table 8.

TABLE 8. CORRELATION BETWEEN YEARS OF SERVICE AND VARIOUS INTERPERSONAL RELATIONS, USING THE E-LOG BOOK

	Years of service		
	Spirman Ro coefficient	Level of significance	Sample size
Teacher - teacher	-.410	.000	99
Teacher - pupil	-.345	.000	99
Teacher - parents	-.235	.018	100
Teaher - principle	-.078	.445	99

IV.CONCLUSION

Education must inevitably go up with the times and the needs of social development. So far in about 500 schools in Serbia e-Log Book is applied. There is a need for constant education, improvement of the system and continuity of data entry. This ensures that the mandatory school statistics do not allow errors and far less work. Compatibility with the EIS, and programs for printing certificates leads to the perfect regularity of school documentation and release large amounts of time. In this way, cognition of computers for many, arouse an idea to use computers in teaching.

In this paper there was an investigation of teachers' attitudes about the possibilities of application didactic and IT innovation in the organization and management of schools, where wearing Software Research was e-Log Book. The first application of this software began in 2004, just in elementary school ,,Zarko Zrenjanin". E-Log Book is used in this school for 10 years, but research has shown that there is still room for further improvement, as well as the training of teachers in the field of ICT. Based on the results of performed research, what was stated in the research and the objectives and tasks, can be concluded that main and auxiliary hypotheses are proven. Elementary school teachers have a positive attitude about the effectiveness of the implementation of e-Log Book.

Methodology for online study program development – case study ePITUP

N. Kadoić., N. Begičević Ređep
Faculty of organization and informatics Varaždin, Croatia
{nkadoic, nbegicev}@foi.hr

Abstract - This paper deals with the methodology for online study program development which was constructed to meet the needs of students, teachers and the institution. The proposed methodology consists of four phases: 1.) Problem definition, 2.) Strategic decision making, 3.) Implementation, 4.) Evaluation. In the first phase, situation analysis is performed and central problem is defined. Strategic decision making phase includes making a decision on several issues: choice of learning strategies, decision on delivery formats, choice of appropriate design, etc. In this phase, needs, target and task analysis must be performed. Also, instructional, delivery and evaluation strategy must be created. It is also recommended to perform TOWS and cost benefit analysis. In the implementation phase an online study program is prepared, based on the strategies created in the previous phase, and delivered to students. The fourth phase involves evaluation of student reactions, achievement of objectives and impact of the project on the institution. In addition, we present the case study of developing ePITUP online study at Faculty of Organization and Informatics. The purpose of the paper is to provide a good insight into methodology for online study program development. It will provide an effective guide for developing online courses and establishing an online study program.

I. INTRODUCTION

E-learning encompasses a range of technology for teaching and learning purposes. According to T. Bates' definition [1], e-learning refers to all computer and Internet-based activities that support teaching and learning, both on-campus and at distance; it also includes administrative and academic uses of information and communication technologies that support teaching and learning. E-learning supports skills needed in a knowledge–based society, such as collecting, analyzing and applying information appropriately. E-learning comprises different teaching methods, for example information management, creative thinking, critical thinking, problem solving and collaborative learning [16].

There are different forms of e-learning. E-learning can be used with classroom aids, in computer labs or laptop programs, in mixed mode or in a fully online form [14, 15). In the form of classroom aids, students may be given supplementary online work after class. With computer labs or laptop programs, the use of computing supports traditional Face-to-Face learning (f2f) but it is still within a classroom setting. In a mixed – blended learning mode, classroom time is combined with online teaching and learning. Blended learning means that some of the classes are done Face–to-Face, and other are done online, or include lab and practical work in classroom and online lectures. Fully online learning is a form of learning and teaching where students never have classroom time, only online lectures.

The strategic planning of e-learning includes planning and decision making about implementing E-learning on different levels: state level, university level, faculty level, study program level and individual (student and teacher) level. There are different options for implementing e-learning in teaching and learning process. E-learning can be used as a means of support to the already established systems of education i.e. blended – learning mode. On the other side it can be implemented as an independent form of teaching; in other words as a separate teaching program. It can also be partially introduced (for a single subject, group of subjects, or a study program) [17].

Based on the document "Criteria for the Evaluation of Online Study Programs" prepared by the National Council for Higher Education on 13 February 2013, online study program is a program where minimum 50 percent of courses is done online. A course is done online when minimum 50 percent of teaching hours is done online. Therefore, we can conclude that mixed learning mode can be implemented when preparing and running higher education online study programs in Croatia.

The topic of this paper will be strategic planning and decision making on implementing e-learning at study program level. This paper deals with the methodology for online study program development consisting of four phases: 1) Problem definition, 2) Strategic decision making, 3) Implementation, 4) Evaluation. A case study on developing a vocational online study program, entitled Information Technology in Business Applications at the Faculty of Organization and Informatics (ePITUP), University of Zagreb, will be presented.

II. STATE OF THE ART

Introduction and implementation of the instructional systems design models and methodology, including guidelines for building effective online training or online courses, has received considerable attention in the literature. However, it has rarely been applied in developing online study programs.

Bates and Sangra [1] recommend the best plan for online education. This plan is at program level since a critical area of developing a vision for the use of

technology is at the academic program planning stage. The program planning process must be integrated with the allocation of resources and financial plans.

In his book, Bates [2] presents a case study of how a Polytechnic developed an e-learning strategic plan. It describes the institution's rationale for moving more strongly into e-learning, and the processes followed by the institution which helped it develop a plan and ensure its acceptance throughout the institutional community. It also refers to the factors that facilitated the process. It indicates that paying attention to objectives, core values and principles, faculty development and training, are critical for a successful transition from mainly Face-to-Face teaching to e-learning.

Methodology for strategic planning and decision making on e-learning implementation has been developed and used in the higher education (HE) context in [11]. The authors deal with strategic planning of e-learning implementation at different levels in HEIs.

As we already mentioned, there are many instructional system design models. The most popular is the ADDIE model. The ADDIE model is a framework that lists generic processes used by instructional designers and training developers. It is a guideline for building effective training (courses) and performance support tools in five phases: Analysis, Design, Development, Implementation and Evaluation (ADDIE) [4]. Florida State University initially developed the ADDIE model to explain the processes involved in the formulation of an instructional systems development program for military interservice training. This training adequately trains individuals to do a particular job, and it can also be applied to any interservice curriculum development activity [5]. The idea of the model was to complete each phase before moving on to the next one. Over the years, practitioners revised the steps, and eventually the model became more dynamic and interactive.

Rooij and Wiliams [6] claim that in the digital age instructional designers must possess both a sound instructional design knowledge base and solid project management skills which would enable them to complete courseware projects on time, on budget and in conformance to expectations. Project management skills include the ability to apply repeatable processes, along with interpersonal skills such as communication and leadership.

A broader framework for developing blended learning programs is provided in Harvey's paper (Harvey, 2003). In the paper, Harvey presents Badrul Khan's blended e-learning framework which serves as a guideline to plan, develop, deliver, manage, and evaluate blended learning programs [8]. It is an Octagonal Framework containing eight dimensions: institutional, pedagogical, technological, interface design, evaluation, management, resource support, and ethical dimension. Each dimension in the framework represents a category of issues that need to be addressed to create a meaningful learning environment. Khan (Khan, 2001) claims that the implementation of this framework can help explore strategies for effective learning and performance, as well as ensure effective delivery of learning. Consequently, this will bring a high return on investment.

A review of the most important activities that must be achieved to reach a successful adoption of a blended learning approach is given in [9]. Randy and Kanuka suggest that a successful adoption of a blended learning approach, which would enhance the effectiveness and efficiency of teaching and learning, would require the following: the creation of a clear institutional direction and policy; potential framework, increased awareness and commitment; establishment of a single point of support, quality assurance and project management; the creation of an innovation fund which would provide the financial support and incentives to faculty and departments for initiating blended learning course transformations; investment in establishing a reliable and accessible technological infrastructure; a strategic selection of prototype projects that prove to be exceptionally successful exemplars of effective learning; development of a formal instructional design support available through a blended format; systematic evaluation of satisfaction and success with the teaching, learning, technology and administration of a new course; creating a task group to address issues, challenges and opportunities, as well as communicate and recommend new directions to the University community.

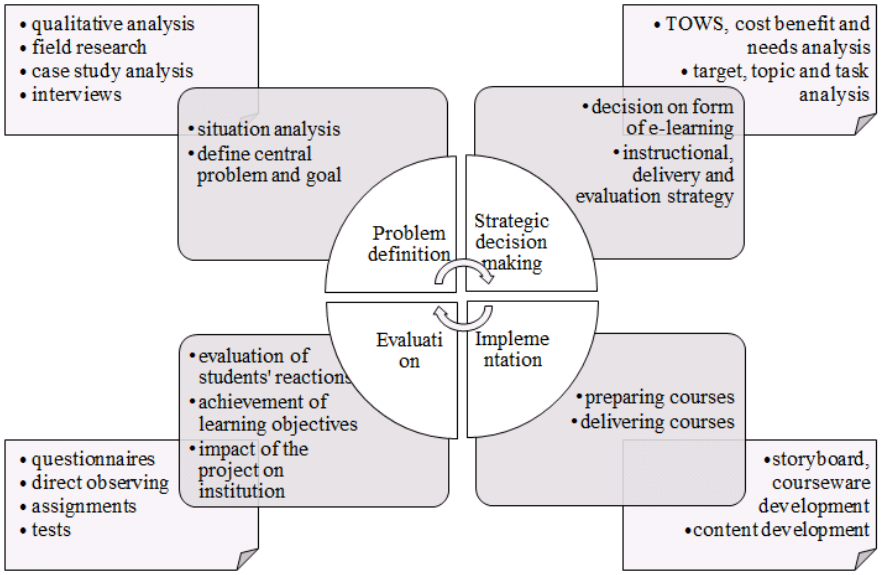
III. METHODOLOGY FOR ONLINE STUDY PROGRAM DEVELOPMENT

Methodology for online study program development presented in this paper consists of four phases: 1.) Problem definition, 2.) Strategic decision making, 3.) Implementation, and 4.) Evaluation.

During the first phase, the situation analysis must be performed and central problem defined. The situation analysis includes a review of key facts and major documents (curriculum, financial report, evaluation report, etc.) and collection of feedback from the stakeholders regarding the problem. The tools used in this phase are qualitative analysis, field research, case study analysis, interviews, etc. Based on the results of situation analysis, the central problem and main goals must be defined.

In the phase of strategic decision making, needs, target, task and topic analysis must be performed; instructional, delivery and evaluation strategy must be created. It is important to conduct needs analysis if there are any indicators for starting a development effort. The results of needs analysis are crucial for making decisions on the e-learning study program form. E-learning study program form can be an ICT supported study program, online program (50% Face-to-Face, 50% online) and fully online study program (100% online). Performance of TOWS and cost benefit analysis is also recommended.

TOWS analysis is a variant of the classic business tool called SWOT analysis. It is an acronym for Threats, Opportunities, Weaknesses and Strengths. It gives answers to the following questions: How to make the most of the strengths?, How to avoid weaknesses?, How to capitalize on opportunities?, and How to manage threats?. TOWS analysis can help decision makers get a better understanding of the strategic choices they face.



Picture 1. Methodology for online study development

Cost–benefit analysis is a systematic process for calculating and comparing benefits and costs of a project or a decision. It has two purposes: to determine if it is a sound investment/decision (justification/feasibility), and to provide a basis for comparing projects. It involves comparing the total expected cost of each option against the total expected benefit, to see whether the benefits outweigh the costs, and by how much [12].

Target analysis is also an important part of this phase because the design and delivery of e-learning materials and preparing online courses must be influenced by characteristics of the students as well as other stakeholders – teachers, administrative staff and management at the institution. Task analysis identifies the tasks that students should learn, and the knowledge and skills they need to develop or reinforce. Topic analysis is carried out to identify and classify the content of study curriculum and course content [3]. The results of topic analysis are identification of course content and classification of content elements. The results of needs, target, task and topic analysis are valuable inputs in the process of decision making on instructional, delivery and evaluation strategy (options).

Decision making on instructional methods includes evaluation of three alternatives: expositive methods, application methods, and collaborative methods concerning the task results and topic analysis. Design of online courses includes the combination of expositive, applications and collaborative methods. Expositive methods emphasize the "absorption" of new information, and include presentations, case studies, worked examples, demonstrations. Application methods emphasize the active processes students use to perform procedural and principle based tasks, and to build new knowledge. Application methods include demonstration-practise method, job aids, case-based or scenario-based exercises, role play, simulations and serious games, guided research, project work. Collaborative methods emphasize a social dimension of learning and engage students sharing knowledge and performing tasks in a collaborative way. They include online guided discussions, collaborative work and peer tutoring [3].

Each method can be delivered in different formats. For example, a presentation can be delivered as a Power Point file or as a video presentation. In preparing a delivery strategy, it is crucial to analyze the following elements: student-related factors (status, time, equipment, delivery channels, technical expertise etc.), technology aspects (infrastructure, connectivity, technical expertise, etc.) and organizational requirements (institution strategy, time, budget, people, etc.).

The aims of evaluation can be different, to check the quality of the courses (program), measure effectiveness of teaching and learning, evaluate present and past state, as well as to compare the two states to see if the aims are reached. Assessments tests are a tool that is often used for evaluation. The tests must be aligned with the learning objectives at study program level and course level.

In the implementation phase an online study program is prepared based on the strategies chosen in the previous phase, and it is delivered to students. The outcome of this phase is an online study program. In this phase, curriculum structure is defined, learning outcomes for each topic, course and study program are prepared; e-learning content is produced with the implementation of instructional, evaluation and delivery strategies. Development of elearning material contains three main modules: content development, storyboard development, and courseware development [3]. Content development is the creation of e-learning materials that integrates the knowledge needed for reaching the learning objectives. Storyboard development is the integration of instructional (pedagogical) methods and media elements. Courseware development is the development of interactive content elements, as well as the integration of these elements into a learning platform accessible by students.

The fourth phase involves the evaluation of student reactions, achievement of learning objectives and impact of the project on the institution. Evaluation of student reactions can be conducted using questionnaires which are usually submitted to students at the end of the course. Evaluation of learning objectives achievement can be done through direct observation, assignments and tests. It is necessary to check if student knowledge and skills are increased, and if the defined learning objectives are

reached. In the evaluation of project impact on the institution, the final results, such as improved quality, decreased costs, increased student interest for study program, must be identified [13].

The proposed methodology for online study program development can be used as an effective guide for developing online courses and establishing an online study program. The framework that was used in developing this methodology was ADDIE instructional design model. The methodology presented in this paper is comprehensive. Therefore, according to the complexity of learning project, project objectives, available resources and expertise, some of the phases and methods described in this methodology can be skipped, simplified or expanded.

IV. CASE STUDY

The methodology presented in this paper was implemented in the development of fully online study program.

The vocational study programme "Information Technology in Business Application" (PITUP) was developed, and is today performed by the Faculty of Organization and Informatics in Varaždin. In the performance of the study program, the Faculty has established cooperation with other institutions of higher education and organizations from private and public sector in the field of applying modern ICT in business organization. The study program "Information Technology in Business Application" is performed during three (3) years and six (6) semesters. Each semester represents one education cycle and lasts 15 weeks.

Till 2008 study "Information Technology in Business Application" was performed Face-2-Face using ICT technology. The Learning Management System called Moodle was used in teaching and learning. However, it was mainly used for uploading teaching materials, providing information about important dates and course deadlines, and for uploading student assignments. Only a small number of teachers used some advanced features of LMS Moodle. This study program is performed at four different locations: Varaždin, Križevci, Sisak and Zabok. In Varaždin, around 50% of students are regular students, and 50% of students are part-time students. In Križevci, Sisak and Zabok, all students are part-time students with full time jobs. The main reason for considering the development of an online study was part-time students who sometimes cannot attend classes due to work obligations. The second reason was time and cost of traveling to cities 2 hours or more away from Varaždin. Still, the decision was made on a more detailed needs analysis, TOWS and cost-benefit analysis. Those methods were used in our methodology for online study program development.

During the first phase (problem definition), situation analysis was conducted and central problem was defined. Based on the conducted situation analysis the following results were gained: the study program PITUP is mostly enrolled by part-time students that are often not able to participate in Face-to-Face activities due to their job; student success is low (low percentage of students who pass exams in the first or second examination period; low grades); high travel costs (sometimes it happens that a teacher travels to Križevci, Zabok or Sisak, and none of students (or only a few of them) attended the lectures).

The situation analysis also showed that there were teachers at Faculty level who have knowledge and experience in e-learning implementation, and were willing to develop an online study program. Also, there is a Center for supporting e-learning activities at the Faculty; so the administrative support is also ensured. In this phase we defined a central strategic goal - the development of an online study program called e-PITUP.

During the second phase, we made a decision on delivery formats that need to be developed in the phase of online course development. We chose delivery formats based on the ADDIE instructional design which was used to be the framework for developing online courses. Some of the delivery formats we defined as mandatory at online course level. These are as follows:

- defined learning outcomes at topic level;
- video lectures for minimum 50% of previous F-2-F lectures;
- video materials for seminar or laboratory activities (mainly tutorials showing how to use a certain tool, application, how to solve a certain problem, etc.);
- different student assignments related to each topic, with aim to include students in the continuous learning process;
- evaluation and self-evaluation tests for each topic.

In developing online courses we decided to use different learning strategies: strategies of repetition, elaboration, organization, understanding and application.

In the second phase, we also performed needs and task analysis. The results show which type of courses can be developed as a role model for further online course development. We choose 5 courses based on the recognized needs of students and teachers and their specific characteristics. We also prepared instructional and delivery model for each of these courses. Also, we planned the resources needed for preparing these 5 pilot online courses (equipment, working hours, etc.). Additionally, time and activity scheduling of implementation process was done.

In the implementation phase, 5 pilot courses were prepared and delivered to the students in Križevci: Quantitative Management, Mathematics, E-Business, Office and Office Management, and Programming.

These courses were performed 50% online and 50% Face-to-Face. In order to achieve positive outcomes, students continuously had assignments, projects, tests, which were previously carefully planned and prepared by teachers. Teachers became instructors who directed students in an active problem solving process. Online

communication became an important part of the teaching process and it was introduced through forums, webinars, chats and direct contact via E-mail or Skype.

In the last phase, evaluation of student reactions, achievements of objectives and impact on the institution was done. In pilot courses, student results were better than the results of only F-2-F teaching: percentage of students who passed exams in the first and second examination period increased. Additionally, average grade point increased. HELAM instrument, upgraded with several open-questions [11], was used for student evaluation. Students evaluated the pilot courses, being a new way of learning, as more convenient and appropriate. In general, the pilot courses got positive feedback. Students were able to compare online learning with Face-to-Face learning. Therefore, the conclusion is that the objectives set by the developed pilot online courses in PITUP study program were achieved. At institutional level, the strategic decision is to develop new online courses at PITUP study and, in a long-term, transform the study into fully online study.

A. Pilot E-course „Quantitative Management"

Quantitative Management is a course at third year of study Information Technology in Business Applications. It is held through 15 hours of lectures and 15 hours of seminars.

There are 5 subjects in the course: analysis of investments, sensitivity analysis, decision making and ranking, decision making in terms of uncertainty and risk, and forecasting. Using the *old* way of learning, in Zabok, Križevci and Sisak, there were 6 weeks with 5 hours of classes per day, one day per week. Each week different subject was covered. The last week a repetition of all subjects, with instructions how to make the project, was done.

In online learning, the goal was to have only three weeks of classes, and the remainder of three weeks switch to fully online activities:

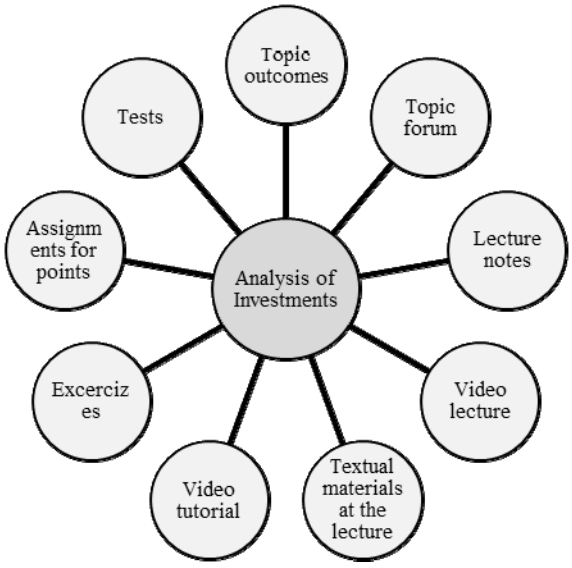
- Week 1 – Face-to-Face learning: introduction into the course, investments analysis;
- Week 2 – online learning: sensitivity analysis;
- Week 3 – Face-to-Face: decision making and ranking;
- Week 4 – online learning: analysis in terms of uncertainty and risks;
- Week 5 – online learning: forecasting;
- Week 6 – repetition, presentation of the project (to be done before final exam)

Pilot course was delivered in Križevci.

Each of topic that was done only online consisted of several elements (according to the delivery formats defined in the methodology):

- Outcomes of each topic;
- Forum for specific topic where students can ask questions and seek for more detailed explanations of how to solve certain assignments, or where teachers can initiate discussions;
- Lecture notes for each topic (cca 20 page document with theoretical base of the topic, examples and exercises);
- Video lecture (simulation of real Face-to-Face lecture; instructor talks about subject matter of topic using a PowerPoint presentation; student can download the presentation separately, print it, and make additional notes during the audio lecture);
- Textual materials at the lecture (if student have strong reading/writing preference for learning according to VARK learning style classification, instead of watching visual video lecture, (s)he can learn about the topic from given textual materials);
- Video lecture/tutorial of how to solve a concrete assignment, use specific software etc., depending on topic;
- Practice exercises (with or without key)
- Assignments for points (grades) which have to be done during the week and uploaded to Moodle;
- Self-evaluation tests and tests for points (grades).

During six weeks students can gather points (grades) by submitting correct solutions on assignments that were previously prepared for each topic, and by solving tests on Moodle. Collected points are added to the project exercise points and to the result on final exam.



Picture 2. Quantitative management: Quantitative management: delivery formats defined by the methodology

Here are some of the results of the new way of learning:

- 80% of students passed the exam at the first examination period, and 100% of students passed the exam, including the first and second examination period;
- Compared to the student results in Križevci, when old way of teaching was implemented,

average grade was increased in online learning for 0.6 of the grade
- 90% of students find online course more attractive than other Face-to-Face courses;
- 90% of students find online course more appropriate for their personal needs considering organization of classes (they encourage the combination of Face-to-Face and online classes because there is flexibility of taking lectures and fulfilling course obligations; also, they can contact the teacher in person).

In general, students are satisfied with the new way of teaching, and find it more convenient for their needs.

V. CONCLUSION

This paper dealt with the development of a methodology for online study program development. The main motive for this topic arose from the current situation at Face-to-Face study called PITUP at Faculty of Organization and Informatics. However, during the performance of the process several issues were identified, mainly related to student needs and impossibility to be present at Face-to-Face classes.

A logical solution for that situation was to create an online study. Firstly, we needed a methodology of how to create an online study. Methodology was created using 4-phase decision making methodology and ADDIE instructional design model. 4-phase decision making methodology combines several important types of analyses (situation analysis, cost-benefit, TOWS, cost-benefit, needs analysis, target, topic, task analysis). Those analyses were primarily used for identifying the context of the problem, as well as for deciding how an online study program would be organized. The basis of online study program is online courses. ADDIE was used to determine how certain course has to be organized to match the study program concept. Finally, we came up with the methodology we applied in our case. Afterwards, we created a framework of e-PITUP pilot study. We chose, prepared and implemented 5 online courses.

The final results of pilot courses were positive: student success was better than before, costs were reduced. We applied the suggested methodology only partially, in future we should work on additional piloting and testing. Nonetheless, the first results are promising.

Abstract - Production sciences and manufacturing technologies are worldwide a central element for societies which take profit and welfare by their producing industries. Especially in the highly industrialized countries it has to be considered that these production plants can only be operated with highly qualified staff.

In this contribution we demonstrate a structure and scheme for knowledge transfer from the tertiary to the secondary educational level with examples in the field of Robotics and Flexible Automation.

Thanks to the initiative Leonardo Lifelong Learning – Transfer of Innovation of the EU it is shown that a successful cooperation of Austrian, Croatian, Slovenian and Turkish partners is realized in terms of education and engineering. The essential elements of the project will be presented in this paper.

I. INTRODUCTION

Modern production sciences and manufacturing technologies processes need both flexibility and a high level of automation [1]. Of similar importance is especially in highly industrialized countries that these production processes can only be operated by highly an excellent qualified staff. This is even more important, if these processes have to be optimized.

The practical relevance and the corresponding complexity is the main reason for choosing the topics "Flexible Automation" and "Robotics" as an example for developing a structure and concept for knowledge transfer to different educational levels as well as to SMEs and their staff.

A. *Associated Project*

The LLL-project of "Flexcell" makes a contribution to keep high standard production plants at the industrial location of Europe by offering a modular teaching concept for the educational demands to start operation of a flexible production cell with success. This modular teaching concept considers the levels of demands of the different target groups, e.g. academic staff, students, pupils and workers. Regional close partnership is necessary and supported by skills and technological equipment of cooperating countries and partners in the project [4].

The present paper is therefore based on a collection (summary) of experiences and knowledge of experts who all work in the field of Flexible Automation and robotics. These people work for example as consultants in industry, teachers in technical schools of higher education and lecturers in universities of applied sciences. It is important to mention that they are in close relationship to the needs of industrial applications.

B. *Educational concept*

The main scope of the considered concept is to establish training modules of VET teachers, trainers of practical lessons in schools as well as employees in companies. Furthermore in order to show the effectivity of the concept training sessions have been successfully undertaken. The basic direction of innovation transfer is from Austria and Slovenia to other countries – for example Turkey. Also a good cooperation to the "Industrial and craftsmen school Pula" was established.

Figure 1. Flexcell Project devices of different partners

It is well known that a profound knowledge leads to higher quality, reduced costs, better company reputation and competitiveness.

The developed scheme is a working guideline for finding the needs of industry in the field of education and how to establish a new education system that is based on those needs. Therefore one of the results of this project is for example the preparation of questionnaires, which identify the needs of industry, their expectations for the future, weaknesses, possible potentials for optimization and how they would like to cooperate with schools and universities. Beside the target group further results are adapted training modules for a specific topic, a special dictionary, knowledge transfer in the field of flexible automation, a better cooperation between industry and schools and evaluation sheets for continuous improvement.

Additionally solutions found in a previous project [9] are prepared to be transferred.

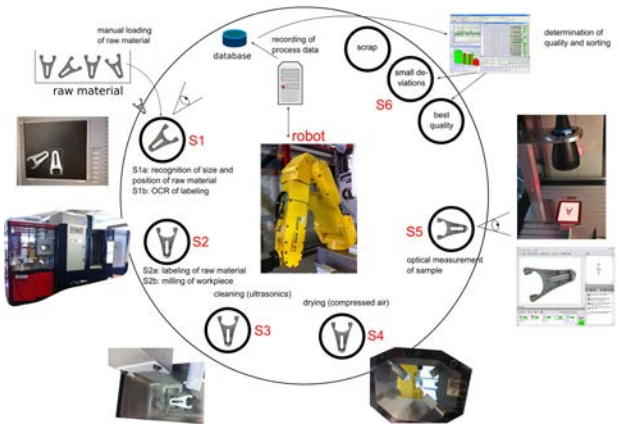

Figure 2. Process Flow FlexCell CUAS

In fig. 1 different flexible cells, which have been developed by project partners and used machines are presented in order to understand the application behind the concept. Basically this can also be seen as a contribution to the implementation of industry 4.0 concept.

II. TRANSFER CONCEPT

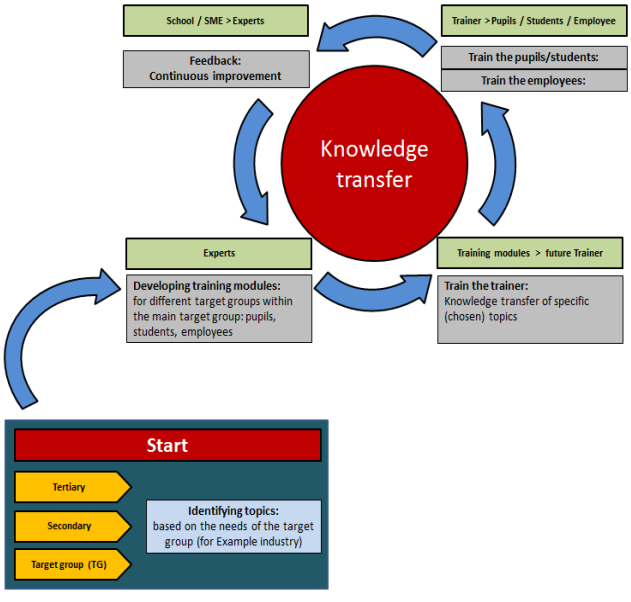

Figure 3. Process of knowledge transfer including continous improvement

The quality of this process is monitored and continuously improved by the Deming circle, which is a four-step method consisting of plan / do / check / act (fig. 3). The last point is essential to assure that the needs of the target groups are met. The combination of theoretical knowledge and practical exercises is also very important for the overall teaching process.

It is worth to mention that an overview of the corresponding school and education system of the partner country is helpful. Fig. 4 gives an example of the Turkish education system from pre-school up to doctorial studies.

Our didactical concept was matched with the current preeducation/knowledge of the students in Turkey. In order to ensure an implementation in the corresponding curriculum it is necessary to understand the overall education structure in Turkey. Finally it could be shown that a smooth integration of the course was successfully performed.

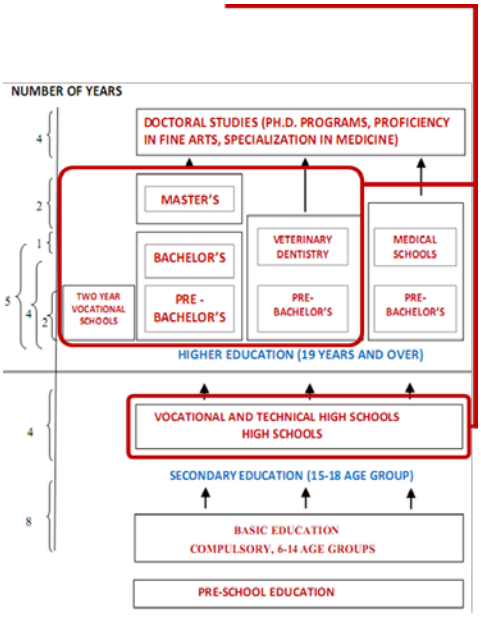

Figure 4. Overall education system in Turkey

III. DIDACTICAL APPROACH

The didactical concept of the project is based on two pillars.

A) Training of trainers in Austria and Slovenia with flexible production cells (see fig. 1).

B) Training of trainers and pupils in partner countries (Turkey and Croatia).

A. Training the trainers

The first part of the training uses the results of the previously reported SIAT project "Koop Flexible Automation" [8], which combines various disciplines of process automation, e.g. robotics, process control for CNC-based manufacturing, image processing and analysis on a high education level (see fig. 2). Due to differently designed cells with various education focus, specific

training modules had been developed earlier and could now be employed in practice (see fig. 1). All prepared courses can be seen in the following fig. 5. Additionally the estimated duration for each part is documented.

Nr.	Module	Hour	Days	Σ
1	CNC Manual Programing (milling + turning)	8	6	48
2	CNC Cam Programing (milling + turning)	8	5,5	44
3	Robotics basic	8	3	24
4	Robotics advanced	6	2	12
5	Quality management	4	1	4
6	Optical measurement systems	4	1	4
7	Process control	6	2	12
8	Machine control and embedded systems b.	6	3	18
9	Machine control and embedded systems a.	6	2	12
10	Safety basic	5	1	5
11	Safety advanced	3	1	3
12	Design I	6	3	18
13	Design II	6	3	18
14	Economics and organization	8	2	16

Figure 5. Training module setup

The modular design has proved to be very advantageous, because it was possible to adapt the training program to the trainees in the short term. Another benefit arises from the fact that the above mentioned modules were presented by the different project partners, which considers their specific skills. This enhances the quality of teaching and offers a wider range of industrial applications. Especially in the field of computer-aided design and material processing our project partners could provide complementary knowhow. Additionally a parallel training of the groups is feasible.

Further details can be found in [9].

B. Training in partner countries

A particular challenge was the training in our partner countries. For this purpose it was essential to perform a local inspection of the sites with special focus on the available infrastructure (see fig. 6).

Figure 6. Local inspection of partner sites

It was immediately recognized that the financial resources of our friends in Turkey and also in Croatia were very limited. Therefore a low-budget concept was absolutely necessary.

An appropriate solution was the implementation of the Open-source learning platform Moodle. It is a learning platform designed to provide educators, administrators and learners with a single robust, secure and integrated system to create personalized learning environments. Moodle is provided freely as Open Source software, under the GNU General Public License. Anyone can adapt, extend or modify Moodle for both commercial and non-commercial projects without any licensing fees and benefit from the cost-efficiencies, flexibility and other advantages of using Moodle. The system is web-based and so can be accessed from anywhere in the world. With a default mobile-compatible interface and cross-browser compatibility, content on the Moodle platform is easily accessible and consistent across different web browsers and devices [10].

Fig. 7 shows the overall structure of the Moodle course which is divided into different courses. These courses exist for Robotics Basic, Robotics Safety, Quality management, Optical measurements, Cam Programming Turning, Machine Control and Embedded Systems, CNC Manual Programming.

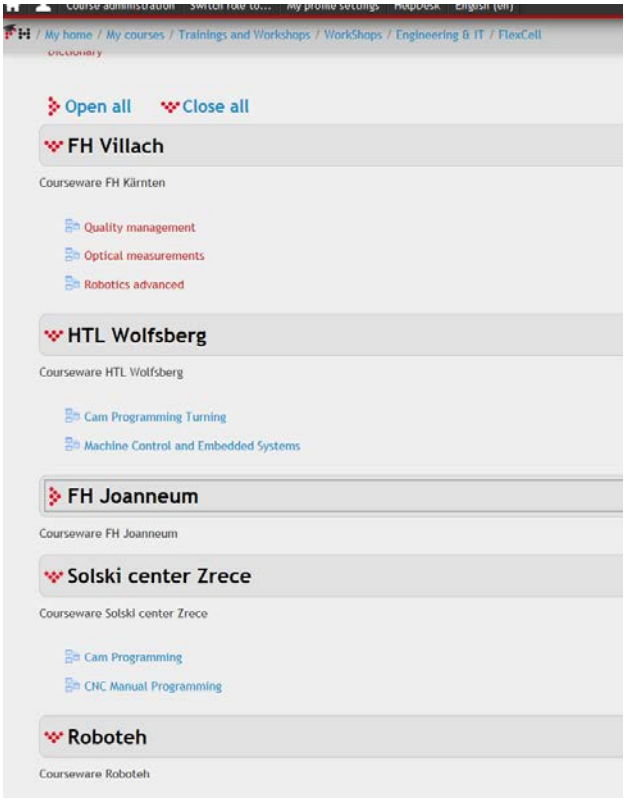

Figure 7. Moodle Training at CUAS

Furthermore a technical dictionary English – Croatian, English – German, English – Slovenian and English – Turkish was added.

C. Software -Tool (Matlab)

Finding solutions for technical problems need first of all physical knowledge of the proposed task and a lot of mathematical relationships. Therefore a successful knowledge (transfer) concept has to cover these topics. Furthermore a modern pedagogical method requires

computational help in solving mathematical problems. It turns out that mathematics is a challenging topic for many pupils and students. On the other hand nowadays there are different pleasant ways to improve mathematical skills. There are for example applications running on a tablet or smartphone, which help to teach and learn mathematical content in a playful way for pupils. For engineers Matlab is a valuable tool - some people would say a "toy" for technicians - for solving mathematical oriented tasks. Matlab and its simulation environment Simulink combine the evaluation of mathematical formulas or complex tasks with the elements of a simple programming language. It is seen as an easy-to-learn tool for solving and understanding mathematical related tasks. Therefore we decided to include an introduction to Matlab in the training module. We are convinced that Matlab is a suitable programming language also for pupils and beginners in a technical field [2].

Due to the fact that our proposed topic is related to robotics the introduction to Matlab is based on the needs of basic robotic calculations.

Furthermore we used the introduced Moodle platform to prepare an interactive "Matlab for robotics" training module [5], [7].

It is clear that users (e.g. pupils involved in the training) need Matlab access when elaborating on the units. We added citrix receiver functionality to the Moodle course, so that the user has access to our Matlab configuration. Thus the student only needs an internet connection but no additional software to perform the training units.

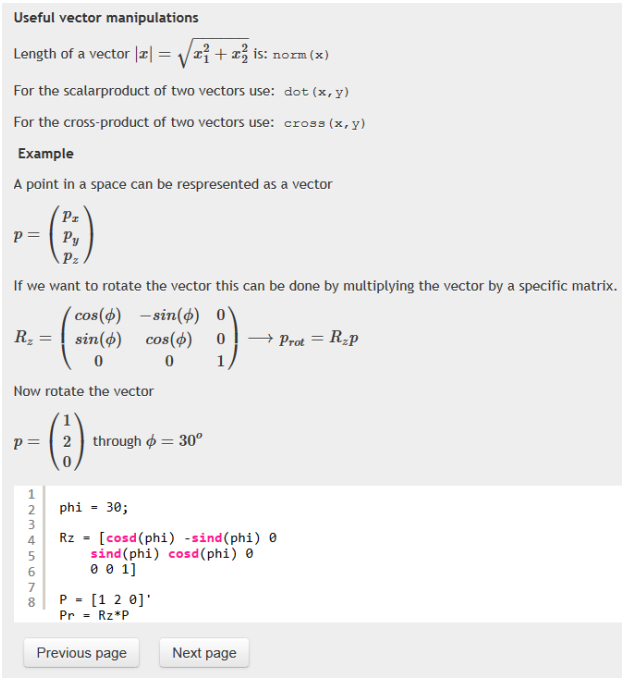

Figure 8. Example of Moodle course

In order to give an impression of the unit the content is summarized. The main task of the module consists of

- Doing simple calculations (scientific calculator)
- Using variables
- Making plots
- Working with vectors and matrices
- Using m-file functionality
- Applying control flow (loops, etc.)
- Trajectory planning

The corresponding pedagogical approach uses three elements. First the considered mathematical background is explained. Then selected examples are presented and solved both by "manual calculation" and Matlab. In addition exercises are included which have to be solved by the user immediately. Of course related solutions can be found in the tutorial so that students are getting direct feedback to their learning progress. A vector/matrix example is presented in fig. 8.

It is clear that there are many printed books and a lot of online material available for Matlab training and Robotics education. Our approach involves comfortable theoretical internet based training, while at the same time Matlab usage is directly integrated in the course.

Moreover it is possible to use the same environment (Moodle-Matlab) for complex robotic tasks. In the case of available budget robust ready-to-use real world components can be integrated. In our labs for example we deal with Quanser elements (e.g. DC-drives) and the Simulink related software "Quarc" to setup robotic experiments. We used this configuration also in the training session for the mentioned project [9], which is integrated in the Moodle course. An additional advantage is that most of the presented Matlab exercises can also be directly solved by free software like octave [11], [12].

D. Low-Cost solution

The training concept that guarantees a successful knowledge transfer and corresponds to the given framework conditions (e.g. long distance training) needs on one hand a web based training platform.

On the other hand practical experiments are still an indispensable pedagogical element in teaching technical subjects. As mentioned above, there are a lot of educational lab products available on the market. Unfortunately this equipment is very expensive.

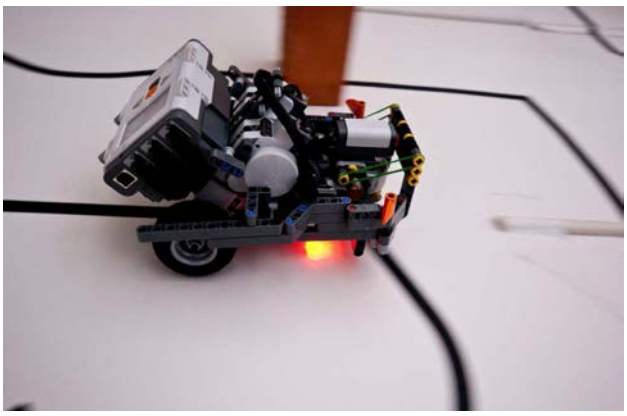

Figure 9. Line follower LEGO

So a setup is needed that takes the particular financial situation of the partners into account. A feasible low-cost hardware solution, which offers especially beginners the possibility to perform robot experiments, is provided by LEGO. The corresponding controller – the LEGO Brick EV3 – and a lot of actuators (DC-Motors) and sensors are used to build a simple robot lab experiment [3]. The specific training module included thereby the following parts:

- Explaining the components of a robot
- Creating a line follower (fig. 9)
- Understanding feedback control [6]

Again a Moodle section was made to provide the theoretical knowledge of the considered hardware. For example the functionality of used sensors is explained at an undergraduate level.

Figure 10. Robotic training of pupils in Turkey

During the local training a line follower was established together with a student group (see fig. 10). It turned out that this was very motivating for both pupils and teachers to get results in a very short time. It has to be mentioned that in this particular session the freely software of LEGO MINDSTORMS was used to create and implement the needed software task. It is a welcome development that the latest controller is now supported by many software producers. Therefore the presented task can basically also be solved by means of Matlab/Simulink.

During the local training basic concept of feedback control was given. The usefulness and mechanism of feedback was explained based on LEGO components. Within one hour pupils without prior knowledge in automated control designed a P-controller for a DC-Motor and performed their first positioning task.

IV. Discussion and Outlook

This paper is a contribution to a modern didactical knowledge transfer concept. It could be shown that a combination of onsite training and web-based learning together with state of the art simulation tools and traditional elements is an excellent method also for long distance education. The feedback of the students and teachers was very positive and a follow-up training was requested.

Beside the technical solution also friendly relationships are established, which leads to an intention of a further collaboration of all partners (fig. 11).

Figure 11. Intention of future collaboration

Acknowledgment

The authors would like to thank the project team for the great collaboration. Without the commitment and good will of all parties, this project could not be realized. Special thanks is given to Mr. Mario Wehr who supported us at any time in case of problems with Moodle.

Implementation of Information Technology in Accounting Course: A Qualitative Analysis

I. Bujan*, A. Flac**
* Polytechnic of Međimurje in Čakovec /Department of Management, Čakovec, Croatia
** Translation Agency / Court Interpreter and Translator for English and German, Čakovec, Croatia
* ibujan@mev.hr, ** info@translatora.net

Abstract - The purpose of this paper is to conduct qualitative analysis of introducing a specific accounting computer program into the teaching process of the course *Foundations* of Accounting held at the Polytechnic of Međimurje of Čakovec. This paper also has a specific purpose of detecting advantages and possible disadvantages of implementing such computer program. A research sample consists of undergraduate students, who are studying management at the Polytechnic of Međimurje. During this research students have been taught accounting in a classical way during the academic year 2013/14 by means of frontal, auditory teaching methods, using whiteboard, but parallel to this, the accounting program was also used. It is hypothesized that students prefer the accounting program and the usage of computer technology over classical teaching methods.

I. INTRODUCTION

Many academic institutions have already built infrastructure which incorporates information technology in the learning process. The main purpose of introducing information technology into the learning process at the academic level is the improvement of learning outcomes and overall success of the students. What is more, technology can enable the effective application of constructive, cognitive, collaborative, and sociocultural models of learning [1]. While analyzing developed countries, especially the United States of America, Western Europe, Great Britain and Australia, classrooms at faculties and other institutions of higher education in these countries are well-equipped with information technology – laptops, computers, iPads, interactive boards and other digital learning media. Nevertheless, computerization of the learning process should be done upon a detailed analysis of needs in the learning process and particularities of each course. It is not to be diminished that also information education of teachers is also a specific issue to analyze. Teachers at institutions of higher education, who are teaching economic group of courses, need to be additionally trained in order to adequately introduce and apply various software solutions to their courses. However, a problem that might arise regarding this situation, is unwillingness of teachers to educate themselves additionally, which is often the case with senior teachers. A national survey on information technology in teacher education in 1999 in the USA reported that most institutions stated that their technology infrastructure is adequate, and faculty IT skills are comparable with students` IT skills [2].

Since the main purpose of this paper is the analysis of information technology introduction into accounting courses, more emphasis shall be put on business schools, institutions of higher education, since accounting is usually taught in such schools.

The second issue to detect, while dealing with the introduction into IT is the ownership of business schools – Faculty or Polytechnic. State-owned schools usually have scarce resources, therefore information technology can not be accessed due to limited funds. On the other hand, private business schools usually invest much more in the learning process, respectively soft skills, but also in information technology – accessibility of computers, iPads, various programs, applications, business simulations and interactive boards. Mentioned issues have been detected in developed and in particularly less developed countries. Special attention shall be paid to as well as more detailed analysis of this issue shall be conducted regarding business schools in Croatia, which can be classified as a post-transition country.

Seeing the importance of IT in education process, Croatian government has adopted e-Croatia program in 2007, which also deals with e-education [3]. However, any action program is useless without a proper strategy. According to the program e-Croatia, some of the detected issues in Croatian institutions of higher education are a relatively high degree of centralization of the Ministry of Education and non-market oriented strategies of the institutions of higher education [4].

The purpose of this paper is to conduct a qualitative analysis among undergraduate students studying at the Polytechnic of Međimurje in Čakovec, Croatia, at the Department of Management and prove the benefits of introducing accounting software into the course Foundations of Accounting. Since the analysis is qualitative, benefits cannot be postulated in this part of the paper but are to be analyzed in the Qualitative Analysis section.

This paper is organized as follows. First section outlines basic ideas on IT in education. Second part analyses information technology and economic schools. Third part encompasses and deals with qualitative analysis

and results and the last section gives basic conclusions, recommendations and limitations of the research.

II. INFORMATION TECHNOLOGY AND ECONOMICS COURSES

Some of the basic economic courses held in business schools in Croatia are statistics, microeconomics, macroeconomics, accounting, finances, marketing, management, organization and other specific courses within a specific field of economics. The above-mentioned courses might be considered as common courses in various business schools. What is more great benefits can be made upon the introduction of information technology – hardware and software solutions. An accounting course has been chosen because a theoretical, "classical" method of teaching significantly differs from the applied software accounting program.

A. Information Technology at the Polytechnic of Međimurje in Čakovec

The Polytechnic of Međimurje in Čakovec is a state-owned institution of higher education, which has been operating since 2008. It performs three main study programs – management in tourism and sports, computing and sustainable development. Since specific study programs, like computing are performed, the Polytechnic is equipped with the latest hardware and software technology necessary for the teaching process. Since it is owned by the Ministry of Education , funds are limited, and hardware is usually purchased through various projects – especially EU funded projects. Software solutions are also funded by EU funded projects, donations and via internal funds obtained by means of market-oriented approach – scholarship from part-time students.

Provided hardware is used for teaching process in the Department of Management. Economic mathematics and statistics, which is taught in the 1st year of the undergraduate study is a good example of IT integration into the learning process. Theoretical content of the courses are well supplemented with Excel. Students use Excel program to attend the course and also pass exam that way. Implementation of IT is well demonstrated in the operational planning course, taught in the 4th semester of the undergraduate program in management. Students take part in classical auditory, frontal lectures but they also do business simulations via CESIM program launched by a Swedish company. The purpose of these simulations is to make business decisions on investments, sales, employments, layoffs and accordingly students can see how their decision turned out – with loss or revenue on a weekly basis. This virtual world gives just a little idea of how different decisions manifest and affect the market.

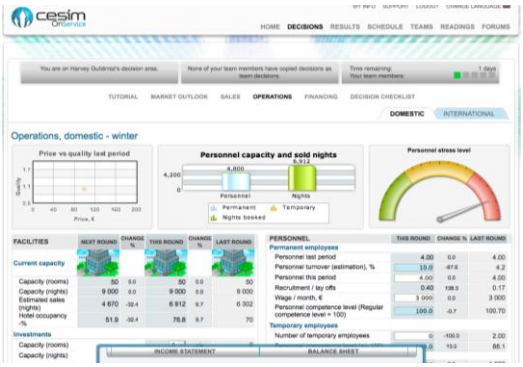

Figure 1. Example of CESIM simulation game

This simulation game is also applicable to other courses – marketing and management, especially to hospitality industry.

The course of a special interest in this paper is the course called Foundations of Accounting taught at the Polytechnic. The mentioned course is taught in the 2nd semester of the undergraduate program for management studies. Teaching methods used in this course can be classified as "classical" and "computer supported" methods. This "classical" way refers to teaching double entry accounting with a "T" account and a "computer "supported" teaching method, which uses various accounting computer programs.

A T account is a graphic representation of a general ledger account consisting of debit and credit side and is a basic training tool in a double entry accounting. Debit entries are depicted to the left of the "T" and credits are shown to the right of the "T". The grand total balance for each "T" account appears at the bottom of the account. A number of T accounts are typically clustered together in order to show all of the accounts affected by accounting transaction. This approach is not used in single entry accounting, since only one account is impacted by each transaction.

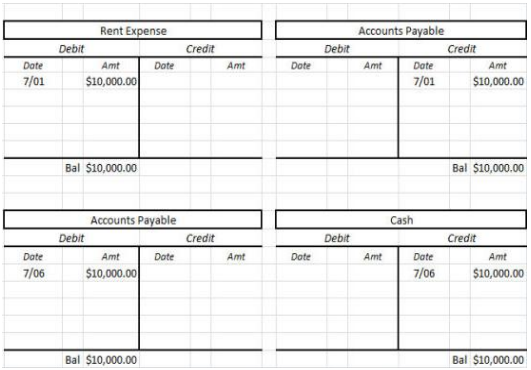

Figure 2. Example of "T" account

The "T" account is very convenient to use for educational purposes, however, it is not used in business practice. Also, it is very useful for compiling more complex accounting transactions. At majority business schools accounting is taught by means of "T" account, not only in Croatia but also in other countries around the world [6]. Professional Croatian magazines, like RIF, RRIF also use "T" accounts, when explaining accounting transactions in the articles. In practice various accounting programs are used [7].

It is more frequently discussed and misunderstood that the usage of an accounting program is possible without passing and learning accounting theory and basic principles of a double entry accounting. The author strongly argues that the implication of accounting software is not possible without any theoretical and "classical" education and that introduction of accounting software gives the right combination of IT and classical teaching.

B. Accounting Programs

There are currently many accounting programs on the market offering various features. Nonetheless, various changes and upgrades of existing accounting programs are quite peculiar to Croatia, due to frequent changes in tax and other laws. Therefore, programmers must provide upgraded versions of programs. Polytechnic of Međimurje has rather limited funds, therefore the accounting program *I.SUSTAV* was obtained from a donation of one Croatian entrepreneur from Čakovec. The main motif of this entrepreneur was to provide the software for students to prepare them for practical work. Also, the students could recommend the program to their future employer since the program offers various other features.

III. QUALITATIVE ANALYSIS

Qualitative analysis has been used as a method of research in this paper since answers of students are necessary to decide what advantages are provided by introducing accounting program (in this case *I.SUSTAV*) into the Foundations of Accounting. Since the method of qualitative analysis shall be used for obtaining non-numerical data, a classical statistical hypothesis testing is not possible. Nevertheless, the author's hypothesis that students understand a basic double entry accounting better when IT, i.e. accounting program is introduced and their basic idea is that unnecessary theory should be excluded from the teaching process and more practical documents should be booked with the accounting program. This hypothesis shall be confirmed by using qualitative questions set in the online survey.

A research sample consists of 70 undergraduate students who have attended Foundations of Accounting. The survey was sent to students` email addresses on 1 February, 2015 and consisted of 9 questions as follows:

Q1. Did you attend an accounting subject in your high school?

Q2. Do you think "T" accounts are more useful than accounting program in the teaching process?

Q3. Do you think that it is possible to learn accounting only by introducing accounting program in the learning process without any theoretical topics?

Q4. Do you think it would be more efficient for learning process, to minimize theory and introduce accounting program?

Q5. Is it easier to learn accounting with the help of accounting program?

Q6. What is, according to your opinion, the most important advantage in using accounting program over "T" accounts?

Q7. What did you dislike about the accounting program?

Q8. Do you think your **computer** literacy is sufficient for using accounting program?

Q9. Would you attend additional classes only to learn working with the accounting program *I.SUSTAV*?

A. Research Results

This section presents a more detailed analysis of research questions. In the e-survey only the above-mentioned questions (from Q1 to Q9) were set, no questions concerning age, gender or any other socio-economic questions were of interest. Concerning Q1. Did you attend an accounting subject in your high school? 70% of the students reported that they have already had some kind of accounting education and 30% did not. At this point it can be concluded that a higher percentage of students, who have some king of accounting knowledge could give better responses in assessing accounting program.

Concerning Q2. Do you think "T" accounts are more useful than accounting program in the teaching process? 45% of students think that "T" accounts are more useful than accounting program, 10% think that "T" accounts could use an additional explanation tool and 45% of students think that it would be more efficient if the accounting program would be used instead of "T" accounts.

Concerning Q3. Do you think that it is possible to learn accounting only by introducing accounting program in the learning process without any theoretical topics? 78% of students think that it is not possible to learn accounting only by introducing accounting program, while on the other hand 22% of students think that it is possible.

Concerning Q4. Do you think it would be more efficient for the learning process, to minimize theory and introduce accounting program? 37% of students think that they would learn accounting more easily without theoretical background. It is interesting to note that a large percentage, i.e. 63% of students think that it is not possible. This question can be correlated with Q8 which investigates students' knowledge of informatics, and it can be concluded that students who dislike informatics also dislike using the accounting program and do not prefer the accounting program.

A.

Concerning Q5. Is it easier to learn accounting with the help of accounting program? It is very interesting to note that 94% of students think that it is easier to learn accounting with the help of accounting program.

Question Q6. What is, according to your opinion, the most important advantage in using accounting program over "T" accounts, was very useful in obtaining primary data. The answers were analyzed and systematized in the Fig. 3.

% of answers	Answer – benefits of the accounting program
37%	I will be able to use the program in the future for my job.
21%	It is quicker and more systematic.
35%	It is more frequently used in practice.
1%	Less paperwork.
3%	I am used of "T" accounts, therefore I don`t like the accounting program.
1%	Easier understanding.
2%	Since computers will be used even more in the future, I think that the accounting program should definitely be used in lectures.

Figure 3. Answers on research Q6.

According to the Fig. 3 it can be concluded that majority of students see the benefits of the accounting program in their future job, think of it as an easier way of learning and understanding the accounting topics.

Q7. What did you dislike about the accounting program? 100% of the students responded that they liked everything about the accounting program.

It is also interesting to point out that regarding Q8. Do you think your information literacy is sufficient for using accounting program, 98% of students consider that their knowledge of informatics is sufficient to use the accounting program without any additional informatics course.

The last questions, Q9 asks students whether they would attend additional classes just to learn to work with the *I.SUSTAV* accounting program. 90% of students reported positively.

IV. CONCLUSION

In this paper a qualitative analysis was conducted on the sample of 70 students studying at the Polytechnic of Međimurje in Čakovec taking the course Foundations of Accounting as part of the bachelor study program Management in tourism and sports. The main goal of this paper was to conduct a qualitative analysis in order to obtain some qualitative data on potentials of using the accounting program *I.SUSTAV* in the future classes. It was hypothesized that students would prefer accounting program, and using computer technology, over classical teaching methods. To prove the hypothesis Q2, Q5, Q7 and Q9 will be discussed.

According to Q2, 45% of students think that it would be more efficient if the accounting program would be used instead of "T" accounts and 10% think that it would be good to use the accounting program with "T" accounts. Furthermore, according to Q5, even 94% of students think it is easier to learn accounting with the help of the accounting program. Q7 was very indicative since 100% of students reported that they have no dislikes regarding the accounting program.

One of the most affirmative questions was Q9 where 90% of students reported that they would attend additional lessons only to learn accounting using the accounting program *I.SUSTAV*.

The questions were analyzed in a qualitative way and according to the percentage of answers the hypothesis could be accepted. Additional support for the hypothesis are benefits of the accounting program set by the Q6 – practical usage of the program, the accounting program is quicker and more systematic, it is more used in practice, less paper work, easier understanding.

On the basis of the conducted research it can be concluded that students generally accept technology in education and that they see many benefits in using the accounting program for their future employment. Limitations of this research lies in the fact that only one generation of students has been tested. For obtaining a more detailed analysis it is recommended to conduct surveys at least five years in a row and start introducing information technology in every accounting course.

snjezana.babic@veleri.hr

Abstract - Programming competences have become an important aspect in many different professions. Considering that games give enjoyment to their players and stimulate their curiosity, they represent a convenient tool for gaining programming skills. With an aim to examine the quality of games designed for learning programming from both pragmatic and hedonic perspective, an empirical study was carried out. Study participants were students enrolled in different programmes at two Croatian higher education institutions. Data was collected with subjective measuring instruments. The reported findings uncovered pros and cons of evaluated games meant for leaning programming concepts.

I. INTRODUCTION

In the context of computer and information sciences there is a special emphasis on motivating applicants in acquiring programming skills on all levels of education. Results of the recent study have shown that 60% of engineering students expect the programming courses to be more fun, user friendly and entertaining [1].

One way how students' motivation can be increased is implementation of computer games in the learning process [2]. Games with educational potential in general and serious games for learning programming in particular enable students to acquire certain learning outcomes in an entertaining fashion [3]. Current games meant for learning programming have confirmed their efficiency in enhancing the level of students' knowledge as well as students' overall satisfaction [4].

With an objective to support development of educational games, a number of frameworks and models have been proposed. However, studies related to evaluation and customization of games to certain educational domains are still rather rare [5]. Along with traditional technological features, an important role in the design and evaluation of educational games play specific pedagogical facets that need to be met during the integration of games into educational settings. According to Kazimoglu et al. [3], well-defined learning outcomes are one of the essential motivational aspects of educational games. The same authors claim that pedagogical framework focused on stimulating skills such as problem solving, building algorithms, debugging, simulating, and socializing can be employed as a guideline for the development of educational games meant for growth of logical thinking. Due to the complexity of the educational process and students' characteristics, designers are increasingly integrating students' requirements in different phases of the game lifecycle such as design and evaluation [6].

User experience (UX) represents an outcome of interaction with educational games and is affected by pragmatic and hedonic facets of User-Centred Design (UCD) paradigm [19]. Hassenzahl et al. [8] revealed that UX enables insight in users' perception of software quality, not only its assessment from objective perspective. In other words, UX balances between diverse aspects of software quality including beauty, challenge, stimulation, and self-expression. The perception of user experience is subjective in nature and is based on individual values of particular user and specific context of use (e.g. user's assignment, social environment, organizational characteristics, etc.) [9].

This paper reports results of the empirical study that was carried out with an aim to determine if perception of pragmatic and hedonic dimensions of quality in the context of games designed for learning programming concepts differ among students with different educational background.

The remainder of the paper is structured as follows. The next section provides a brief overview of current advances in the field. Findings of the empirical study are discussed in the third section. The last section offers concluding remarks and guidelines for future work.

II. LITERATURE REVIEW

Considering educational games as a representative sample of slow technology, Orehovački et al. [7] introduced a theoretical framework of hedonic quality that reflects an interplay of following attributes: expectation,

confirmation, perceived usefulness, perceived ease of use, pleasure, aesthetics, playfulness, satisfaction, and loyalty.

With an aim to determine factors that contribute to students' acceptance of educational games, Ibrahim and Jaafar [10] extended a set of constructs introduced by Venkatesh et al. [17] with two additional factors (learning opportunities and enjoyment) and two moderating variables (gender and game experience).

Games with higher level of usability are more appealing and pleasurable to players. Results of the study carried out by Christou [11] indicate that inexperienced players provide more beneficial and precise feedback on usability issues of games than experienced players. The same author also discovered that inexperienced players relate usability with availability of game features whereas the experienced ones relate this concept with the ease of using a game. Since the aforementioned aspects of usability are different but in the same time complementary, both inexperienced and experienced players should be involved in studies related to the quality evaluation of games.

As an outcome of their work, Zaharias et al. [6] confirmed that hedonic and pragmatic facets of quality have equal influence on players' perception of game's attractiveness. The same authors also found that different aspects of perceived usability together with assignments which constitute a particular game significantly affect the motivation of players. Therefore, when developing a game, special attention should be paid to the design of assignments implemented into game as well as interface features.

Barnes and Richter [12] discovered that the awards and penalties as an integral part of in-game's feedback are significantly related to specified learning objectives. Zhang and Lu [13] explored usability of a mobile serious game for learning programming iPlayCode with following attributes: learnability, efficiency, memorability, errors, and satisfaction. The results of their study imply that 61% of students play this game because its interface is easy to manage and use. The set forth usability aspects were operationalized as dimensions of satisfaction that appeared to be a major predictor of students' continuance intentions related to iPlayCode game.

Based on the initial postulates of the UTAUT model [17], Ibrahim et al. [14] confirmed significant influence of performance expectancy, attitude and enjoyment perceived by students on their behavioural intentions to use educational games. On the other hand, it appeared that effort expectancy, self-efficacy and anxiety do not affect students' behavioural intentions in that respect.

III. EMPIRICAL STUDY

A. Measuring Instruments

Drawing on proposed models for evaluating Web 2.0 applications [15][16][20][21][22], a set of attributes aimed for measuring pragmatic and hedonic dimensions of quality in the context of educational games designed for learning programming have been identified. In addition, attribute meant for assessing self-efficiency was adopted from UTAUT model [17] whereas attribute that reflects aspects of challenge was adopted from model introduced by Hainey et al. [18].

Data was collected with two online questionnaires. A total of 60 items constituted the first questionnaire. These items were associated with demographic data of the participants, frequencies in using computer and mobile games, students' anxiety related to programming and playing computer games, their previous experience in playing games, students' perception of programming as a discipline and their desires related to the employment of games in the educational ecosystem. The second questionnaire was composed of 150 items related to the evaluation of 28 different aspects of the perceived quality of the games for learning computer programming. The responses to the items referring to the perceived quality were modulated on a four-point Likert scale (1- strongly agree, 4 – strongly disagree).

B. Participants

A total of 175 subjects took part in the study. The majority of them (70.86%) were students at the Polytechnic of Rijeka (POLYRI) while the remaining 29. 14% studied at University of Zagreb, Faculty of Organization and Informatics (FOI). The sample was mainly composed of full-time students (POLYRI = 96%, FOI = 98%). The average age of FOI students was 20.80 (SD=3.589) years while POLYRI students aged 19.27 years (SD=1.212) on average. At the time the study was carried out, majority of FOI students were enrolled in the Information Systems while only 3.9% of them were enrolled in Business Systems undergraduate study programme. The sample of POLYRI students was composed of 33.9% individuals enrolled in Informatics, 24.2% students of Entrepreneurship and 41.9% of subjects enrolled in Transport undergraduate study programme. The vast majority (28.2%) of POLYRI students do not play computer games, 22.6% of them play computer games less than once a week whereas 19.4% of POLYRI students play computer games between once and twice a week. On the other hand, only 3.9% of FOI students do not play computer games. The majority of study participants from both groups of students (POLYRI=27.4%, FOI =29.4%) play mobile games between once and twice a week. In addition, 41.2% of FOI students and 36.3% of POLYRI students play mobile games more than one hour a week.

C. Procedure

The research was conducted during the winter semester of the academic year 2014/2015 and consisted of two parts. Prior to the implementation of the study, FOI students have completed one course related to the programming. Therefore, they can be referred to as experienced programmers. Several weeks before the study took place, general programming concepts were presented to POLYRI students. In that respect, they can be labelled as novice programmers. At the beginning of the study, the participants were asked to complete first (pre-use) questionnaire. Afterwards, they played each of two educational games (LightBot 2.0 and CodeCombat) designed for learning programming for 30 minutes. When

the time for playing each game has run out, participants were asked to complete second (post-use) questionnaire. Since results of Shapiro-Wilk Tests uncovered that at least one of the variables in a pairwise comparison violates the assumption of normality in data ($p < .05$), differences between evaluated games were explored with Wilcoxon Signed-Rank Tests. Taking into account the aforementioned, reported results are expressed as median values. Considering that data collected from FOI students for the construct "minimal memory load" was normally distributed, differences between games in the context of this construct were examined with parametric T-test.

D. Quality of games designed for learning programming perceived by FOI students

Data that reflect certain hedonic and pragmatic dimensions of quality perceived by FOI students in the context of games meant for learning programming are presented in Table 1. The analysis of collected data revealed that LightBot 2.0 (Mdn=17) fosters significantly more (Z=-2.044, p=.041) self-efficiency among FOI students than CodeCombat (Mdn=18). Namely, it appeared that 47.1% of FOI students had to use a tutorial before solving tasks in LightBot 2.0 whereas 41.2% of them had to do the same before playing the CodeCombat. It was also found that it was significantly easier for FOI students (Z=-2.753, p=.006) to learn to use LightBot 2.0 (Mdn=6) than to employ CodeCombat (Mdn=6). More specifically, the results indicate that 86.3% of FOI students agreed that it was easier for them to become proficient in solving assignments that constitute LightBot 2.0 while 74.5% of them confirmed that the set forth is true for the CodeCombat. Furthermore, 92.2% of FOI students believe that it was easy to learn how to solve the assignments which LightBot 2.0 is composed of where 80.4% of them confirmed the same for CodeCombat. The analysis of data also uncovered that it was significantly easier (Z=-2.901, p=.004) for FOI students to play CodeCombat (Mdn=8) than to use LightBot 2.0 (Mdn=10). Namely, 84.3% of FOI students supported the claim that it was easy to solve assignments implemented into LightBot 2.0 while 94.1% of them agreed with this statement in the context of CodeCombat. Moreover, 98% and 92.2% of FOI students stated that they could alone solve assignments which constitute CodeCombat and LightBot 2.0, respectively. According to the results of data analysis, FOI students had to employ significantly less physical activity (Z=-4.380, p=.000) while solving the assignments integrated in CodeCombat (Mdn=14) than when dealing with assignments implemented in LightBot 2.0 (Mdn=13). Majority (90.2%) of FOI students confirmed they had to use mouse frequently when they were playing LightBot 2.0. On the other hand, most of FOI students reported they had to employ keyboard (86.3%) and exchange work with keyboard and mouse (64.7%) continually when they were solving assignments integrated into CodeCombat.

Study results imply that FOI students had to invest significantly less (T=-3.789, p=.000) mental effort while dealing with the assignments of CodeCombat (M=17.53,

RELIABILITY		
RLB1. While using the game for learning programming, there was no operational interruptions.	91.1	72.5
RLB2. While solving the assignments that constitute the game for learning programming, there were no errors.	80.4	62.8
RLB4. The game for learning programming is stable.	94.1	78.5
RLB5. The game for learning programming is bug-free.	90.2	80.4
CHALLENGE		
CHL2. The game for learning programming increases the difficulty level of assignments with an acceptable speed rate.	74.5	86.2
CHL3. The assignments that are implemented in the game for learning programming are not challenging enough.	17.6	47.1

SD=2.969) than when solving those of LightBot 2.0 (M=16.27, SD=3.007). More detailed, 72.5% of FOI students believe they had to undertake a lot of mental and perceptive activities while playing LightBot 2.0 while 58.8% of them agree they had to think a lot and make too many decisions when solving assignments integrated into CodeCombat. It was also discovered that compared to LightBot 2.0 (Mdn=17), FOI students perceived CodeCombat (Mdn=16) as significantly more attractive (Z=-2.264, p=.024) game for learning programming. Namely, majority of FOI students agree that CodeCombat is visually appealing (86.3%), has attractive interface (80.4%), and looks nice (86.3%). On contrary, results of the analysis suggest that in comparison with LightBot 2.0 (Mdn=8), CodeCombat (Mdn=10) was perceived by FOI students as significantly less reliable (Z=-3.346, p=.001) game meant for learning programming concepts. More specifically, 90.2% of FOI students agree that LightBot 2.0 does not have bugs and is therefore perceived as dependable game for learning programming by 94.1% FOI students. On the other hand, 27.5% of FOI students experienced interruptions when playing CodeCombat whereas 37.2% of them reported errors while solving assignments implemented in CodeCombat. Finally, it appeared that assignments which constitute LightBot 2.0 (Mdn=7) represent a significantly greater challenge (Z=-2.924, p=.003) for FOI students than those integrated in CodeCombat (Mdn=6). While 74.5% of FOI students agree that difficulty of assignments implemented into LightBot 2.0 increases at acceptable rate, only 17.6% of them thinks that assignments which constitute LightBot 2.0 are not challenging enough.

E. Quality of games designed for learning programming perceived by POLYRI students

Results of the data analysis that indicate extent to which evaluated games aimed for learning programming have met particular facets of hedonic and pragmatic quality from the viewpoint of POLYRI students are illustrated in Table 2.

According to study results, it was significantly easier (Z=-2.271, p=.023) for POLYRI students to learn how to use CodeCombat (Mdn=6) than to learn how to employ LightBot 2.0 (Mdn=6). More specifically, it appeared that 83.1% of POLYRI students agree that it is easy to become proficient in playing CodeCombat whereas 88.7% of them support the claim that it is easy to learn how to solve assignments which are included in this game for learning programming. The analysis of collected data also uncovered that POLYRI students had to employ significantly more physical activity (Z=-8.109, p=.000) when solving assignments in LightBot 2.0 (Mdn=13) than when doing the same in Code Combat (Mdn=15). Namely, 89.9% of POLYRI students reported they had to use mouse very often while solving assignments in LightBot 2.0. On the other hand, 87.9% and 73.4% of POLYRI students argued they had to frequently use keyboard and switch between mouse and keyboard, respectively, when dealing with the assignments that constitute CodeCombat. It appeared that interaction with LightBot 2.0 (Mdn=16) required significantly more mental load (Z=-3.165, p=.002) of POLYRI students than it demands playing the CodeCombat (Mdn=17) game. More detailed, 78.2% and 88.7% of POLYRI students claimed that solving assignments implemented in LightBot 2.0 required a lot of mental and perceptive effort as well as a great amount of thinking and making decisions, respectively. The results of data analysis also revealed that compared to LightBot 2.0 (Mdn=7), POLYRI students perceived CodeCombat (Mdn=8) as significantly less reliable (Z=-5.879, p=.000) game. More specifically, 88.7% of POLYRI students have not experienced operational interruption when playing LightBot 2.0 while 83.1% of them claimed there were no errors when solving assignments in LightBot 2.0, Moreover, 96.8%, 96%, and 92.8% of POLYRI students agreed that LightBot 2.0 is reliable, stable, and bug-free game designed for learning programming concepts, respectively.

POLYRI students also determined that CodeCombat (Mdn=5) is significantly more usable (Z=-3.323, p=.001) to individuals with wide variety of characteristics than LightBot 2.0 (Mdn=5) is. Namely, 86.3% of POLYRI students agree that CodeCombat displays labels that describe functionality of particular interface functionalities when mouse cursor hoovers over them. According to the results of data analysis, help resources offered by CodeCombat (Mdn=10) are of significantly higher quality (Z=-2.786, p=.005) than those provided by LightBot 2.0 (Mdn=11). More specifically, 93.6% of POLYRI students think that CodeCombat has diverse forms of user help, 95.1% of them agree that help resources can be accessed to equal extent from different parts of CodeCombat game, while 92% of POLYRI students believe that solutions to assignments that constitute CodeCombat can be found in its help materials. It was also found that quality of feedback provided by LightBot 2.0 (Mdn=12) was of significantly lower quality (Z=-2.392, p=.017) than those displayed by CodeCombat (Mdn=14). Namely, 90.3% of POLYRI students support the claim that LightBot 2.0 displays appropriate messages while they are solving the assignments, 85.4% of them agree that LightBot 2.0 offers information to what extent particular assignment has been solved whereas only 51.4% of POLYRI students think that LightBot 2.0 provides feedback on accuracy of solution to certain assignment.

On the other hand, POLYRI students believe they were significantly more effective (z=-2.317, p=.020) in solving assignments implemented in LightBot 2.0 (Mdn=13) than when doing the same in CodeCombat (Mdn=13). More detailed, 70.3% of POLYRI students reported that playing LightBot 2.0 improved their productivity in learning programming concepts whereas 67.4% of them stated that solving assignments which constitute this game resulted in an increase of their understanding of programming concepts. It also turned out that playing LightBot 2.0 (Mdn=7) represented a significantly greater challenge (Z =- 3.557, p=.000) for POLYRI students than solving assignments that are part of CodeCombat (Mdn=6). Namely, the results of data analysis indicate that 86.3% of POLYRI students were pleased with speed rate at which LightBot 2.0 increases difficulty of its assignments. Moreover, 76.6% of POLYRI students agree that assignments implemented in LightBot 2.0 are challenging enough.

The study results also indicate that LightBot 2.0 (Mdn=14) held the attention of POLYRI students to the significantly greater extent (Z=-2.775, p=.006) than CodeCombat (Mdn=15). More specifically, 72.6% of POLYRI students stated that they have not noticed what was happening around them when they were playing LightBot 2.0. In addition, 89.5%, 84.7%, and 88.7% of POLYRI students reported that solving assignments that constitute LightBot 2.0 encourages their creativity, imagination, and curiosity, respectively. Finally, compared to CodeCombat (Mdn=8.5), LightBot 2.0 (Mdn=7) has met expectations of POLYRI students to significantly greater level (Z=-2.172, p=.030). Namely, 65.1% of POLYRI students reported they were pleased with the assignments implemented in LightBot 2.0.

IV. CONCLUSION

The contribution of this paper is twofold. First, a set of fourteen different attributes which reflect pragmatic and hedonic aspects of quality in the context of games intended for learning programming concepts was

TABLE II HEDONIC AND PRAGMATIC QUALITY OF GAMES DESIGNED FOR LEARNING PROGRAMMING PERCEIVED BY POLYRI STUDENTS

CATEGORY / ITEMS	Percentage of the participants responded with "Strongly Agree" or "Agree'

SATISFACTION		
STF2. I am satisfied with the assignments that constitute the game for learning programming.	65.1	62.8

identified. Second, relevance which students with different educational background assign to quality attributes has been determined. More specifically, it appeared that both experienced programmers (FOI students) and programming novices (POLYRI students) found differences between evaluated games in terms of quality attributes intended for measuring the extent to which was easy to learn how to solve assignment that constitute particular game, levels to which playing a certain game requires minimal action and memory load, and the extent to which a certain game represent a challenge. The analysis of data collected from FOI students uncovered that they also found differences between LightBot 2.0 and CodeCombat related to the level to which playing particular game improves their self-efficacy in learning programming concepts, the extent to which is easy to solve assignments implemented in specific game, the degree to which a game is visually appealing, and the level to which a game is reliable. On the other hand, data gathered from POLYRI students indicate that games involved in empirical study differ also in terms of the degree to which a game is usable to people with wide variety of capabilities, the extent to which a game contains diverse help materials, the level to which a game provides useful feedback information, the degree to which playing a game enhances students' effectiveness in learning programming concepts, the extent to which a game successfully holds students' attention for a long period of time, and the level to which a game has fulfilled students' expectations. Third, based on the aforementioned study results, advantages and disadvantages of games meant for learning programming have been discovered. Taking the above into consideration, findings reported in this paper can be used as a backbone for future advances in the field. In addition, identified set of attributes can be employed for the assessment of programming-oriented educational games. However, since only two games were evaluated in the empirical study, results cannot be generalized to all genres of games designed for learning programming. With an objective to examine the robustness of presented results, in our future work we will carry out several additional studies that will be focused on exploring interrelations among quality attributes as well as their contribution to students' continuance intentions related to games designed for learning programming.

Approaches for Implementation of Distance Learning in Higher Education

T.A. Hryhorova*, V.P. Lyashenko* and D.M. Kalinichenko*
* Kremenchuk Mykhailo Ostohradskyi National University, Kremenchuk, Ukraine
gasta1@yandex.ru

Abstract - Life requires an integration of the on-line distance learning into higher educational institutions of Ukraine. It can be used as an element of distance learning, as a separate form of learning, and as an additional instrument in the traditional form of learning. The introduction of this form of training revealed a number of problems like a lack of motivation among teachers, a preparation of teaching material, and the learning model of the majority of distance learning systems. An approach for integration and spreading of the on-line distance learning in the higher education institutions has been proposed in this work. It will allow solving the problems by using special software that takes into account the organization of the educational process management in Ukrainian universities and enables a preparation of the multimedia training courses.

I. INTRODUCTION

The use of the Internet in the education system allows a significant enrichment of the higher education institutions activities by improving the quality of education and expanding its availability. Life demands the new approaches to the learning process in the Ukrainian universities to be introduced in order to ensure the development of the communicative, creative and professional skills of students as well as an improvement of the educational process management. All of this significantly expands the possibilities of the existing traditional learning technologies. The development of the distance education in Ukraine is included in the National Program of Information Development.

A. Advantages of Distance Learning

- For students: it provides the most favorable conditions for using technological capabilities of modern computers and communications. Distance learning improves searching and obtaining for information, helps in developing of cognitive and communicative abilities, an ability to quickly make informative decisions in complex situations, etc.
- For teachers: it provides the release from teaching formal knowledge, the freedom to choose a form of interaction with students. It gives an, opportunity to improve approaches to studying a discipline based on individual abilities and needs of students by learning through discussions, group planning and critical analysis of the obtaining results, and unconventional approaches to soling problems.
- For institutions: it adds a new content to the traditional lecture-form study format.

Platforms for distance learning (E-learning platforms) are already used in some universities Ukraine, and they have many years of practical use in other countries.

That said, we can confidently assert that the on-line distance learning can be used as a separate form of education, as a part of a distance learning, and as an aid in the traditional form of education. But despite the all advantages it has still not became a widespread form of learning in Ukrainian universities.

B. Reasons

- Teachers are not motivated.
- There is a need to create new methods and lectures for new method of learning. All of this can be done using e-learning platforms, as well as using special editor's software. However, the use of editors is not a very convenient approach it because this requires additional set of skills. Also, editor's software environments do not have expanded system of recommendations on how to create a multimedia educational material.
- Most of systems are focused on the Western model of learning (focus on the creation of courses). They have an excessive commercialization, a surplus universality, and complicated set of settings. Also, they often have the bulky and unclear user interface that requires additional development time.

II. RESULTS AND DISCUSSION

A purpose of this work is to develop approaches that will facilitate the implementation of the on-line distance learning for various forms of training in the higher education system, as well as the creation of an information system based on these approaches.

In order to better implement new forms of learning, each institution is required an adaptation period (learning curve). During this period it is better to leave the familiar form of organization and learning management.

A learning management system is a combination of the several components including educational and methodological support, organizational of educational processes, a maintenance of computer and telecommunications systems, a training and professional development of teaching staff, etc.

Institutions, faculties, and departments are basic structural units of the higher education institutions of the accreditation levels III-IV. Department is the basic structural unit of the teaching and research institution of the higher education system that provides educational, methodical, scientific, and research work with the relevant specialty training. The mechanism of the educational and teaching process at the level of the department staff is essential. The educational process should be organized in such a way that provides a teacher with a freedom of choice in selecting methods and forms of organizing the learning process, and it should give a student an academic freedom of choice to select his(or her) own education "trajectory" [1].

If we consider the department from a system's perspective, its main elements are the staff people: a head of the department, teachers, facilitators, laboratory assistants, and students. Each of the system's elements performs a specific task, but it is the interconnection of these elements that provides an achieving of the main task of the system: students learning. All elements of the system are interconnected and form a whole structure; the system simply does not exist in the absence of even one element.

To some extent, it can be argued that the task of the automatic management of the educational process of the higher educational institution is reduced to the task of the automatic management of the educational process within the department. Data on the learning process of various departments are poorly linked. Implementation of the curriculum, monitoring progress, and other elements of the educational process within a specific department faculty do not affect the learning process in other departments of the faculty.

Main Functions of the Learning Management System are:

- the user management system;
- the management of roles (administrator, teacher, student, etc.);
- the management of access rights;
- learning management;
- providing of different types of communication between students and teachers;
- the creation, storage, and delivery of e-learning materials;
- the analysis of learning processes;
- monitoring of the success of training;
- building of the reports, etc.

A research has shown that by using such existing distance learning platforms as Moodle, Claronline, ATutor, SharePointLMS, Live @ EDU, eFront, you can effectively solve the problem of management training activities in the environment of the designing of the adaptive learning courses, its development, and individual control and analysis of the learning process. However, there is no such system structural unit as the Department, there is no role of the "Head of the Department", there is no such a term as 'semester' and no concept of the training course within the semester, here is nothing exist in terms of academic group in these systems. Also, the ability to operate with the grading of students' achievements within semester is not provided in these systems. As a result, there is no way to make a final statement, for instance, of all disciplines taught in the semester. For these reasons, the management of the Kremenchuk Mykhailo Ostohradskyi National University in 2013, refused to use the system Moodle and the like. Therefore, the need has arisen for the information and organization system of educational process of universities that should be oriented primarily on the use of educational groups. Such system should take in the consideration the distribution of learning courses within the semester and support the organizational control of the educational process. This will help to introduce new forms of learning safely and also help monitoring the success of training in the study groups within a separate department.

Another problem that has a serious influence on providing a distant learning is difficulty in preparation of the training materials. Most of teachers are not trained and are not motivated professionally and psychologically to use remote technologies in the educational process [2, 3]. New technologies differ from traditional forms of education; therefore, teachers often have no clear idea of how to develop remote courses in such a way that material is better acquired by students [4]. Also, teachers often have no experience with operating in the electronic educational systems. Despite the fact that special pedagogical technologies for new forms of education are developed for training of teachers of Higher Education Institutions (HEI), the readiness of teachers to use the distance education system increased insignificantly [5].

The offered approach to preparation of the training materials for distance learning system and its program realization will help solving a problem of psychological training of teachers by reducing a time spent on the lecture material preparation and on learning new technologies [6]. This approach is based on the taking into account pedagogical and psychological components of the learning process. It includes recommendations developed in the text editor on the training material preparation. The editor is a component of information system and has an option to generate a package of material automatically. The package includes lectures or recommendations concerning practical and laboratory works developed on the basis of the text document prepared by teacher. All this will allow increasing an interest in use of control systems of the electronic training and will improve a quality of training in different forms of student education.

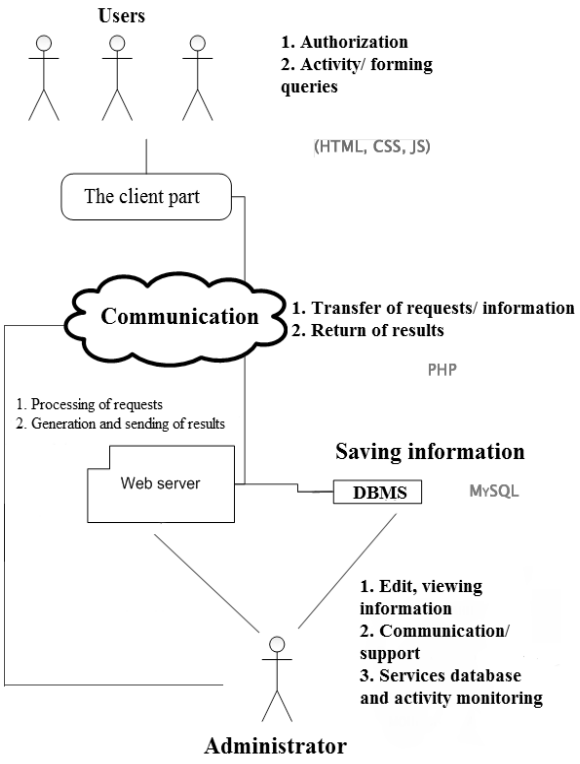

Figure 1. The structure and the interdependence of system components

Three level client-server architecture (Fig. 1) and component model were used for development of information system.

The distance learning system contains such a structural unit as Chair, and new chairs of the HEI can be added, and by adding new Chairs the system increase could be provided. Thus, the system supports a possibility of creating an unlimited number of subsystems, each of which at the same time is an independent link in system. So, each subsystem in its turn has client-server architecture as well.

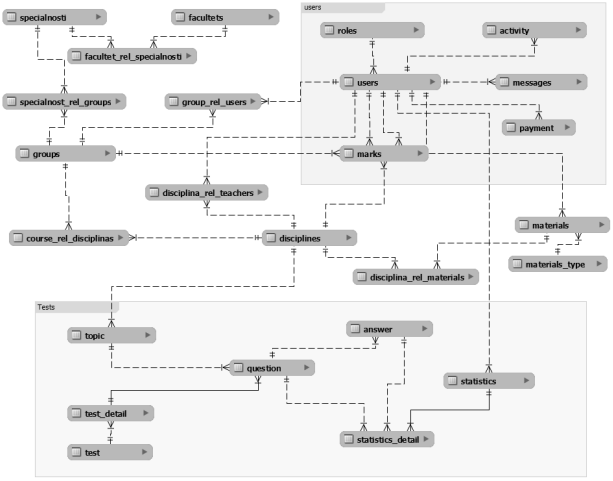

Figure 2. Database of Information System

During the data model development a method of building multi-sites was used with a possibility of creating an unlimited number of databases for each created subsystem with the identical list of metadata.

A database learning management system meets all requirements of the institution and follows the three basic principles, such as scalability, availability and, reliability. Fig. 2 shows the relational database that consists of the tables of information entities.

The data model is divided into three parts: the "Users", "Learning Processes", and "Test". Part "Users" contains information about the users of the system, which includes three main groups: students, teachers and administrators. A head of the department is a part of a group of teachers with elevated privileges that allow access to more information. Part "Learning Process" contains information about the department, study groups, disciplines, courses, and teaching materials. Part "Test" contains information for screening tests in various academic disciplines.

The system consists of four components that are presented as separate modules: Student, Teacher, Administrator and Editor of the system. The module of the Administrator of a control system of educational process gives the user with the permissions of the Administrator a full access to viewing and editing information placed in the MySQL database that is necessary for correct functioning of the system.

The following permissions are available to Administrator:

- to add and delete users, to edit their data, and to define a role of the user;
- to connect students with groups;
- to connect teachers with disciplines;
- to view activity history of users;
- to add faculties, departments, and groups;
- to review information about progress of students with possibility of export;
- to review and edit information contained in a MySQL database by means of the library Adminer.

The module of the Administrator includes the following pages:

- page that displays the main information about users (first name, middle initial, last name, group, login, and payment details);
- page that displays information about activity of users (time of visit, activity on the site);
- page that displays information about progress of the student (first name, middle initial, last name, group, a subject, an assessment, first and last name of the teacher);
- page that displays information on the training materials (available lectures, links of access, and so on);
- page-form for registration of new users;

- page for editing information about users (first name, middle initial, last name, group, login, the password, details of payment, and other);
- page for access to a database;
- page for sending messages to other users of system.

The module of the Teacher allows the user to perform the following actions:

- to add and create materials;
- to delete materials;
- to post and review grades;
- to communicate with other users and administrator;
- to add information about the discipline;
- to view students and teachers activities history;
- to add tests to the system.

Head of the Chair has all the permissions of the Teacher and some additional ones:

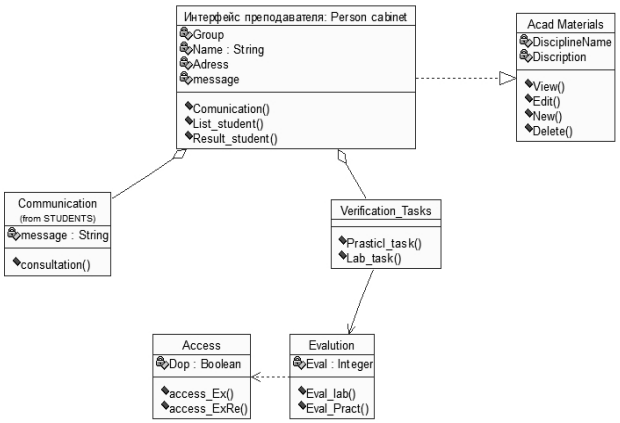

Figure 3. Chart of classes of the module of the teacher

- to view and revise grades of all groups of students in all disciplines of the chair;
- to view the activity history of students and teachers;
- to connect teachers with disciplines, and add in new disciplines;
- to connect student groups with teachers.

After registration or authorization Teacher has an access to his private page where all options/activities are available to him.

The chart of classes of the module is shown in Fig. 3.

The following options are available to Student:

- to view materials on disciplines;

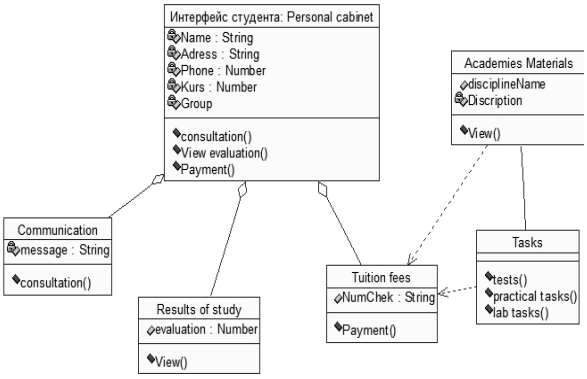

Figure 4. The chart of classes for the student

- to view grades;
- to communicate with other users and the administrator;

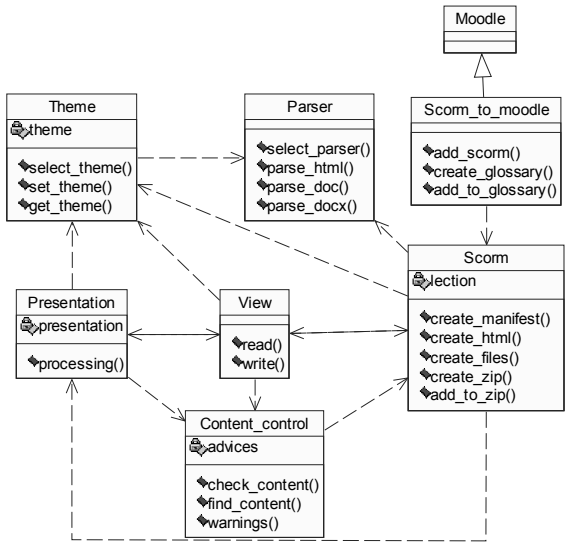

Figure 5. Class diagram of the module editor

- to send works for grading to the teacher;
- to take tests.

After registration or authorization student has to go enter his private page in order to be able to perform all allowed operations.

A chart of classes of the Student module is shown in Fig. 4.

The Editor module allows creating a training material in a form of html document or a SCORM package that includes a lecture text, presentation, and methodical materials with support of the glossary.

A chart of classes of the Editor module is shown in Fig. 5.

The module Editor allows analyzing a lecture material text and creates a template of electronic lecture or presentation on the basis of the rules which are described in the external xml-file. The template is created using keywords found in the text, based on the specifics of a

subject, the amount of available information including such supplemental information like schedules, tables, drawings, video, etc.

The template usually is *.css file. It contains information on color combinations, font size, font style and rules of positions of elements on pages. Separate templates are created for lectures and presentations that account for difference in the features of each lecture types.

A PHP language and the MySQL database server were chosen for implementation of the project. WAMP web server was used for local testing. Macromedia Dreamweaver was chosen as the development environment for creating of web-knots. An interface was created by means of the markup languages HTML and CSS. Interactivity is provided using JavaScript. The database was designed in the MySQL Workbench environment. All necessary statistical information is displayed in tables. Queries in the Database are carried out on the server side with the help of the PHP.

Only a user registered as Administrator in this database has an access to a Chair database. The database and the module are protected from external intervention by mandatory authorization.

A hash function SHA-512 was used to ensure password security. Also, a SSL technology and HTTPS protocols are used for increasing a level of security of the data transfers within system modules. A key (certificate) received by the client from the server is used for encrypting /decrypting of a traffic.

The system supports the 100-poins scale system of grading. The teacher independently determines a type of control for each discipline and number of points reserved for each type. The teacher can grade tasks/types of activities only in those disciplines for which he is assigned. The system automatically calculates number of points by each type of tasks, students rating in group, and estimates both on a national scale, and on the ECTS scale. The system allows preparing and analyzing midterm and final grade sheets for groups on the chosen discipline. For each student, the page with all his/her grades for all types of classes in this discipline is created. An additional module is developed at this stage; this module allows creating structured courses based on the methodical laboratory works prepared in a word-processor Microsoft Word. The courses account for specialty of the learning material design.

III. CONLUSION

The custom system was created at Department of Informatics and Higher mathematics that can be used not only for the organizing distance learning, but can also help increase efficiency of the classical in-class education. The system ensures functioning of the following groups of users: students, lecturers, managers, and administrators of educational institutions, and system administrator. For each user the system supports the authorized access to the resources according to its permissions. The system gives to the management of the educational organization a chance to realize its policy in the field of Internet training, namely: to organize process of training according to curricula, to keep records of academic performance in study groups, to keep records of the working time teachers and students in the system, to keep records and review prepared textbooks and training material of the courses, to connect accounting institutions for tuition payment records keeping if necessary. This control system of educational process is available to public and targets a wide audience.

Usage of Databases and the Information Literacy of Students of the Faculty of Electrical Engineering and Computing

N. Jelača*
* University of Zagreb, Faculty of Electrical Engineering and Computing / Central Library,
Unska 3, 10000 Zagreb, Croatia
nina.jelaca@fer.hr

Abstract - Given the area of their research, the students of the Faculty of Electrical Engineering and Computing (FER) need the latest scientific information from both domestic and foreign journals. That is why the Croatian Ministry of Science, Education and Sports has provided them with the access to various databases of scientific and technical journals. Furthermore, the Faculty of Electrical Engineering and Computing is a provider of one of the most important databases for engineers – IEEE Explore. Students can access these databases either from their homes or from the Faculty premises; they can also attend seminars on information retrieval. The goal of this article is presenting the research on students of the Faculty of Electrical Engineering and Computing, their usage of available databases and their familiarity with the search tools for those databases.

I. INTRODUCTION

The main interest of this article is finding out whether students use online databases, whether they seek information independently and whether they evaluate information they find online. Students can gather information for their research from many sources, such as libraries, textbooks, journals and articles, their colleagues, etc. The question is – do they look for that information properly? There is a need for students to attend classes and courses on information seeking. This would help them work on their information literacy and means of looking for new information, thus helping them complete their papers, research, seminars and assignments more quickly and efficiently.

The term "information literacy" was first used by Paul Zurkowski in 1974. There are numerous definitions that strive to explain what the term means. Information literacy is a set of skills and knowledge an individual uses to locate, retrieve, analyze and use effectively the information that is needed. The Association of College and Research states that colleges need to incorporate information literacy into their programs and promote it to students, because information-literate people are the ones who have learned how to learn. They are prepared for lifelong learning and have the ability to find and evaluate the information they need. However, the fact that students are not aware of what problems information illiteracy causes is a growing issue [1].

The research that Project Information Literacy has conducted on information-seeking behavior of college students shows that students mostly use Google and a few similar information sources for their research and are not aware of how search engines work, which keeps them from conducting quality research [2]. Their information seeking behavior is more random than organized and they rarely evaluate information they receive as long as it answers the question given in the assignment [3].

The Faculty of Electrical Engineering and Computing (FER) and its Central Library provide students with information on databases they can access and courses they can take up in order to learn more about information retrieval. For example, on FER's Central Library's web page, one can find news about how and where students and other members of the academic society can access databases such as EBSCO, Elsevier, Thomson Reuters and the Web of Knowledge [4],[5]. The Central Library's web page also shows which catalogues and bibliographies, such as PERO and the NSK catalogue, are available for students [6]. There are also news about online training webinars from IEEE Xplore that students can attend in order to adopt the best practices in searching IEEE Xplore [7].

The Faculty of Electrical Engineering and Computing also organizes seminars for the acquisition of research, academic and business generic skills for PhD students. One of the workshops is focused on scientific information retrieval and publishing research results. The students who attend these seminars can gain basic knowledge about relevant bibliographic citation databases, methods of effective searching and retrieval of information and the basic elements of writing scientific articles and their submission process, review and publication in journals [8]. Students may also choose an elective humanistic course that teaches the basic principles of scientific ways of thinking and conducting of scientific research. [9].

Croatian students are given access to many quality online databases from a wide range of interest fields. Access is provided through the Online Database Center, a project of the Croatian Ministry of Education and Sports, CARNet and the Library of Ruđer Bošković Institute [10]. Databases can be used via an AAI@EduHr account – electronic academic identity.

The Online Database Center provides network access to 63 commercial bibliographic and open access databases to all members of scientific and academic communities in Croatia. All databases are acquired after consulting scientists, teachers, users and librarians that are well acquainted with the needs of their users. The Online Database Center provides access to:

- Bibliographic databases from different scientific fields (Medline, INSPEC, MathSciNet, Agricola, GeoRef, PsycINFO, FSTA, Compendex).
- Databases covering all scientific fields (Current Contents, Web of Science, Academic Search Premier, Scopus).
- Full text databases (Blackwell Synergy, Cambridge Journals Online, Springer Link, Science Direct, Oxford Journals, Wiley Interscience, Top 100 Lippincott Journals, Evidence Based Medicine Reviews, Business Source Premier, HeinOnline, Ovid Core Biomedical Collection).
- Open access databases (ArXiv, CiteSeer, DOAJ, Google Scholar, OAIster, PLoS, PubMed Central, Scirus, spiers, etc.) [11].

The Center also provides educational courses for users that teach practical searching skills. Courses are held online and at universities [12].

FER students can also access articles from IEEE Xplore. IEEE Xplore is one of the most valuable databases which covers literature on electrical engineering, computer science and ICT, as well as many interdisciplinary subject areas [13]. It provides access to scientific and technical content and offers more than 3 million full text articles published by IEEE and its publishing partners [14]. In 2012, FER established institutional approach to the IEEE Xplore online database. FER and IEEE singed a 3 year contract, from July 1st 2012 to June 30th 2015, which means that all employees and students can now access the database from the IP address of the University of Zagreb, including student dormitories [15].

II. THE SURVEY

The goal of this study is determining how FER students carry out their research for assignments and papers, what online resources they use and whether they seek help from librarians.

A survey that was distributed to a random selection of 100 students from the Faculty of Electrical Engineering and Computing had nine questions and was anonymous. It was conducted in a three day period during the February of 2015. All 100 surveys where filled. The study addressed following questions:

- What information resources do FER students use to conduct their research?
- Do students use WEB 2.0 applications to cooperate with their colleagues while writing papers?
- Who do students ask for help in finding relevant information resources for their research?
- Do students use advanced options while searching databases and the web?
- Have they ever attended seminars or courses on information retrieval?
- Does the Faculty of Electrical Engineering and Computing need to add more courses on that subject?
- Which databases do students mostly use?

III. RESULTS

The survey was mostly filled by male students (75%, 75 out of 100 students), from the bachelor programme (78%, 78 out of 100 students) and the master programme (22%, 22 out of 100 students).

Table 1. Survey respondents gender

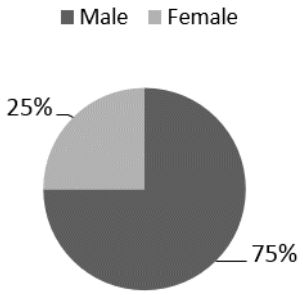

Table 2. Survey respondents college programme

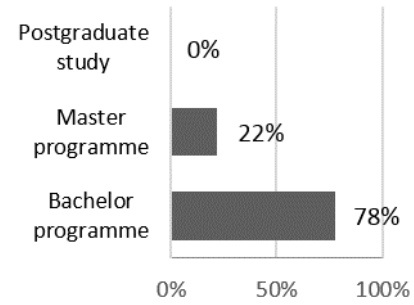
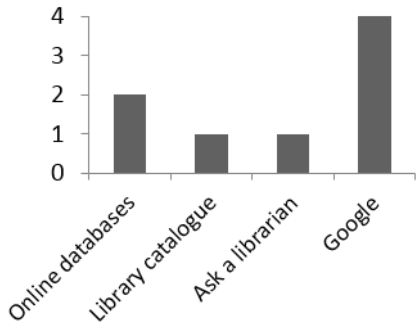


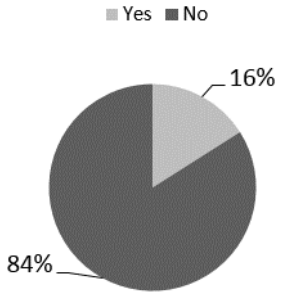
The results indicate that students usually turn to Google for their research and rarely use anything else, such as databases or the library catalogue. They never use library services such as Ask a Librarian.

Table 3. Use of Web sources



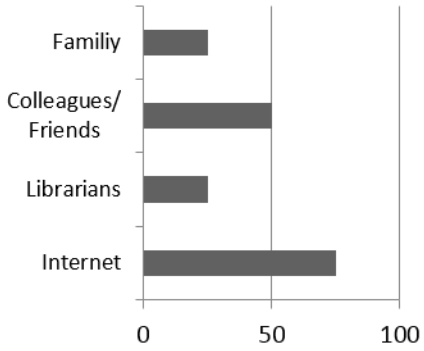
84% (84 out of 100 students) of FER students do not use WEB 2.0 applications (such as Mendeley or Endnote) to help them in bibliography organization and collaboration with colleagues.

Table 4. Use of WEB 2.0 applications



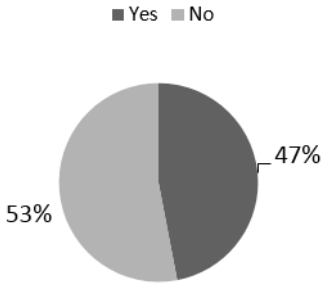
They always use the Internet if they have problems finding the right information and also often turn to their colleagues and friends. They ask their parents or librarians for help rarely.

Table 5. Asking for help



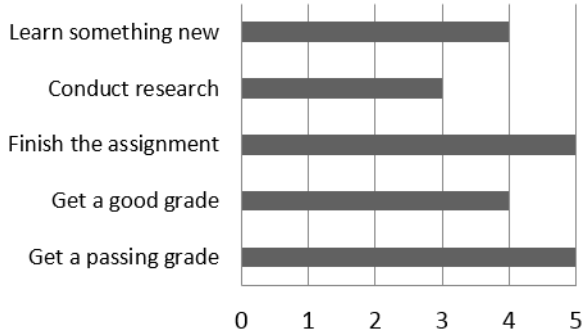
Only 47% (47 out of 100 students) of students use advanced options while searching through databases or the Internet.

Table 6. Use of advanced search options



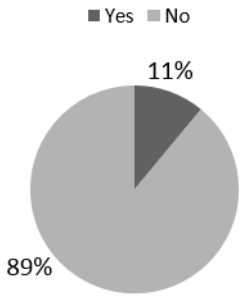
The most important thing to FER students is getting a passing grade and finishing the assignment while getting a good grade. They do not consider learning something new or conducting research to be very important.

Table 7. What is important to FER students



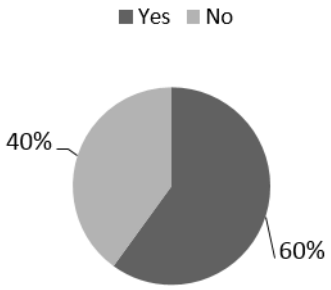
There are few students who attended seminars, courses or lectures on information retrieval and information literacy, only 11% (11 out of 100 students). Seminars where mostly attended by graduate students on FER, in secondary school and Algebra [15].

Table 8. Information literacy and information searching seminars



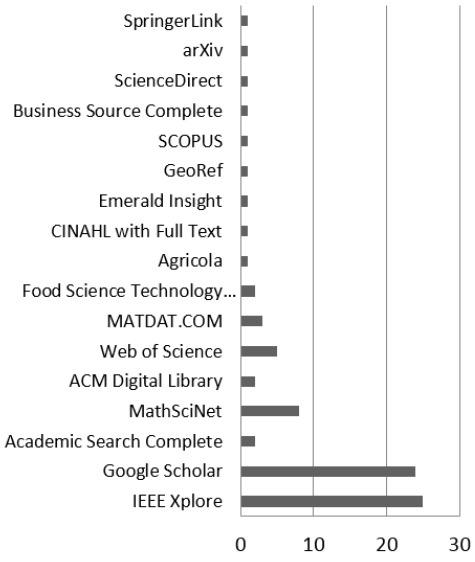
Only 40% (40 out of 100 students) of students think FER should include more of said courses for all students into its programme.

Table 9. Need for more seminars about information literacy



Students where asked which databases they use to conduct research. 51% (51 out of 100 students) of students responded to this question. Databases they use the most are IEEE Xplore, Google Scholar, MathSciNet and Web of Science.

Table 10. Most used online databases



IV. DISCUSSION

The technological advances of today make access to information much easier, yet students still limit themselves to searching for information on Google. They are not information literate and do not have the necessary skills to find, retrieve and evaluate the information they need. Nowadays, students are not acquainted with different types of information sources, such as databases or library catalogues.

Students are either unacquainted with the value of these sources or are uninformed about them and means of using them properly. Students find that getting a passing grade and finishing the given assignment is most important. They are much less concerned with getting a good grade or learning something new. With that mindset, the students' information seeking is reduced to a minimum required to finish the given assignment. Virtually none of the students have extra knowledge and skills in information retrieval because only few had attended seminars on the subject and merely half of them feel that FER should include that type of education in their programme.

Almost all students use the Web as the only resource of information and rely on the Internet for writing papers and finishing assignments. They do not tend to use reliable information sources such as library catalogues or databases which they are welcome to use freely. The results indicate that students either lack the knowledge about certain information resources or about their usage. More than half of the respondents say they never use advanced options, which would help them find relevant information more easily and more quickly, while researching. FER students never use library services or databases the access to which is provided by Croatian Ministry of Education and Sports or FER.

Although master programme students have more access to courses on information literacy on FER than bachelor programme students this research has shown that there is not a big difference between their attendances. From 11% of students who attended those kind of seminars 50% are bachelor and 50% are master programme students.

All of this indicates that libraries and FER have a big task ahead of them. The fact is that acquiring access to databases such as IEEE Xplore means spending a huge amount of money. This research, on the other hand, makes it obvious that students do not use these databases frequently. The college and its library need to work together on promoting and educating students about relevant information sources and how to use them, so that students could start trusting and using them with the skills needed for conducting proper research that would give relevant results.

V. CONCLUSION

Most of the findings from this article indicate that libraries as well as professors have a big problem to solve. Students from bachelor and master programme search for information only on the Web, very rarely consulting relevant information sources such as the library catalogue or scientific databases. There is a need to engage students in critical thinking and to work on their information literacy. Although students are offered different options as to where and how to learn about conducting scientific research, they do not apply to those courses or attend seminars and workshops. Perhaps making those courses mandatory would improve how students see the importance of information literacy. Professors need to help solve this problem by requiring students to use relevant sources for writing their papers and assignments. The Faculty of Electrical Engineering and Computing's educational programme should

incorporate more information literacy and research methodology courses that would be mandatory for students at least at some point of their education. The Library also needs to be included in the implementation of these courses by supporting the teachers and the learning process with its expertise. The Central Library has to promote various quality information resources and help students understand the important role of the library in a student's life. This would make students more independent and critical in their research and provide them with the skills required for lifelong learning – the one that extends beyond their college education.

Summary

Massive Open Online Courses (MOOCs) are known as free online courses available for hundreds or thousands of participants worldwide. MOOCs have been a hot and current topic within the field of e-learning, with numerous platforms developing and growing, each of which is specialized for courses in different areas. Due to the technology development and its pervasion in everyday activities, platforms that offer MOOCs are developing courses and all related activities in a way that they are available for usage on different platforms and devices, adapting to the trend of ubiquitous learning. MOOCs are being adjusted for mobile and desktop usage and a need to create a frame for evaluating and comparing mobile and desktop instances of MOOCs arose. This paper reviews literature, questions mobile and desktop versions of MOOCs, and provides a frame for their comparison.

I. Introduction

E-learning is a widespread way of disseminating and acquiring knowledge, in all its forms and appearances. It could be defined as a usage of information and communication technologies in order to leverage and enhance process of learning and teaching [1]. One of the most popular e-learning instances are MOOCs, Massive Open Online Courses, which are basically free online courses available for hundreds or thousands of participants worldwide [2].

Furthermore, MOOCs have become very popular because publication and participation are easy to manage, students do not have to pay for a MOOC which is an advantage [3], and the technology has become an essential part of everyday life. Naturally, an extreme role technology has in everyday personal and professional activities raises the question of adapting learning in every situation and in all times. MOOCs are not excluded from this issue.

The paper starts with differing m-learning from e-learning and considering access to MOOCs in mobile and desktop environments. The chapter is followed by presenting potential criteria for comparing MOOCs in m-learning and e-learning.

II. MOOCs In Mobile And Desktop Environment

A. *E-learning, m-learning, t-learning and u-learning*

E-learning is defined in many ways, and one of most popular definitions is that it is the use of technologies in the process of gaining and disseminating knowledge. Similarly, mobile learning (m-learning) is considered as constructing every kind of knowledge and skills by using mobile technologies [4]. m-learning is also defined as learning through multiple contexts, social interactions and interactions of content, by using personal electronic devices [5].

M-learning can be viewed as a natural "extension" of e-learning and, as such, as another component/module of more complex ICT solutions for hybrid learning. In particular, e-learning is a macro-concept that includes the environment for online and mobile learning. E-learning is also a "subset" of distance learning, which is also part of the flexible learning concept [6].

As with e-learning, some of the most important advantages of m-learning (illustrated in Figure 1) are that the study can be done by anyone, in any place, at any time when the user is ready to learn thus taking advantage of mobile phones and wifi enabled PDAs [7]. In general, teachers believe that learners' participation and engagement increases when using mobile devices for class activities outside of class, but does not positively affects their participation and engagement while in class [8]. Obviously, there should be some concern with regards to this type of access to learning content. At the same time, there are a number of advantages that usage of mobile devices brings forth elaborated hereinafter.

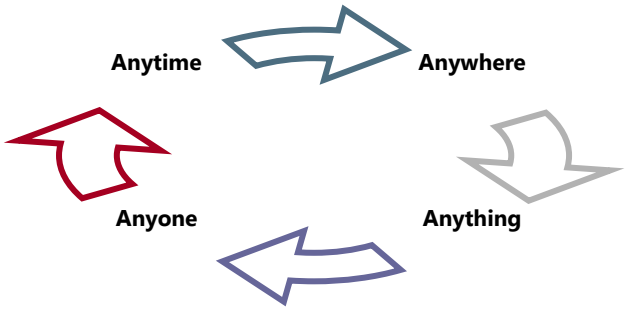

Figure 1: Advantages of m-learning, adapted from [7]

E-learning producers tend to adjust their content and products to make use of the new opportunities enabled by technology development accordingly. Consequently, end users interact with each other using ubiquitous devices because of the increased availability of free wireless network access points, and in this way they are "extending traditional e-Learning into a new phenomenon named Ubiquitous Learning"[9]. U-Learning can be defined as "a function of different parameters: u-Learning = *{u-Environment, u-Contents, u-Behaviour, u-Interface, u-Service}*" [10]. Despite the ubiquitous character of learning, there are some areas for which m-learning is more appropriate and have been emphasized as convenient for m-learning initiatives. These include any form of scan-and-learn project, just-in-time guides, initiatives that can include location, refresher learning [11] and support for on-demand learning in everyday business activities. A research [12] on proliferation of mobile learning in business settings (with 538 respondents from 481 organisations) shows little difference in uptake of mobile learning between not-for-profit (74%), public (73%), and private (69%) sector. As for industries with the highest use of mobile devices commercial training providers (90%), manufacturing, science and engineering (79%), and professional and technical services (72%) are among the leading adopters. Similarly, BYOD (*Bring Your Own Device*) movement contributes to u-learning adoption. It is more frequent in large organizations (20000+ employees), multinational companies and companies with over 10 years´ experience of using e-learning (ibid). As great effort is needed to integrate BYOD properly (especially from security perspective), it is clear that large companies would be at the forefront.

Popularity of tablet devices contributes to u-learning movement as well. Tablet learning can be perceived as a type of mobile learning, concerning portability and personalization of the device used. Still, a lot of theoreticians and experienced professionals emphasize that tablets are not as portable and ubiquitous as mobile devices. Also, t-learning offers many more opportunities for delivering and disseminating content. In all cases, course design is one of the most important factors that influence performing activities and finally completing course assignments.

Presence of mobile internet access grew rapidly in previous years, and a proliferation of smartphones (later, tablets as well) became one of the most relevant game-changers in area of online learning. Due to high availability of devices and learning material, learners should always be able to retrieve the material without the technology becoming a deterrent [7]. An example of successful m-learning project is Merrill Lynch. Their compliance training courses were delivered on BlackBerry mobile phones [13] to: (i) enable learning outside the offices, (ii) make use of existing mobile device usage habits, and (iii) allow people to consult learning content in chunks at time and place they prefer. Reported results are exemplary, namely, the company reported a 1.21% increase in average competency score (comparing to control groups) and a 12% higher completion rate in the set timeframe. Overall, it took less time for employees to complete the course (on average 45% less time in training). Similar superiority of m-learning was identified in the previously mentioned study [12]: as high as 70% improvement in productivity, 47% improvement in manager perception of additional business benefit, and 25% improvement in revenue was identified in some cases when m-learning was used to increase the numbers of participants in learning and development programmes. Similarly, the eLearning Guild in their Mobile learning report [13] emphasise that some of their members who have implemented m-Learning report a 52% improvement in user performance and an 83% increase in making learning available to users.

There are a number of studies comparing mobile and desktop versions of same course. An empirical study [15] inspected delivery of an existing e-learning course within Department of Defense (USA). In the original (e-learning) version of the course, it took around 40 to 60 minutes to complete the course. For the mobile version of the course, completion time dropped to 25 to 45 minutes. In addition, subjective preference was measured – 38% rated the mobile version as 5/5 (being very satisfied with it), 46% as 4/5, and 13% as 3/5. Around 70% of the participants that previously used the e-learning version preferred the m-Learning course, while 26% of the participants preferred the e-Learning course.

Conversely, another study [16] found no difference in learning performance across the three modes of workforce training: classroom face-to-face instruction, laboratory-based e-training, and mobile learning. This supports the commendation that knowledge acquisition can be equally good regardles of the way material is delivered – via desktops or mobile devices (depending on the context of course).

Based on the above, a profound consideration of devices used to access learning materials in MOOCs is needed. Courses need to be created and developed in accordance with instructional design principles, bearing mobile, tablet and desktop computer usage in mind. Companies "push" the use of mobile devices, tablets and own computers and so according to the reported study [12] 52% of organisations that participated in the study provided learners/employees with smartphones (or as high as 60% in "top learning" companies) while 48% provide learners with tablets and 41% have a policy of BYOD (or as high as 66% in "top learning" companies.

Another comparison of e-learning and m-learning/t-learning in the context of use that illustrates why it is important to support both ways is given in Table 1 based on [7]. Collaborative character of e-learning is related to learners behavior during knowledge acquiring: learners can exchange opinions and build ideas and frameworks, as well as challenge their ideas. Further on, networked learning is "learning in which information and communications (ICT) is used to promote connections: between one learner and other learners, between learners and tutors; between a learning community and its learning resources" [17]. With regards to access using mobile devices it is important to note that it is mostly used for

informal learning, which is a type of learning in which learner sets his own goals and ways to achieve these goals, as well as the moment in which they are achieved [18]. In short, m-learning characterizes accesing adapted material that it stripped of excess media content, i.e. is more lightweight.

TABLE I. DIFFERENCE BETWEEN E-LEARNING AND M-LEARNING ACCESS

E-learning	M-learning
Collaborative	Networked
Media rich	Lightweight
Distance learning	Situated learning
Formal	Informal

B. MOOCs

MOOCs have been described as the new form of online learning, while their popularity is growing with academics and within business circles. The term was first used to describe an online open course *'Connectivism and Connective Knowledge (CCK08)'* developed by George Siemens and Stephen Downes [19]. Early MOOCs have been known as cMOOCs, which are based on the *connectivism* theory of learning, which favours networks of learners evolving informally [20]. In 2011 a number of universities in the United States started offering MOOCs via commercial platforms, and these MOOCs were called xMOOCs. xMOOCs have been "focused around a set of short, modularised video-lectures, followed by automated, multiple-choice testing of learners' understanding of the content" [19], and are used to define and describe MOOC concept we use today.

As already stated, what mostly differentiaties an xMOOC from a cMOOC is who provides a MOOC. Namely, cMOOCs are mostly provided by a group of individuals while xMOOCs are usually provided by one or more higher education institutions or lately more often for-profit companies [21].

The most popular MOOC providers are presented in Figure 2. In 2013 Coursera was the largest MOOC provider by far, with almost half (47%) of all the open online courses offered [22]. Its share of courses is slowly being reduced by new MOOC providers.

In 2014 Coursera's share of courses was 36% enrolling around 10.5 million students [23]. Nonetheless, Coursera's share is still twice as large as competitors. Namely, edX holds 16% of the provided courses and has around 3 million registered students.

Based on the same data source, other providers in the "top 5" list per number of students are Udacity (1.5 million students), MiriadaX (1 million students) and FutureLearn (800.000 students), while in the "top 5" list per number of courses besides Coursera and edX are Canvas Network (8.4%), Miriada (5.3%) and FutureLearn (4.7%).

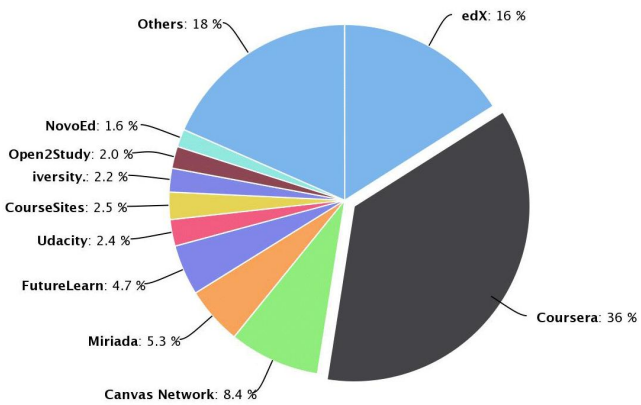

Figure 2: Course distribution by provider in 2014 [23]

C. Accessing MOOCs in mobile and desktop environments

Many of the listed providers maintain and upgrade MOOC learning platforms that offer responsive websites or (native) mobile apps (tablet and smartphone versions). Mobile and desktop versions are often different. When it comes to considering MOOC design, creators have different options for adapting the course for usage on different types of devices.

First of all, it is possible to implement responsive design. By doing this, the web app (e-learning website or a platform) is automatically resized and adjusted for usage on mobile and/or tablet devices, i.e. onscreen content automatically changes layout in response to the size of the screen it is being displayed on [24]. Responsive design is a good idea if creators of a MOOC want to enable mobile learning without dealing with mobile apps. Naturally, responsive design and development is a more complicated and resource-consuming task than e-learning development.

Access to a MOOC titled "E-learning and Digital Cultures" provided by The University of Edinburgh available from Coursera using different devices is illustrated below. The course is not optimized for access from mobile phones or tablets using responsive design principles (compare Figure 3 and Figure 4) but is available through Coursera native mobile app for iOS (Figure 5).

MOOC designers also have an option of developing mobile apps in addition to desktop version of the online course. Majority of MOOC providers do post their mobile apps in Windows, Android and Apple stores for download. Apps are attractive because they are, among other features, "formatted perfectly for the devices on which they are based, tend not to tempt the user away from the job in hand with links, pop-ups and extraneous clutter and they can usually be accessed with a single touch" [25].

Both mobile apps and responsive web apps have advantages and disadvantages that should be taken into consideration when evaluating and comparing MOOCs in m-learning and e-learning environments. Such criteria is presented and analysed in the following chapter of the paper.

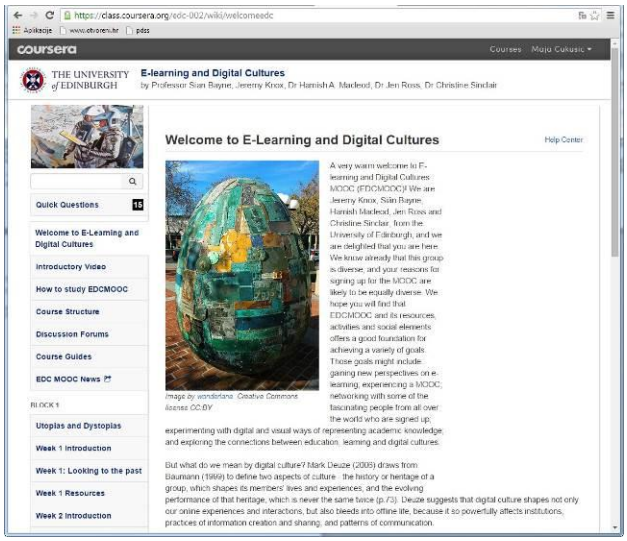

Figure 3: Accessing a MOOC using browser on a desktop computer

Figure 4: Accessing a MOOC using browser on a mobile phone

III. Criteria For Comparing MOOCs In M-Learning And E-Learning Settings

In order to inspect thoroughly MOOCs in different learning contexts it is important to consider sets of criteria for comparison. This paper brings forth the preliminary criteria based on the available body of literature and as such presents a starting point for our future empirical research/comparison of major MOOC platforms (such as Coursera, Khan Academy, Udacity, edX). The aim of the research is to provide a methodological and eventually and empirical overview of similarities and differences of MOOCs design in mobile and desktop environments, supported by comparison of the courses provided by major MOOC platforms.

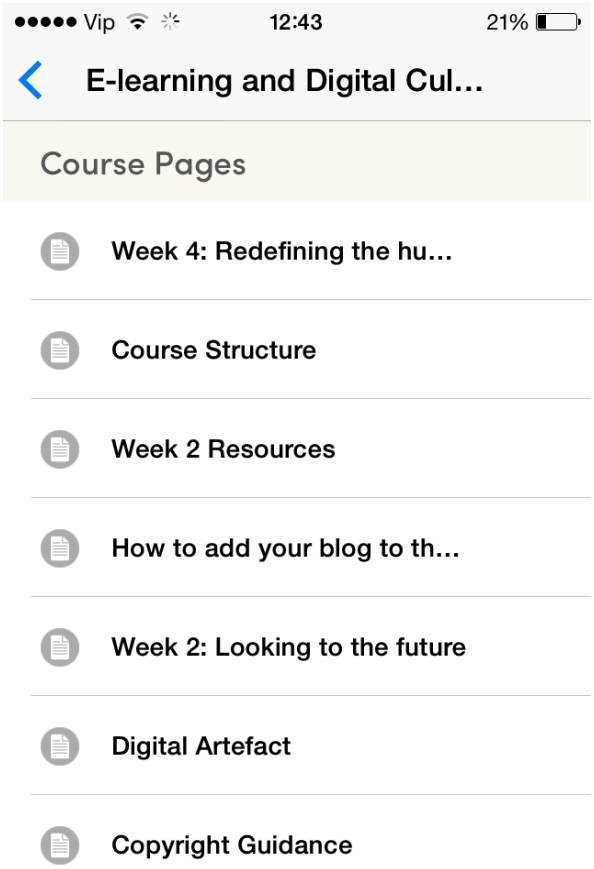

Figure 5: Accessing a MOOC using mobile app

First of all, MOOCs can be observed and compared in relation to popular learning theories. For example, [26] states that "popular MOOCs employ predominantly instructivist approaches to teaching". Courses from the likes of Coursera and Udacity tend to follow a highly instructivist model but, because of their size, spawn networks and study groups of learners who meet face-to-face, and through various social media such as Facebook, to enhance and support one another using quite different and more connectivist approaches [27].

Some common criteria for comparing MOOCs in mobile and desktop environment are presented in Table 2. In their paper, [28] list elements of effective traditional learning, that should be connected to particular characteristics of online learning, to ensure that a successful learning context will be created. The same characteristic should be used to evaluate MOOCs as an instance of e-learning. Other criteria are based on previous considerations of quality e-learning courses (in [29]; [30]; [31]) and common platform features (in [32]).

With regards to devices used to access MOOCs it is important to consider course design and ease of use. Perceived ease of use is one of key variables that influence learning flow in online learning process [33]. It is related to course design, which depends on series of issues. Screen size, time and frequency of use, connectivity, internet connection quality, type of content, target group, all are variables that influence course design.

When it comes to online learning design, content must be broken into smaller chunks of content, called learning

objects [34]. By creating and combining learning objects, online courses are developed in an easier way, and they are more manageable. Also, thanks to granularity and the way that learning object is programmed, marked and saved, possibility of sharing and re-use is increased. One of the questions set before instructional designers is: „How to envision and create learning objects in order to incorporate them in different methodological and technological predispositions connected to different environments".

Differences between e-learning and m-learning in terms of content and parts of instructional design are fading in MOOCs. Idea of MOOCs in mobile devices is to provide the same resources, and slightly altered experience to the users (considered in Table 3 under two different categories of criteria). The experience is the crucial difference between these versions.

TABLE II. CRITERIA FOR COMPARING MOOCS IN MOBILE AND DESKTOP ENVIRONMENT – MOOC CHARACTERISTICS

Quality and expected MOOC features	Author(s)
MOOC should be interactive	Wild, Griggs, & Downing, 2002
MOOC should provide an opportunity to repeat and practice	Wild, Griggs, & Downing, 2002
MOOC should provide a choice between different presentation styles	Wild, Griggs, & Downing, 2002
MOOC content should be relevant and practical	Wild, Griggs, & Downing, 2002
Goals of MOOC are defined	Ćukušić & Jadrić, 2012
Working plan of MOOC activities (*syllabus*) should be created	Ćukušić & Jadrić, 2012
Educational content should be created, its course (sequence) and structure defined	Ćukušić & Jadrić, 2012
Students are being motivated	Johnson & Aragon, 2003
Social interaction is encouraged	Johnson & Aragon, 2003 Gillani & Eynon, 2014 Dron & Anderson, 2014 Ozuorcun & Tabak, 2012
Additional types of activities are provided	Johnson & Aragon, 2003
Acquired knowledge is assessed	Garača, 2008
Platform provides auxiliary functions for instructors (logs, enrollment options…)	Garača, 2008
Course is scheduled (the start and end dates are defined)	Ćukušić & Jadrić, 2012

TABLE III. CRITERIA FOR COMPARING MOOCS IN MOBILE AND DESKTOP ENVIRONMENT – ACCESS TO MOOC FEATURES

Mobile MOOC features	Author(s)
Allows offline viewing (mobile apps)	Korucu & Alkan, 2011 Elucidat, 2013
Allows download only on Wi-Fi	
Content is broken into small pieces	Govindasamy, 2002
Connection of a mobile learning tool to an individual	Ozuorcun & Tabak, 2012
Able to watch in vertical in horizontal position of device	
Responsive MOOC features	**Author(s)**
Supports a range of devices and screens	Elucidat , 2013
Over 90% of website content is delivered through mobile version of the responsive web page as well	

Access to MOOC features using: **a) Desktop computer b) Mobile device c) Mobile App**

Another important feature that mobile environments provide is offline/online access to learning material [35], [36]. Online access provides up-to-date information and access to data, while offline status ensures speed and no communication costs.

Mobile setting is different than the desktop one, and particular rules should be applied when designing an m-learning course. According to [7], there are several requirements when it comes to designing an m-learning tool: portability, connection to an individual, retrieving knowledge without the technology becoming a deterrent, communication, adaptation to learners development, persistency, usefulness and user-friendliness.

The second part of the table 3 is prepared based on the review of common MOOC features that should be available in both desktop and mobile versions. The content, as already suggested should be delivered in an appropriate way. The representation of both the content, and the features should be different when accessing from different devices. The list is non-exhaustive and will be amended by additional features based on extensive research of 76 randomly selected MOOCs conducted by [19].

IV. CONCLUSION

In the years to come MOOC market is expected to consolidate. It is expected that only largest platform that provide highest quality content will survive thus achieving even greater integration and exploitation of the massive potential of this type of learning, in all learning environments (such as academic or business).

Platforms that offer MOOCs are developing courses and all activities related to those courses in a way that they are available for usage on different platforms and devices, adapting to the trend of ubiquitous learning.

The aim of this paper was to investigate the potential of adjusting MOOCs for desktop and mobile environment and to propose a set of criteria for comparison of MOOC design and implementation tasks and challenges in both surroundings, having methodological and technological terms in mind, moreover, questioning them in MOOC's mobile and desktop environment.

So far, studies focused on mostly methodological issues in MOOC learning since some of the instructional design principles may pose a challenge due to large numbers of users (such as achieving expert human feedback). A number of key areas in which instructional design of these courses should be improved were identified (see for example [19] for a through comparison of over 70 MOOC courses from Coursera, EdX, Udacity, Codeacademy, Canvas Network, FutureLearn, and other websites). Nevertheless, other than rethinking "soft" aspects of MOOCs (some of which are presented earlier in table 2), technological adequacy of the MOOCs should be considered as well. "Pedagogy first, technology second" underpins the criteria presented earlier. Seamless transfer from one device to another, continuing with learning material should be supported by technological solutions and that is the base for criteria presented in table 3.

Future research will aim to validate and further expand the proposed criteria. Also, it will be reviewed whether top 5 MOOC platforms have responsive websites or mobile apps (tablet and smartphone versions), and how are they designed, i.e. what are similarities and patterns followed by more platforms. Additionally, it will be reviewed if mobile and desktop version follows methodological and technological ground of e-learning and how do they (if they do) differ from each other.

Abstract – Learning management systems collect huge amounts of data that can later be analysed. The University of Rijeka uses MudRi e-learning system, which is based on the Moodle open source software. This paper focuses on the Programming course, for which data over several years are available. The data can be interpreted and valuable knowledge can be obtained and used for improving the quality of lectures, as well as making the lectures more suitable for students based on the actions and material deemed the most popular. Since the MudRi database contains many facts that might affect each other (e.g. homework might affect the final grade), association rule mining, which discovers regularities in data, is the most suitable data mining method. Apriori algorithm for the discovery of association rules is used for finding connections between various actions and final grades. Many interesting rules and information are discovered, which lead to conclusions on actions that seem to be in relation with the course success.

I. INTRODUCTION

Many companies accumulate huge amounts of data from their daily operations. For instance, shops gather a lot of data about its customers based solely on products they buy. All the transactions are stored in databases and data warehouses and they are available for further analysis, which helps understanding customers' behaviour better, which in turn helps managing the store, its promotions etc. Similar application can be seen in education since it nowadays relies on e-learning systems which collect a lot of information about students and their actions.

This paper focuses on the data from the Programming course in the MudRi e-learning system, with the purpose of getting information which help better understanding students' behaviour, improving the quality of course and e-learning system, and establishing connection between students' usage of the system and achieved success.

There are many kinds of knowledge that can be found in data. This paper focuses on the discovery of association rules, as well as their explanation. The tool that we use is R, the free software environment for statistical computing and graphics.

The remaining sections are as follows:

Section 2: Lists some related work

Section 3: Gives a description of the dataset and explains the process of mining association rules

Section 4: Discusses the results of this analysis

Section 5: Gives the conclusion of this research

II. RELATED WORK

Educational data mining is a promising area of research, so there are many works in this field [1]. Although methods and goals vary, all these works are trying to improve education systems.

The authors in [2] use data mining algorithms to identify behaviour of failing students in order to warn students who behave in such a way prior to the final exam, as well as to help teachers with managing their class.

The research in [3] predicts students' final grades using classification algorithms based on features extracted from the data logged in the e-learning system, while the one in [4] uses data mining to help engineering students to select an appropriate major.

In [5], the authors propose a novel Critical Relative Support to deal with the criticality or significant level of least association rules on the examination result of computer science students from the University of Malaysia Terengganu. The authors in [6] use data mining techniques to try to connect students' behaviour and their final success.

The work in [7] presents a case study on the data from the subjects which are common at graduation and post-graduation level to predict the factors that explain student's success or failure by using association rules discovery.

Several case studies related to video lectures and their impact on the learning process, along with their advantages and disadvantages are presented in [8, 9, 10].

III. ASSOCIATION RULE MINING

The process of association rule mining could be divided into five most common phases: selection, pre-processing, transformation, data mining and the evaluation of rules [11].

A. Selection

The data used in this research come from the Programming course in the Moodle e-learning system called MudRi, and contain five years of continuous system usage in the form of transactions. Every action that students take is recorded, no matter if it is just a click on some resource or upload/download of some file, along with the date and time of the action. Students of the course are required to attend at least 70% of the lectures. Additional activities and course content files are at their disposal within the MudRi system. The two activities specially observed in this paper are demonstrator classes and video lectures, the latter being a new element in the course.

The actions that the system records are joined with students' final grades at the end of the selection process, since the main objective of the paper is to see whether there is a correlation between those two activities and students' final grades.

B. Pre-processing

The first thing that needs to be done on this set of transactions is the anonymisation of students' personal information. Everyone is given a unique ID to enable keeping track of their actions. Furthermore, as five years is a long span, the format of some fields might have changed, so it is crucial to make sure everything is consistent.

Another important pre-processing step is the use of taxonomy. Taxonomy makes it possible to define groups of items based on their shared characteristics [12]. In this case it is used to group points, so all the grade points between 80 and 100 become grade A, points between 70 and 80 become grade B, etc. Most of these point totals are transformed to its letter counterpart directly by the system, but some of them are wrongly aligned, possibly due to some missing values, and as such present a noise that needs to be cleaned. An example can be seen in Fig. 1 where numeric grade 71.33 matches grade F instead of B.

C. Data transformation and data mining

Since R needs special data formats to deal with data mining, our set of transactions needs to be transformed into a data frame which is a list of vectors of equal length.

Fig. 2 represents an excerpt of the dataset used in this research in the form of a data frame, with its fields and matching values shown.

Association rules could be defined as an expression of the form X -> Y, where X and Y are disjoint and non-empty item sets [13]. The interpretation of the expression is that when all the items from set X are in a transaction, the items from Y are in the transaction too.

There are many algorithms that could be used for mining association rules, and in this research the Apriori algorithm is used.

Apriori is a classic algorithm for association rule discovery. It can be used on any database that contains transactions, where for every item set it tries to find a subset with at least a minimum number of item sets. Apriori uses a bottom-up approach [14], so it adds one item at a time to frequent subsets (candidate generation step) and tests the new group against the data. When there are no further successful extensions found, the algorithm terminates, as seen in Fig. 3.

For counting of items, Apriori uses a breadth-first search and a tree structure [14]. It first generates item sets of length *k* from item sets of *k-1*, and then prunes the candidates with infrequent sub pattern. Although the size of item sets grows exponentially, efficient search is possible since it uses the downward-closure property of *support* [15] (anti-monotonicity [16]), which guarantees that for an infrequent item set, all its supersets must also be infrequent.

D. *Rules validation*

For rules validation, a few metrics of interest are used.

- Support

Support is first introduced in [15]. It is defined as:

$$\text{supp}(Z) = P(Z) \tag{1}$$

Support is defined on a dataset and gives a proportion of the number of rules that contain *Z*. It is used as a measure of importance of a dataset. As it uses the count of transactions, it is often called frequency.

Support is the main measure of significance (importance) of an item set. An item set is called large or frequent only if it has *support* greater than the set minimum.

The main feature of *support* is the downward-closure property or anti-monotonicity. It means that all subsets of a frequent set are also frequent, while all supersets of an infrequent set are also infrequent. That feature is used for tree pruning in level-wise algorithms, such as the Apriori algorithm.

The main weakness of *support* is the rare item problem. In some systems, due to uneven distributions, many transactions that could be significant get pruned away because of low *support*. However, it is also possible that transactions with low *support* happen simply by chance.

- Confidence

Like *support*, it is first introduced in [15]. Its definition is:

$$\text{conf}(X \rightarrow Y) = \text{supp}(X \rightarrow Y)/\text{supp}(X) =$$

$$P(X \text{ and } Y)/P(X) = P(Y \mid X) \tag{2}$$

That means that *confidence* is the probability of seeing the consequent of a rule under the condition that the transactions also contain the antecedent. *Confidence* is directed and gives different values for the rules X -> Y and Y -> X [17]. It does not have the downward-closure property.

Confidence, like *support*, is developed by Agrawal et al. (the so-called support-confidence framework). It is used after pruning of the search space for producing rules from frequent item sets which satisfy the minimum confidence that is set.

The biggest problem with *confidence* is its sensitivity towards the frequency of the consequent, which means that consequents with higher *support* will automatically produce higher *confidence* values.

- Lift (Interest)

Introduced in [18], its definition is:

$$\text{lift}(X \text{ -> } Y) = \text{lift}(Y \text{ -> } X) = \text{conf}(X \text{ -> } Y)/\text{supp}(Y) =$$

$$\text{conf}(Y \text{ -> } X)/\text{supp}(X) = P(X \text{ and } Y)/(P(X)P(Y)) \tag{2}$$

Lift measures how many times X and Y occur together more often than expected if they were statistically independent [18].

As *confidence*, *lift* does not have the downward-closure property, but it does not suffer from the rare item problem. However, in small databases it is susceptible to noise. Rare item sets with low counts (low probability) which occur together only few times (or only once) completely by chance can produce enormous *lift* values [17].

IV. Experimental Results

Unfortunately, for every useful piece of information obtained, there is a lot more trivial information being generated [19]. General rules that could be mined from our data do not have great value for this research, since there are many unique values which produce specific rules that describe specific situations which are based either on student ids or academic years. However, after eliminating the data that cause such rules (i.e. student ID), and defining what we want to mine, associations discovered become a little more interesting.

The subject of our research are student demonstrator classes, and the visualization of data in Fig. 4 shows us that there are some rules that stand out with their high *confidence*.

Upon further inspection, the rules with the highest *confidence* about student demonstrator classes show that most of the students interested in these classes try to find information on the course forum. The majority of related transactions happened in year 2012. Rules that support this fact can be seen in Fig. 5.

Another element we find interesting for research are video lectures. Programming 2 video lectures were recorded out of the class. In total 13 short 4-15 minutes lectures were captured covering about 40% of the course topics. The video lecture activities are represented in the analysis by the total number of clicks on each particular resource. Since watching video lectures does not have a direct influence on the total course score but serves solely as a supportive activity, i.e. students do not earn points by watching video lectures, our hypothesis is that watching video lectures nevertheless impacts the learning process. Video lectures are of interest since this activity is newly introduced and since it is based on modern technology which increases learning motivation. The latter is particularly important for introductory programming courses. Mining on transactions that contain video lectures produces several interesting rules, as seen in Fig. 6.

Since this is a fairly new element in the big dataset, it is not plausible to rely only on the frequency of rules, which is why *support* and *lift* have greater impact on making conclusions.

Ordered by *support*, the most important rule is that students who watch Video lecture 1 are also students graded E, which is concluded with the values of *confidence* and *lift* 0.284 and 1.268, respectively. However, the same lecture has grades C and D as consequences, as can be seen in Table 1. A similar situation happens with other lectures. Although the rules can be read in this form, it is easier to find the real knowledge in them by visualisation, in our case with R package ArulesViz, as in Fig. 6.

The visualisation in Fig. 6 makes it evident that some of the students graded FX watch all the videos, but most of them watch only the first one, as indicated by the size of the circle which represents *support* of the rule. These facts are somewhat more connected than it would be expected if they were independent, as indicated by the darker shade which represents *lift*. That can be explained by the fact that many students open the first video out of curiosity, but then decide that they dislike learning from videos.

Grade E is quite similar to FX in a way, since most of the students watch the first lecture, but only few of them watch other lectures, probably those that they have some special interest in.

C and D students watch most of the lectures, but it is interesting that there are no C students that watch the last two lectures.

Grade B students watch most of the lectures, but they are especially interested in lecture number 5, while A students watch only lectures 3 and 4. It is interesting that those two videos are absent from grade B, which makes it the biggest difference between the two grades. The colour of circles in grade A indicates that there is a strong connection between lectures 3 and 4 and the grade, with *lift* values of 1.6 and 1.7 being some of the biggest *lift* values among the rules.

The most interesting rule in this research is actually the one that is absent. Not even one student that watched video lectures got grade F, which means that those students did not fail the class.

It can be concluded that video lectures really raise the quality of the class and that they show connection to the final grades.

Table I. Part of Video Lecture Rules

Rule left-hand side	Rule right-hand side	support	confidence	lift
{SUBJECT = Video lekcija 1 - Sortiranje umetanjem}	{GRADE=E}	0.050632911	0.2834646	1.2675680
{SUBJECT = Video lekcija 1 - Sortiranje umetanjem}	{GRADE=C}	0.030942335	0.1732283	0.8378596
{SUBJECT = Video lekcija 1 - Sortiranje umetanjem}	{GRADE=D}	0.023909986	0.1338583	0.6846995

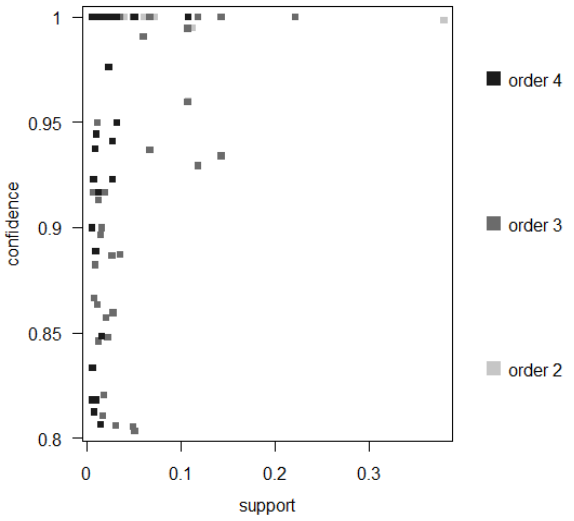

Figure 4. Visualisation of rules

```
>  rules.sorted2 <- sort(rulesd, by="support")
>  inspect(rules.sorted2)
     lhs                                                    rhs
1    {SUBJECT=Demonstrature       }                     => {ACTION=forum view discussion}
2    {YEAR=2012}                                        => {SUBJECT=Demonstrature       }
3    {YEAR=2012}                                        => {ACTION=forum view discussion}
4    {SUBJECT=Demonstrature       ,
      YEAR=2012}                                        => {ACTION=forum view discussion}
5    {ACTION=forum view discussion,
      YEAR=2012}                                        => {SUBJECT=Demonstrature       }
```

Figure 5. Association rules mined

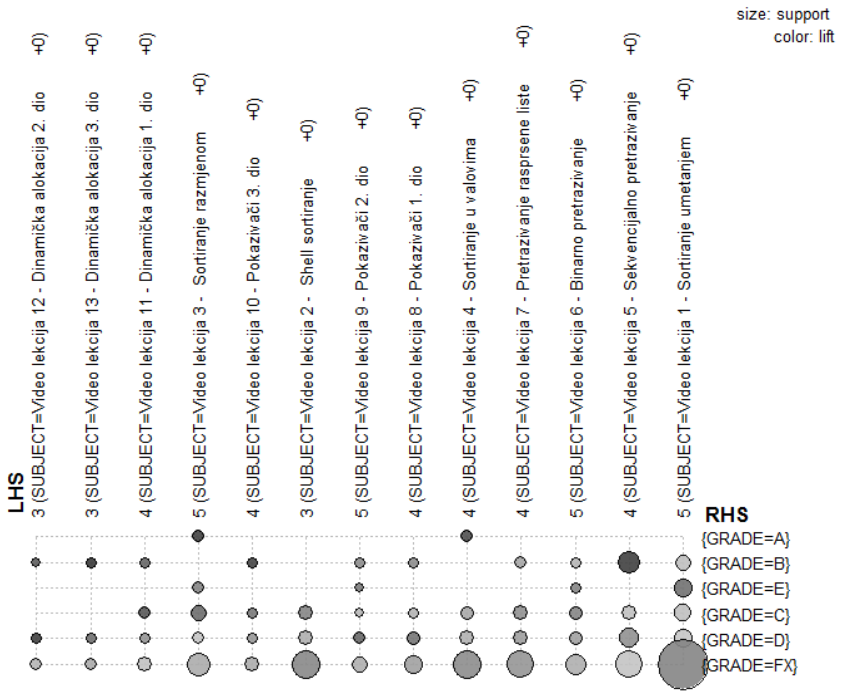

Figure 6. Visualisation of rules regarding video lectures

V. CONCLUSION

Mining association rules is a very valuable tool in data mining, since rules made from patterns might be strange or unexpected at first, but are realistic picture of the system. Although the most famous usage of association rule mining is "market basket analysis", it is valuable for educational purposes as well.

In this work we use students' data from the MudRi e-learning system database, and apply the data mining technique of association rule mining in order to discover knowledge. We find some rules that support the fact that students have better success in the course when using video materials, and we find out which lessons seem to have greater connection to the final grades. Discovered knowledge could be used in raising the quality of the course and checking whether video lectures can be used for improving the overall success of students.

ACKNOWLEDGMENT

This research has been supported under the Grant No. 13.13.1.3.03 of the University of Rijeka.

alexp_p@mail.ru

Abstract - With increasing complexity of modern software, including on-line environments, it is important to organize user training and support, a significant part of which could be implemented through the ICT-based learning activities.

During the learning process a learner goes through several stages. Starting from the understanding the basics of the given software, through training course the learner finally comes to a practical work, which still requires learner to refer to a user manual or contact the customer support to resolve some complicated issues. Within a traditional approach the content blocks used at every stage of the learning process are not interconnected, despite they are related to the same subject domain.

The approach offered in the work is aimed to increase the results of such learning process, by establishing an effective management of all available learning content within particular subject domain. The approach is based on integration of four main blocks of the content: one used to build the learning course, content from its built-in help system, user guides and information resources used by the customer support team.

The use of this approach allows keeping the balance between sets of the content as well as optimize the learning process at all stages.

I. INTRODUCTION

Recently growing numbers of distributed multi-user online systems are brought to life. With their increasing complexity and extending functional features we witness the escalation of demands to the qualifications and skills of their users. The users should know the whole spectrum of the system's functionality, be able to solve complex, sometimes ill-defined, problems, cope with time pressure and permanent changes. As an example, one can consider the requirements to the operators of the modern on-line call center, which need to know supporting computer system in detail to be able to quickly resolve client's issues, be aware of current products, services, and changes, customer bases, corporate policies and procedures [1].

Approaches and methods of personnel training for multi-user online systems do not follow software lifecycle trends quickly enough and still mostly rely on traditional professional training, use of manuals and distribution of information about recent changes through communication channels (corporate email). As a result, the users are insufficiently prepared for their professional activity. Moreover, a detailed analysis of operator's activity demonstrated the need for careful planning of learning and training, which should penetrate business and work processes to ensure efficiency of the human-computer system as a whole. The design of human-centered systems should envisage potential needs of their users in problem solving and interaction support to provide individual and personalized assistance and help. Ideally, these systems should adaptively be able to help situated problem solving or assist the user to move to the next action of activity where needed. However, a detailed analysis of users activity needed to organize intelligent support, such as described in [2, 3] is so far rather laborious so there is a need for some efficient solution for existing systems support.

II. PROBLEM STATEMENT

Observation and analysis of user activities during their work with some online systems, in-depth study of help requests from customers who successfully finished their training made it clear that training on specific system functions and distribution of reference materials is sometimes insufficient for practical problem solving. Significant amount of requests to the system's help desk was caused by the lack of understanding how the task may be completed with the system rather than related to technical failures.

To simplify on-line system management and support by the staff we focused on better automatic assistance for the users. In case of limited resources the purpose was to enhance self-training and performance support of the users by better organization and structuring of training and reference content. Another idea was to address the most critical issues first, at the same time collecting information for further enhancement. This course of action corresponds to the process quality approach, focusing on major issues and thus enhancing quality without delay for detailed analysis and reengineering.

III. ANALYSIS

In the first phase of the study we have analyzed the main components of the user training and support system. As a result, it was possible to identify four basic sources of information which constitute knowledge about system functionality and its use:

- Distance training course that provides general information about the system and its functions. Successful completion of it is a prerequisite for an operator to obtain the access to the system.
- User Guide – a thick book (or its electronic version) which describes all functions of the system. It is assumed that the reference information from the Guide is used as an additional information source by the staff that has already completed a training distance course and is working with the system.
- inline help – small reference blocks, built directly into the system interface. It is usually implemented as an icon with a question mark and simply by clicking or hovering the mouse on it user can get a concise reference about the function of this interface element. Such reference blocks are small, but there are a lot of them and they are present in almost all sections of the system.
- Customer support service, contacted by users in case of problems. Customer Support is contacted not only when there are technical problems, but also in the case a user does not know how to perform a particular operation. In this situation, the support service should solve this problem and explain to the user how he or she may achieve the desired result.

It should be noted that in this study we have not considered the mechanisms of informal learning, when people learn from each other and communicate with each other to obtain an advice or hint, which could be useful for performing their professional tasks.

Undoubtedly, this learning mechanism also exists and can be quite effective, but it has been excluded from the study because, in general, we could not control the communication of the system users. Although it is possible to use social services to support a community of the users [4, 5], we could not control how people communicate with each other, for example, outside the office and we could not influence this process.

Therefore, in this study, we have started from the assumption that each user was working alone.

General scheme of the user activity is as follows:

- The user passes the distance training course successfully and after that gains access to the system.

In case of problems user's activity goes the following way:

- To solve a problem, the user can click on inline help elements;
- If there are no clues, user refers to the User Guide;
- If still there is no solution, a call or an email to customer support service follows.

General scheme is provided on figure 1.

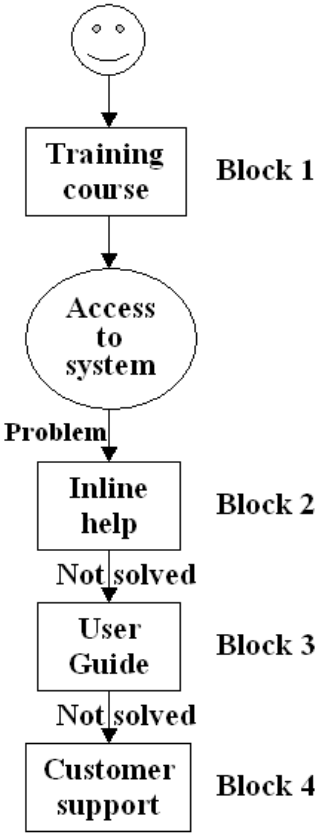

Figure 1. General scheme of the user activity in case of problem.

Further study of the reference and training information brought the following basic questions:

- What are the information sources for the four blocks mentioned above?
- Who manages this information?
- On what procedure and set of criteria the information is updated?

After analysis, we concluded that these four blocks are not directly linked. They are produced and managed independently. Inline help is produced by the developers. Tutors of distance training course get basic reference materials and then build the course and make changes on their own, sometimes with no one consulting them on the system features. Technical customer support service operates with its own database. The User Guide is written by technical experts who are not always directly linked with the developers, training course tutors and customer support service.

However, we managed to identify a single source of all information initially used in all four blocks: the system project documentation. There is no other information at the initial stage of user training and support system creation. On the basis of this project documentation all four blocks are subsequently built.

IV. SOLUTION

The proposed solution, aimed to increase overall efficiency of users' training and reference system, consists of several stages.

The first stage - the initial processing of the raw project information. The totality of the information that may be useful should be extracted from the project documentation and cut into some elementary units (chunks) that may be used to describe a single function of the system, system interface element, a system task, a problem situations, a solution of a typical problem, etc.

Further, these chunks are used to compose the content of the main four blocks (distance training course, User Guide, inline help and Customer support service, as shown on the figure 1). In this way, they, first, do not contradict each other in the details, and secondly, all the information is formulated in a uniform manner, stylistically and logically. This improves the user's perception of the main four information blocks used further for users' training and support. The first stage is presented on figure 2.

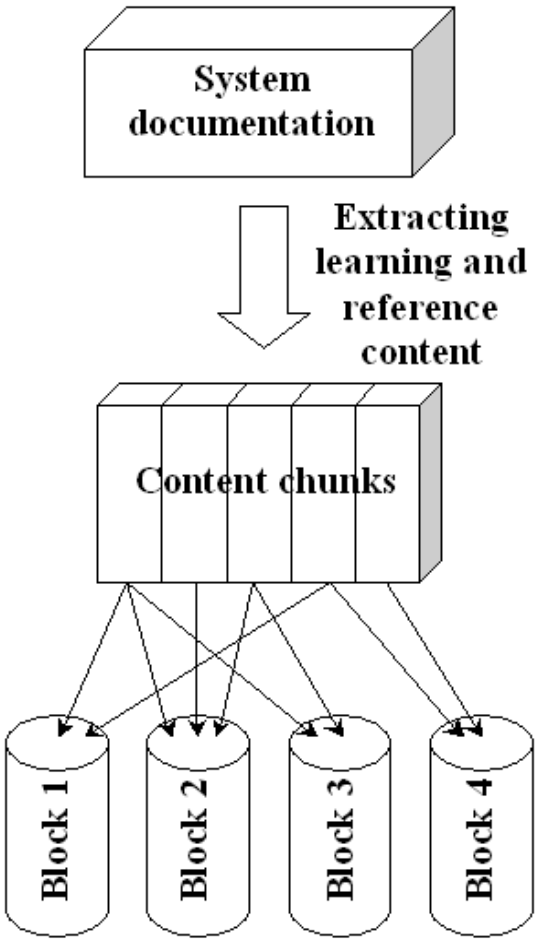

Figure 2. The first stage.

The second stage is the collection of statistical data (logs) of the users' activities. In order to efficiently collect data about users' activity in the system, all four blocks have to be online. In particular, a User Guide should be implemented as a web resource that is not downloadable to a local drive. All users' queries to each of the four blocks should be logged. Every request to customer support service, every session of User Guide use and every click on an element of inline help should be logged. All information recorded should be stored in separate databases for all four blocks.

The third stage is the analysis and processing of the collected data. Information stored in each database passes statistical processing and analytical reports are submitted for analysis. Then it is possible to locate situations where users have problems most often, find what functions caused the greatest number of questions and what interface elements are problematic for use.

As a result of the analysis it is possible to identify common problem situations that arise during users' activity from the entry into distance training course to the routine work with the system.

The fourth stage is the modification of learning and reference information. After analyzing the information gathered a set of decisions should be made about entire information update. As a result, content chunks are updated. At this stage, not only the content of four main blocks of information is updated and modified, but also their structure. For example, the number of chapters in the User Guide may be changed, as well as the structure of distance training course may be significantly updated, not only the particular course elements.

In the inline help new items may appear or, on the contrary, some unclaimed ones are excluded. The database of problem situations operated by the customer support service is also a subject of modifications. Stages 2-4 are presented at figure 3.

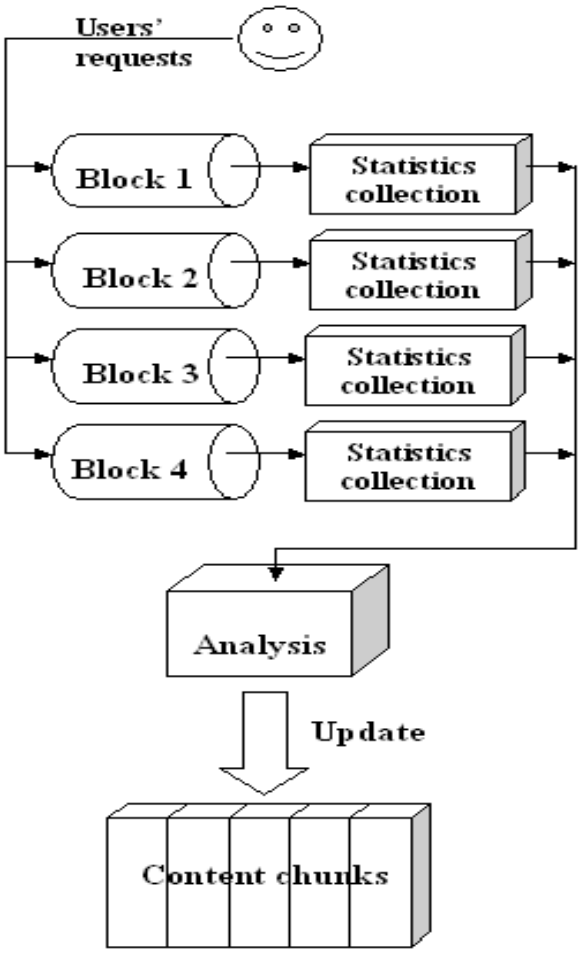

Figure 3. Stages 2-4.

The fifth stage is a deployment of updated learning and reference components within existing information system.

At the last stage the updated blocks should be included back into the system and run. The described approach can be effective for small information systems or for the releases of the new versions of already used information system.

V. CONCLUSION

The proposed approach initiates ongoing user support enhancement process. Monitoring of user activities can provide valuable information about potential causes of user's mistakes and difficulties and thus indicate how the issue could be addressed. For multiuser online systems with hundreds of users the cycles of updates should take place on a regular basis, without delay. All registered issues should be analyzed, processed according to the suggested procedure and resolved through changes in an online user guide and inline help. If updates of both learning and reference content are managed by the same team, the changes are easily coordinated and could be done whenever necessary without synchronizing them with updates in the system itself. In other words, it enables permanent enhancement of learning and performance support for the user.

It should be mentioned that information regarding user actions and problems encountered while working with the system is an excellent source of information for developers who could use it for making system interface more efficient and friendly. It was also recognized that many users do not feel comfortable switching between several windows but need to have user guide at hand when working with the system.

Therefore, it was decided to prepare a trial version of user guide for mobile devices to assist them.

Istraživanje
Mišljenje učenika, roditelja, učitelja i uprave škole o primjeni e-Dnevnika, unutar III. osnovne škole Čakovec

Nataša Boj*
* III. osnovna škola Čakovec, Čakovec, Republika Hrvatska
natasha.boj@gmail.com

Sažetak – u III. osnovnoj školi Čakovec je provedeno istraživanje o primjeni e-Dnevnika na inicijativu administratora. Ispitanici su bili učenici, roditelji učenika, učitelji i uprava škole s ciljem da se sazna kakva su njihova razmišljanja i zaključci o primjeni istog. Očekivano, većina ispitanika je dala pozitivne odgovore i pohvale aplikaciji. Bilo je nekoliko primjedbi i prijedloga od strane svih ispitanika. Jedan od ciljeva ovog istraživanja bio je da se prezentacijom rezultata na različitim skupovima i objavom u medijima potaknu svi oni koji ne koriste e-Dnevnik da započnu s njegovom primjenom, tim više ukoliko raspolažu potrebnom opremom i imaju brzi pristup Internetu u cijeloj školi.

I. UVOD

E-dnevnik je u III. OŠ Čakovec u primjeni od šk. god. 2013./2014.

S obzirom da je proteklo određeno vrijeme i svi su dionici odgojno-obrazovnog procesa imali priliku koristiti se e-Dnevnikom, provedeno je istraživanje o njihovim iskustvima u radu s istim kako bi se dobile informacije o tome jesu li korisnici zadovoljni u potpunosti ili bi se eventualno još nešto moglo poboljšati u samoj aplikaciji ili načinu rada samih učitelja a na zadovoljstvo učitelja s jedne strane te učenika i roditelja s druge strane.

Istraživanjem je bilo obuhvaćeno 24 učitelja, 153 roditelja i 130 učenika i 3 člana uprave škole (ravnateljica, psihologinja, tajnica).

Ankete su napravljene u Google Disk okruženju.

U glavnom dijelu će biti prikazani rezultati istraživanja.

II. GLAVNI DIO

A. Rezultati istraživanja vezanog za učitelje

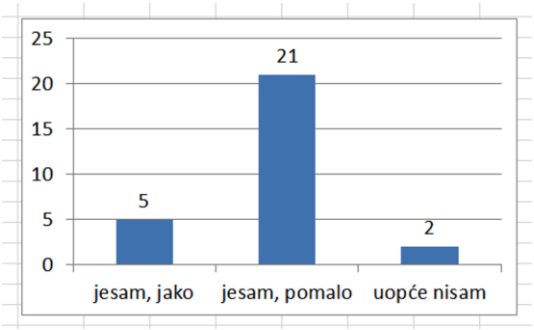
Anketna pitanja:

- „Ti si - učitelj RN, učitelj PN, učitelj PN i razrednik?“
- „Godine radnog staža?“
- „Jesi li nakon najave uvođenja e-dnevnika a prije edukacije osjećao strah i nelagodu?“
- „Jesi li nakon edukacije osjećao strah i nelagodu?“
- „Koji način vođenja dnevnika/imenika ti se više sviđa?„
- „Prednost daješ e-Dnevniku zbog: pristupa svim podacima od bilo kud i bilo kad, zato što vidim samo svoj predmet, zato što sve važne podatke imam na jednom mjestu, zato što mogu biti u e-komunikaciji s roditeljima“
- „Je li slučajni odabir učenika u redu?“
- „Jesi li u e-komunikaciji s roditeljima?“
- „ Koristiš li mogućnost upisivanja bilježaka bez obzira na ocjene?“
- „Kada upisuješ sat i izostanke i ocjene?“
- „Jesi li zadovoljan opremom koja ti je na raspolaganju?“
- „Koju ocjenu daješ adminu e-Dnevnika?“
- „Poruka za kraj?“

ANALIZA ODGOVORA UČITELJA

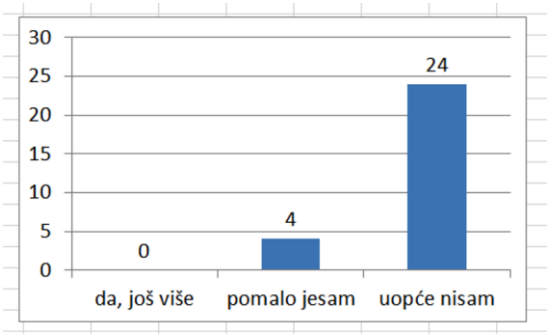
- Status učitelja: 8 učitelja razredne nastave, 8 učitelja predmetne nastave koji su ujedno i razrednici te 8 učitelja predmetne nastave koji nisu razrednici.
- Godine radnog staža: različite, od 1 do 31 i više
- Većina učitelja je nakon najave uvođenja e-Dnevnika osjećala pomalo strah i nelagodu, ali nije bilo otpora.
- Nakon provedene edukacije u školi samo manji broj njih i dalje osjeća strah i nelagodu.
- Pri kraju školske godine većina njih se izjasnila kako im se više sviđa elektronski način vođenja evidencije (22).

Jesi li nakon najave uvođenja e-Dnevnika a prije edukacije osjećao/la strah i nelagodu?



Slika 1. Osjećaj straha i nelagode kod učitelja, bez otpora

Jesi li nakon edukacije osjećao/la strah i nelagodu? - učitelji



Slika 2. Osjećaj straha i nelagode kod učitelja nestaje nakon edukacije

- Najveću prednost učitelji vide u tome što imaju pristup svim podacima u bilo koje vrijeme i s bilo kojeg mjesta te što nisu ograničeni prostorom gdje mogu upisivati bilješke. Nadalje, navode kako je sve uredno i vrlo pregledno.
- Zadovoljni su mogućnošću slučajnog odabira učenika.
- Koriste mogućnost e-komunikacije sa roditeljima.
- Redovito uz ocjene upisuju bilješke ali i samo bilješke.
- Većina njih upisuje nastavne sata na početku sata, no, ima i onih koji to rade pri kraju sata, u nekoj pauzi ili kod kuće.
- Većina njih ocjene upisuje na satu. Većina je u potpunosti zadovoljna opremom koja im stoji na raspolaganju.
- Svi anketirani učitelji su zadovoljni načinom na koji je bila provedena edukacija u školi kao i sa suradnjom administratora e-Dnevnika.
- Učitelji imaju primjedbe što nemaju više vremena za korekcije grešaka već za sve moraju kontaktirati administratora.
- Nekim učiteljima nedostaje neposredni kontakt s roditeljima kojeg je prije uvođenja e-Dnevnika bilo više, a nekima je baš suprotno.

B. Rezultati istraživanja vezanog za roditelje/staratelje

Anketna pitanja:

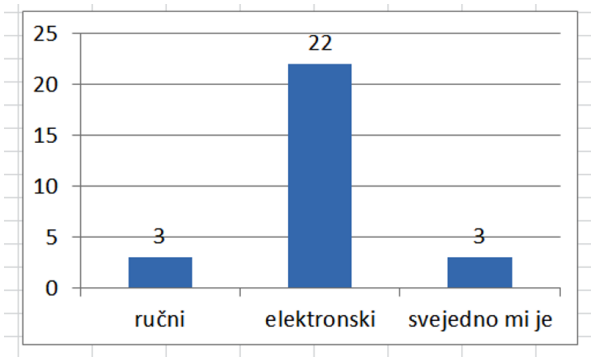
- „Jeste li upoznati s primjenom e-Dnevnika u školi?“
- „Možete li sami do web adrese e-Dnevnika?“
- „Kojem dnevniku dajete prednost – papirnatom ili elektronskom?“
- „Zašto elektronskom?“ – zato što: a)“imam pristup svim podacima bilo kad i bilo gdje“, b) „imam apsolutnu kontrolu nad djetetom“, c) „mogu biti u e komunikaciji s razrednikom“
- „Komunicirate li s razrednikom preko e-maila?“
- „Dolazite li i dalje na primanja zbog ocjena?“
- „Provjeravate li ocjene prije nego li dijete dođe iz škole?“
- Jeste li zadovoljni evidencijama koje vode predmetni učitelji?“
- „Poruka za kraj?“

U istraživanje je bilo uključeno 153 roditelja, od toga 67 roditelja učenika razredne nastave i 86 roditelja učenika predmetne nastave.
54% roditelja ima srednju školsku spremu, 13% višu i 33% visoku školsku spremu.

ANALIZA ODGOVORA RODITELJA

- Svi roditelji su upoznati s primjenom e Dnevnika u školi.
- Većina roditelja sama pristupa aplikaciji, samo manjem broju njih pomognu njihova djeca.
- 89% roditelja daje prednost e-dnevniku, 6% ručnom načinu a 5% njih se izjasnilo kako im je svejedno.
- Polovica roditelja je u povremenoj komunikaciji s razrednikom/com putem e-pošte.
- Većina roditelja sada manje dolazi na primanja roditelja, ili nemaju potrebu ili idu na primanje samo kada nastane neki problem
- Polovina roditelja nema potrebu provjeravati ocjene prije nego li dijete dođe iz škole, dok 16 % njih to ipak radi redovito.
- Većina roditelja je zadovoljna načinom na koji učitelji vode evidencije koje se odnose na njihovu djecu u e-Dnevniku, manji postotak njih je zadovoljan samo s pojedinim učiteljima.

Kojem načinu vođenja evidencije daješ prednost?



Slika 3. Odgovori učitelja

Pozitivne primjedbe roditelja:

- „Pohvala e-Dnevniku općenito, jednostavan pristup ocjenama bilo kad i bilo gdje.“
- „E-dnevnik – super stvar, oduševljeni smo e-dnevnikom, svaka čast na uvođenju e-Dnevnika.“
- „Zadovoljni smo sa svime, sve pohvale, ne može bolje.“
- „Pohvala razrednici na upisanim komentarima i objašnjenjima kod svake ocjene.“
- „Vrlo praktično, brzo i efikasno.“
- „Sve je vrlo pregledno i razumljivo.“

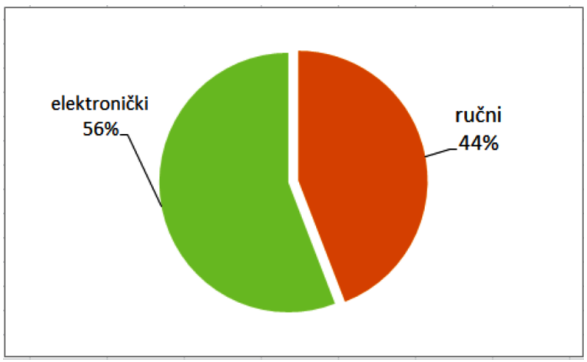
Negativne primjedbe roditelja:

- „Pojedini učitelji upišu ocjene tek nakon nekoliko dana.“
- „Otuđenost od razrednika, škole.“
- „Bilo bi dobro da se neke općenite obavijesti vide u e-dnevniku a ne samo u e-mailu.“

Neutralne primjedbe roditelja:

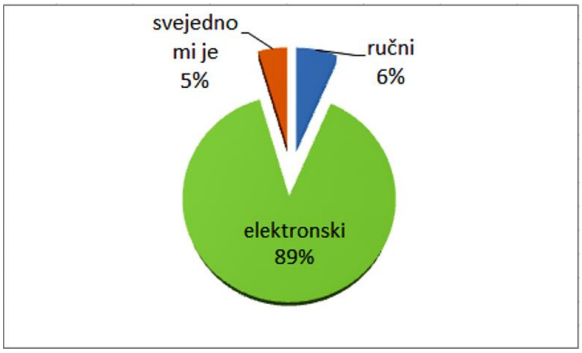
- „Podržavam e-dnevnik ali isto tako volim doći u školu i čuti se s učiteljem.“
- „Nadamo se da ćemo uskoro imati i e-udžbenike.“

Kojem načinu vođenja evidencije daješ prednost?



Slika 4. Odgovori učenika

Kojem načinu vođenja evidencije dajete prednost?



Slika 5. Odgovori roditelja

C. Rezultati istraživanja vezanog za učenike

Anketna pitanja:

- „Znaš li što je e-Dnevnik?“
- „Znaš li pristupne podatke?“
- „Pratiš li svoje ocjene i bilješke i koliko često?“
- „Kojem načinu vođenja daješ prednost – ručnom ili elektronskom? „
- „Jesi li zadovoljan što tvoji roditelji imaju dnevni pristup ocjenama, bilješkama i izostancima? „
- „Koju ocjenu bi dao svojim učiteljima o vezi načina korištenja e-Dnevnika? „
- „Što misliš o mogućnosti slučajnog odabira učenika?“
- „Poruka za kraj“

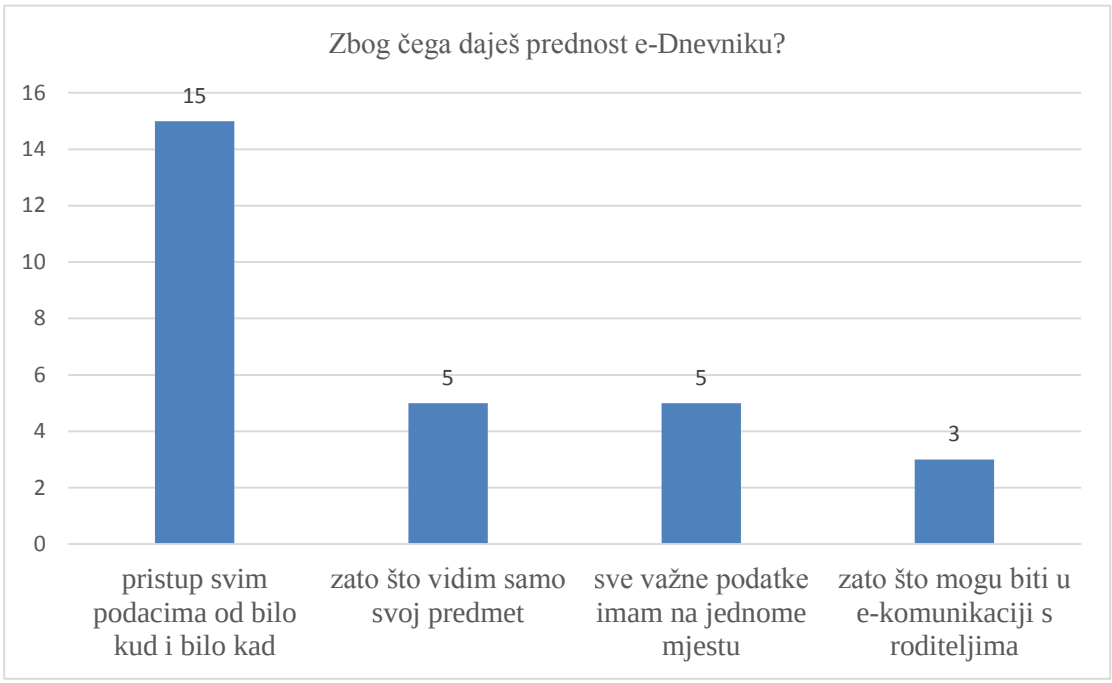
U istraživanje je bilo uključeno 130 učenika predmetne nastave. Svi su upoznati s e-Dnevnikom i većina zna napamet pristupne podatke za ulaz.

ANALIZA ODGOVORA UČENIKA

- 46 % učenika redovito prati ocjene i bilješke
- 57% učenika daje prednost e- načinu vođenja evidencije, 19 % učenika ručnom vođenju.
- Razlog - učenici nisu zadovoljni što roditelji imaju svakodnevni pristup ocjenama, bilješkama i izostancima.
- 44% učenika je dalo učiteljima ocjenu vrlo dobar za način na koji koriste e-dnevnik, a 5% njih ocjenu nedovoljan.

Primjedbe učenika:

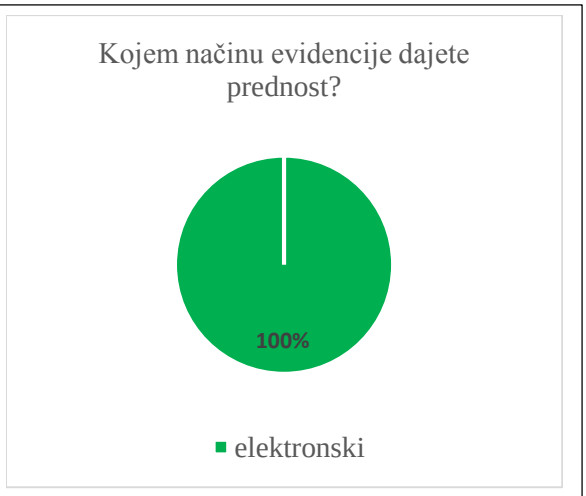
- „Super stvar, trebale bi ga uvesti sve škole.“
- „Dobro je što učitelji ne vide ocjene drugih predmeta, dobar dizajn.“
- „e-Dnevnik je fer prema učenicima, super je jer mogu vidjeti sve ocjene kod kuće.“
- „Slučajni odabir mi se ne sviđa.“
- „Slučajni odabir je pravedan.“
- „Nije dobro to što roditelji mogu vidjeti dnevno sve ocjene.“



Slika 6. Odgovori učitelja

D. Rezultati istraživanja vezanog za upravu škole

U upravu škole ulaze ravnateljica, tajnica, psihologinja i knjižničar kao stručni suradnici te računovotkinja.
U svom radu e-Dnevnikom se služe ravnateljica, tajnica i psihologinja.
Na osnovu rezultata istraživanja može se zaključiti kako oni u cijelosti daju prednost e-Dnevniku u odnosu na papirnati.



Slika 7. Odgovori uprave škole

III. ZAKLJUČAK

Na osnovu rezultata provedenog istraživanja može se sa sigurnošću zaključiti kako su primjenom e–Dnevnika svi zadovoljni, čak oduševljeni, što se može vidjeti iz odgovora ispitanika i primjedbi koje su naveli na kraju anketa.

Najviše su zadovoljstva izrazili roditelji, učitelji i uprava škole.

Učiteljima je ovakav način evidencije znatno opširniji s obzirom da nisu ograničeni prostorom za upis kao što su bili u papirnatom dnevniku/imeniku i zato imaju bolji pregled. Nadaje, svi važni dokumenti su na jednom mjestu i kao takvi uvijek dostupni i lako se pronađu. Veliku prednost navode to što imaju pristup svim podacima u bilo koje vrijeme i s bilo kojeg mjesta i što na kraju nastavne godine mogu vrlo brzo zbog prijenosa podatka iz e-Dnevnika u e-Maticu, ispisati svjedodžbe i zaključiti nastavnu godinu.

Roditelji su zadovoljni što ne trebaju više tako često dolaziti u školu zbog ocjena, već im je sve dostupno od kuće a većina u školu dolazi samo ako nastane neki problem.

Zadovoljna je i većina učenika, posebno oni koji nemaju problema s učenjem i ocjenama, dok oni drugi nisu baš oduševljeni uvođenjem e-Dnevnika zbog toga što se svaka loša ocjena i negativna bilješka ne može sakriti.

Zadovoljna je i uprava škole.

Rezultati provedenog istraživanja su do sada prezentirani Učiteljskom vijeću III. OŠ Čakovec, Vijeću roditelja III. OŠ Čakovec, Vijeću učenika III. OŠ Čakovec, nadalje na Županijskom stručnom vijeću učitelja informatike Međimurske županije, Županijskom stručnom vijeću ravnatelja Međimurske županije i na Carnetovoj korisničkoj konferenciji prošle godine.

Sažetak - Vrijeme brzih promjena i razvoja tehnologije, potreba praćenja gospodarskih i društvenih promjena nameće cjeloživotno učenje kao potrebu, a ne kao izbor. Da bi odgovorili izazovu vremena, nastavnici trebaju pratiti napredak tehnologije i suvremene tijekove u obrazovanju i kroz uporabu informacijsko komunikacijske tehnologije (IKT). Promjene utječu na način učenja i poučavanja. Zato se nameće potreba za usavršavanjem nastavnika za sigurnu i kritičku uporabu IKT- a u poučavanju odnosno za postizanje digitalne kompetentnosti. Razvoj digitalne kompetentnosti postiže se kroz sudjelovanje i komuniciranje pomoću IKT-a te uporabom alata za izradu e-sadržaja.

Ključne riječi: informacijsko-komunikacijska tehnologija, stručno usavršavanje nastavnika, digitalna kompetencija

.

I. UVOD

Digitalna kompetencija je jedna od osam ključnih kompetencija za cjeloživotno učenje (Europski referentni okvir, 2004):

1. Komuniciranje na materinjem jeziku
2. Komuniciranje na stranom jeziku
3. Matematička pismenost i osnovna znanja iz znanosti i tehnologije
4. Digitalna kompetencija
5. Učiti kako se uči
6. Međuljudska i građanska kompetencija
7. Poduzetništvo
8. Kulturno izražavanje

Europska komisija potvrdila je razvoj digitalne kompetencije kao relevantan prioritet politika Europske unije (European Commission, 2010a, 2010b). Sudjelovanje u društvu danas zahtijeva skup kompetencija povezanih s tehnologijom koje se prepoznaju i kao „životne vještine". Potrebna je digitalna inkluzija koja ovisi, naravno, o pristupačnosti i mogućnosti, ali i o znanju, vještinama i stavovima. A to se uči i razvija kroz digitalnu kompetenciju.

II. DIGITALNA KOMPETENCIJA - POJAM, OKVIR

Gotovo sve europske zemlje imaju posebnu nacionalnu strategiju vezanu za digitalnu kompetenciju. *Nacionalni okvirni kurikulum za predškolski odgoj i obrazovanje te opće obvezno i srednjoškolsko obrazovanje Republike Hrvatske* definira digitalnu kompetenciju na sljedeći način:

"Digitalna kompetencija - odnosi se na osposobljenost za sigurnu i kritičku upotrebu informacijsko-komunikacijske tehnologije za rad, u osobnomu i društvenomu životu te u komunikaciji. Njezini su ključni elementi osnovne informacijsko-komunikacijske vještine i sposobnosti: upotreba računala za pronalaženje, procjenu, pohranjivanje, stvaranje, prikazivanje i razmjenu informacija te razvijanje suradničkih mreža putem interneta."

Digitalna kompetencija je najčešće korišten koncept za opis tehnološki povezane vještine. Posljednjih godina, nekoliko naziva se koristilo za opis kompetencije korištenja digitalnih tehnologija: IKT vještine, tehnološke vještine, vještine 21. stoljeća, digitalne vještine, digitalna pismenost. Promjene u društvu i kulturi temeljene na novoj tehnologiji, imaju utjecaj i na nazivlje. Digitalna kompetencija sastoji se ne samo od digitalnih vještina već i od socijalnih i emotivnih aspekata uporabe i razumijevanja digitalnih uređaja.

Prema okviru za razvoj i razumijevanje digitalne kompetencije (*A Framework for Developing and Understanding Digital Competence in Europe, 2013*), područja digitalne kompetencije su:

- Informacija: pronaći, pohraniti, organizirati i analizirati digitalne informacije, prema njihovoj važnosti i svrsi.
- Komunikacija: komunicirati u digitalnome okruženju, dijeliti resurse pomoću *online* alata, surađivati kroz digitalne medije, interakcija na mreži, svijest o međukulturalnosti.
- Izrada sadržaja: izraditi i urediti novi sadržaj (tekst, slike, video), integrirati prethodna znanja i sadržaje, stvarati kreativne multimedijske uratke, programirati, primjenjivati prava intelektualnog vlasništva i licence.
- Sigurnost: osobna zaštita, zaštita podataka, zaštita digitalnog identiteta, mjere sigurnosti, sigurno i održivo korištenje.
- Rješavanje problema: utvrditi digitalne potrebe i resurse, odabirati odgovarajuće digitalne alate s obzirom na namjenu ili potrebu, rješavati konceptualne probleme putem digitalnih sredstava, krea-

tivno koristiti tehnologiju, rješavati tehničke probleme.

Okvir digitalne kompetencije strukturiran je u pet dimenzija:

1. Identificirano područje kompetencija
2. Kompetencije primjerene svakom području
3. Razina stručnosti (osnovna, srednja, napredna)
4. Primjeri znanja, vještina i stavova za svaku kompetenciju
5. Primjeri o primjenjivosti u različite svrhe (učenje, zapošljavanje, slobodno vrijeme, kupnja i prodaja, ..)

Okvir digitalne kompetencije u prve dvije dimenzije:

Područje kompetencije Dimenzija 1	Kompetencija Dimenzija 2
Informacija	**1.1 Pregledavanje, pretraživanje i filtriranje informacija** Pretraživati i pristupati informacijama *online*, iskazati potrebu za informacijom, učinkovito pronaći resurse, kretati se između raznih *online* izvora. **1.2 Vrednovanje informacija** Sakupiti, obraditi, razumjeti i kritički vrednovati informacije. **1.3 Pohrana i pronalaženje informacija** Manipulirati i pohranjivati informacije i sadržaje za lakše pretraživanje, organizirati informacije i podatke.
Komunikacija	**2.1 Interakcija putem tehnologije** Komunicirati kroz različite digitalne uređaje i aplikacije, razumjeti kako se ostvaruje digitalna komunikacije te načine komuniciranja putem digitalnih sredstava; razlikovati komunikacijske formate, prilagoditi načine komunikacije i strategije određenoj publici. **2.2 Razmjena informacija i sadržaja** Podijeliti s drugima mjesto i sadržaj pronađene informacije, spremnost i sposobnost za razmjenu znanja, sadržaja i resursa, biti proaktivan u širenju vijesti, sadržaja i resursa, znati kako se citiraju informacije, integrirati nove podatke u postojeća znanja. **2.3 Uključenje u *online* društvo** Sudjelovati u društvu kroz online angažman, tražiti mogućnosti za vlastiti razvoj i osnaživanje u korištenju tehnologije i digitalnog okružja, biti svjestan potencijala za sudjelovanje pojedinca pomoću tehnologije. **2.4 Suradnja putem digitalnih kanala** Koristiti tehnologiju i medije za timski rad i suradnju, zajednička izgradnja i stvaranje resursa, znanja i sadržaja. **2.5 Pravila lijepog ponašanja na internetu** Znati i primjenjivati norme ponašanja u *online*/virtualom okruženju, biti svjestan kulturoloških raznolikosti, zaštititi sebe i druge od mogućih *online* opasnosti (npr. zlostavljanje putem interneta), razviti aktivne strategije otkrivanja neprimjerenog ponašanja. **2.6 Upravljanje digitalnim identitetom** Stvoriti, prilagoditi i upravljati jednim ili više digitalnih identiteta, zaštititi svoj e-ugled, raditi s podatcima kreiranim kroz više osobnih računa i aplikacija.
Izrada sadržaja	**3.1 Razvoj sadržaja** Stvarati sadržaje u različitim formatima uključujući multimediju, urediti i poboljšati razvijene sadržaje, kreativno se izraziti putem digitalnih medija i tehnologije. **3.2 Integriranje i ponovno razrađivanje** Mijenjati, poboljšavati i kombinirati postojeće resurse za stvaranje novih, izvornih i relevantnih sadržaja i znanja. **3.3 Autorska prava i dozvole** Primjenjivati prava intelektualnog vlasništva i licence na informacije i sadržaj. **3.4 Programiranje** Primjenjivati postavke, modificirati programe, programirati aplikacije i uređaje, razumjeti načela programiranja.
Sigurnost	**4.1 Zaštita uređaja** Zaštititi svoje uređaje i razumjeti *online* rizike i prijetnje, razumjeti potrebu provođenja sigurnosnih mjera. **4.2 Zaštita osobnih podataka** Razumjeti uobičajene uvjete korištenja/pružanja usluge, zaštititi osobne podatke, poštivati privatnost drugih, zaštititi se od *online* prijevara, prijetnji i virtualnog zlostavljanja. **4.3 Zaštita zdravlja** Poznavati zdravstvene rizike povezane s korištenjem tehnologije u smislu fizičkog i psihičkog zdravlja. **4.4 Zaštita okoliša** Biti svjestan utjecaja IKT-a na okoliš.

Rješavanje problema

5.1 Rješavanje tehničkih problema

Identificirati moguće probleme (od jednostavnih problema u radu do rješavanja složenijih problema) i riješavati ih pomoću digitalnog sredstva.

5.2 Prepoznavanje potreba

Procijeniti vlastite potrebe u smislu resursa, alata i razvoja kompetencija, povezati potrebe s mogućim rješenjima, prilagođavati alate za osobne potrebe, kritički procijeniti moguća rješenja i digitalne alate.

5.3 Inovacije i kreativno korištenje tehnologije

Koristiti tehnologiju kreativno/ inovativno, surađivati u izradi digitalnih i multimedijskih sadržaja, kreativno se izraziti kroz digitalne medije i tehnologiju, stvarati znanje i rješavati konceptualne probleme pomoću digitalnih alata.

5.4 Prepoznavanje potrebe unaprjeđivanja digitalne kompetencije

Prepoznati potrebu unaprjeđivanja vlastite razine digitalne kompetencije u skladu s novim potrebama i tehnologijama, podržati razvoj digitalne kompetencije drugih pojedinaca.

III. MOGUĆI MODEL UČENJA DIGITALNE KOMPETENCIJE

Učenje informacijsko-komunikacijske tehnologije od najranije dobi kroz jednostavne, intuitivne aplikacije ili društvene mreže dovodi do toga da se čini da su pojedinci toliko naviknuli na tehnologiju da poučavanje informacijsko-komunikacijske tehnologije više nije potrebno. Međutim, međunarodna istraživanja i akademska literatura upozoravaju na nedostatak digitalne osposobljenosti pojedinaca.

Jačanje digitalnih kompetencija je jedan od prioriteta u okviru strategije Europa 2020. Razvoj digitalnih vještina u svim područjima obrazovanja može doprinijeti razvoju inovativnih pedagoških pristupa učenicima. Povećanjem udjela IKT-a u nastavi i u učenju, otvara se prostor korištenja i stvaranja otvorenih obrazovnih sadržaja (Open Education Resources, OER). Potrebno je ustanoviti sustav trajnog usavršavanja nastavnika u području digitalnih kompetencija te procjenu njihova znanja.

Jedan od načina usavršavanja nastavnika u području digitalnih komptencija može biti MOOC model (Massive Open Online Course). Danas je MOOC model učenja snažno prisutan u svijetu. Međutim, prilikom razvijanja *online* tečajeva treba imati na umu da je sadržaj namijenjen isključivo za učenje na daljinu. Koriste se različita digitalna sredstva (audio, video, igre, grafikoni, appleti) jer je drugačiji način donošenja informacija (pripovijedanje, uvodni video, postavljanje problemske situacije, primjer). Uvode se interaktivni elementi kao i procjena/priznavanje stečenih kompetencija. U MOOC modelu učenja, kada može biti veliki broj sudionika, teško je imati dovoljan broj mentora koji će pomagati i voditi sudionike do cilja – uspješnog svladavanja stručnog usavršavanja. Dobra ideja može biti uvođenje peer-mentorstva kada svi pomažu svima. Važnu ulogu u učenju tada imaju i društvene mreže. Također, za procjenu usvojenosti digitalne kompetencije može se razviti peer-review model. Osim procjene znanja pomoću kvizova s raznim tipovima pitanja, tada se uvodi „završni uradak“ kojeg procjenjuju barem još dva sudionika stručnog usavršavanja. Uspješno svladavanje kvizova znanja, pozitivna procjena završnog uratka te izvršena procjena barem još dva završna uratka definirat će prolaznost/uspješnost sudionika stručnog usavršavanja. Tako se može dobiti održiv sustav stručnog usavršavanja.

Europska komisija u izvješću iz 2012 *Digital Agenda for Europe, Survey of Schools, ICT in Education (2)* navodi da je Hrvatska jedina država EU u kojoj se digitalna kompetencija ne stječe kroz kurikulume raznih nastavnih predmeta već kroz zaseban nastavni predmet *Informatika/Računalstvo*. Treba napomenuti i da nastavni predmet *Informatika* nije obvezan u osnovnom obrazovanju. Također, prema *Eurydice Report: Developing Key Competence in school in Europe*, *2012* u hrvatskim strukovnim školama više od 50% nastavnika strukovnih predmeta koristi IKT u manje od 25% nastavnih sati. To se svakako može objasniti nedostatkom digitalnih kompetencija kod nastavnika. Nastavnici trebaju biti digitalno sigurni da bi koristili digitalnu tehnologiju u učionici, i za učenje i za poučavanje.

IV. ZAKLJUČAK

Analize pokazuju kako današnji učenici provode vrijeme na internetu najviše za druženje u virtualnim okruženjima i društvenim mrežama, komunikaciju putem elektroničke pošte, pretraživanje interneta za zabavu te za izradu školskih projekata. Njihovi prioriteti su prijatelji, zabava, interakcija u realnom vremenu. Ne vole složenost i loš dizajn. Stoga, da bi nastavnici odgovorili zahtjevu vremena i tehnologiji trebaju steći digitalnu kompetentnost. Trebaju koristiti i stvarati digitalne nastavne materijale (kvalitetne i primjerene prezentacije, multimedijske i interaktivne plakate, konceptualne mape, stripove, ..) te koristiti IKT za učenje i poučavanje. Samo tako će održati pažnju svojih učenika i ostvariti zadane ishode učenja svojih nastavnih predmeta. Potrebno je sveobuhvatno i kontinuirano stručno usavršavanje.

Primjena internetskog foruma u prezentaciji i obrani seminarskih radova – studija slučaja kolegija Planiranje informacijskih sustava

Adela Sočković*, Alen Jakupović*
*Veleučilište u Rijeci/Poslovni odjel, Rijeka, Republika Hrvatska
asockovi@veleri.hr
alen.jakupovic@veleri.hr

Sažetak – Seminarska nastava je oblik nastave tijekom koje studenti izrađuju seminarski rad – stručni rad kojim se detaljnije obrađuje neka tematika iz domene nastavnoga programa, te ga javno prezentiraju i brane. Jedan od ciljeva javne prezentacije i obrane je poticanje rasprave o obrađenoj temi. Ponekad do rasprave ne dolazi, a neki od uzroka toga su ograničeno vrijeme trajanja prezentacije i obrane, te nemotiviranost studenata za raspravom. Jedno od rješenja navedenog problema je primjena internetskog foruma u prezentaciji i obrani seminarskoga rada. Članak opisuje jednu takvu primjenu kroz analizu studije slučaja seminarske nastave iz kolegija Planiranje informacijskih sustava koja je održana na specijalističkom diplomskom stručnom studiju Informacijske tehnologije u poslovnim sustavima na Veleučilištu u Rijeci. U članku je prikazana metodika seminarske nastave koja je temeljena na internetskome forumu, kao i korištena informacijsko-komunikacijska tehnologija. Analizom 28 obrana seminarskih radova opisana su iskustva studenata koji su sudjelovali u nastavi bilo kao autori seminarskoga rada ili kao njegovi čitatelji. Ukazano je na prednosti i nedostatke primjene internetskoga foruma u seminarskoj nastavi, te su predložena poboljšanja.

I. UVOD

Članak se bavi problemom nedovoljne aktiviranosti studenata slušatelja tijekom javne prezentacije i obrane seminarskih radova. Nedostatak rasprave tijekom seminarske obrane i javne prezentacije, kojom bi i autor i slušatelji došli do novih spoznaja i bili ponukani na šire razmišljanje o temi iz nastavnog programa, čest je slučaj u nastavi. Brojni su razlozi uzrok tom problemu, a želja je u što većoj mjeri nadići taj problem i pronaći adekvatno rješenje koje bi bilo primjereno današnjim studentima, njihovom tempu i načinu života, što za posljedicu može imati i osuvremenjivanje održavanja nastave.

Nastava je prvenstveno interakcijski stvaralački napor u savladavanju propisanih sadržaja i stjecanju znanja. Važno je da je ta interakcija kvalitetno podržana i ostvarena [1]. S druge pak strane, internet tehnologije danas gotovo ne možemo zaobići u svakodnevnom životu, a njihova prednost u ostvarivanju interakcije je već neko vrijeme prepoznata. Brojne prednosti internet tehnologije su svakim danom sve više korištene u obrazovanju i ona je, k tome, bliska mladim ljudima [2].

Člankom se želi utvrditi opravdanost uvođenja internetskog foruma u seminarski dio nastave. Svrha je prikazati jednu takvu primjenu suvremene metode prezentacije i obrane seminarskih radova u edukativne svrhe. Ciljevi su usmjereni na opisivanje primjene metode internetskog foruma, odnosno uvođenje računala i individualnog pristupa u taj nastavni dio na Veleučilištu u Rijeci, njenih prednosti i nedostataka, dosadašnjih ostvarenja, iskustva samih korisnika, kao i mogućnosti za poboljšanjem i širom primjenom.

Članak se osim uvoda sastoji iz još četiri poglavlja. U drugome poglavlju se kratko opisuje povijest e-učenja. Treće poglavlje detaljno opisuje metodu primjene internetskoga foruma u obrani seminarskih radova te rezultate provedene analize. Četvrto poglavlje opisuje mogućnost primjene ove metode u rješavanju problema dugoga studiranja i male prolaznosti. Peto i zadnje poglavlje – zaključak – donosi sintezu prednosti, nedostataka i mogućih poboljšanja prikazane metode obrane seminarskih radova.

II. E-UČENJE KROZ POVIJEST

Kada govorimo o primjeni internet tehnologije u obrazovanju i nastavi ne možemo se ne susresti s pojmom e-učenja. *„E-učenje (engl. e-learning) je proces obrazovanja (proces učenja i podučavanja) koji se izvodi uz uporabu nekog oblika informacijske i komunikacijske tehnologije, a s ciljem unapređenja kvalitete toga procesa i kvalitete ishoda obrazovanja"* [3]. Primjena internetskog foruma svakako spada u oblik e-učenja. To je pojam s kojim se sve češće svakodnevno susrećemo, a sam početak obrazovanja na daljinu veže se uz Sjedinjene Američke Države krajem 19. stoljeća, kada je pokrenuto više inicijativa za obrazovanje putem dopisnih studija. Ubrzo je početkom 20. stoljeća pozornost usmjerena na kreiranje novih pedagoških modela za studije tog tipa i standarda kvalitete za njihovo provođenje.

Kod suvremenog načina učenja naglasak je svakako na računalnoj tehnologiji, koja je tada trebala osigurati interaktivno poučavanje u obrazovanju na daljinu. Kako bi se takvo podučavanje ostvarilo, 1960. godine pojavljuju se posebno dizajnirani obrazovni softveri (engl. *courseware*). Razvoj razmjene podataka, odnosno *World Wide Weba* je izazvao pak posebnu tehnološku i pedagošku revoluciju u obrazovanju na daljinu.

S vremenom su se za navedene oblike poučavanja pojavili pojmovi koji ih definiraju, pa su neki od primjera

računalom podržano učenje (engl. *computer assisted learning*, CAL), kao i na računalu zasnovano podučavanje (engl. *computer based instruction*, CBI). Ovi pojmovi su već više od trideset godina u uporabi u jeziku, no još uvijek nedovoljno primijenjeni u obrazovanju [4].

III. METODA INTERNETSKOG FORUMA U PREZENTACIJI I OBRANI SEMINARSKIH RADOVA

Više no ikada prije nužno je uskladiti obrazovanje s potrebama tržišta. U vremenu inovacija i rasta društva iznimno su važne vještine rješavanja složenih problema, inovativnost i kreativni napor. Te vještine se ne stječu dovoljno kvalitetno (ili ponekad uopće) u školama i na fakultetima [5].

U cjelokupnom obrazovanju izostaje kritičko mišljenje, koje je ključ za kreativnost i inovativnost za kojima tržište vapi. S tim na umu krenulo se u primjenu metode internetskog foruma u seminarskom dijelu nastave kolegija Planiranje informacijskih sustava. Uloga internetskog foruma je pokrenuti raspravu među studentima o temama iz struke. Pored toga su omogućene razne ostale prednosti karakteristične za uporabu internet tehnologija u obrazovanju, među kojima se ističu individualnost u pristupu i podjednaka angažiranost svih studenata tijekom ovog oblika nastave, odnosno sudjelovanje u učenju i kritičkom razmišljanju i od strane čitatelja, kao i od strane autora.

A. Izbor i obrada teme seminarskog rada metodom instrukcijskog dizajna

Tema seminarskog rada je samostalno izabrana s ponuđenog popisa tema unutar kolegija Planiranje informacijskih sustava te obrađena metodom instrukcijskoga dizajna od strane studenta, autora seminarskog rada. To znači da je za izabranu temu student otvorio novu diskusijsku temu unutar foruma „Seminarski radovi“ u kojoj je definirao ishode učenja. Oni u metodi instrukcijskog dizajna zapravo predstavljaju uspostavljanje budućeg sadržaja jer sadržaj seminara treba biti upravo takav i volumenski toliki da pokriva postavljene ishode učenja. Ishodi učenja su „kostur“ seminarskog rada i ujedno vodilja autoru u oblikovanju izlaganja tematike, a predstavljaju i temelj za izradu zadataka za provjeru kojima čitatelji mogu provjeriti jesu li pročitanim sadržajem uspjeli savladati definirane ishode, postavljene od strane autora rada.

Unutar istoga foruma se također navodi i literatura koja će se koristiti u izradi seminara te se može diskutirati i postavljati pitanja profesoru u vezi izabrane teme prilikom izrade seminarskog rada. Treba primijetiti da nitko od 30 studenata nije iskoristio mogućnost postavljanja pitanja profesoru u vezi izabrane teme. Više je mogućih razloga tome od kojih neki mogu biti da su studenti navikli samostalno izrađivati radove ovog tipa i pretraživati literaturu, da su neki taj dio obavili putem konzultacija ili elektroničke pošte, da su se studenti ustručavali pokazati da im nešto nije jasno i slično. S obzirom da su se studenti prvi put susreli s ovakvim načinom izrade seminarskih radova i njihove obrane, postoji mogućnost da će se ta opcija više koristiti u daljnjem radu s internet forumom, nakon što im taj način održavanja seminarskog dijela nastave postane bliskiji.

Tijekom izrade seminara autor se koristi dokumentima „Sadržaj seminarskoga rada i kriterij ocjenjivanja“ i „Bloomova taksonomija - Kognitivna domena“. To su materijali na internet stranicama kolegija koji objašnjavaju koje elemente treba rad sadržavati i na koji način se isti vrednuju te kako što bolje oblikovati rad metodom instrukcijskog dizajna kako bi se uspješno poučilo kolege o prezentiranoj tematici. S obzirom da studenti do sada nisu koristili taj način poučavanja, Bloomova taksonomija je bila od velike pomoći u oblikovanju rada na način da autori spoznaju čemu žele naučiti svoje kolege i time izdvoje bitno od nebitnog te oblikuju kvalitetan materijal za učenje na internet forumu. Čitatelji su ishodima učenja dobili sliku onoga što se od njih očekuje i na što trebaju obratiti posebnu pažnju tijekom proučavanja sadržaja [6].

B. Prezentacija i obrana seminarskog rada

Svaki student je bio dužan izraditi i obraniti seminarski rad, jer je to preduvjet za izlazak na završni/popravni ispit. Po završetku izrade seminarskog rada je tako napravljen materijal u formatu za elektronsko izdavaštvo, odnosno PDF (engl. *Portable Document Format*) obliku poslan na čitanje studentima (njih 28). Studenti čitatelji su potom trebali u roku od tri dana od objave seminara unutar posebnog foruma „Obrane seminarskih radova“ postaviti netrivijalno pitanje (ono pitanje čiji odgovor ne slijedi direktno iz seminara) otvaranjem diskusijske teme. Autor seminarskoga rada, u roku od sedam dana od objave rada, postavlja objavu na otvorenu diskusijsku temu svakog pojedinog čitatelja i na taj način odgovara na postavljeno pitanje.

Studenti su dodatno motivirani bodovanjem za postavljanje pitanja i odgovaranje na ista. Za svaki seminarski rad student može postaviti najviše jedno pitanje i za svako postavljeno netrivijalno pitanje student čitatelj dobiva jedan bod. Za svaki odgovor na netrivijalno pitanje autor dobiva jedan bod. Također se dodjeljuju i negativni bodovi, odnosno student koji ne postavi netrivijalno pitanje dobiva -1 bod, kao što i autor koji ne odgovori na netrivijalno pitanje dobiva -1 bod.

C. Rezultati metode

Prilikom korištenja metode internetskog foruma pojavila su se razna pitanja od strane čitatelja vezana uz teme seminara, ali su i autori na kraju prezentacije i obrane svojih seminarskih radova iznijeli unutar objave „Zaključak“ svoje dojmove o provedenoj edukaciji koju su oni predvodili, njenim korisnicima, odnosno studentima čitateljima, kao i o mogućim poboljšanjima. Na taj su način veoma efikasno, brzo i „iz prve ruke“ empirijskom metodom prikupljeni dojmovi samih korisnika metode internetskog foruma.

Primjeri najčešće postavljanih pitanja odnose se na više informacija o temi koje nisu spomenute u samom seminaru, tj. prednosti, nedostaci, gdje su bile primijenjene, softveri koji podržavaju metodologiju ili barem neke njene dijelove, mogućnost preskakanja faza i sl.:

„Koji su nedostaci Event-driven process chain tehnike za modeliranje?“

„Da li si možda tijekom istraživanja za seminarski rad naišla na informaciju koja su poznatija poduzeća razvijala svoj informacijski sustav po Nolan Norton metodologiji?“

„Navela si u radu računalno podržane dijagrame, neki primjer možda softvera u kojem se izrađuju?“

Također bi u drugoj pak skupini bila pitanja koja su povezana uz dodatne informacije u vezi napisanog u seminarskom radu, odnosno ona koja iskazuju potrebu za detaljnijim objašnjenjem nekog dijela, pojma i sl. Ona su obično prikazana poput poveznice na tekst, citirajući autora:

„U smjernicama za upravljanje procesima razvoja piše: "potrudite se da upravni odbor radi svoj posao". Na koje načine bi se to trebalo postići? Koliko upravni odbor utječe na daljnji razvoj?“

Trećoj skupini bi pripadala pitanja koja se odnose na mišljenje autora:

„Da li imaš ideju kojem projektu/tvrtki iz realnog života možeš danas savjetovanjem temeljem prethodno stečenog znanje iz Nolan - Norton metodologije pomoći?“

„Imaš li ideju kako bi se uspješno mogao primijeniti ovaj model na primjeru Veleučilišta u Rijeci?“

Ova se pitanja smatraju veoma važnima jer pokreću kritičko mišljenje kod studenta, čime je svakako primjenom internetskog foruma učinjen korak prema kvalitetnijem obrazovanju u kojem je studentu omogućeno da s kolegama diskutira i kreativno odgovara na izazove koji se pred njega postavljaju.

Kad je riječ o zaključku na kraju prezentacije i obrane seminarskih radova, u kojem su se iznosili dojmovi autora o provedenoj edukaciji koju su predvodili, korisnicima, odnosno čitateljima i mogućim poboljšanjima, valja napomenuti da su se autori često osim o dojmu o primjeni internetskog foruma s gledišta autora, izjasnili i o svom dojmu u primjeni kao čitatelji. Tu su dobivene korisne informacije o stajalištu korisnika ove metode učenja.

„...Što se tiče same obrane ovog rada, bila je na drugačiji način, zanimljivija, svatko od nas je „prisiljen“ pročitati rad ostalih kolega i postavljati pitanja te se na taj način pokušava više zainteresirati za usvajanjem novog znanja iz svakog seminarskog rada. Na taj način, postavljanjem pitanja se dolazi i do dodatne literature i proširuje se sam seminarski rad. Ovo je prvi put da smo imali ovakvu obranu seminarskog rada, zanimljivija je, više se sazna o temi nego na klasičan način i mislim da bi trebali imati što više obrana seminara na ovaj način.“

„S obzirom da sam se prvi puta susreo s online obranom završnog rada moram priznati da mi se jako dopalo iako sam bio malo skeptičan na početku jer ni ja kao i većina kolega nismo imali mogućnost online obrane seminarskog rada. Sama online obrana seminarskog rada je po meni dobra jer autor seminarskog rada konstantno kroz vrijeme obrane proširuje svoje znanje o metodologiji te tako još više proučava i nadopunjuje znanje vezano uz tematiku svojega rada, a usput kroz proučavanje radova koje su napravile kolege susrećemo se i upoznajemo s velikim brojem različitih metodologija što je svakako korisno u budućem radu i školovanju. Kroz eventualna pitanja kolega kroz samu obranu seminarskog rada se najbolje mogu uočiti moguća poboljšanja ili nedostaci samog seminara i definitivno mislim da je ovaj način obrane rada daleko kvalitetniji od klasične obrane jer i od autora rada i od čitatelja zahtijeva veće shvaćanje i proučavanje tematike seminarskog rada jer dolazi do veće diskusije a samim time i do većeg saznanja svih sudionika diskusije. “

„Što se tiče provedene edukacije, smatram da smo ovim načinom obrane i kolege i ja naučili nešto više. Oni su imali priliku seminarom se dodatno zainteresirati za metodologiju i njenu primjenu, te također izraziti eventualne nedoumice u vezi pročitanog. To je pak mene poticalo na dublje istraživanje, i također „šire“ razmišljanje. Svi smo sa svojim iskustvima i znanjem (što tijekom obrazovanja, što iz obavljanja naših poslova) razmjenjivali mišljenja te konačno sudjelovali i u vrednovanju metodologije.

Smatram da je ovakav način dobar za učitelje, profesore, izlagače, kada žele dobiti povratnu informaciju o tome koliko su pažljivo čitatelji pročitali lekciju, predavanje i sl., te koliko su istu shvatili. Dodatno bi se, ukoliko je to potrebno, provjera mogla „pojačati“ na način da čitatelji pošalju svoje odgovore na Zadatke za provjeru ostvarenih ishoda učenja.

Meni osobno su pitanja svakako pomogla da provjerim koliko sam naučila metodologiju i to znanje primijenim u dodatnom istraživanju i razmišljanju o mogućnostima i načinima primjene. Po pitanjima svakako vidim da su kolege gradivo seminara nastojali iskoristiti kombinirajući postojeća znanja, stečena na fakultetu, što je i bila svrha seminara.“

„Provedena edukacija mi se je jako svidjela iz razloga što postoje studenti koji ne mogu kvalitetno izlagati pred publikom, a drugi razlog je to što se tema obradi znatno kvalitetnije. Kada se izlaže na predavanju nismo u mogućnosti odgovoriti na neka pitanja vezana za temu jer nam je "promakao" taj dio u istraživanju, a ovdje ako nam i promakne možemo nastaviti istraživanje i naći odgovor te produbiti istraživanje o temi.

Bilo bi jako dobro kada bi profesori na Veleučilištu prihvatili ovakav načina izlaganja seminara jer će se bolje i kvalitetnije obraditi seminari. ...“

Prema rezultatima provedene metode, odnosno napisanim „Zaključcima“ može se primijetiti da je primjena metode internetskog foruma u nastavi polučila dobre rezultate i dobila i više no prolazne ocijene od strane studenata koji su je uz vodstvo profesora primijenili kako bi prezentirali i obranili svoje seminare, ali i sudjelovali u edukaciji postavljanjem pitanja. Korisnici su kao prednosti u svojim komentarima navodili barem kvalitetnu izmjenu mišljenja i proširenje sadržaja seminara, kao i da je pristup zanimljiv jer predstavlja za njih nešto novo i nepoznato, dok je jako velik broj iznimno zadovoljan povećanjem kvalitete u obrani jer se dobiva na vremenu za dodatno proučavanje literature i detaljnije i točnije odgovaranje na pitanja. Svakako ne treba zanemariti kako su pojedini studenti istakli i prednost samog izlaganja bez publike, koja mnogima stvara stres te u tim situacijama često gube bodove jer ne

mogu pokazati svoje pravo znanje radi velike treme i sličnih uzroka. Time svakako dobivamo motiv i za nekim budućim istraživanjem primjene ove metode na kolegijima gdje javna usmena obrana nije ključna.

Osim po pozitivnim komentarima, prema kojima se vidi da je svatko našao nešto za sebe u ovoj metodi, i prema broju onih koji su napravili seminarski rad i branili ga na ovaj način možemo zaključiti da je metoda jako dobro prihvaćena jer je 28 studenata od njih ukupno 30 (93,33 %) sudjelovalo u ovom načinu obrane i prezentacije seminarskog rada.

D. Prednosti primjene metode

Prednost za slušatelje, odnosno u ovom slučaju čitatelje je da samostalno biraju vrijeme i mjesto u kojem će posvetiti svoju pažnju čitanju sadržaja i učenju nečeg novog. To svakako nudi kvalitetniji i individualniji pristup učenju. Ovakva metoda obrane i prezentacije seminarskog rada se posebno preporučuje za kolegije koji su vremenski kasnije po rasporedu, a imaju u sklopu nastavnog plana predviđene seminare. U tim situacijama pažnja studenata obično popušta i svakako izlagani sadržaj ne bi zadobio dovoljno koncentracije i pažnje ciljane publike.

Ovakav način obrane seminara je više nego dobrodošao za obranu i prezentaciju tema koje pokrivaju opširnije gradivo, kao i u slučaju da seminarski dio nastave ima velik broj sličnih tema koje je potrebno prezentirati. On omogućava čitateljima da se posvete tom seminaru s punom pažnjom, da sami iz udobnosti svoga doma, uz pomoć Interneta, istraže razlike i sličnosti u odnosu na neke prethodne teme seminara te se dodatno zaintrigiraju tematikom. Time se dobivaju pitanja studenata koja su postavljena na „višoj razini“ te oni imaju mogućnost sudjelovati u raspravama i pokretati iste, koristeći dostupnu literaturu na Internetu ili kod kuće. Internet je svakako najveći zbir podataka i uvelike skraćuje pretraživanje te ubrzava postupak dolaženja do novih spoznaja koji je nekada trajao tjednima, mjesecima u pretraživanju i obilaženju knjižnica i sličnih izvora.

S druge strane autor, koji je najviše upoznat s temom, ima priliku proširiti svoje znanje dodatnim istraživanjem te kvalitetno odgovoriti na pitanja. Autor ponukan postavljenim pitanjem kolega kreće u dublje istraživanje i pretraživanje literature i Interneta. Odgovaranjem nadopunjava svoje znanje, ali i sam sadržaj postojećeg seminara. Moguće je da neke dijelove autor nije dovoljno detaljno i razumljivo objasnio, da je neke bitne činjenice ili zanimljivosti propustio u svom radu, a na to će mu sve ukazati pitanja kolega. Svakako se vidi da iz ovog načina proizlaze kvalitetni rezultati za obje strane, a sama obrana je podignuta u svojoj razini kvalitete.

Čest je problem prilikom javne usmene prezentacije nemogućnost autora da provjeri svoj odgovor za neko postavljeno pitanje te kvalitetna pitanja često ostanu bez kvalitetnih odgovora. To je i razumljivo jer autor seminara, koliko god da je upoznat s temom, ne može znati odgovor na sva pitanja „iz glave“ jer obrađena tema seminara nije njegov „izum“, „otkriće“ i sl. On je temu obradio proučavajući dostupnu literaturu, no on zato ima jako dobre predispozicije da u jako kratkom vremenu pronađe ispravan odgovor, detaljnije proučavajući već korištenu literaturu ili neku njoj sličnu. Ovim se načinom osigurava interakcija studenata po principu brzog, ali i kvalitetnog i provjerenog odgovaranja na postavljena pitanja s ciljem dobivanja trenutne slike o tome jesu li studenti razumjeli što im se izlaže [2].

E. Nedostaci primjene metode

Autor svakako jako puno nauči o svojoj temi, no to se ne može reći i za čitatelje. Svakako nije jednaka razina znanja o temi u oba slučaja. Velik broj pročitanih seminara ne može rezultirati jednakom kvalitetom naučenog za čitatelja, odnosno on neće jednako dobro naučiti sve teme, a posebno ih sve ne može ni približno dobro razumjeti kao autor pojedine teme.

Studenti često ne provjeravaju svoje znanje o naučenom prema zadacima za provjeru ostvarenih ishoda učenja. Ishodi učenja su većinom primijenjeni samo od strane autora, koji prema njima stvara sadržaj seminara, no od strane čitatelja su slabo ili nikako korišteni.

Ovaj način obrane seminara ne preporučuje se za primjenu na svim vrstama kolegija jer je važno da studenti i dalje imaju javnu obranu, usmeno izlaganje ideja, mišljenja i zaključaka koje trebaju znati prezentirati pred publikom.

F. Prijedlozi za poboljšanje metode

Bilo bi veoma korisno omogućiti da student može sudjelovati (npr. u obliku ankete i sl.) u odgovaranju na pitanja zadataka za provjeru ostvarenih ishoda, a odgovori se odmah analiziraju i dobiva se jasna predodžba koliko je studenta razumjelo obrađeno gradivo. Taj dio može se vrednovati kao aktivnost na nastavi ili biti dijelom kolokvija. Ovime se osigurava i iskorištenost zadataka za provjeru ishoda učenja od strane čitatelja, koji tako ponavljaju pročitano te dobivaju povratnu informaciju o naučenom, i da isti budu ponukani bolje razumjeti pojedinu temu, bolje je proučiti i više o njoj zapamtiti. Time se popravlja i razina znanja čitatelja teme u odnosu na autora.

Mogućnost jačeg fokusiranja na raspravu, također, bi mogla doprinijeti boljem pamćenju sadržaja pojedinih seminara. Tijekom primjene metode internetskog foruma čitatelji su većinom postavljali pitanja na koja je autor odgovarao, a iznimno je malen broj čitatelja koji su nakon odgovora ulazili u diskusiju i ako su istu željeli pokrenuti nisu dobivali odgovor. To se može popraviti uvođenjem obveznog pitanja od strane autora prilikom odgovaranja, npr. autor odgovori na pitanje, ali da bi dobio jedan bod treba postaviti i protupitanje, koje bi preporučljivo moglo biti vezano uz čitateljevo pitanje, a odgovor se može naći u samom sadržaju seminara. I u tom slučaju i čitatelj dobiva jedan bod tek kad i sam odgovori na protupitanje, a u protivnom oba mogu dobiti samo po pola boda (ako u autorovu odgovoru nije bilo pitanja i na to se nije reagiralo). U slučaju da čitatelj zamijeti da nije dobio protupitanje, ima pravo sam postaviti komentar na odgovor (protuizjavu – onu koja se suprotstavlja autorovoj) ili još jedno netrivijalno pitanje za autora. On tada može dobiti jedan bod, a autor će isti ostvariti odgovaranjem na protuizjavu ili drugo postavljeno pitanje svojim argumentima (ako ne odgovori ostaje mu pola boda).

Ovime rasprava može dobiti svoj intenzitet i postati zanimljivija, no vrlo je vjerojatno da će samo čitanje i odgovaranje u tom slučaju zahtijevati produljenje potrebnog roka koje se mora uzeti u obzir. Ipak, produljenjem roka i pojačanjem fokusa na raspravu će se uistinu morati od strane čitatelja pratiti autorovi odgovori, a pitanja se neće postavljati „radi reda“ te će se time i puno više naučiti.

Zornije prikazivanje povezanosti sadržaja s ishodima učenja, također, bi moglo biti od pomoći u boljem postizanju istih, pa bi se kroz primjerice kviz prilikom netočnog odgovora mogao prikazati dio teksta u kojem se nalazi odgovor. To bi pak uključivalo uvođenje dodatnih tehnologija i ulaganje dodatnog vremena pa bi se u daljnjim istraživanjima mogla provjeriti korisnost i isplativost takve mogućnosti.

Klasična nastava ne treba izgubiti svoj značaj. Na nastavi se zajedno s profesorom može komentirati prezentirano gradivo i tu se treba očekivati puna aktivnost studenata [2]. Tada studenti mogu usmeno raspraviti o temi i dobiti korisne povratne informacije od profesora.

IV. BUDUĆNOST METODE

Smatra se da bi se na ovaj način čak i na „neinformatičkim“ studijima mogli postići kvalitetni rezultati. Neki studiji, poput Prava, Ekonomije i sl. bi se u seminarskom dijelu nastave nekih kolegija mogli veoma učinkovito odrađivati na ovaj način. Do ideje se došlo proučavanjem istraživanja o koncentraciji studenata, gdje je jedan projekt na tu temu proveden na Pravnom fakultetu u Zagrebu. Zbog problema dugog studiranja i jako male prolaznosti, proveden je spomenuti projekt u svrhu unaprjeđivanja kvalitete studiranja, a unutar njega je provedeno i istraživanje sa zanimljivim rezultatima.

Okolnosti koje su studenti naveli kao otežavajuće za studij su najvećim dijelom bile nemotiviranost i nezainteresiranost (36 %), lijenost i pomanjkanje upornosti (31 %) i sl., te na kraju i manja sposobnost usvajanja gradiva i loša koncentracija (5,5 %) [7]. Na takvim studijima studenti imaju seminarski dio nastave i često „barataju“ s poprilično opsežnim gradivom, sličnim pojmovima i puno informacija odjednom. Ovakav način, u kojem bi svatko imao kod kuće, u knjižnici, na tabletu u prirodi i sl. mogućnost proučavanja gradiva te samostalnog istraživanja, djelovao bi više motivirajuće i potaknuo veću zainteresiranost. Bitno je da studenti sami upravljaju svojim vremenom te da nisu nigdje fizički prisiljeni biti (npr. na predavanju).

V. ZAKLJUČAK

Članak opisuje iskustva u primjeni internetskog foruma u obrani seminarskih radova, do kojih se došlo analizom provedene seminarske nastave u akademskoj 2014./2015. godini na kolegiju Planiranje informacijskih sustava koji se održava u sklopu specijalističkog diplomskog stručnog studija Informacijske tehnologije u poslovnim sustavima na Veleučilištu u Rijeci.

Rezultati analize, koja se temeljila na deskriptivnoj povratnoj informaciji studenata – sudionika prezentacije i obrane seminarskih radova, pokazuju izrazito dobru prihvaćenost ovakvoga oblika nastave. Neke od uočenih prednosti su: slobodan izbor vremena i mjesta kada će se seminar pročitati, kada će se postaviti pitanje i dati odgovor (uz poštivanje početno zadanoga vremenskog intervala od sedam dana), postavljena pitanja potiču autora na produbljivanje znanja, otklonjen je pritisak izlaganja pred publikom itd.

Pored navedenih prednosti, uočene su i neke mane ovoga pristupa: razina usvojenosti znanja autora o pojedinoj temi je zbog dodatnih pitanja veća nego kod čitatelja, čitatelja se ne prisiljava da iskoristi zadatke za provjeru dostignuća ishoda učenja, nije dobro apsolutno ukloniti javno izlaganje itd.

Nakon provedene analize iskristalizirale su se ideje za dodatnim poboljšanjem primjene internet foruma u obrani seminarskih radova. Neke od ideja su: obavezno uključivanje provjere dostignuća ishoda učenja čitatelja, uključivanje pitanja autora čitatelju, zornije povezivanje ishoda učenja sa sadržajem seminarskoga rada itd.

Upravljanje Arduino platformom pomoću programskog jezika Processing

Andrej Lacković
Visoko učilište Algebra – visoka škola za primijenjeno računarstvo, Zagreb, Hrvatska
andrej.lackovic@racunarstvo.hr

Sažetak - Arduino platforma je jednostavna i univerzalna platforma zasnovana pomoću mikrokontrolera na ATmel tehnologiji. Idealna je za razvoj upravljačke elektronike i robotike. Jedan od mogućih načina upravljanja Arduino platformom je pomoću računala kroz programski jezik Processing. Processing je vrsta programskog jezika baziranog na simplificiranoj varijanti Java programskog jezika i integriranog razvojnog okruženja. Rad opisuje osnovno programiranje Arduino mikrokontrolera, te upravljanje pomoću računala kroz programski jezik Processing kroz realan primjer upravljanja RGB LED trakom.

I. UVOD

Mikrokontroler je digitalna elektronička naprava u obliku integriranog kruga. Namjena mikrokontrolera je upravljanje uređajima i procesima, pa u sebi ima integrirani mikroprocesor, memoriju, digitalne i analogne ulaze i izlaze, komunikacijske sklopove i druge dodatke. Mikrokontroler normalno radi u kontroliranoj petlji, dakle očitava ulaze i zatim podešava izlaze sukladno sa svojim programom. Petlja se stalno ponavlja dok traje kontrola procesa.

Programi za mikrokontroler se pišu na računalu te pomoću programatora prebacuju u njihovu memoriju. Najpoznatiji proizvođači mikrokontrolera, uglavnom za hobiste, su Atmel i Microchip.

II. ARDUINO

Arduino je platforma otvorenog koda za kreiranje elektroničkih prototipova baziran na sklopovlju i programskom paketu koji je fleksibilan i jednostavan za korištenje. Namijenjen je umjetnicima, dizajnerima, hobistima, elektroničarima i svima koji su zainteresirani za kreiranje interaktivnih objekata i okruženja.

Slika 1. Arduino Uno mikrokotroler

Arduino je skup elektroničkih i softverskih komponenti koje se mogu jednostavno povezivati u složenije cjeline s ciljem izrade zabavnih i poučnih elektroničkih sklopova. Srce Arduina jesu mikrokontroleri. Najčešće koristi 8 bitne mikrokotrolere koje proizvodi tvrtka Atmel.

A. *Verzije Arduina*

Arduino dolazi u nekoliko različitih verzija. Uglavnom se razlikuju po mikroprocesoru, količini memorije, te broju analognih i digitalnih ulaza/izlaza.

Pa tako razlikujemo:

- Arduino Uno (ATmega 328, I/O: 14) (slika 1.)
- Arduino Mega (ATmega 2560, I/O: 54)
- Arduino Micro
- Arduino Nano

B. *Moguće nadogradenje*

Arduino je moguće nadograditi sa njemu kompatibilnim modulima za različite potrebe. Moguće nadogradnje možemo svesti na module i dodatke.

Neki od mogućih modula:

- GSM Shield (GSM modul)
- Ethernet Shield (mrežni modul)
- WiFi Shield (WiFi modul)

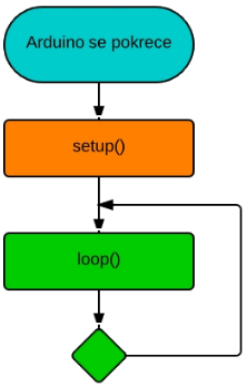
Neki od mogućih dodataka:

- TFT LCD screen (LCD monitor)
- SD card adapter (dodatna memorija)
- Mini USB/Serial adapter

C. *Programska podrška i programiranje*

Programiranje Arduino platforme radi se kroz posebno dizajnirano sučelje nazvano Arduino IDE (slika 2.) Inače sam programski jezik baziran je na AVR C programskom jeziku.

Slika 2. Arduino IDE



Slika 3. Dijelovi programskog koda

Arduino IDE ujedno služi za pisanje programa i za prenošenje samog programa na mikrokontroler. Dok kod većine drugih mikrokontrolera je potreban fizički programator, kod Arduina to nije potrebno. Na samom Arduinu nalazi se Arduino „bootloader“. Mali program koji služi za prenošenje programa na sam mikrokontroler bez nekakvog dodatnog hardvera.

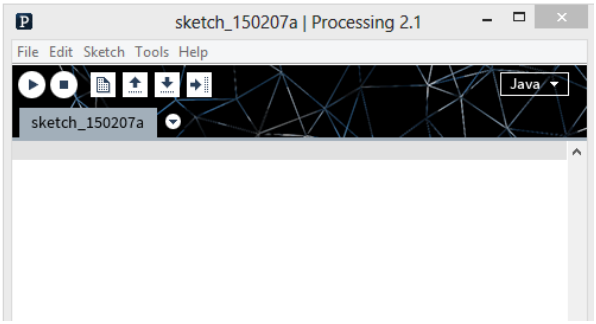
Sam program se sastoji od dva osnovna dijela(slika 3):

- Prvog podešavanja – setup()
- Program koji se izvršava stalno – loop()

Dio prvog podešavanja (setup()) predstavlja dio koda kojim se vrši podešavanje Arduino kontrolera (ulazno izlazne pinovi, definiranje vrste komunikacija kako sa računalom tako i sa ostalim komponentama). Drugi dio (loop()) je dio koda koji Arduino stalno ponavlja. Ovim ponavljanjem može se simulirati „pametan“ uređaj koji stalno osluškuje komande koje mu dolaze kroz ulazne komponente, te na taj način prati ponašanje okoline.

III. PROCESSING

Okruženje Processing jezika je Java. Programi napisani u Processing-u se prevode u Java programski jezik i pokreću kao Java aplikacija. Najčešće će se pokretati brže od programa baziranih na skriptim jezicima kao što je ActionScript, što je posebno važno kod mnogih grafičkih aplikacija.
Najveća razlika između Processing-a i Java programskog jezika je što Processing nudi jednostavno sučelje za programiranje koje ne zahtjeva napredne koncepte programiranja kao što su klase, objekti ili animacije, no ujedno omogućuje naprednim korisnicima njihovo korištenje.



Slika 4. Programsko okruženje Processing

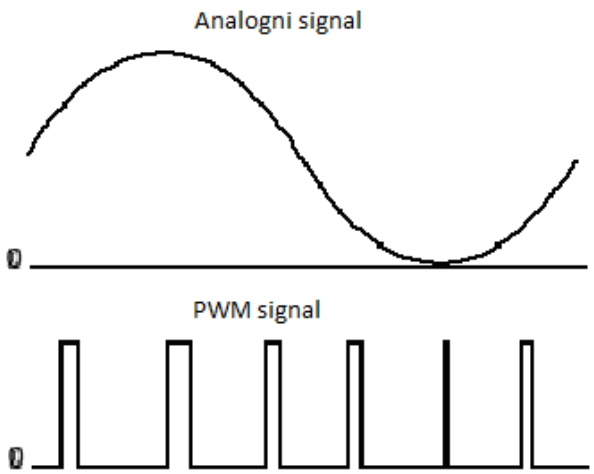
Zbog toga su programi kraći i čitljiviji. Processing koristi razne pristupe renderiranja tipografije uključujući i rasterska i vektorska rješenja. Povijesno gledajući, grafički dizajneri su tipografiju na Webu mogli oblikovati pomoću standardnih i sveprisutnih fontova (koji se mogu naći na računalima svih korisnika) ili koristeći kompliciranija, memorijski zahtjevnija te nepredvidiva rješenja. Processing omogućuje programiranje i prikazivanje tipografije na Web-u neovisno o korisničkom Web pregledniku i bazi fontova.

A. *Definicija Processinga*

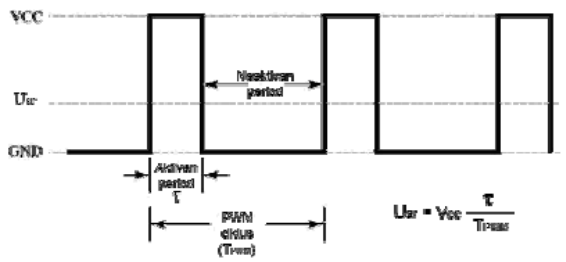
Processing povezuje koncepte programiranja sa principima vizualne forme, pokreta i interakcije. On integrira programski jezik i razvojno okruženje u jedinstveni sistem. Kreiran je za učenje osnova kompjuterskog programiranja unutar vizualnog konteksta. Jezik Processinga je specifično namijenjen za generiranje i modificiranje slika. Cilj mu je dostići ravnotežu između jasnoće (jednostavnosti) i naprednih mogućnosti, tako da je prilagođen i amaterima i naprednim programerima. Sistem omogućava korištenje i izradu kompjutorske grafike i interakcije uključujući vektorske/rasterske crteže, procesiranje slika, boje, događaje, mrežnu komunikaciju i objektno programiranje. Također ima mogućnost generiranja zvuka, slanja i primanja podataka u raznim formatima te slanja i primanja 2D i 3D datoteka. Processing je otvorenog formata što omogućuje svima da se njime bave i da ga razvijaju bez obzira na financijske mogućnosti.
Osnova jezika je Java koji također dijeli elemente sa C programskim jezikom te time omogućava brži razvitak i razumljivost programerima upoznatim tim programskim jezicima.

IV. PWM – PULSE WIDTH MODULATION

Impulsno širinska modulacija je tehnika kontroliranja analognih strujnih krugova preko digitalnih izlaza (najčešće mikrokotrolera). Napon, odnosno struja se dovode do analognog primaoca kao serija impulsa, a informacija o amplitudi analognog signala se predstavlja širinom (trajanjem) impulsa PWM signala (slika 5).



Slika 5. Analogni signal i PWM signal



Slika 6. Zavisnost srednjeg napona u PWM signalu

Analogni naponi se koriste za direktnu kontrolu uređaja, te se taj način pokazuje kao jako jednostavan i jasan način kontrole, ali nije uvijek praktičan i izvediv. Analogna kontrola ima razne mane kao što su promjenjive karakteristike komponenti tokom vremena, veća potrošnja, grijanje, osjetljivost na šum itd. Digitalnim kontroliranjem analognih signala smanjuje se potrošnja energije, imun na šum način upravljanja, te energetski efikasan način. Šum može utjecati na digitalni signal samo ako je toliko jak da promijeni logičku jedinicu na nulu ili obrnuto. Također mnogi današnji mikrokontroleri imaju ugrađene periferije za PWM modulacije što uvelike olakšava implementaciju.

Glavna prednost korištenja PWM signala je što signal ostaje digitalan cijelim putem od kontrolera do primaoca, tako da konverzija nije potrebna. PWM se smatra digitalnim signalom, jer u svakom trenutku vremena nivo signala je ili na nuli ili na maksimumu.

Zavisnost i računanje srednjeg napona (napona koji dolazi do uređaja kojim se upravlja) vidljiva je na slici 6.

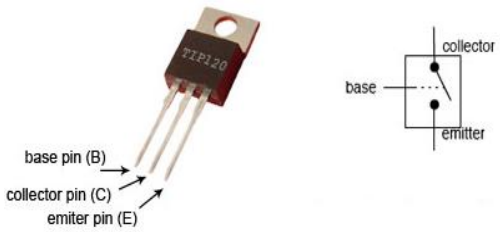
V. PROJEKT RGB TRAKA

Ideja projekta je pomoću računala, odnosno programa napisanog u programskom jeziku Processing upravljati Arduino platformom, odnosno RGB LED trakom spojenog na kontroler. Komunikacija računala i Arduina ostvarena je pomoću serijske veze.

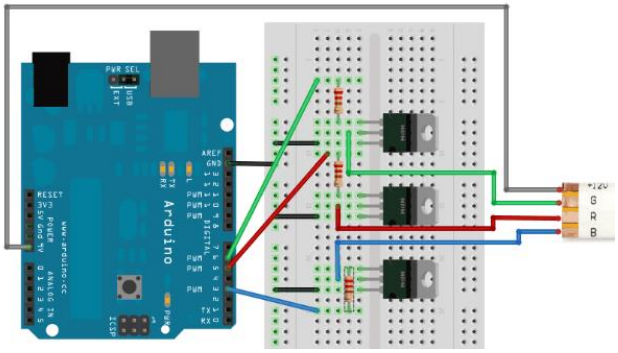
Komponente korištene u projektu:

- Arduino Uno (ATmega 328)
- RGB LED traka (12V DC, 14,4 W/m)
- Tranzistor TIP 120 (slika 8)
- Računalo (Windows 8)

Izlazni pinovi na Arduinu imaju ograničenje na 5V, a RGB traka je na 12V, te je korišten tranzistor TIP120



Slika 8. Tranzistor TIP 120



Slika 9. Shema spajanja

Shema spajanja RGB LED trake prikazana je na slici 9. Traka je direktno spojena na plus 12V DC, a upravljanje pojedinom bojom (crvena/zelena/plava) vrši se tako da se minus pol dovede preko Arduina (pomoću tranzistorske sklopke). Za tranzistorsku sklopku potreban je i otpornik vrijednosti 10 kΩ. Osim tranzistora moguće je koristiti i MOSFET.

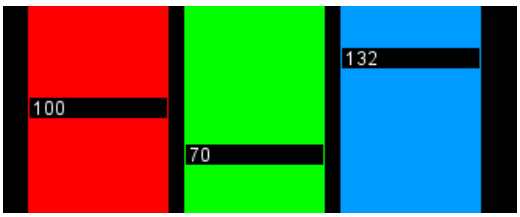
A. *Arduino programski kod*

```
void setup(){
  // deklariranje serijske veze na 9600
        Serial.begin(9600);

  // izlazni pinovi
        pinMode(5, OUTPUT); // crvena
        pinMode(6, OUTPUT); // zelena
        pinMode(3, OUTPUT); // plava

  // još jedan izlazni pin kao GND
        pinMode(8, OUTPUT); // GND
        digitalWrite(8, LOW);
}
void loop() {
  // poziv funkcije GetFromSerial()
        switch(GetFromSerial()){
         case 'R':
                analogWrite(5, GetFromSerial());
                break;
          case 'G':
                analogWrite(6, GetFromSerial());
                break;
          case 'B':
                analogWrite(3, GetFromSerial());
                break;
       }
}
// čitanje serijskog porta
int GetFromSerial(){
       while (Serial.available()<=0) {
}
return Serial.read();
}
```

Izlazni pinovi koji se koriste su PWM izlazi (Pulse Width Modulation). To nisu klasični digitalni pinovi već digitalni pinovi koji mogu poprimiti 255 mogućih stanja i ovisno o tome imaju analognu vrijednost napona.



Slika 10. Pprosessing - upravljanje

Vrijednost 0 je 0V, dok je 255 jednako 5V. Vrijednosti između 0 i 255 daju različite vrijednosti napona. To se postiže širinom 0 ili 1 intervala u određenim vremenskim razmacima.

B. Processing programski kod

```
import processing.serial.*;
Serial port;
sliderV sV1, sV2, sV3;
color cor;

void setup() {
      size(500, 500);
      println("Available serial ports:");
      println(Serial.list());

 // provjera otvorenih portova na računalu
      port = new Serial(this, Serial.list()[1], 9600);

 // kreiranje 3 instance sliderV klase
       sV1 = new sliderV(100, 100, 90, 255,
       #FF0000);
       sV2 = new sliderV(200, 100, 90, 255,
       #03FF00);
       sV3 = new sliderV(300, 100, 90, 255,
       #009BFF);
}

//crtanje
void draw() {
       background(0);
       sV1.render();
       sV2.render();
       sV3.render();

  // slanje „sync“ znaka
  // slanje željene vrijednosti
      port.write('R');
      port.write(sV1.p);
      port.write('G');
      port.write(sV2.p);
      port.write('B');
      port.write(sV3.p);
}

//Slider klasa
class sliderV {
      int x, y, w, h, p;
      color cor;
      boolean slide;

      sliderV (int _x, int _y, int _w, int _h,
      color _cor) {
      x = _x;   y = _y;
      w = _w;  h = _h;
      p = 90;   cor = _cor;
      slide = true;
 }
 void render() {
      fill(cor);
      rect(x-1, y-4, w, h+10);
      noStroke();
      fill(0);
      rect(x, h-p+y-5, w-2, 13);
      fill(255);
      text(p, x+2, h-p+y+6);
      if(slide==true&&mousePressed==true&&mouse
        X<x+w && mouseX>x)
      {
      if((mouseY<=y+h+150) && (mouseY>=y-150))
      {
            p = h-(mouseY-y);
            if (p<0) {
                p=0;
            }
            else if (p>h) {
                p=h;
            }
      }
     }
   }
 }
```

Rezultat izvršavanja cijelog processing koda vidljiv je na slici 10. Pomicanjem klizača sa vrijednošću na pojedinoj boji šaljemo naredbe Arduinu za pojedinu boju. Osim 3 osnovne boje, moguće je dobiti paletu boja tako da kombiniramo intenzitete 3 osnovne (crvena/plava/zelena).

VI. ZAKLJUČAK

Dovršenje jednog projekta je u biti gotovo uvijek početak nekog sljedećeg u smislu nadogradnje postojećeg novim idejama i mogućnostima. Komunikacija mikrokotrolerima putem mreže nudi mogućnost upravljanja putem udaljenih računala, mobilnih ili tablet uređaja što i ovom opisanom projektu izgleda kao super mogućnost i vrlo vjerojatno sljedeći korak. Rad sa mikrokontrolerima je uvijek zanimljiv i dinamičan, te je samo mašta granica.

UČENJE PROGRAMIRANJA KROZ ROBOTIKU

Petar Dobrić* i Maja Mačinko Kovač**
*OŠ Julija Klovića/Nova cesta 133, Zagreb, Hrvatska
**OŠ Eugen Kvaternik/Školska 4, Velika Gorica, Hrvatska
*e-mail: dobripero@gmail.com
**e-mail: xjamax@gmail.com

Sažetak – Učenje programiranja danas djeci često predstavlja nešto strano i nerazumljivo. Programiranje je budućnost i jedan od načina kako ga učiniti zanimljivim je učenje kroz igru. Ovim smo radom pokazali kako učiti programiranje s praktičnom primjenom u robotici pomoću programskog jezika RoboPro te ga usporedili s programiranjem u jeziku Basic koji učenici već poznaju. Pokazali smo praktične primjere pomoću kojih odmah vide učinak napisanih programa i automatizaciju istih. Bez unapređivanja načina kako mlade privući programiranju, nema ni digitalne revolucije u obrazovanju. A učenje robotike kroz igru je upravo ono što nam je potrebno.

I. UVOD

Učenje programiranja u osnovnoj školi predstavlja izazov za učitelje zbog činjenice da današnji učenici imaju velikih problema u usvajanju osnovnih konceptualnih i problemskih načina razmišljanja prilikom algoritamskog načina rješavanja zadataka. Usvajanje programskih jezika (LOGO, BASIC, Phyton) tijekom osnovnoškolskog razdoblja kod velike većine učenika stvara animozitet i otpor. Do pozitivnih načina i metoda pri učenju programiranja, kako bi prve programerske korake učenici lakše usvojili, došli smo kroz izvannastavnu aktivnost robotike. Programiranje u programu RoboPro razotkriva uobičajeno mišljenje o teškoći istog. Objektno orijentirani princip učenja je konceptualno jednostavan način usvajanja algoritamskog razmišljanja tijekom rješavanja problemskih zadataka te kao takav olakšava proces učenja programiranja. Učenici odmah vide rezultat svog programa te ga u slučaju pogreške u kratkom vremenu lako korigiraju. Izvođenje zadanog problemskog zadatka odvija se pomoću sučelja koje je povezano s računalom i ulazno-izlaznim elementima (žaruljice, motori, različiti senzori...). Naše iskustvo je da učenje programiranja kroz igru daje odlične rezultate i olakšava rad učenicima i učiteljima na zadovoljstvo svih sudionika obrazovnog procesa. Ovakav način poučavanja kod učenika razvija vještinu samostalnog spajanja i programiranja modela robota te poboljšava učenikove psihomotoričke vještine. Pobuđivanje interesa za istraživanjem i rješavanjem problemskih zadataka, potiče algoritamski način razmišljanja.

II. ZAŠTO BAŠ ROBOTIKA I KOJI JEZIK IZABRATI

Mnogi se pitaju zašto učiti osnove programiranja pomoću robota umjesto tradicionalnih metoda učenja. U posljednjih nekoliko godina vidjeli smo ubrzano širenje uređaja koji sakupljaju i upravljaju informacije u realnom vremenu putem nekog sučelja i komponente među njima, kao što su roveri na Marsu, ABS sustavi, umjetni udovi i operacije, pa čak i IPodi. Kako ti uređaji postaju sveprisutni, slobodoumno obrazovana osoba trebala bi biti upoznata s načinima kako takvi uređaji rade, kao i s njihovim mogućnostima i ograničenjima.

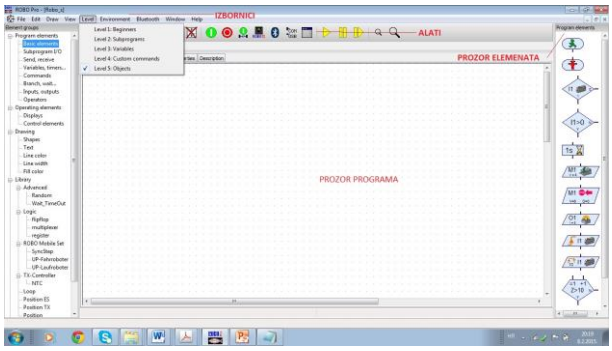
Odgovarajući jezik, jezične strukture i arhitekture za razvoj softvera robota oduvijek su tema rasprava još od prvih računalno upravljanih robotskih sustava. Činjenica da ne postoji univerzalni dogovor ne čudi s obzirom na probleme kojima se jezik susreće. Prvi dio problema odnosi se na činjenicu da se robot stvara na nestrukturiranom, dinamičnom svijetu koji se brzo mijenja i isto tako mora biti u mogućnosti efektivno reagirati na njega. Na osnovnoj razini to implicira da bi jezik trebao olakšati upravljanje algoritama koji se baziraju na radu senzora. Isto tako, bilo koji takav algoritam mora moći biti prekinut u bilo koje vrijeme. Idealno, dobar robotski program trebao bi omogućiti jednostavan skup naredbi za opisivanje i kombiniranje kontroliranog ponašanja. Drugi dio problema proizlazi iz prirode zadataka koji bi taj robot izvršavao, a posljednji problem javlja se oko praktičnih problema razvoja robotskog softvera. Ono s čime se i sami učenici često susreću jest činjenica da je programiranje robota veoma eksperimentalno u prirodi, često ne znamo kako u početku najbolje namjestiti senzore, pogone i ostalo. Često je potrebno puno testiranja, dorade i naknadnog programiranja da bi robot idealno radio. Potrebno je pronaći jezik koji bi dovoljno brzo izvršavao zadane algoritme, upravljao protokom istih, a da sve odvija dovoljno dinamično i zadani zadaci se izvrše.

RoboPro je vrlo jednostavan programski softver. Čak i početnici mogu jednostavno početi programiranje korištenjem dijagrama toka i raznih građevnih blokova. Osim toga, razmjena informacija koristi se varijablama i grafičkim vezama. To omogućava prikaz programske funkcije na jasan i razumljiv način. Grafički programski jezik RoboPro pruža sve elemente modernog programskog jezika, kao što su polja, funkcije, objekti, rekurzije što je koristan alat čak i za profesionalne programere. Programi su prevedeni izravno u strojni jezik za učinkovito izvršenje čak i najsloženijih programa. Programski jezik ne poznaje

granice i lako je pisati programe ili razmjenjivati podatke s ostalim Windows softverima.

III. ROBOPRO SUČELJE

Automatizacija i upravljačka tehnologija prisutna u svim područjima ljudskog djelovanja olakšava rad i ubrzava napredak naše civilizacije. RoboPro sučelje omogućava potpunu kontrolu pri upravljanju Fishertechnick modelima. Intuitivnost i jednostavnost omogućava brzo učenje logike programiranja kroz kontrolne programe ili dijagrame tijeka. Takvi programi za kontrolu i upravljanje robotima mogu se sastaviti i pomoću programskih jezika opće namjene kao što je npr. Qbasic ili ROBOPro. Grafičko korisničko sučelje omogućava odabir ikona pomoću miša gdje slažemo program u obliku dijagrama tijeka. Kako bismo pomoću računala mogli upravljati robotom, potreban je elektronički sklop - sučelje, koje povezuje računalo i robota. Napisani program prenosimo putem međusklopa - sučelja koje prenosi naredbe modelu robota. Sučelje na računalo spajamo pomoću USB kabela koji prenosi programe s računala u memoriju robota. Osim RoboPro programa, na računalo moramo instalirati i upravljačke programe koji omogućavaju dvosmjernu komunikaciju između računala i modela robota. Sučelje napajamo akumulatorskom baterijom napona 9V ili ispravljačem.

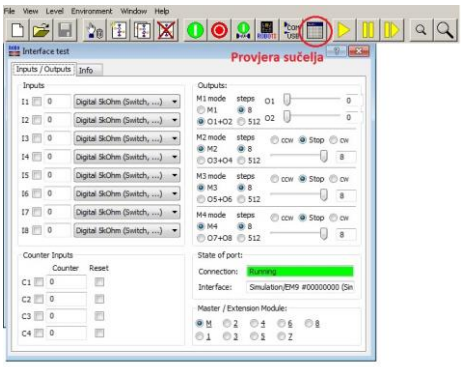


Slika 1. Sučelje programa RoboPro

Podešavanjem sučelja definiramo način rada i odabir vrste sučelja. Program podržava rad sa spojenim elementima (lampice, motori, tipkala i ostali senzori) na sučelje i bez sučelja – simulacija. Ovaj način rada je pogodan ako nemamo vremena za spajanje elemenata ili ako programiramo izvan škole.

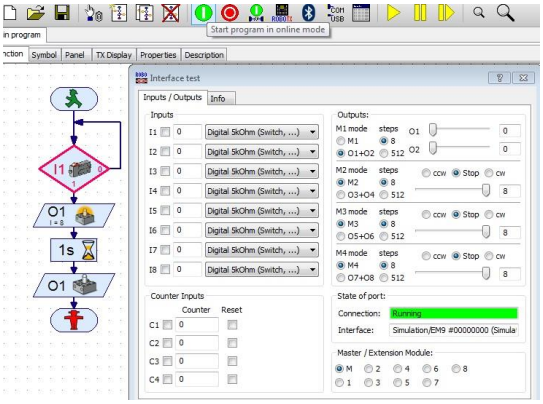
Slika 2. Postavke izlaznog sučelja

Provjera rada izlaznog sučelja i veze s računalom omogućava pravovremeno otklanjanje grešaka (nepravilno spojeni elementi, neispravan USB kabel, pad napona na bateriji ispod 9V) na početku rada. Zelena traka u dnu prozora pokazuje da je sučelje pravilno spojeno.



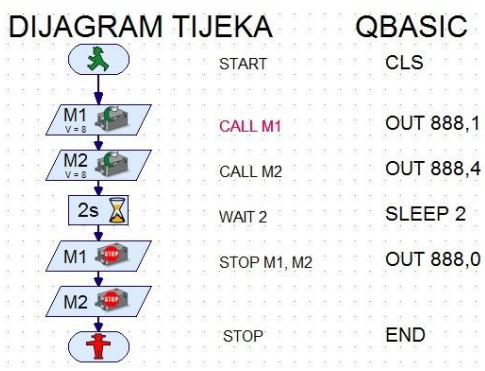
Slika 3. Provjera ispravnosti veze sučelja i računala

Dijagram tijeka sastoji se od programskih elemenata koji se umeću i povezuju u prozoru programa pomoću miša (tehnika povuci – pusti). Grafički prikaz tijeka programa olakšava praćenje tijeka programa i učenje logičkog pristupa programiranju.



Slika 4. Dijagram tijeka i provjera rada programa

Primjer pokretanja robotskog vozila u programima Qbasic i RoboPro zorno prikazuje jednostavnost logike izrade programa. Pokretanjem programa motori M1 i M2 se pokrenu i vozilo se kreće naprijed dvije sekunde. Motori se zaustavljaju i slijedi završetak programa. Učenici vide učinak napisanih naredbi i njihovu ulogu u automatiziranom procesu. Spremanjem programa u memoriju sučelja vozilo pokrećemo neovisno o fizičkoj vezi računala i robota. Grafičko sučelje olakšava početno zanimanje za programiranje i rješavanje problemskih zadataka već kod učenika nižih razreda.

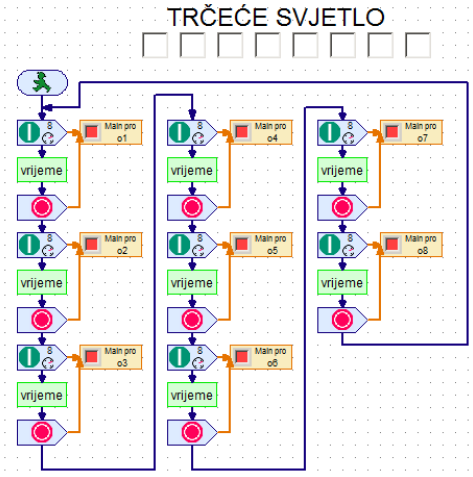


Slika 5. Program pokretanja robotskog vozila

IV. PRAKTIČNA PRIMJENA

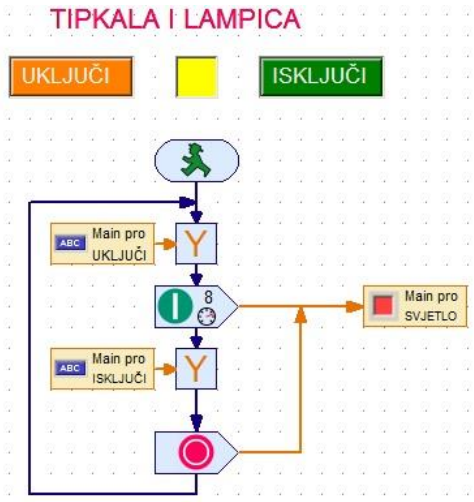
Rješavanje problemskih situacija ostvarivo je bez opreme koja je jako skupa i nedostižna većini škola. Podešavanje programa na modul simulacije donosi novu dimenziju u učenju i razumijevanju programiranja. RoboPro podržava i rad s podprogramima, čime je dobivena preglednost i lakše snalaženje u praćenju tijeka programa i pronalaženju mogućih grešaka.

Primjer zadatka „trčeće svjetlo“ pokazuje jedno od mogućih rješenja. Lampice je potrebno paliti i gasiti zadanim redoslijedom (O1 do O8), u pravilnim vremenskim razmacima. Podprogram „vrijeme“ pojednostavljuje promjenu vremena paljenja i gašenja lampica.



Slika 6. Simulacija – program trčeće svjetlo

Primjer uključivanja i isključivanja svjetla pomoću tipkala (uključi, isključi) riješen je pomoću simulacije. Tipkalo „uključi“ pali svjetlo, a „isključi“ gasi svjetlo. Tipkala su povezana ulaznim panelima, čime je omogućena jednostavna kontrola zadanog modela. Jedan panel je pridružen svakom programu ili podprogramu. Prvo moramo kreirati panel sa svim elementima i tek tada možemo povezati panel s panel programskim elementom.



Slika 7. Simulacija – program uključi, isključi svjetlo

V. ZAKLJUČAK

Ovim načinom rada učenicima je omogućeno da vide praktičnu primjenu svih naredbi koje u nastavi informatike uče i koja im je jedna od mogućih uloga. Samim programiranjem bez dodatnih stimulacija, učenicima učenje zna postati zamorno i besmisleno, a na ovaj smo im način omogućili da kroz zabavan način zavole programiranje i sve mogućnosti koje ono pruža. RoboPro sučelje nije jedini mogući način kojime se uči kroz igru, no svakako je jedan od jednostavnijih i dostupnijih načina kako to postići. Logika programiranja vrlo je slična programskom jeziku Basic kojeg uče u nastavi informatike, i samim time učenicima je lakše pokazati jedan od mogućih načina praktične primjene istoga.

Infomatika je budućnost, i ako ne pronađemo načine kako učenicima približiti i pojednostavniti njeno učenje, teško ćemo zadobiti njihovu pažnju i volju za učenjem. Programiranje nije samo za računalne fanatike ili one koji se opredjeljuju za karijeru u IKT sektoru. Cijela paleta kreativnih i zanimljivih poslova ovisi o poznavanju programiranja, kao što je filmska industrija, analiza medicinskih podataka, izrada sigurnosnih softvera… Programiranje je nit koja se provlači kroz sve buduće profesije, i moramo pronaći načine kako ga učenicima učiniti zabavnim i korisnim.

Primjer implementacije e – učenja u nastavi Informatike

Jozica Pažanin*, Marko Rosić**, Ani Grubišić**
*Ekonomsko – birotehnička škola, Split, Hrvatska
**Prirodoslovno-matematički fakultet, Split, Hrvatska
jozica.pazanin@gmail.com

Sažetak – U cilju unapređenja kvalitete procesa poučavanja, upoznavanja suvremenih modela učenja važnih za cijeloživotno obrazovanje te razvoja digitalnih kompetencija učenika, kroz nastavu predmeta Informatika određeni nastavni sadržaji realizirani su konceptom e-učenja. E-učenje svojim klasifikacijama pruža različite načine implementacije u nastavni proces. U ovom radu prikazana je implementacija e-učenja kombiniranim (hibridnim) modelom nastave putem dva e-kolegija: „Sigurnost na Internetu“ i „Matematičke osnove računala“. E-kolegij „Matematičke osnove računala“ korišten je kao dopuna klasičnoj nastavi i predstavlja popratni nastavni materijal obrađenoj nastavnoj jedinici u učionici. E-kolegij „Sigurnost na Internetu“ sadrži cjelovitu nastavnu jedinicu, te je njegova realizacija koncipirana na način da se učenike tijekom sata u učionici upućuje u nastavni sadržaj koji oni potom u potpunosti usvajaju u online okruženju. U radu su navedeni rezultati istraživanja provedenog eksperimenta u kojem jedna skupina učenika nastavnu jedinicu usvaja modelom e-učenja putem sustava Loomen, a druga skupina putem klasične nastave u učionici. Rezultati dobiveni eksperimentom pokazuju usporedbu postignutih obrazovnih ciljeva zadane lekcije u klasičnom i online modelu učenja. Usporedba ostvarenih rezultata obrađene lekcije, pokazuje zadovoljava li koncept e-učenja postizanje obrazovnih ciljeva. U radu su prikazani i rezultati anketnog upitnika koji pokazuju stavove učenika o e-učenju, te njihovu spremnost i motiviranost za prihvaćanjem novih suvremenih modela nastave.

I. UVOD

E-učenje kao proces obrazovanja (proces učenja i podučavanja) koji se izvodi uz uporabu nekog oblika informacijske i komunikacijske tehnologije, s ciljem unapređenja kvalitete toga procesa i kvalitete ishoda obrazovanja [1] omogućava različite načine integriranja u redovni nastavni proces. Kako e-učenje podrazumijeva različite aspekte korištenja informacijsko-komunikacijske tehnologije ovisno o razini zastupljenosti, intenzitetu i načinu korištenja tehnologije u nastavi proizlazi klasifikacija e-učenja. [2]

Tablica 1. prikazuje proširenu klasifikaciju e-učenja koja podrazumijeva korištenje tehnologije u nastavi.

U Ekonomsko-birotehničkoj školi u Splitu kroz nastavu Informatike u hibridnom modelu nastave implementirana su dva e-kolegija: „Matematičke osnove računala“ i „Sigurnost na Internetu“.

TABLICA 1. KLASIFIKACIJA E-UČENJA

Kategorija	**Opis**	**Način korištenja ICT-a**
Klasična nastava (face2face – f2f)	Klasična nastava – nastava u učionici	Tehnologija se uglavnom koristi na razini upotrebe programa za obradu teksta (npr. pisanja priprema u Word-u).
Nastava uz pomoć ICT-a	Tehnologija se uglavnom koristi da bi se poboljšala klasična nastava	Primjer korištenja ICT-a: Power Point prezentacije, programi za testiranje (kvizovi za samoprovjeru i provjeru znanja), društvene mreže, Web stranice za kolegije
Hibridna (kombinirana) nastava	Kombinacija klasične nastave u učionici i nastave uz pomoć tehnologije (online nastave)	LMS (*eng. Learning Management Systems*) - sustavi za upravljanje učenjem
Online nastava	Nastava se odvija isključivo u online okruženju (na f2f nastave)	E-kolegiji se „dostavljaju“ putem LMS-a

U navedenim kolegijima hibridni model nastave predstavlja kombinaciju klasične nastave u učionici i online nastave putem sustava za upravljanje učenjem Loomen (hrvatska inačica sustava Moodle).

E-kolegij „Matematičke osnove računala“ koristi se u prvom razredu ekonomske gimnazije, kao dodatni nastavni sadržaj koji upotpunjuje klasičnu nastavu u učionici. Kolegij se realizira na način da učenici tijekom nastave u učionici usvajaju nove nastavne sadržaje a potom u online okruženju e-kolegija koriste popratne sadržaje (prezentacije i digitalne knjižice sa obrađenim sadržajem nastavne jedinice, primjere riješenih zadataka i kvizove za samoprovjeru znanja) te ponavljaju i utvrđuju gradivo obrađene nastavne jedinice. Osim kao dopuna klasičnoj nastavi u učionici, e-kolegij se koristi i kao samostalna cjelina u online modelu nastave te u tom obliku služi učenicima za pripremanje državne mature iz Informatike i natjecanja „Osnove Informatike“.

E-kolegij „Sigurnost na Internetu" se provodi već tri godine među učenicima prvog razreda ekonomskog usmjerenja. Kolegij se provodi na način da se učenici na

satu u učionici samo upućuje u nastavni sadržaj koji potom samostalno usvajaju u online okruženju. E-kolegij sadrži sljedeći niz aktivnosti i resursa za usvajanje nastavnog sadržaja:

- digitalnu knjigu s objašnjenim sadržajem lekcije, unutar koje je inkorporirano niz zadataka, pdf datoteka i kvizova za ponavljanje
- rječnik koji sadrži nepoznate pojmove iz lekcije
- interaktivne igre (milijunaš, križaljka, vješalo) za ponavljanje gradiva
- forum za komunikaciju sa ostalim polaznicima i komunikaciju s mentorom
- linkove na dodatne izvore znanja.

Detaljno obrazložen sadržaj e-kolegija „Sigurnost na Internetu“, sa definiranim ciljevima i detaljno opisanim zadacima prikazan je u radu [3] a dalje u ovom radu, ovaj e-kolegij biti će izložen u kontekstu provedenog eksperimentalnog istraživanje o efikasnosti e-učenja putem LMS sustava.

II. ISTRAŽIVANJE EKSPERIMENTOM

Tijekom veljače 2015. god. provedeno je eksperimentalno istraživanje u kojem je tema „Sigurnost na Internetu“ među dvije skupine učenika (dva razreda) obrađena različitim modelima nastave. Jedna skupina učenika (eksperimentalna skupina – 18 učenika) nastavnu jedinicu usvajala je modelom e-učenja putem sustava Loomen, a druga skupina (kontrolna skupina – 18 učenika) putem klasične nastave u učionici. U nastavku su izloženi cilj i zadaci ovog istraživanja kao i analiza postignutih rezultata.

Cilj istraživanja

Ispitati, s obzirom na upotrebu različitih modela učenja istog nastavnog sadržaja, postoji li razlika u postizanju obrazovnih ciljeva obrađene nastavne jedinice tj. postoji li razlika u postignutim rezultatima između klasične nastave u učionici i online nastave putem sustava Loomen.

Zadaci istraživanja

- Formirati eksperimentalnu i kontrolnu skupinu učenika. Ove dvije skupine moraju biti ekvivalentne u razini predznanja njihovih članova vezano za predloženu temu. Stoga je potrebno provesti i inicijalni test predznanja o predloženoj temi kako bi se formirale prikladne skupine učenika.
- Realizirati nastavu iz preložene teme. Nastavu realizirati putem klasičnog načina u učionici (kontrolna skupina) i pomoću sustava za e-učenje – Loomen (eksperimentalna skupina).
- Provedba završnog testa kojim se ispituju ostvareni obrazovni ciljevi obrađene lekcije u eksperimentalnoj i kontrolnoj skupini.

Tijek istraživanja

Nakon provedenog inicijalnog testa, učenici su upućeni u obradu novih nastavnih sadržaja na način da je eksperimentalna skupina obrazovne sadržaje usvajala u kombiniranom modelu nastave, a kontrolna skupina putem klasične nastave u učionici. U nastavku se ukratko izlaže realizacija nastave u obje skupine.

Realizacija nastave u eksperimentalnoj skupini učenika

Učenici eksperimentalne skupine usvajaju nastavne sadržaje na način da ih tijekom nastave u učionici nastavnik upućuje u nastavni sadržaj te im zadaje tjedne zadatke koje oni potom samostalno rješavaju u online okruženju putem e-kolegija „Sigurnost na Internetu“. Učenici unutar e-kolegija pristupaju različitim aktivnostima putem kojih pregledavaju nastavni sadržaj koristeći prezentaciju, proučavaju sadržaj lekcije putem digitalne knjige i rječnika te ponavljaju nastavno gradivo putem interaktivnih igara.

Slika 1. Okruženje za realizaciju nastave u eksperimentalnoj skupini

Realizacija nastave u kontrolnoj skupini učenika

Učenicima kontrolne skupine je tijekom klasične nastave u učionici putem PowerPoint prezentacije prezentiran sadržaj nastavne jedinice. U zadnjem dijelu sata obrađeni sadržaj je ponovljen putem interaktivne križaljke. Da bi nastavni materijal za učenje (detaljno razrađen sadržaj nastavne jedinice) bio odgovarajući kao i u eksperimentalnoj skupini, učenicima iz kontrolne skupine podijeljeni su nastavni materijali za učenje identični materijalima iz eksperimentalne skupine. Svi dodatni materijali za učenje (linkovi na kvizove i dodatne izvore znanja) učenicima kontrolne skupine objavljeni su na web stranici škole.

Nakon obrađenog nastavnog sadržaja među učenicima eksperimentalne i kontrolne skupine provedena je pisana provjera znanja testom kojim se provjerava usvojenost obrazovnih sadržaja.

Prikaz i analiza rezultata

Rezultati inicijalnog testa i testa provjere znanja obrađeni su u programi Microsoft Office Excel 2007.

Uspoređujući rezultate inicijalnog testa T-testom (t = - 0,6896) se dobilo da se eksperimentalna i kontrolna grupa statistički značajno ne razlikuju, tj. da su ekvivalentni jer je $|t| < 1,684$ (granična vrijednost). Interpretacija rezultata napravljena je u skladu s uputama [4] i [6].

U tablici 2. prikazani su rezultati obrade nad razlikom rezultata završnog i inicijalnog testa.

TABLICA 2. REZULTATI STATISTIČKE OBRADE

TEST (= Test provjere (završni test) – Inicijalni test)		
	Kontrolna grupa	Eksperimentalna grupa
Broj učenika	18	18
Aritmetička sredina	31,94	38,47
Standardna devijacija	13,3822	13,4803
T-test	-1,458	

Izračun standardizirane veličine učinka inicijalnog i završnog testa proveden je prema Glass-u[5], tj. razlika aritmetičkih sredina eksperimentalne i kontrolne grupe je podijeljena sa standardnom devijacijom kontrolne grupe. Rezultat razlike između veličine učinka inicijalnog i završnog testa predstavlja da je eksperimentalna grupa bolja od kontrolne grupe za 0,4878 standardne devijacije.

Obradom podataka, kojom se utvrđivalo postoji li statistički značajna razlika između eksperimentalne i kontrolne grupe pokazalo se da ovim eksperimentom nema statistički značajne razlike jer je $|t| <$ granične vrijednosti ($|-1,458| < 1,684$) .

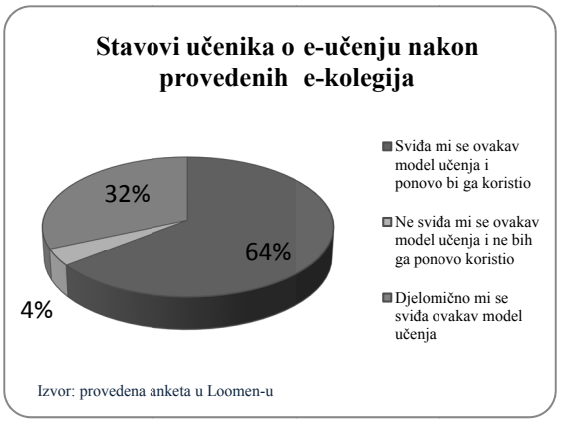
III. ISTRAŽIVANJE ANKETNIM UPITNIKOM

Anketnim upitnikom su ispitani stavovi učenika o e-učenju. Upitniku koji je proveden u sklopu e-kolegija „Sigurnost na Internetu“ pristupilo je 20 učenika. Tablica 3. prikazuje izdvojena tri pitanja specifična za tematiku ovog rada.

TABLICA 3. REZULTATI ANKETNOG UPITNIKA ROVEDENOG U EKSPERIMENTALNOJ SKUPINI

Lakoća korištenja sustava Loomen s obzirom na kompleksnost sustava i informatičko predznanje Skala od 1-5 gdje je 1-izuzetno teško, 5 –izuzetno lako.		4,2
Karakteristika koji smatrate najkorisnijom za učenje putem Loomen-a	Mogućnost ponavljanja gradiva uz pomoć interaktivnih igara (milijunaš, križaljka, vješalo)	70%
	Komunikacija sa ostalim polaznicima i nastavnikom	20%
	Lako su dostupni izvori za učenje	10%
Kad biste mogli birati koji način učenja bi odabrali	E-učenje bez nastavnika	10%
	Tradicionalnu nastavu s nastavnikom	10%
	Kombinaciju e-učenja i klasične nastave s nastavnikom	80%

Tijekom školske godine 2013./2014. proveden je slični anketni upitnik o e-učenju na uzorku od 152 učenika Ekonomsko-birotehničke škole Split koji su koristili e-učenje u svojem obrazovanju. Od ukupnog broja anketiranih učenika njih 103 su bili sudionici e-kolegija „Sigurnost na Internetu (učenici prvih razreda ekonomskog usmjerenja), 32 učenika su sudionici e-kolegija „Izrada marketing plana“ (učenici maturalnih razreda ekonomskog usmjerenja) i 17 učenika su bili sudionici e-kolegija „Matematičke osnove računala“ (učenici prvog razreda ekonomske gimnazije). Rezultati provedene ankete bile su osnova za izradu priloženog grafikona (Slika 2.) koji prikazuje zainteresiranost učenika za ovakav model učenja.



Slika 2. Prikaz razmišljanja učenika o e-učenju

IV. ZAKLJUČAK

Rezultati provedenog eksperimenta pokazuju da ne postoji statistički značajna razlika u postizanju obrazovnih ciljeva klasičnim modelom učenja u učionici u odnosu na online model e-učenja putem LMS-a. Iz toga možemo zaključiti da se konceptom e-učenja mogu u potpunosti postignuti planirani obrazovni ciljevi. Tumačenjem ovih rezultata dolazi se do zaključka da e-učenje:

- u pojedenim nastavnim sadržajima može biti i zamjena klasičnoj nastavi
- može predstavljati izvrsnu dopunu klasičnoj nastavi u učionici.

Brojne su prednosti koje u takvom modelu učenja doprinose kvaliteti procesa obrazovanja npr. mogućnosti ponavljanja gradiva samo-provjerama putem različitih interaktivnih kvizova čime učenici mogu pratiti vlastiti napredak, dostupnost drugih izvora znanja, postizanje interakcije putem komunikacijskih alata itd.

Rezultati anketnog upitnika pokazuju da su učenici spremni za učenje uz pomoć informacijske i komunikacijske tehnologije te da im je ovakav pristup nastavi ne samo prihvatljiv nego i zanimljiv. Izuzetno veliki postotak učenika (80%) izabralo bi obrazovanje kombiniranim modelom.

Učenici kroz kombinirani program e-učenja i klasične nastave osim što uspješno prate planirani nastavni plan i program pojedinog predmeta, unapređuju informatičku pismenost te razvijaju vlastite digitalne kompetencije. Ovakvim modelom nastave učenici upoznaju e-učenje kao izvrstan način za cijeloživotno obrazovanje i neprestano stručno usavršavanje neophodno na današnjem tržištu rada.

Digitalna zbirka zadataka s evaluatorom programskih rješenja

Vinkoslav Galešev, Robert Šipek
Udžbenik.hr, Zagreb, Hrvatska
vgalesev@enter.bug.hr, robert@bug.hr

Jedna od glavnih prednosti on-line digitalne zbirke zadataka je njena fleksibilnost, odnosno mogućnost dorade i prilagodbe sadržaja potrebama nastavnog procesa te interaktivnost s korisnikom. Također omogućava i neke nove mogućnosti posebice važne u didaktičke svrhe, a koje nije moguće realizirati klasičnom zbirkom zadataka u tiskanom obliku.

Za ostvarenje didaktičkih ciljeva digitalna zbirka zadataka treba sadržavati i mogućnost evaluacije programskih rješenja. Iako već postoje aplikacije za evaluaciju programskog koda, gotovo u pravilu nisu namjenski kreirane za potrebe nastave. Zato smo razvili vlastitu aplikaciju koja objedinjuje digitalnu zbirku zadataka i evaluator programskih rješenja pisanih u programskom jeziku Python. Aplikacija *Eva* koju opisujemo u ovome radu namijenjena je kako samostalnom vježbanju učenika, tako i podrški nastavnicima u organiziranju i provođenju nastavnog procesa.

I. UVOD

Unazad par godina programski jezik Python počeo se uvoditi u nastavne programe pojedinih srednjih škola u nas. U skladu s time, izdani su i prvi udžbenici koji obrađuju ovaj programski jezik. Slijedom toga, ukazala se potreba i za izradom odgovarajuće zbirke zadataka. Budući da se radi o predmetu informatike, svrsishodno je postaviti temeljno koncepcijsko pitanje - u kojem medijskom obliku realizirati takvu zbirku?

Nedostatak je klasične zbirke zadataka u tiskanom obliku što je statična, tj. nepromjenjiva, barem do sljedećeg reizdanja. Nasuprot tome, jedna od glavnih prednosti on-line digitalne zbirke je njena fleksibilnost, odnosno razmjerno jednostavna mogućnost dorade i prilagodbe njenog sadržaja i oblika. Osim spomenute prednosti, on-line digitalna zbirka zadataka omogućava i neke nove didaktičke elemente primjene u nastavnom procesu, o čemu ćemo nešto više reći u nastavku.

U klasičnoj tiskanoj zbirci, pod pretpostavkom da sadrži i rješenja zadataka, povratna se informacija većinom svodi na dihotomni ishod – rješenje je točno ili nije. Analiziramo li funkcionalnost zbirke zadataka iz programiranja, potrebno je uzeti u obzir da kod programskih rješenja postoji dodatna specifičnost – zadatak se gotovo u pravilu može riješiti na više, manje ili više učinkovitih, načina. Pronalaženje ne samo točnog nego i optimalnog programskog rješenja od izuzetne je važnosti za usvajanje vještine programiranja. U tom pogledu digitalna zbirka ima nesumnjive prednosti nad "analognom", posebice ako je u on-line obliku, odnosno ako je dostupna preko Internet mreže. Primjerice, tehnologija on-line digitalne zbirke omogućuje mjerenje brzine izvođenja programskog koda, pamćenje svih pokušaja rješavanja zadatka, praćenje rada učenika (rješavanje zadataka) u stvarnom vremenu itd.

Za pretpostaviti je da spomenuti didaktički elementi, koji nisu ostvarivi uporabom klasične tiskane zbirke, doprinose kvaliteti učenja, a isto tako i poučavanja, kao što su potvrdila neka dosadašnja istraživanja [1].

Osim rješavanja zadataka u užem smislu, digitalna zbirka omogućava i e-ispitivanje (eng. *e-assessment*), pojam koji se odnosi na ciljane aktivnosti u kojima se informacijsko-komunikacijska tehnologija (IKT) koristi za procjenu, odnosno provjeru znanja i vještina. Jedna od ključnih prednosti takvog načina provjere znanja je automatsko vrednovanje rezultata, odnosno računalom potpomognuta evaluacija programskih rješenja.

Iako se kod nas još uvijek rijetko koristi u nastavnom procesu, automatska evaluacija ima čitav niz prednosti. Primjerice, bitno skraćuje vrijeme ispravljanja zadataka odnosno smanjuje potrebne ljudske resurse, omogućuje brzu i sadržajnu povratnu informaciju ne samo osobama čije znanje se provjerava, nego i sastavljaču ispita o svakom pojedinom ispitnom zadatku i/ili provjeri u cjelini [2].

Navedene prednosti bile su motiv da se upustimo u izradu on-line digitalne zbirke zadataka s automatskom evaluacijom koja će poslužiti kao prateće dodatno nastavno sredstvo udžbeniku iz Informatike za 2. razred prirodoslovno-matematičkih gimnazija u izdanju nakladničke kuće SysPrint. Taj smo udžbenik odabrali budući da sadržajno pokriva uvod u algoritamsko rješavanje problema uporabom programskog jezika Python. Naime, polazište nam je bilo napraviti takvu zbirku koja će učenicima osigurati podršku u rješavanju problema programiranjem, a nastavnicima omogućiti vođenje i praćenje učenika kroz taj proces.

II. PLANIRANJE I RAZVOJ APLIKACIJE

Na Internetu se može pronaći nekoliko aplikacija za evaluaciju programskih rješenja u programskom jeziku Python. Primjerice, *Python-evaluator*, *Pylint*, *Taskeval*, *MIOC evaluator* i dr., Međutim, nijedna od tih aplikacija nije namjenski kreirana za uporabu u nastavi, odnosno kao specijalizirana podrška nastavnom procesu. Stoga smo se odlučili razviti vlastitu, koja će se poglavito rukovoditi obrazovnim i didaktičkim ciljevima.

Jedno od pitanja koje treba riješiti već na samom početku koncipiranja digitalne zbirke jest način evaluiranja programskih rješenja. Naime, postoje dva pristupa vrednovanju programa:

- analizatori programskog koda (engl. *Source Code Analyzer*) koji ispituju različite aspekte programa: sintaksu, semantiku, tijek programa, njegovu učinkovitost (npr. uporabom metode *Dead Code Elimination*), sigurnost i slično,
- evaluatori programskog rješenja koji ispituju izlazne vrijednosti (*output*) programa i uspoređuju ih s unaprijed zadanim, odnosno referentnim kriterijem.

Budući da je aplikacija primarno (digitalna) zbirka zadataka pomoću koje želimo provjeravati točnost rješenja što ga generira programski kôd, odlučili smo se za potonji pristup, tj. *black-box* evaluaciju kakva se koristi i na međunarodnim informatičkim natjecanjima.

Drugo je važno pitanje kako postaviti i organizirati on-line digitalnu zbirku na Internet, tako da bude stalno dostupna svim korisnicima, ali da količina korisnika i zadataka ne utječe na pouzdanost i sigurnost procesa evaluacije.

A. Arhitektura sustava

Aplikacija se sastoji od dvije nezavisne komponente: web sučelja (*front end*) i jedne ili više radilica (*back end*). Web sučelje je prezentacijski a radilica funkcionalni dio. Korisnik ima interakciju isključivo s web sučeljem. Pomoću njega unosi svoje programsko rješenje i prima rezultate evaluacije. Zadatak web sučelja je i briga o autentifikaciji korisnika te pohranjivanje zadataka i korisničkih podataka u jedinstvenu bazu podataka.

Radilica je pozadinski program koji od web sučelja prima zahtjeve za evaluacijom. Zahtjevi se zatim asinkrono izvršavaju i kad se pojedini zahtjev izvrši, rezultat evaluacije vraća se web sučelju

Kako se radi o procesorski intenzivnoj operaciji, radi poboljšanja performansi u slučaju velikog broja zahtjeva, moguće je pokrenuti više radilica na više računala. Raspodjela posla na više radilica je za korisnika transparentna. U slučaju da je pokrenuto više radilica, Web sučelje na temelju opterećenosti radilica odlučuje kojoj će poslati sljedeći zahtjev. Opterećenje radilice prati se na temelju trenutnog prosječnog zauzeća procesora. Zahtjev se šalje radilici s najmanjim prosječnim opterećenjem. Računala na kojima se izvršavaju radilice mogu biti u lokalnoj mreži ali i bilo kojoj lokaciji povezanoj Internetom.

Komunikacija između web sučelja i radilice odvija se preko standardnih TCP/IP socketa. Radilice međusobno ne komuniciraju.

B. Radilica

Radilica od web sučelja prima zadatke u obliku zahtjeva. Zahtjev za evaluacijom sadrži sljedeće podatke: ID zahtjeva, naziv zadatka, timeout, programsko rješenje zadataka (programski kôd u Pythonu), testne ulazne podatke i referentne izlazne podatke.

Za svaki primljeni zahtjev radilica u zasebnom *threadu* pokreće Python interpreter s proslijeđenim programskim rješenjem. Standardni izlaz se preusmjerava u datoteku koja se zatim uspoređuje s referentnim skupom izlaznih podataka. Rezultat komparacije vraća se u web sučelje. U slučaju greške ili prekoračenja dozvoljenog vremena, vraća se poruka o grešci.

Radilica se sastoji od više funkcionalnih modula koji se pokreću na dvije razine sigurnosti: 1. razina – visoka sigurnost, 2. razina – niska sigurnost.

Na razini visoke sigurnosti izvršavaju se sljedeći funkcionalni moduli:

- upravljački modul
- modul za nadzor ispravnosti, pokretanje i zaustavljanja sustava
- modul za komunikaciju s web sučeljem
- modul za praćenje statistike opterećenja
- modul za udaljeni nadzor i upravljanje radilicom
- modul za usporedbu rezultata izvršavanja testnog programa s referentnim rezultatima

Na razini niske sigurnosti izvršavaju se Python interpreter i korisničko programsko rješenje u Pythonu.

Procesi koji se pokreću na razini niske sigurnosti izvršavaju se u izoliranoj i zaštićenoj virtualiziranoj okolini (*sandbox*). Svaki od ovih procesa tako ima vlastiti zaštićeni memorijski prostor i zasebni zaštićeni i virtualizirani datotečni sustav. Program koji se izvršava unutar *sandboxa* nema izravan pristup do memorije, datotečnog sustava niti mrežnih funkcija računala. Svaki program se pokreće u zasebnom sandboxu a nakon izvršavanja upravljački proces briše cijelu virtualnu okolinu. Ukoliko se testni program ne završi u predviđenom vremenu (*timeout*), kontrolni proces će ga zaustaviti i pobrisati njegov *sandbox*. Valja napomenuti da se u virtualiziranoj okolini ne pokreće samo testni program već i Python interpreter tako da čak i u slučaju sigurnosnog propusta u samom interpreteru programi koji se istovremeno izvršavaju niti na koji način ne mogu utjecati jedni na druge ili na sam sustav na kojem se izvršavaju.

Korištenje *sandboxa* je nužno i osigurava zaštitu od malicioznog koda, mrtvih petlji i beskonačnih rekurzija. Ovakav način rada ograničava mogućnost evaluacije programa samo na programe koji ne upravljaju direktno hardverskim aspektima računala, no to je uvjet za stabilan rad.

Kako bi više korisnika moglo istovremeno koristiti evaluator, radilica pokreće svaki *sandbox* proces u zasebnom *threadu*. *Threadovi* se izvršavaju paralelno i imaju isti prioritet izvršavanja.

Funkcionalnost radilice pojednostavljeno se može opisati pseudojezikom na sljedeći način:

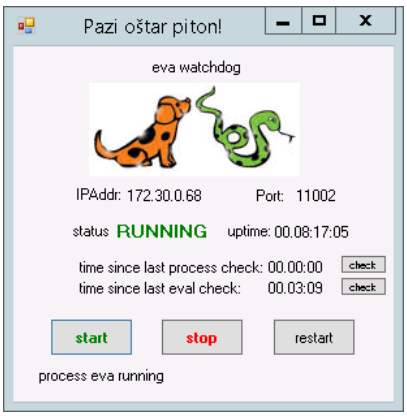
```
početak
    zaprimanje zahtjeva od web sučelja
    ako je zahtjev naredba onda:
        pozivanje upravljačkog modula
        izvršavanje naredbe (pokretanje, zaustavljanje, restart, statistika)
    ako je zahtjev program za evaluaciju onda:
```

pokretanje novog *threada*
formiranje novog *sandboxa*
pokretanje Python interpretera u *sandboxu*
pokretanje testnog programa u Python interpreteru
redirekcija standardnog izlaza u datoteku
dok proces ne završi radi

ako je prošao timeout onda
prekidanje procesa
terminiranje *threada* i prijava greške
ako je proces završio bez greške onda
formalna kontrola izlaznih podataka
usporedba izlaznih podataka s referentnim podacima
brisanje *sandboxa*
vraćanje rezultata i terminiranje *threada*
inače
brisanje *sandboxa*
vraćanje greške i terminiranje *threada*
kraj

C. *Raspoloživost sustava*

Kako bi se postigla visoka razina raspoloživosti sustava zamišljeno je da se radilice izvršavaju na računalima u udaljenim podatkovnim centrima, bez izravnog pristupa korisnika. Rad radilice stoga nadzire zasebni nadzorni program (*watchdog*). Nadzorni program provjerava je li na nivou operacijskog sustava aktivan proces radilice te mu u predodređenim vremenskim razmacima šalje na evaluaciju testni program i na taj način provjerava funkcionalnost radilice.



Slika 1. Nadzorni program Eva Watchdog.

Ukoliko nadzorni program ne dobije odgovarajući odgovor u unaprijed određenom vremenu, prekida izvršavanje radilice i ponovno ju pokreće. Nadzorni program može se pokrenuti i na nekom drugom računalu kako bi se detektirao privremeni prekid rada pojedinog računala te uslijed toga pokrenula rezervna radilica na drugom računalu.

Izravna interakcija administratora s radilicom nije predviđena, nego se radilicom upravlja putem administratorskog web sučelja. Tako administrator može istovremeno upravljati s više radilica, nadzirati njihov rad i mijenjati im parametre.

III. WEB SUČELJE I ZNAČAJKE APLIKACIJE

Budući da je aplikacija (u daljnjem tekstu Eva) zamišljena kao pomoćno nastavno sredstvo, bilo je potrebno ugraditi elemente koji prate nastavni sadržaj iz udžbenika. Međutim, da bi on-line digitalna zbirka zadataka bila dostupna svima, mora omogućiti uporabu i korisnicima izvan nastavnog procesa. To smo riješili tako što se Eva sastoji od dva, relativno nezavisna modula:

- *Fitness* način rada namijenjen je za vježbanje i (samo)provjeru vlastitoga znanja. Učenici ga mogu prakticirati samostalno, kod kuće ili bilo gdje drugdje gdje imaju pristup Internetu. Ovaj način ne zahtijeva povezivanje podataka sa školom, razredom ili nastavnikom pa je potpuno neovisan o njima.
- *Stress* način koristi se za organiziranje i provođenje školskih testova, što zahtijeva određene korake i predradnje. Primjerice, nastavnik najprije mora odabrati zadatke za test i zakazati datum i vrijeme provođenja testa, za svaki razred zasebno. Da bi učenik pristupio testu, mora se prijaviti u taj razred i mora znati pristupu šifru razreda (dodjeljuje ju nastavnik).

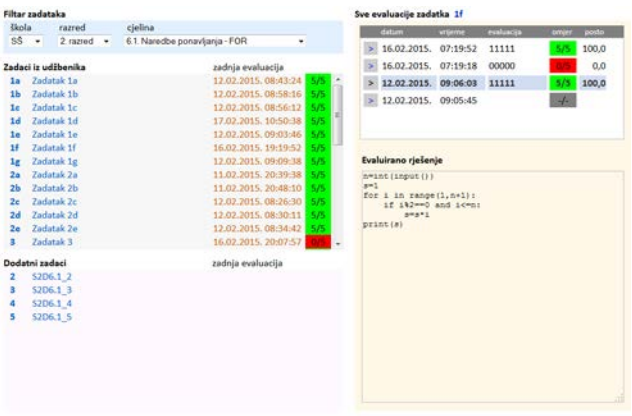
Spomenuli smo u uvodu da je aplikacija Eva namijenjena kako učenicima, tako i njihovim nastavnicima. Zato je web sučelje organizacijski i funkcionalno podijeljeno u dva modula, ovisno o vrsti prijavljenog korisnika (učenik ili nastavnik).

Još je jedna dvojakost značajna za aplikaciju Eva. Pored zadataka koji su inicijalno već ugrađeni i sastavni su dio digitalne zbirke, nastavnicima je omogućeno da u zbirku dodaju (*uploadaju*) svoje zadatke.

A. *Modul za učenike*

Nakon što se učenik prijavi na uvodnoj web stranici, odabire način rada – fitness ili stress (kasnije se uvijek može vratiti na taj izbornik i promijeniti svoj odabir).

Na uvodnoj stranici u fitness način (slika 2.) učenik ima pregled nad svojim dosadašnjim evaluacijama fitness zadataka. Za svaki zadatak koji je učenik rješavao prikazani su datum i vrijeme te rezultat zadnje evaluacije u obliku omjera točnih i ukupnog broja izlaznih parova zadataka. Naime, za svaki zadatak u zbirci priređeno je 5 do 10 parova referentnih ulazno/izlaznih podataka s kojima se uspoređuje izlaz kojeg generira programsko rješenje učenika. Osim što učenik ima pregled nad svim evaluacijama, može provjeriti i koje je programsko rješenje poslao na evaluaciju.



Slika 2. Uvodna stranica *fitness* načina rada.

Klikom mišem na naziv pojedinog zadatka otvara se nova stranica u kojoj se programski kôd tj. programsko rješenje zadatka šalje na evaluaciju (slika 3.).

Slika 3. Stranica za slanje programskog rješenja na evaluaciju.

Učenik može učitati programsko rješenje iz .py datoteke ili ga neposredno upisati u tekstni okvir. Svijetlo-plavo dugme "U/I podaci" služi za prikaz referentnih ulazno/izlaznih podataka s kojima će se usporediti izlaz (*output*) učenikova programa i tako evaluirati njegovo programsko rješenje zadatka.

Pomoću dugmeta "→" učenik može učitati jedno od svojih prijašnjih rješenja, promijeniti tj. popraviti ga i ponovo poslati na evaluaciju, što se u aplikaciji naziva postupak reevaluacije. Ova mogućnost ima dodatnu didaktičku vrijednost jer potiče učenike da popravljaju i dorađuju svoj programski kôd, bez da se to evidentira kao nova evaluacija.

Od posebnog didaktičkog značaja je funkcija dugmeta "| |" koja učeniku omogućava usporedbu referentnih izlaznih podataka i podataka koje generira njegovo programsko rješenje (slika 4.).

Procedura za usporedbu pronalazi outpute učenika koji se razlikuju od referentnih i oboja ih crvenom bojom. Na taj način pomaže učeniku u otkrivanju grešaka, koje ponekad mogu biti teško zamjetne, a ipak dovoljne da rješenje vrednuje kao netočno. Na učeniku je da sam otkrije grešku u svom programu i ispravi je pa mu u tome modul ne može pomoći.

Slika 4. Usporedba izlaznih podataka.

Drugi način korištenja aplikacije Eva je stress način rada, poglavito namijenjen pisanju školskih testova. Da bi učenik sudjelovao u pisanju testa, aplikacija traži da se najprije prijavi u svoje razredno odjeljenje (više o tome u opisu modula za nastavnike).

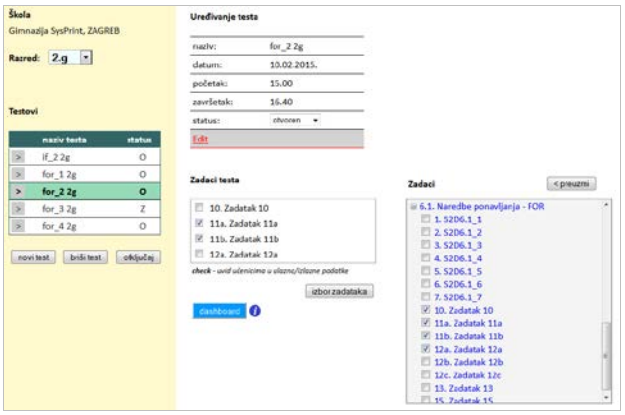
Ako je test otvoren, učenik mu može pristupiti i rješavati zadatke koje je nastavnik prije toga odabrao. Nakon što nastavnik zaključi rješavanje testa, učenik može vidjeti svoje rezultate, tj. ishod evaluacije svojih programskih rješenja za svaki zadatak.

Iako je postupak prijave rješenja i njegove evaluacije u mnogočemu sličan fitness načinu, zbog prirode školskog teksta postoje i određene razlike. Primjerice, u stress načinu učeniku nije omogućena reevaluacija rješenja kako bi nastavnik imao potpuni uvid u sve njegove pokušaje rješavanja pojedinog zadataka. Naime, s pedagoškog i dokimološkog aspekta nije svejedno je li učenik riješio zadatak u dva ili u deset pokušaja.

B. Modul za nastavnike

Ovaj je modul opremljen znatno većim brojem mogućnosti nego modul za učenike. To je iz razloga što omogućava nastavniku da:

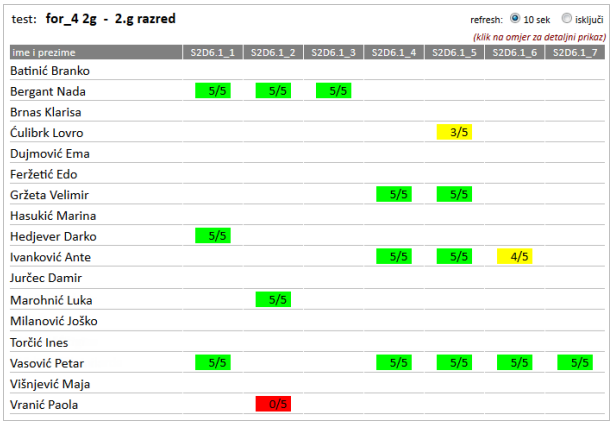
- organizira razredna odjeljenja škole, uređuje i ažurira njihove podatke te podatke učenika, komunicira s učenicima elektroničkom poštom i sl.
- pregledava i nadopunjuje zadatke iz zbirke,
- priprema i provodi školske testove,
- nadzire rad učenika tijekom rješavanja školskog testa i ispisuje završne popise njihova postignuća,
- nadzire rad učenika tijekom fitness načina rada.



Slika 5. Kreiranje i uređivanje školskih testova.

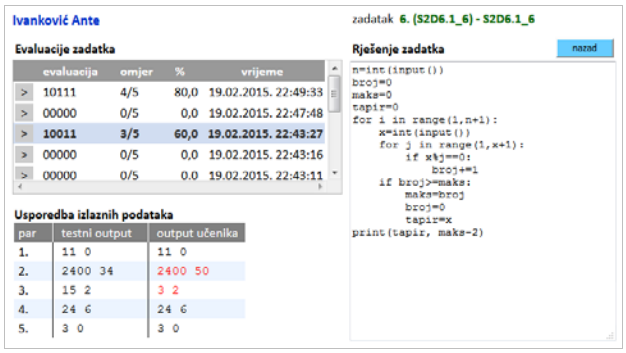
Na slici 5. prikazana je stranica na kojoj nastavnik kreira i uređuje školske testove, što podrazumijeva odabir zadataka pojedinog testa te određivanje statusa svakog zadatka (npr. nastavnik ovdje bira hoće li učenici imati uvid u referentne ulazno/izlazne podatke).

Tijekom rješavanja testa nastavnik na svojem računalu ima pregled nad uradcima učenika – koje zadatke su riješili i koje rezultate su postigli. To mu omogućava stranica pod nazivom dashboard prikazana na slici 6.



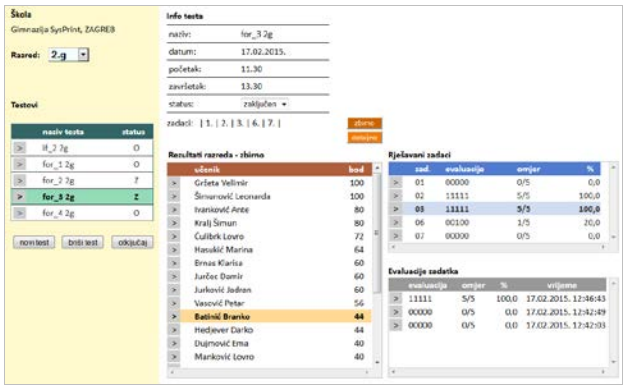
Slika 6. Pogled na rezultate tijekom riješavanja testa.

Osim "panoramskog" pogleda na rezultate čitavog razrednog odjeljenja, klikom na pojedini rezultat nastavnik može detaljno analizirati postignuća učenika tijekom rješavanja tog zadatka – koliko je učenik imao pokušaja i s kojim ishodom, koje programsko rješenje je poslao na evaluaciju, pri čemu mu uvid olakšava komparator outputa (slika 7.).



Slika 7. Detaljna analiza rješavanja zadatka učenika.

Nakon što nastavnik zaključi test, stranica za školske testove (na slici 5. prikazana dok je test još bio otvoren) poprima drugačiji oblik. Nastavnik sada ima na raspolaganju rang-listu ukupnih rezultata učenika na testu, te može analizirati kompletan tijek rješavanja svakog pojedinog zadatka (slika 8.), što mu pomaže u donošenju konačne ocjene. Osim toga, nastavniku su na raspolaganju i dvije završne rang-liste priređene za ispis na pisač.



Slika 8. Pregled ukupnih i pojedinačnih rezultata.

Uz rješavanje školskih testova i provjeru znanja neminovno se vezuje i pitanje prepisivanja tuđih rješenja. Zasad u aplikaciju nisu ugrađeni moduli koji bi to sprječavali, ali učitelju je na raspolaganju mogućnost da prirediti A i B formu testa.

Za kraj ovog letimičnog prikaza aplikacije Eva ostavili smo mogućnost za koju vjerujemo da ima veliki značaj za unaprjeđenje kvalitete rada nastavnika.

Učenje i vježbanje učenika kod kuće u klasičnoj je nastavi velika nepoznanica svakom nastavniku. Međutim, on-line uporaba nastavnog sredstva otvara nove mogućnosti komunikacije, pa smo to pokušali ugraditi u ovu digitalnu zbirku. Pomoću modula *Vježbe* nastavnik ima mogućnost uvida u fitness način rada učenika, i to u stvarnom vremenu. Primjer uporabe tog modula prikazan je na slici 9.

Slika 9. Uvid nastavnika u rad učenika kod kuće (fitness).

Princip rada je sličan *dashboardu* za školski test, s tom razlikom što ovdje nastavnik može birati razredno odjeljenje te bilo koji dan za koji želi dobiti uvid u rad učenika kod kuće (fitness način rada).

IV. TESTIRANJE APLIKACIJE

Kako bismo aplikaciju Eva što više, odnosno što bolje, uskladili s potrebama učenika, nastavnika i općenito nastavnog procesa, najprije smo je probno aplicirali u nekoliko škola. Učenici i nastavnici testirali su rad aplikacije i slali svoje primjedbe i prijedloge (popis škola koje su sudjelovale u testiranju naveden je u Zahvali). Na kraju testne faze organizirali smo za učenike on-line anketu s desetak pitanja o njihovim dojmovima.

U trenutku zaključivanja pisanja ovoga rada još se prikupljaju i analiziraju rezultati on-line ankete iz testne faze. Iako raspolažemo s nepotpunim podacima, preliminarna obrada na uzorku 61 učenika ukazuje na dobru prihvaćenost ovakve online digitalne zbirke.

Prije prikaza rezultata nekoliko čestica iz online anketnog upitnika, spomenimo da je ispunjavanje ankete bilo na dragovoljnoj osnovi.

Na pitanje "*Da možeš birati, što bi odabrao za vježbanje zadataka iz informatike?*" od tri ponuđena odgovora 88,5% učenika odgovorilo je online digitalnu zbirku kao što je ova, 8,2% učenika odabralo je digitalnu zbirku, a samo 3,3% učenika odabralo bi tiskanu zbirku.

Tablica 1. Odgovori učenika na pitanja iz ankete.

čestica	da	ne
Bi li koristio/la zbirku i bez da nastavnik to traži?	87%	13%
Dobro - Odmah vidim da mi je rješenje točno.	85%	15%
Loše - Nastavnik ima previše uvida u moj rad i vježbanje.	10%	90%
Potiče li te zbirka da još više vježbaš zadatke?	79%	21%
Potiče li te zbirka da više učiš gradivo iz udžbenika?	61%	39%
Pomaže li ti zbirka da brže i/ili bolje naučiš gradivo iz informatike?	95%	5%
Bi li ovu zbirku preporučio/la drugima za vježbanje/učenje?	98%	2%

Iz tablice 1. zamjetno je da velika većina učenika pozitivno vrednuje on-line digitalnu zbiru zadataka (kao što je aplikacija Eva), da bi je koristili i bez da nastavnik to traži (87%) te da bi je preporučili i drugim učenicima/korisnicima za vježbanje i učenje (98%). Za daljnji razvoj aplikacije svakako je poticajno što zbirka potiče učenike da još više vježbaju (79%) i uče gradivo (61%) te da mi pomaže da brže i/ili bolje nauče gradivo iz informatike (95%).

Ako se ovi preliminarni rezultati pokažu istinitim, odnosno da vrijede za značajnu većinu učenika, moći ćemo zaključiti da smo postigli cilj koji smo si postavili na početku – načiniti digitalnu zbirku zadataka koja će poslužiti kao upotrebljivo nastavno sredstvo.

V. ZAKLJUČAK

Povratne informacije tijekom probne primjene aplikacije Eva te preliminarni rezultati ankete za učenike upućuju na zaključak da je on-line digitalna zbirka zadataka upotrebljivo i, štoviše, poželjno nastavno sredstvo. Ne samo što je kao medij bolja od tiskane zbirke, nego pruža i posve nove mogućnosti primjene u didaktičke svrhe. Primjerice, nastavnik može pratiti rad učenika kod kuće i to u stvarnom vremenu.

No, dosadašnja iskustva ukazuju da je potrebna određena doza opreza i pažljive pripreme u koncipiranju i realizaciji digitalne zbirke zadataka, posebice u pogledu načina evaluacije programskih rješenja. U uvodu smo već spomenuli da smo u svrhu evaluacije primijenili *black-box* metodu. Pojedini autori koji su analizirali učinkovitost ove metode u primjeni na informatičkim olimpijadama ističu nedostatke takvog načina evaluacije [3], sve do kritika da u nekim slučajevima postoje zadaci za koje se uopće ne mogu napisati odgovarajući referentni ulazno/izlazni podaci [4].

Iako se na srednjoškolskoj razini učenici neće susretati s tako zahtjevnim zadacima, svejedno je potrebno iznimno pažljivo sastavljati referentne ulazno/izlazne podatke te ih provjeriti na više (što više) načina. Prema dosadašnjem iskustvu, to je ujedno i jedino osjetljivo mjesto opisane aplikacije.

Na osnovu početnih povoljnih dojmova i iskustava korisnika, daljnji razvoj aplikacije planiramo u nekoliko segmenata:

- mogućnost evaluacije programskih rješenja koja zahtijevaju pristup datotečnom sustavu,
- implementacija metrike trajanja izvršavanja programa,
- mogućnost zadavanja referentnih rezultata u slobodnijoj formi, uporabom regularnih izraza,
- izvršavanje radilica na Unix, odnosno Linux operacijskim sustavima,
- implementacija modela dinamičkog skaliranja pokretanjem dodatnih radilica u slučaju većeg opterećenja sustava,
- implementacija komunikacije web sučelja s radilicama putem SSL protokola.

Nova inačica aplikacije koja je trenutno u fazi testiranja u školama nudi mogućnost evaluacije programskih rješenja i u drugim programskim jezicima osim Pythona. U toj je inačici realizirana podrška za C, C++, C#, Pascal, QuickBasic, SmallBasic te Java programski jezik.

ZAHVALA

U probnoj fazi primjene aplikacije sudjelovalo je nekoliko škola koje su svojim primjedbama i prijedlozima doprinijele njenom konačnom izgledu i funkcionalnosti: XV. gimnazija (Zagreb), III. gimnazija (Split), Gimnazija Lucijana Vranjanina (Zagreb) i Srednja škola Krapina (Krapina).

Primjena računalne animacije u nastavi općeg obveznog tehničkog odgoja i obrazovanja

Damir Purković*
* Filozofski fakultet u Rijeci/Odsjek za politehniku, Rijeka, Hrvatska
damir@ffri.hr

Sažetak - Suvremeno temeljno tehničko obrazovanje zahtijeva sve učinkovitije metode, postupke, strategije i pristupe razvoju tehničko-tehnoloških kompetencija učenika. Problem razvoja tih kompetencija izražen je zbog nedostatnih materijalno-tehničkih i organizacijskih uvjeta, ali i zbog iskustvenih ograničenja učenika, povezanih s razinom obrazovanja i dobi učenika. Konstruktivistička teorija i kontekstualni pristup nastavi i učenju predstavljaju temelj za razvoj potrebnih kompetencija učenika, ali je osmišljavanje prikladnog nastavnog konteksta često složeno i neizvjesno. Prikladna uporaba računalnih animacija bi mogla doprinijeti oplemenjivanju kontekstualne nastave, kao segment koji može upotpuniti prazninu između teorijske podloge i praktičnih tehničko-tehnoloških vještina. U tom smislu u radu se iznose uvjeti i ograničenja uporabe animacije u metodičkom i tehničkom smislu, te se predlaže utemeljeni metodički okvir za primjenu animacije u nastavi općeg obveznog tehničkog odgoja i obrazovanja.

I. UVOD

Tehničko (tehnološko) odgojno-obrazovno područje i tehničko obrazovanje u cjelini svoju pravu odgojno-obrazovnu vrijednost može iskazati danas, u uvjetima izraženog komunikacijskog hendikepa mlade generacije [1] i stoga bitno narušenog razvoja metakognitivnih sposobnosti učenika. Naime, današnji rapidni rast tehničko-tehnoloških spoznaja i dinamika radno-socijalnih odnosa determiniraju kompetencije koje učenici trebaju steći tijekom obrazovanja, zbog čega do izražaja dolazi potreba za razvojem samosvijesti, samoučinkovitosti i samoreguliranog učenja, potrebnih za brzu prilagodbu novom tehničko-tehnološkom okružju i svijetu rada. S obzirom da glavni cilj tehničkog odgoja i obrazovanja podrazumijeva osposobljenost učenika za uspješno snalaženje i djelovanje u kontekstu tehnologije i u kontekstu svakodnevnog životnog okružja, djelovanja i rada u današnjem tehnološkom društvu [2], [3], [4], [5], razvidna je važnost istog za razvoj društva u cjelini.

Konstruktivizam, kao paradigmatska osnovica odgoja i obrazovanja, ali i kao teorija spoznavanja i pristupa obrazovanju, danas čini važnu i prihvatljivu podlogu na kojoj bi trebalo graditi svaki odgoj i obrazovanje pojedinca. Konstruktivistički pristup stvaranje znanja zasniva na aktivnoj ulozi učenika, važnosti osobnog i društvenog iskustva, te na spoznaji da će se kakvoća znanja, pa tako i percepcija stvarnosti, individualno razlikovati [6]. U tom smislu, kontekstualni pristup učenju i poučavanju, kao konkretizacija konstruktivističke paradigme, pridaje veliku važnost nastavnom kontekstu čija uloga, uz ključnu ulogu nastavnika, može bitno doprinijeti kakvoći spoznaje kod pojedinca i razvoju primjerenih kompetencija. U kontekstualnom pristupu nastavi proces učenja i poučavanja zasniva se na autentičnom nastavnom kontekstu na kojem se grade aktivnosti značajne za učenike [7]. Opće obvezno tehničko obrazovanje, kao važan preduvjet profesionalnog obrazovanja nužnog za održivost gospodarstva, pri razradi nastavnih strategija, modela, metoda i pristupa u obzir treba uzeti ograničenja odgojno-obrazovnog procesa na toj razini. Ograničenja se odnose na: iskustvo učenika na koje treba „nadograditi“ nove spoznaje; poznavanje pojmova, činjenica i generalizacija s obzirom na dosadašnje obrazovanje; učenikove mogućnosti apstrahiranja činjenica i generalizacija (mogućnosti za razvoj mentalnih modela) s obzirom na dob učenika; te ograničeno vrijeme i materijalno-tehničku podlogu s kojom na toj razini obrazovanja školski sustav može raspolagati. Navedena ograničenja, kao polazišta, uvjetuju mogućnosti realizacije kontekstualnog pristupa nastavi, te pružaju priliku za razvoj kontekstualnih artefakata, pa tako i računalnih animacija koje će se koristiti u nastavnom procesu.

Uporaba računalne animacije u nastavi danas, unatoč uvriježenom vjerovanju kako može bitno utjecati na kakvoću razumijevanja složenih fenomena i koncepata, ima dvojben učinak na postignuća učenika. Naime, empirijska istraživanja učinka animacije na ishode učenja variraju od pozitivnih do negativnih ili pak rezultata koji pokazuju neutralni učinak animacije [8]. Izvjesno je da učinak same animacije na znanje i razumijevanje ovisi o više različitih čimbenika koji mogu utjecati na način na koji ljudi uče s animacije, te da će uspjeh takvog učenja ovisiti o interakciji tih čimbenika [8]. Dosadašnja iskustva, također, opovrgavaju radikalna shvaćanja kako računalna animacija, ali i uporaba IKT-a u nastavi u cjelini, mogu zamijeniti iskustva učenika zasnovana na autentičnoj stvarnosti. Stoga je ovaj rad usmjeren razradi primjerenog i smislenog metodičkog okvira i mehanizma za razvoj i primjenu računalne animacije u općem obveznom tehničkom odgoju i obrazovanju, u okviru kontekstualnog pristupa nastavi. U tom smislu će se iznijeti okvir i znanstveno utemeljeni način uporabe animacije u nastavi ovog specifičnog nastavnog područja te tako praktičarima olakšati primjenu iste.

II. TRENDOVI PRIMJENE RAČUNALNE ANIMACIJE U NASTAVI

Danas se animacija u nastavi različito shvaća i tumači, zbog čega se često poistovjećuje s video-zapisom ili pak s računalnim simulacijama, što nikako nisu istoznačnice.

Naime, video-sadržaji su izvorno namijenjeni prikazivanju stvarnih objekata, dok animacija prikazuje simulirane sadržaje i objekte [20]. S druge strane, u prirodoslovnom, matematičkom i tehničkom obrazovanju računalne simulacije se uglavnom odnose na relativno složene simulacije procesa, pojava, sustava, modela ili tehnologije. Dok simulacija treba odražavati stvarne ulazno-izlazne veličite bitne za rad sustava, primarno svojstvo animacije je dinamička vizualizacija sadržaja na simboličkoj razini. Uporaba simulacija u nastavi ovog područja često je uvjetovana dostupnošću specijaliziranih softverskih alata, specijaliziranim znanjem nastavnika i visoko razvijenim učenikovim mentalnim modelima potrebnim za praćenje i razumijevanje sadržaja. Dakle, računalna simulacija i nastavna animacija u pozadini mogu dijeliti istu strukturu, ali se bitno razlikuju u primarnoj namjeni, ali i u percepcijskoj i interakcijskoj prilagodbi krajnjeg produkta mentalnim modelima učenika.

Sam pojam animacije može se odrediti kao dinamička reprezentacija prikaza procesa koji se mijenja s vremenom [8], odnosno, kao serija okvira na način da se svaki okvir pojavljuje kao alternacija prethodnome [10]. Suvremene nastavne animacije razvijaju se uglavnom kao računalne animacije, a koriste se onda kad postoji potreba za prikazivanjem onog što nije lako ili moguće vidjeti u stvarnosti, promjena koje nije moguće vidjeti u realnom vremenu, apstraktnih prikaza koji nisu sami po sebi vizualni [8], te kada je stvarna provedba određene aktivnosti nepraktična, opasna za sudionike ili su sredstva za provedbu aktivnosti nedostupna [11]. Za izradu nastavnih animacija nastavnici i stručnjaci danas koriste čitavu lepezu dostupnog softvera, od onog univerzalnog poput Flash-a, Jave i različitih alata za izradu animiranih slika, do specijaliziranih aplikacija kao što su *Moviestorm*, *Autodesk Maya*, *GoAnimate*, *Blender* i sl. Pri tom kakvoća konačnog produkta uvelike ovisi o umješnosti autora, dok je učinak animacije na postignuća učenika upitan, uglavnom zbog nedostatne znanstveno-metodičke podloge i preporuka za razvoj i primjenu animacije u nastavnom procesu. Prema načinu prikazivanja sadržaja u nastavi, animacije se najčešće dijele na ekspozitivne (opisne), čiji sadržaj učenici gledaju i slušaju na zaslonu, i na interaktivne, kojima učenici mogu upravljati na višoj razini. Određeni autori u načine prikazivanja svrstavaju i kvizove [12], koji služe testiranju učenika uz pomoć animiranog sadržaja. Većina animiranih nastavnih sadržaja današnjice razvijena je u 2D tehnologiji, dok se sadržaji razvijeni u 3D tehnologiji najčešće prikazuju na 2D zaslonima. Razlog tome je zahtjevna i skupa uporaba 3D tehnologije u tipičnom školskom okružju. Zbog što jasnijeg uvida u aktualne načine, trendove i probleme prikazivanja animacije u nastavi neophodno je pojasniti glavne tehničke značajke dvije temeljne vrste animacija, ekspozitivnih i interaktivnih 3D animacija.

A. Ekspozitivna animacija (animacija za izlaganje)

Ekspozitivna animacija, koja se danas najčešće koristi u nastavi, uglavnom se primjenjuje u vidu animiranih video sadržaja [12], ali i animiranih slika. Za izradu animiranih video sadržaja češće se koriste specijalizirani softverski alati različitih proizvođača (*GoAnimate*, *Moviestorm*, *Animasher* i sl.), dok se za izradu animiranih slika koristi čitava lepeza softvera, od jednostavnih besplatnih alata, uredskih paketa, do specijaliziranog softvera. Ekspozitivna animacija nastoji kod učenika razviti spoznaju o određenom dinamičkom procesu koji se odvija izvan vizualnog i vremenskog dosega učenika tako da im se taj sadržaj frontalno prezentira i demonstrira u nastavnom procesu. U tehničkom smislu, ključno pitanje je kako animacijom pokazati (vizualno i auditivno) ono što je bitno i kako organizirati sadržaj animacije [12]. Problem pri tom predstavlja spoznaja da učinak animacije na postignuće učenika može biti minoran ili čak neprihvatljiv, ponajprije zbog individualnih razlika u načinu učenja i sposobnostima učenika za učenje složenog sadržaja s animacije. Ovakvi problemi se nastoje zaobići uvođenjem određene interaktivnosti, poput izbora značajki objekata ili osobina subjekata u animaciji, dodavanjem dijaloga, mogućnostima upravljanja tempom animacije i sl. [12]. Ipak, bitan nedostatak autentičnosti, realističnosti i stvarne interaktivnosti ostaje i dalje veliko ograničenje animacije, a učinak iste na postignuća učenika upitan.

B. Interaktivna 3D animacija

Glavna intencija trenda razvoja interaktivnih 3D animacija općenito, pa tako i u nastavi, je pokušaj realističnog i interaktivnog nadomještanja izvorne stvarnosti uporabom tehnologije za 3D vizualizaciju i simulaciju u realnom vremenu [12]. Tehnologija 3D interaktivnih animacija, simulacija i tzv. virtualne stvarnosti permanentno se razvija već više od dva desetljeća, a napredak je osobito uočljiv u svijetu igraćih konzola, profesionalnih simulacija i računalnih igara. No, prava primjena u nastavnom procesu je još daleko od željene i široko prihvaćene. Problemi primjene u nastavi mogu se svesti na tri razine: složena je za korištenje (manipulaciju) od strane učenika – zahtijeva posebno osposobljavanje učenika; izrada animacija je vrlo složeni proces – neophodno je profesionalno osposobljavanje nastavnika; tehnološki je zahtjevna – primjena zahtijeva skupu specijaliziranu opremu, softver i računalnu podlogu. Unatoč tome očekivanja od 3D animacije u nastavi su velika jer se predviđa stjecanje iskustava bliskih iskustvima koja bi učenici stekli u stvarnom svijetu.

U tehničkom smislu, arhitektura 3D interaktivnih animacija, koje se danas primjenjuju u nastavi, zasniva se na podlozi koju čine [12]: *senzori*, čija primarna funkcija je praćenje i reagiranje na korisničke pokrete, te permanentno slanje signala o tim pokretima jezgri sustava. U trenutnoj školskoj praksi ovaj dio se, na žalost, svodi uporabu standardne tipkovnice i miša računala; *Upravljački programi*, koji čine interaktivnu sponu različitog računalnog sklopovlja i sadržaja nastavne animacije; *Fizikalni model (jezgra)* koja ustvari predstavlja matematički model fizičkih procesa kojim se pokušava što realnije simulirati stvarnost, odnosno, autentičnost interakcije korisnika i sadržaja. Modelom se obavljaju potrebni proračuni koji determiniraju ponašanje sustava u skladu s korisnikovim pokretima (interakcijom); *3D zasloni* kojima se nastoji prikazati visoka razina realističnosti sadržaja (3D virtualne stvarnosti), usklađena s razinom interakcije korisnika s 3D sadržajem. U trenutnoj nastavnoj praksi glavna interakcija se ustvari odvija na 2D razini, dok su samo određeni prikazi predstavljeni u 3D tehnologiji. Sam 3D prikaz načelno se zasniva na „varanju“ ljudskog mozga pri interpretaciji

dvije 2D slike u jednu koja ima dimenziju dubine. Danas se u tu svrhu pokušavaju koristiti različite tehnologije, poput stereoskopskih prikaza, polarizacijskih sustava, sustava koji koriste *Eclipse* metodu, sustava koji koriste *Pullfrich efekt*, volumetrijskih zaslona, holografskih zaslona i sl. [13]. Viša razina interaktivne 3D animacije (tzv. virtualne stvarnosti) pretpostavlja stvarnu 3D interakciju korisnika i sadržaja uporabom posebnih senzora, poput haptičkih i sličnih senzora, ali i prethodno spomenutih namjenskih sustava za 3D prikaz. Ovakvi sustavi bi trebali imati i određeni emocionalni i fizički utjecaj na učenika, a moguće ih je, uporabom glasovne, tekstualne i videokomunikacije, iskoristiti za udaljeno suradničko učenje u realnom vremenu, u okviru odgovarajućeg interaktivnog sustava za učenje [12]. Unatoč realno ostvarivoj tehnologiji 3D interaktivne animacije, uporaba takvih sustava u današnjem školskom okružju nije nešto na što se školski sustav može osloniti, osobito s obzirom na upitan i nedostatno istražen učinak ove tehnologije na postignuća učenika. Osim toga, terminološki gledano, sofisticirani sustavi virtualne stvarnosti najčešće se određuju kao simulatori određenog iskustva, što njihovo određenje kao računalne ili bilo koje druge animacije može činiti upitnim.

III. OGRANIČENJA I PREDUVJETI PRIMJENE ANIMACIJE U NASTAVI

Koncept primjene animacije u nastavi može se analizirati na tehničkoj, semiotičkoj i psihološkoj razini [20], koje u nastavnom procesu čine jedinstvenu i neodvojivu cjelinu s ciljem doprinosa spoznajnim procesima i postignućima učenika. Stoga bi glavni cilj uporabe računalne animacije u nastavi trebao uključiti doprinos boljem razumijevanju određenih procesa, pojava, sustava, situacija, tehnologija i sl., koje na drugi način nije moguće predstaviti učenicima. Drugim riječima, nastavna animacija bi trebala doprinijeti razvoju mentalnih modela učenika nužnih za razumijevanje apstraktnih prikaza, ali i utjecati na razvoj učenikove sposobnosti apstraktnog predočavanja izvorne stvarnosti. Zbog toga nastavnu animaciju treba promatrati kroz prizmu doprinosa postignućima učenika, preduvjeta koje treba zadovoljavati i načina na koji je treba implementirati u nastavni proces kako bi polučila željeni učinak. U tom smislu nije primjereno izdvojeno tražiti odgovore na to pomažu li animacije učenicima pri učenju, već treba istražiti i uvjete u kojima je uporaba animacije korisna za učenike [8].

Suvremena istraživanja obilježja nastavne animacije i učinka na postignuća učenika su, unatoč dugotrajnoj primjeni iste, relativno skromna, često kontradiktorna [8], a nisu niti univerzalno primjenjiva na sva nastavna područja. Ipak, dosadašnja istraživanja ukazuju na vrlo egzaktne kriterije koji mogu odrediti uvjete i načine izvedbe nastavne animacije. Razumijevanje animacije u nastavi najčešće je uvjetovano optimizacijom kognitivne opterećenosti učenika [14], [15], [16], [17], [18], [19], razvijenošću učenikovih mentalnih modela za praćenje animacije [21], [22] i individualnim razlikama svakog pojedinca [23], [8]. Individualne razlike učenika su ponajprije odraz dispozicijske dominantne vrste inteligencije kod pojedinca [24], pri čemu se osobito ističe bolje razumijevanje animacije od strane učenika koji imaju razvijenije prostorne sposobnosti [21]. Kod ekspozicijskih animacija, koje se najčešće koriste u nastavi, empirijska istraživanja pokazuju kako sama animacija nema bolji učinak na razumijevanje sadržaja u odnosu na statičke slike istog sadržaja [21], [22], već je razumijevanje sadržaja potaknuto dodatnim glasovnim pojašnjenjima i opisima [8], [21] te pitanjima kojima, na temelju statičkih slika, učenici mogu predvidjeti ponašanje dinamičkog procesa [21]. Ovaj nalaz donekle potvrđuju i istraživanja u kojima bolji učinak na postignuća ima segmentirana grafika u odnosu na kontinuiranu animaciju [25]. Iako su minimalni tekstualni pojmovi, zbog temeljne orijentacije učenika, često dijelom animacije, istraživanja pokazuju kako tekstualni komentari i objašnjenja, suprotno prvotnim istraživanjima, nisu učinkoviti zbog ignoriranja takvih informacija ali i neučinkovitosti s obzirom na razinu predznanja učenika [22]. Dakle, temeljni problem učinka ekspozitivne animacije najčešće predstavlja nedostatno predznanje i nedovoljno razvijen mentalni animacijski model učenika potreban za praćenje i učenje pomoću ili s animacije, čiji nedostatak može kod učenika izazvati nerazumijevanje animiranog sadržaja, tzv. „iluziju“ o razumijevanju [8], [26], ali i razvoj potpuno pogrešnog mentalnog modela [21], [22], [27]. Sličan učinak ustanovljen je i primjenom interaktivne animacije s dodatnom signalizacijom, pri čemu interaktivnost i dodatni elementi pomoći nisu kod učenika izazvali bolje razumijevanje, već su naprotiv, razvijeni mentalni modeli bili potpuno pogrešni [22]. U navedenom istraživanju se nadalje sugerira kako je prethodno dobro poznavanje sadržaja, uz višestruko ponavljanje i pružanje učenicima različitih iskustava sa sličnim sadržajem, neophodno za razvoj ispravnih mentalnih modela učenika. U skladu s tim Bétrancourt [26] navodi kako animaciju u nastavi možemo primijeniti samo kada: a) animirani fenomen uključuje promjene tijekom vremena, te realno možemo pretpostaviti da učenici iz statičkih slika ne bi izveli ispravne zaključke; b) ako su učenici početnici u navedenom području ili su suočeni s visokom razinom kognitivne opterećenosti. U skladu s prethodno navedenim općim razlozima i uvjetima primjene animacije, te ograničenjima proizašlim iz empirijskih istraživanja, Ainsworth [8] navodi moguća obilježja animacije, koja se ovdje iznose u skladu s posebnostima tehničkog nastavnog područja:

Izražajna obilježja – odnose se na svojstvo animacije da izrazi apstrakciju neovisno o prirodi tumača. Može se objasniti i kao količina „izračuna“ u glavi pojedinca potrebnih za izvođenje „ispravnih“ zaključaka. Ova obilježja važna su za prikaz određenih aktivnosti, procesa, tvorevine ili tehnologije koje se odvijaju određenim redoslijedom. Zbog toga je izražajnost animacije iznimno važna kada se prezentira dinamička aktivnost koja treba i biti shvaćena kao vremenski slijed događanja, što može biti problem kod animacija koje nisu takve.

Kognitivna obilježja – govore nam o tome koliko animacija može doprinijeti razvoju spoznajnih procesa kod učenika. U tom smislu, cilj i sadržaj animacije treba biti usmjeren na to da određenu apstrakciju prikaže jasno, nedvosmisleno, usklađeno s kognitivnim predispozicijama učenika, te tako kod učenika potakne i izazove razumijevanje sadržaja koji proizlazi iz animacije.

Motorička obilježja – odnose se na to koliko ishod animacije može potaknuti ili doprinijeti aktivnostima učenika u nastavni (i izvan nastave), odnosno, potaknuti tzv. akciju učenika kojom će realizirati određene aktivnosti u nastavi, koje vode do razumijevanja sadržaja.

Perciptivna obilježja – uključuju tendenciju animacije da umanji (optimizira) količinu kognitivnog napora učenika potrebnog za spoznavanje sadržaja. O kakvoći ovih obilježja animacije ovisi hoće li animacija utjecati na percepciju učenika tako da on izvede pravilne zaključke, ili će izazvati nepremostivu opterećenost učenika te zbunjivanje, nezainteresiranost i nerazumijevanje sadržaja.

Afektivna i motivacijska obilježja – trebaju odgovoriti na pitanje kako animacija može utjecati na stavove, mišljenja i ponašanje učenika, te koliko može motivirati učenike za aktivnosti u nastavi. Znanstvenici često navode kako multimedijalna nastava, pa tako i animacija, pozitivno utječu na motivaciju i interes učenika [28], što može, ali i ne mora značiti da će polučiti razvoj pozitivnih vrijednosti i stavova.

Strategijska obilježja – mogu biti ključna za razumijevanje animacije, a odnose se na one karakteristike animacije koje mogu poboljšati učenikovu strategiju učenja. Učenika bi stoga trebalo osposobiti za učenje s animacije (razviti mentalne animacijske modele), a animaciju prilagoditi različitim strategijama učenja. Ova obilježja usko su povezana s metakognitivnim obilježjima animacije.

Metakognitivna obilježja – uključuju mogući utjecaj animacije na razvoj samoreguliranog učenja, odnosno, na to koliko animacija može utjecati na učenikovo planiranje učenja, samoprocjenu i vlastitu kontrolu na učenjem. U praksi je razvoj metakognicije učenjem iz animacije provediv samo kao nadogradnja znanja učenicima koji već imaju stečeno autentično iskustvo i razvijene pravilne animacijske mentalne modele. Kod učenika bez takvoga iskustva problem često predstavlja pogrešno razumijevanje animacije, odnosno, stvaranje tzv. iluzije o razumijevanju.

Retorička (socijalna) obilježja – odnose se na pitanje u kojoj mjeri animacija može doprinijeti socijalnom učenju kroz verbalizaciju (objašnjenja) sadržaja animacije u socijalnoj sredini. Dakle, animacija bi trebala biti poticajna za rad na zajedničkom i suradničkom razumijevanju sadržaja tako što će potaknuti učenike na verbalno pojašnjavanje sadržaja. Pri tom problem predstavlja osmišljavanje takve animacije koja može poboljšati verbalizaciju i učenje u socijalnoj sredini učenika, pri čemu je nastavnikovo vođenje presudno za uspjeh takvog učenja.

Pojedina obilježja nastavne animacije nisu neovisna jedna od drugih već se nalaze u složenoj međusobnoj interakciji, a naglašenost jednog obilježja može pozitivno ali i negativno utjecati na druga obilježja [8]. Izražajna obilježja bi sadržajem trebala biti vrlo ograničena jer su zasnovana na vremenskom slijedu događaja, što ograničava mogućnost učeničkog zapamćivanja istih. Učeničke strategije učenja ovise o dostupnim kognitivnim resursima učenika (metakognitivnim strategijama), ali i o motivaciji učenika potrebnoj za ulaganje napora kojima će otkriti prikladne strategije učenja. Povećanjem učenikove kontrole nad sadržajem animacije može se utjecati na višu razinu kognitivnih obilježja, ali takvo učenje pretpostavlja metakognitivne vještine i strategije koje učenik nema.

Današnja istraživanja animacije u nastavi uglavnom su usmjerena na istraživanja kognitivnih obilježja u umjetno stvorenim okolnostima, dok se druga navedena obilježja i njihov učinak na postignuća u nastavi sustavno ne proučavaju. Stoga je potrebno više pažnje posvetiti sveobuhvatnom učinku animacije u nastavi, u realnim i tradicijski uvjetovanim okolnostima nastave. Pri tom suvremene spoznaje iz područja kognitivnih znanosti i neuroznanosti mogu odigrati važnu ulogu u istraživanju ovog vrlo složenog područja.

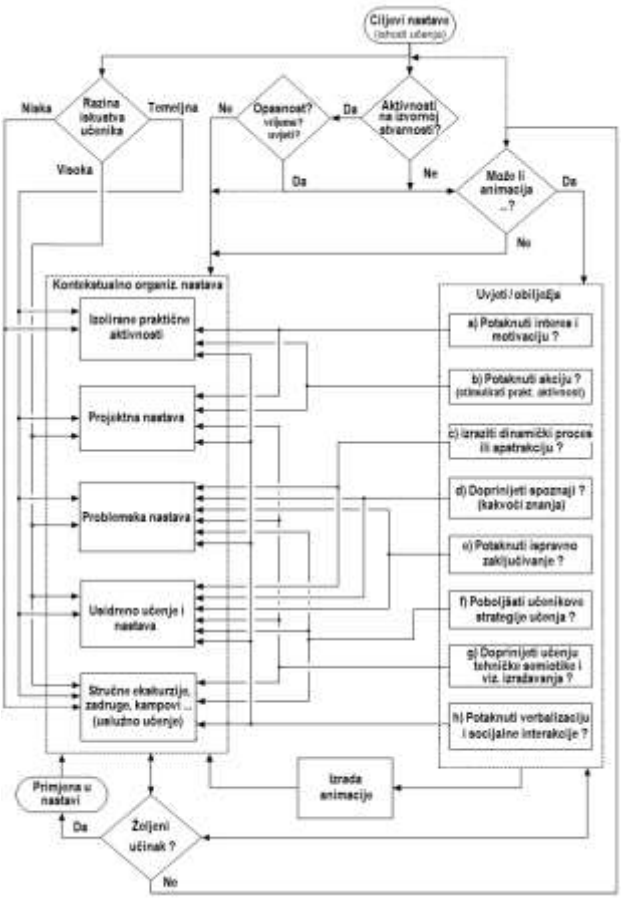
IV. PRIMJENA ANIMACIJE U TEMELJNOJ EDUKACIJI TEHNIKE

S obzirom na aplikativnu i kontekstualno omeđenu prirodu temeljnog tehničkog odgoja i obrazovanja, okvir za primjenu animacije razrađen je kao dio kontekstualnog pristupa nastavi, koji se smatra osobito učinkovitim u tehničkom nastavnom području [29]. Pristup se zasniva na kontekstualnom učenju i poučavanju, kao holističkom sustavu koji ima za cilj pomoći učenicima vidjeti smisao akademskog sadržaja kojeg uče povezivanjem sadržaja s kontekstom svakodnevnog života, odnosno, s kontekstom svojih osobnih, društvenih i kulturalnih okolnosti [7]. U nastavi općeg tehničkog odgojno-obrazovnog područja se, zbog ograničenja navedenih u uvodu, kao kontekstualno organizirana nastava može primijeniti: projektna nastava i učenje, rad u učeničkim zadrugama, kampovima, vrtovima i radionicama, stručne ekskurzije, problemska nastava i učenje, usidreno učenje i nastava te izolirane praktične aktivnosti učenika [30]. Navedeni pristupi ukazuju na to kako se kontekstualno učenje i poučavanje u tehničkom području zasniva na iskustvu učenika stečenom smislenim aktivnostima pri radu s izvornom stvarnošću. No, kako tu stvarnost nije uvijek niti u potpunosti moguće transferirati u školsko okružje, otvara se mogućnost uporabe računalnih animacija, kao kontekstualnih artefakata u nastavi, koji mogu poboljšati motivaciju učenika i razumijevanje tehničko-tehnoloških fenomena.

U sadržajnom smislu, svako tehničko obrazovanje se može zasnivati na procesima koji obilježavaju današnju tehniku i tehnologiju, kao što su: tehnički dizajn, rješavanje tehničkih problema, sistemski pristup, izum (inovacija) u tehnici, te proizvodnja [31]. Najvažnije generičke aktivnosti učenika, kojima se realizira takva nastava, uključuju: procjenu, komunikaciju, modeliranje, generiranje ideja, istraživanje i ispitivanje, proizvodnju i dokumentiranje [31]. Problem koji se pri tom često javlja je realizacija nastave prema unaprijed određenim (diktiranim), sadržajno zasićenim ili pak isključivo proizvodno inspiriranim aktivnostima, pri kojima do izražaja ne dolaze složeni spoznajni procesi kod učenika. Ovi procesi su osobito važni za razvoj metakognitivnih vještina i tehničkih kompetencija učenika. U tom smislu, tehničke kompetencije se mogu definirati kao posebna ponašanja u okviru tehničkog područja djelovanja, a formiraju se integracijom znanja, i/ili sposobnosti, i/ili vještina potrebnih za uspješno ostvarivanje konkretne

aktivnosti [32]. Iz takve određenosti kompetencija razvidno je kako se sposobnosti učenika za tehničko dizajniranje, stvaranje i razvoj inovacije, rješavanje tehničkog problema, ali i razvoj sistemskog pristupa radu, mogu razvijati uglavnom kontekstualnim pristupom nastavi. Zbog toga je važno utvrditi u kojim uvjetima i s kojom svrhom animaciju možemo primijeniti u kontekstualnim pristupima nastavi, vodeći se pri tom dosadašnjim znanstvenim spoznajama i posebnostima nastave općeg tehničkog odgoja i obrazovanja.

Kako bi se nastavnicima i praktičarima olakšalo donošenje odluke o razvoju, te načelno usmjerila izrada i primjena animacije u ovom nastavnom području, razrađen je dijagram uvjeta primjene animacije (slika 1), kao dio metodičkog okvira za primjenu animacije u nastavi. S desne strane dijagrama prikazana je moguća svrhovitost primjene animacije, koja u velikoj mjeri odgovara mogućim obilježjima animacije koja navodi Ainsworth [8], dok su na samom početku prikazani opći uvjeti bitni za svaku, pa tako i kontekstualno organiziranu nastavu tehničkog odgoja i obrazovanja. Među tim uvjetima, donošenje početne odluke o primjeni animacije u nastavi izravno je u svezi s mogućnostima uporabe izvorne stvarnosti na kojoj će se graditi glavne aktivnosti učenika. Iako je nastavnu animaciju moguće, a katkad i poželjno, koristiti i uz aktivnosti na izvornoj stvarnosti, animacija pri tom gubi prioritet, izuzev kao dio kontekstualizacije pri usidrenoj i problemskoj nastavi. Dakle, odluku o izradi i primjeni animacije je potrebno donijeti odmah na početku pripremanja kontekstualno organizirane nastave i u skladu s tom odlukom predvidjeti mogući doprinos animacije za postignuća učenika. Svaki od navedenih uvjeta povezan je s kontekstualnim pristupima nastavi, zbog posebnosti svakog pristupa i očekivano različite funkcije animacije u tom pristupu. Treći početni uvjet, iskustvo učenika, je neizravno povezan s odlukom o uporabi animacije putem kontekstualnih pristupa nastavi, a uvjetovan je očekivanim djelovanjem animacije na učenike. U tom smislu učenici s niskom razinom iskustva primarno trebaju pristupati izoliranim praktičnim aktivnostima radi stjecanja temeljnih znanja i vještina potrebnih za složenije aktivnosti. Za takvu početnu razinu učenja, animacije trebaju poslužiti kao sredstvo za poticanje interesa i aktivnosti učenika, ali i za poticanje verbalizacije, socijalnog pregovaranja i vlastitog, često i neprikladnog ali nužno potrebnog, tumačenja stvarnosti. Motivacijske animacije trebaju biti atraktivne za učenike, olakšavajuće po pitanju kognitivne opterećenosti i dobro vođene od strane nastavnika. Za projektnu nastavu, animacija, također, treba biti motivirajuća, poticajna za praktičnu aktivnost i za socijalne interakcije učenika. No, kako projektna nastava uključuje materijalizaciju tehničke tvorevine koja je produkt samostalnog rada učenika, očekuje se da se ovdje animacija koristi i kao sredstvo učenikovog predstavljanja vlastitog rada. Stoga do izražaja dolazi učenje temeljne tehničko-tehnološke semiotike i načina vizualizacije sadržaja. Za realizaciju problemske nastave te usidrenog učenja i nastave, kao kognitivno najsloženijeg segmenta temeljnog tehničkog odgoja i obrazovanja, potrebna je viša razina iskustva učenika, ali i više različitih animiranih i statičkih prikaza iste izvorne stvarnosti. Stoga, uz obilježja navedena za početno učenje, do izražaja dolaze izražajna, spoznajna, strategijska i obilježja povezana s mogućnošću izvođenja ispravnih zaključaka iz animacije. Ipak, u problemskoj



Slika 1. Dijagram uvjeta primjene animacije u kontekstualno organiziranoj nastavi

nastavi dominira samostalni rad učenika, stoga animacije koje učenici koriste trebaju biti izvedene na različitim spoznajnim razinama (od jednostavnih do zahtjevnih), prilagođene mogućim različitim dispozicijama učenika i strategijama učenja (vizualno, tekstualno i glasovno), te imati temeljne značajke interaktivnosti (upravljivost, oznake i signalizacija, poveznice s vanjskim sadržajima i sl.). Pri usidrenom učenju i nastavi samostalni rad učenika odvija se nakon i uz nastavnikovo kognitivno naukovanje zbog čega animacije trebaju biti kognitivno zahtjevne, temeljno upravljive te raznolike u smislu prikazivanja različitih situacija iste tehničko-tehnološke stvarnosti. Aktivnosti stručnih ekskurzija i različitih inačica radnog i uslužnog učenja, usmjerene su samostalnim aktivnostima učenika isključivo na izvornoj tehničko-tehnološkoj stvarnosti, zbog čega primjena animacija pri glavnoj aktivnosti nema osobitog smisla. Animacija je ovdje primjenjiva kao rezultat učenikovih spoznaja o toj stvarnosti, zbog čega se očekuje temeljno poznavanja alata za izradu iste, ali i upoznavanje i primjena dijela tehničko-tehnološke semiotike, odnosno načina tehničkog vizualnog izražavanja. Dakle, izrada animacije je pri ovakvoj nastavi dio produkta učenikovog rada i predstavljanja toga rada, a manifestacija razvijenog animacijskog mentalnog modela u završnoj etapi takve nastave je predmet evaluacije, učeničkih višestrukih tumačenja, te nastavnikovog moderiranja, usmjeravanja i dopunjavanja toga modela. U konačnici, nastavnik bi

učinak svake primjene animacije u nastavnom procesu, kao refleksivni praktičar, trebao vlastitim instrumentima vrednovati te, sukladno rezultatima, donijeti odluku o budućoj primjeni i/ili redizajnu animacije. Evaluacija učinka treba u prvom redu uzeti u obzir očekivanja od animacije i ciljeve nastave, a rezultat treba biti usmjeren primjeni, poboljšanjima ili pak odbacivanju iste. S obzirom na dominirajuće obilježje i svrhu primjene, animacije u općem tehničkom odgoju i obrazovanju mogu uključivati četiri osnovne skupine:

a) **motivacijske i poticajne ekspozitivne animacije** – predstavljaju kratkotrajni slijed slikovito i atraktivno predočenih događanja, procedura ili tehnološkog procesa, važnog za aktivnosti učenika koje slijede. Animacija treba biti popraćena verbalnim nastavnikovim pojašnjenjima i tek osnovnim tekstualnim sadržajima (elementi, glavni dijelovi, nazivlje, događaji). Dizajn ovakvih animacija treba biti jednostavan, s dominirajućim središnjim subjektom i minimalnim dodatnim elementima (optimalna kognitivna opterećenost učenika). Sadržaj animacije treba uskladiti s razvijenim mentalnim modelima učenika (poznati elementi), uz relativno nisku razinu apstraktnosti koju su učenici u mogućnosti razumjeti.

b) **izražajne i kognitivno značajne ekspozitivne animacije** – predstavljaju nositelje informacija bitnih za učenikovu spoznaju, zaključivanje i proces učenja. Ovakve animacije sežu od jednostavnih dinamičkih prikaza tehničkih tvorevina, sustava, procesa ili tehnologije, koji ustvari predstavljaju apstrahiranu izvornu stvarnost, preko složenih animacija koje prikazuju sadržaj na nižem stupnju apstrakcije (bliže izvornoj stvarnosti) ali s puno više činjenica i detalja, do visoko-apstraktnih dinamičkih shematskih prikaza i dijagrama za čije praćenje i zaključivanje su potrebni razvijeni mentalni modeli učenika. Uporaba sve tri razine ove vrste animacija je poželjna za potpuno razumijevanje određenog sadržaja, učenje tehničke semiotike i razvoj strategija učenja. Dizajn ovakvih animacija nužno treba biti na višoj razini apstrakcije, sa središnjim subjektom, ali i popratnim objektima, koji trebaju izazvati optimalnu kognitivnu opterećenost učenika. Kako bi se izbjegla kognitivna preopterećenost, učenicima se animacija višestruko ponavlja uz nastavnikovo pojašnjenje fokusirano svaki put na drugom skupinom elemenata animiranog prikaza.

c) **izražajne i kognitivno značajne interaktivne animacije** – imaju ista obilježja kao i prethodne, izuzev ugrađene dodatne interaktivnosti, glasovne podrške i poveznica na cjelovita tekstualna pojašnjenja i/ili izvore informacija. Primarno, ova vrsta animacija namijenjena je samostalnom (istraživačkom) radu učenika tijekom problemske nastave ili usidrenog učenja i nastave, ali može služiti i za samoučenje i udaljeno učenje. S obzirom da se radi o podvrsti prethodnih animacija, sve izražajne i kognitivno značajne animacije poželjno je razvijati s navedenim dodatnim elementima, s tim da je sve elemente moguće isključiti tijekom vođene nastave. Ovakve animacije trebale bi biti sastavnim dijelom repozitorija za nastavne materijale i e-učenje, koje bi nastavnici razvijali i razmjenjivali, čime bi se poboljšala dostupnost animiranih materijala, njihova raznolikost, a s vremenom i kakvoća.

d) **učeničke animacije** – predstavljaju jednostavne i kratkotrajne dinamičke prikaze učenikove percepcije tehničko-tehnološke stvarnosti, koja nam daje vrijednu povratnu informaciju o razvijenom mentalnom modelu učenika. Učenička izrada i prezentacija animiranog materijala je sastavni dio autentične evaluacije postignuća u kontekstualno organiziranoj nastavi. Ovakve animacije trebaju nastati kao učenikov izbor, a ne na izričit zahtjev nastavnika, jer se određena aktivnost, projekt, proizvod ili tehnologija mogu predstaviti i drugim načinima.

Sve vrste animacija bi, zbog optimalnog zadržavanja pažnje učenika, trebale trajati najdulje nekoliko minuta, što nikako ne determinira vrijeme i broj ponavljanja potrebnih za obradu sadržaja animacije izravno u nastavi. Dizajn i izradu animacija poželjno je zasnivati na alatima koji su široko dostupni nastavniku i učenicima, a za čije korištenje nastavnik ima dostatne vještine ili se te vještine mogu steći u relativno kratkom vremenu. U tom smislu motivacijske i učeničke animacije se mogu izraditi dostupnim uredskim aplikacijama i besplatnim softverom za izradu animiranih slika, kao na primjeru [33], kojima se relativno jednostavno može dodati govorna podrška. Ovakvi alati najčešće su dostatni i za izradu jednostavnih dinamičkih prikaza rada tehničkih tvorevina, procesa, sustava ili tehnologije, primjer [34]. Za složenije i realnije 3D dinamičke prikaze tehničko-tehnološke stvarnosti, kao i za visoko-apstraktne prikaze s elementima poželjne interaktivnosti, često su potrebni složeniji specijalizirani alati, koji ne moraju nužno biti komercijalni i skupi. Za izradu realnijih dinamičkih prikaza tehničko-tehnološke stvarnosti nastavnici tehničkog područja trebali bi ovladati osnovnim kompetencijama korištenja barem jednog alata za tehnički dizajn, koji ima mogućnost animiranog prikaza tehničke tvorevine, dok su za izradu visoko-apstraktnih i interaktivnih dinamičkih prikaza (i simulacija) poželjne kompetencije i vještine korištenja nekog široko rasprostranjenog skriptnog programskog jezika. Zbog jednostavnije distribucije sadržaja, osobito za potrebe problemskog i suradničkog učenja, poželjno je sve animacije razvijati na način da budu iskoristive u različitim sustavima za udaljeno učenje.

Ipak, vrijedi napomenuti kako animacija u tehničkom obrazovanju nije sredstvo na kojem se zasnivaju glavne aktivnosti, pa time nije ni osnova za spoznaju, već kvalitativni kontekstualni artefakt koji može, ali i ne mora, doprinijeti spoznaji i postignućima učenika.

V. ZAKLJUČAK

Uspješnost učenja i nastave u općem tehničkom odgojno-obrazovnom području često se zasniva na kontekstualno organiziranim učeničkim aktivnostima, pri kojima je autentičnost artefakata neizostavna. Ipak, zbog nedostatnog iskustva učenika i uvjeta školskog okružja, aktivnosti je potrebno prilagođavati učenicima, a izvornu stvarnost često nadopunjavati didaktički prerađenom. Kontekstualizacija je pri tom važan segment nastavnog procesa pri čemu, uz prioritetnu izvornu stvarnost, različiti kontekstualni artefakti, poput računalne animacije, mogu doprinijeti postignućima učenika i motivirati ih za rad.

Dosadašnja istraživanja uporabe računalne animacije u nastavi često osporavaju njen izravni doprinos boljem

razumijevanju sadržaja i postignućima učenika. Unatoč tome, rezultati istraživanja ukazuju kako u primjerenim uvjetima optimalne kognitivne opterećenosti, dobre pripremljenosti učenika, predviđanja dinamike procesa, višestrukog opetovanja i interaktivnosti, animacija može doprinijeti razvoju ispravnih mentalnih modela učenika.

Uzimajući u obzir rezultate empirijskih istraživanja i posebnosti kontekstualno organizirane nastave općeg tehničkog odgoja i obrazovanja, izdvojen je metodički okvir za primjenu animacije u ovom nastavnom području. Primjenu animacije uvjetuje početno iskustvo učenika, kontekstualno organizirana glavna aktivnost, krajnji ciljevi nastave i obilježja kojima animacija može doprinijeti postignućima učenika. U skladu s navedenim uvjetima, za izolirane praktične aktivnosti preporučuje se uporaba motivacijskih animacija prije glavne aktivnosti učenika, za usidreno i problemsko učenje izražajne i kognitivno značajne animacije tijekom aktivnosti, dok se za varijante projektnog i uslužnog učenja preporučuje korištenje učeničke animacije nakon glavne aktivnosti.

Potrebno je istaknuti kako su dosadašnje spoznaje o uporabi animacije u nastavi i učenju zasnovane na teorijskim pretpostavkama i empirijskim istraživanjima u umjetnim, laboratorijskim uvjetima. Stoga daljnja istraživanja treba usmjeriti na uvjete i utjecaj animacije u stvarnim nastavnim uvjetima i situacijama i u različitim nastavnim područjima. Rezultati takvih istraživanja mogu bitno utjecati na dosadašnje spoznaje o utjecaju animacije na učenike, pa tako i na predloženi okvir za primjenu animacije u nastavi općeg tehničkog odgoja i obrazovanja.

Žene i informacijsko-komunikacijske tehnologije: zašto su studentice rijetkost na studiju računarstva?

Tihana Babić, Ana Ogrin i Klaudija Šarkanj
Visoko učilište Algebra - visoka škola za primijenjeno računarstvo, Zagreb, Hrvatska
tihana.babic@algebra.hr, ana.ogrin@algebra.hr, klaudija.sarkanj@algebra.hr

Rad se bavi pitanjem vrlo slabog interesa žena za studije računarstva odnosno informacijsko - komunikacijskih tehnologija. Statistički podaci Agencije za znanost i visoko obrazovanje pokazuju da u Hrvatskoj samo 13% studentica izabire studije u području tehničkih, biotehničkih, inženjerskih i prirodnih znanosti (STEM).

Na Visoko učilište Algebra – visoku školu za primijenjeno računarstvo upisan je 491 student na preddiplomske i diplomski studij u školskoj godini 2014./2015., od čega samo 43 studentice, što znači da je zastupljenost studentica manja od 9%. Svrha ovog kvalitativnog istraživanja, u kojem je sudjelovalo 36 studentica, je identificirati motive upisanih studentica te, suprotno, moguće razloge zbog kojih studij računarstva nije popularniji odnosno atraktivniji među djevojkama.

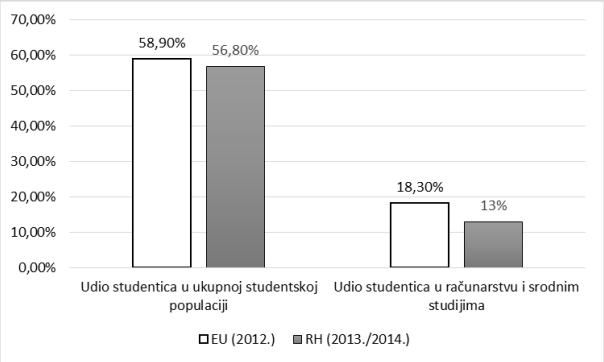
Studentice ističu intrinzične motive za upis, ali i dobre poslovne mogućnosti nakon završenog studija. Smatraju da glavni uzroci slabe zastupljenosti žena u ICT-u leže u tradicionalnom vjerovanju da je to muški posao, slabijem predznanju u području tehnologija, društvenom neprihvaćanju te slaboj informiranosti.

Kao moguća rješenja proizašla iz ovog istraživanja ističu se obvezna rana informatička edukacija, adekvatno informiranje učenika te kreativne promotivne aktivnosti.

I. UVOD

Prema podacima Državnog zavoda za statistiku u zimskom semestru školeske godine 2013./2014. na visoka učilišta Republike Hrvatske, uključivo upis na sve godine studija, upisalo se ukupno 161 911 studenata, od čega 91 997 studentica. Udio studentica je dakle 56,8% [1]. Ako se taj podatak usporedi sa statističkim podacima iz analize interesa mladih za STEM Balena i Drvodelića prema kojoj samo 13% studentica odabire studije u području znanosti, tehnologije, inženjerstva i matematike (STEM) [2], pitanje "zašto?" nameće se samo po sebi.

Statistički podaci iz godine ranije, odnosno 2012. godine, za 27 zemalja Europske unije govore da je preddiplomski i diplomski studij upisalo 4.800,964 studenata od čega 2.826,619 žena [3] (u postotku 58.9). Usporedbom podataka možemo zaključiti da žene i u drugim zemljama Europske unije, kao i u Hrvatskoj, u većem broju upisuju studij od muškaraca (u prosjeku oko 15%). No, udio žena u ukupnom broju studenata upisanih na studij računarstva u 27 zemalja Europske unije (njih 28,246 od ukupno 153,856 studenata) je 18,3% i postotak Hrvatica je ipak niži od europskog prosjeka [3].



Grafikon 1. Usporedba udjela studentica u ukupnoj studentskoj populaciji i studijima u računarstvu u zemljama EU i Republici Hrvatskoj

Na Visoko učilište Algebra – visoku školu za primijenjeno računarstvo upisan je 491 student na preddiplomske studije primijenjenog računarstva i multimedijskog računarstva i diplomski studij primijenjenog računarstva u školskoj godini 2014./2015., od čega samo 43 studentice, što znači da je zastupljenost studentica manja od 9%. Prema tome taj postotak je još manji od gore navedenih podataka.

Slika 1. Promocija 25.04.2014.g.: diplomirali na Visokom učilištu Algebra u šk.god. 2013./2014. (29 prisutnih studenata koji su diplomirali od čega 2 diplomantice)

Zašto su žene rijetkost u informacijsko-komunikacijskim znanostima pitanje je na čiji se odgovor ne smije dugo čekati. Općenito se u hrvatskom obrazovnom sustavu ne ulaže dovoljno u informacijsko–komunikacijske tehnologije (ICT) iako je Strategija obrazovanja, znanosti i tehnologije RH, koju je donio Hrvatski sabor 17. listopada 2014. godine, veoma naglasila značaj ICT-a: „Europski tehnološki prioriteti vezani uz industrijsko vodstvo usmjereni su potpori istraživanjima i inovacijama u informacijskoj i komunikacijskoj tehnologiji (ICT), nanotehnologijama, naprednim materijalima, biotehnologiji i naprednoj proizvodnji. Procjenjuje se da više od 10% svjetskog BDP-a ovisi o informacijskoj i komunikacijskoj tehnologiji, a internet i web ključni su za pokretanje inovacija i kreativnost u društvu i gospodarstvu.“ [4]. Nažalost, vrlo izgledno je da se radi o problemu financijske prirode, jer je istom propisano da će se u Republici Hrvatskoj do 2020. godine ulagati 6% BDP-a u obrazovanje [4], dok se sada ulaže tek do 3,5% [5].

Potaknute navedenim podacima te činjenicom da je udio žena u ICT-u drastično manji od udjela muškaraca, autorice su pokušale do odgovora kako bi se taj broj mogao povećati ne zadirući u državne financije već u mentalitet svih sudionika odgojno-obrazovnog procesa: učenika, nastavnika i roditelja.

II. METODOLOGIJA ISTRAŽIVANJA MOTIVA, ZADOVOLJSTVA IZBOROM I UZROKA SLABE ZASTUPLJENOSTI ŽENA U PODRUČJU RAČUNARSTVA

A. Sudionici

U istraživanju koje je provedeno na Visokom učilištu Algebra - visokoj školi za primijenjeno računarstvo, sudjelovalo je 36 studentica stručnih studija računarstva. U istraživanju je korišten prigodni uzorak.

U Tablici I. prikazana je struktura sudionica s obzirom na studij, razinu i godinu studija.

TABLICA I. STRUKTURA SUDIONICA PREMA STUDIJU

	Primijenjeno računarstvo	**Multimedijsko računarstvo**
Preddiplomski studij	**17**	**10**
1. godina	*8*	*6*
2. godina	*3*	*2*
3. godina i apsolventice	*6*	*2*
Diplomski studij	**5**	**4**
1. godina	*4*	*2*
2. godina	*1*	*2*

B. Instrumentarij

Podaci su prikupljeni pomoću upitnika koji je sadržavao pitanja višestrukog izbora i pitanja otvorenog tipa bez unaprijed ponuđenih odgovora. Nakon objašnjenja svrhe ispitivanja, sve studentice dobile su upitnike te su zamoljene da iskreno odgovore na pitanja. Odgovori ispitanica obrađeni su kvantitativnom i kvalitativnom analizom.

III. REZULTATI

A. Motivi za studij računarstva

Studenticama je postavljeno pitanje kako su se odlučile za studij računarstva. U upitniku su unaprijed ponuđena tri moguća motiva koji se u javnosti često ističu kao prednosti studija u ovom polju te dodatna kategorija „nešto drugo“ odnosno otvoreno polje za unos konkretnog odgovora. Sudionice su mogle birati više odgovora.

U Tablici II. prikazane su frekvencije odgovora studentica na pitanje o motivima izbora studija u računarstvu.

TABLICA II. MOTIVI IZBORA STUDIJA (N=36)

Razlog upisa	**Postotak pojedinog odgovora**
To ih oduvijek zanima	78%
Visoke plaće	8%
Velika potražnja za tim profilom stručnjaka	14%
Nešto drugo *(želja za učenjem, priroda posla)*	11%

Iz odgovora studentica vidljivo je da su glavni motivi za upis studija intrinzične prirode odnosno da proizlaze iz njihovih unutarnjih pobuda jer je to područje njihovog interesa. Njih 78% navelo je kako je to područje koje ih oduvijek zanima. Tzv. ekstrinzični faktori vezani uz tržište rada (kao što su npr. plaće i laka zapošljivost) odnosno izvana potaknuti motivi pojavljuju se, ali u puno manjim frekvencijama, visoke plaće predstavljaju izvor motivacije za 8% ispitanih studentica, a velika potražnja za ovim profilom stručnjaka za 14% studentica. Njih 11% navelo je da ih je motivirala priroda tog posla i želja za učenjem, . Zanimljivo je da se s druge strane prilikom razgovora o potrebi povećanja stručnjaka u ICT-u često posebno naglašavaju upravo pozitivni aspekti tržišta rada kao nešto

što bi trebalo motivirati učenike na odabir ovakvih zanimanja, što nije u skladu s odgovorima studentica.

B. Zadovoljstvo izborom (područja i polja) studija

Na pitanje bi li sada promijenile područje studija da ponovno upisuju fakultet, njih 5, odnosno 14% je odgovorilo da bi mijenjale studij. Od toga je samo jedna studentica navela razlog promjene i to „diskriminaciju i podcjenjivanje od strane muških kolega". Ostale studentice (njih 31, odnosno 86%) ne bi mijenjale studij, a razlozi zašto žele ostati u području ICT-a prikazani su u Tablici III.

TABLICA III. RAZLOZI OSTAJANJA U ICT-u (N=31)

Razlog ostajanja u ICT-u (kategorije odgovora)	**Postotak pojedinog odgovora**
zanimljivo područje	45%
mogućnost kontinuiranog učenja i razvoja vlastitih potencijala	29%
to je zanimanje budućnosti (traženo je i dobro plaćeno)	13%
dinamika razvoja i ljubav prema tehnologijama	13%
vrlo izazovno područje	10%
široko područje rada (raznovrsni poslovi)	10%
logičan nastavak dosadašnjeg obrazovanja	6%
kreativnost područja	3%
internacionalnost područja	3%

Navedeni razlozi ostajanju u području informacijsko-komunikacijskih tehnologija povezani su s inicijalnim motivima upisa studija te su u tom smislu i očekivani. Gotovo polovica studentica (45%) ne bi mijenjale studij zato jer ovo područje smatraju zanimljivim. Ostali češće zastupljeni razlozi ostajanja u području računarstva odnose se na mogućnost kontinuiranog učenja i razvoja potencijala (29%), potražnja na tržištu rada i perspektiva u budućnosti (13%) te dinamika razvoja tehnologija (13%). Opet se pokazuje da unutarnji motivi, interes za to područje i želja za učenjem, predstavljaju glavne faktore ustrajanja u odabranom studiju.

C. Uzroci slabe zastupljenosti žena

Na pitanje koji su, po njihovom mišljenju, uzroci slabe zastupljenosti žena u računarstvu i ICT-u iskristalizirali su se sljedeći odgovori (N=36):

- Predrasude da je to muški posao (36%).
- Karijera žene u ICT-u još uvijek je „društveno neprihvatljiva" (6%).
- Žene zanimaju druga područja (8%).
- Djevojke se od rane dobi usmjeravaju u društveno područje (17%).
- Djevojke se u startu smatraju manje sposobnima za takve poslove pa se trebaju dodatno dokazivati, na što one reagiraju tako da izbjegavaju takve izazove (6%).
- Nisu dovoljno i adekvatno informirane (19%).
- Postoji nedostatak socijalne podrške i diskriminacija prema ženama koje se odluče za takve poslove (8%).

Od svih navedenih, prilikom odabira karijere među studenticama najčešće prevladavaju razlozi koji upućuju na tradicionalnu svijest da je to muški posao (njih 36%), te razlozi koji govore da su djevojkama tehnologije daleke, odnosno da prirodno biraju društvena područja (17%) i nisu dovoljno upoznate s njima, odnosno nisu adekvatno informirane (19%).

D. Koraci za povećanje udjela žena

Jedan dio studentica smatra da se zapravo ne može puno učiniti kako bi se povećao udio žena u računarstvu i općenito u ICT-u jer udio žena u toj branši zapravo je razmjeran udjelu žena koje pokazuju sklonost prema tehničkim znanostima u ukupnoj ženskoj populaciji. Osim toga, smatraju da je teško mijenjati stavove, a i žene idu linijom manjeg otpora. To je navelo 8% studentica, dok 17% ispitanih studentica ne zna što učiniti. Međutim, ostalih 75% studentica je ipak predložilo neke korake kojima bi se situacija u budućnosti mogla poboljšati, a koji su nabrojeni u nastavku:

- Pružati više informacija o IT-u i zanimanjima iz tog sektora te o njihovim opisima od najranije dobi (11%).
- Približiti znanost i demistificirati je odnosno razbiti mitove o podjeli na „muške" i „ženske" karijere (11%).
- Već u osnovnoj školi započeti s obaveznim informatičkim obrazovanjem, koje će pripremiti i motivirati za zanimanja u području ICT-a (8%).
- Osvijestiti društvo i poslodavce (kao i same žene) da se žene u jednakoj mjeri mogu posvetiti ovoj vrsti posla (djelatnosti) kao i muškarci (6%).
- Educirati žene, a i promijeniti stav određenih muškaraca u ICT svijetu odnosno uvesti pozitivnu diskriminaciju (6%).
- Približiti IT ženama kroz određene marketinške kampanje (6%).
- Učiniti način na koji se podučava zanimljivijim (3%).
- Prikazivati računala kao alat pomoću kojeg se mogu napraviti razne kreativne stvari, a ne kao nešto dosadno (3%).
- Uvesti osnove programiranja u srednje škole (3%).
- Organizirati radionice s jednostavnim primjerima koje bi mogle pomoći u porastu interesa, a također ženama pomoći da pronađu granu ICT-a koja im se sviđa i kojom bi se jednog dana mogle baviti (3%).

- Promovirati primjere uspješnih žena u ICT-u te timove i poduzeća s dobrom radnom atmosferom (3%).
- Prezentirati ICT kao industriju otvorenu svima koja ne trpi diskriminiranje, s naglaskom na raznolikost karijera u tom području (3%).
- Uvesti posebne programe za uključivanje žena na projekte na fakultetu i razmjenu studenata (3%).
- Kroz poticajne mjere podržati razvoj ICT poduzetništva čiji su osnivači žene (3%).
- Više naglasiti da su žene dobrodošle i stvoriti atmosferu u kojoj bi se osjećale ugodno i na ovakvim do sada muškim studijima (3%).

IV. ZAKLJUČAK

Iako je zbog prirode uzorka korištenog u ovom istraživanju nemoguće napraviti generalizaciju rezultata na cjelokupnu studentsku populaciju u Hrvatskoj, ovi podaci se ipak mogu smatrati indikativnima te potaknuti daljnja istraživanja i konkretne akcije za povećanje udjela žena u ICT-u.

Osnovni motivi za izbor studija su unutarnje prirode za razliku od vanjskih faktora koji se u radu s učenicima i studentima češće naglašavaju (sigurna radna mjesta i visoke plaće). Stoga je važno od rane dobi učenike, a osobito učenice, „izlagati“ pozitivnim stranama tehnologija i omogućiti im da razviju znatiželju i strast za istraživanjem.

U obrazovanje je nužno uključiti sadržaje iz informatike i računarstva na način da oba spola imaju jednaku priliku upoznati područje, ali i svoje sposobnosti za bavljenje računarstvom. To ne mora nužno značiti informatiku kao obavezan predmet, već se informatički alati trebaju uklopiti u sve ili većinu školskih predmeta.

Isto tako, u postupcima profesionalnog usmjeravanja učenika tijekom školovanja organizirati terensku nastavu kroz npr. posjete tehnološkim tvrtkama. Zatim, kroz ponudu izvannastavnih aktivnosti omogućiti učenicima da se iskustveno bave tehničkim aktivnostima.

Ipak, osnovni problem identificiran u ovom radu jest naš „mentalni sklop“, odnosno tradicionalno utemeljene podjele zanimanja i predrasude prema ženama u ICT-u. To je problem koji treba započeti rješavati u sustavu obrazovanja, ali i izvan njega, u politikama zapošljavanja i poslovnom sektoru. Jedan od mogućih načina promjene (koja nikako neće biti brza) jesu kampanje koje bi trebale imati za cilj upoznati široku javnost (učenike, roditelje, nastavnike) s poslovima u području ICT-a te prikazati primjere dobre prakse, odnosno žene koje su uspjele u tom području.

Temeljni je zaključak kako je potrebno provesti široku raspravu o ovom problemu i ne prepustiti strukturu stručnjaka u ICT-u pukoj stihiji i tradicionalnim društvenim stavovima. To je obrazovno, sociološko, ali i ekonomsko pitanje koje se nikako ne smije zanemariti.

Prema uspješnijem razvoju algoritamskog načina razmišljanja

K. Blažeka, Tehnička škola Čakovec, Čakovec, Hrvatska
kristinka.blazeka@ck.t-com.hr

Sažetak - Novi strukovni kurikulumi, iako još u eksperimentalnoj provedbi, svojim naglaskom na temeljne ishode učenja uveli su niz pozitivnih pomaka u pristupu i provedbi obrazovanja za zanimanje Tehničar za računalstvo. Očekivano, najvažniji ishodi učenja povezani su sa stjecanjem vještina traženih na tržištu rada jer su od presudne važnosti za potvrđivanje kompetentnosti za obavljanje poslova i radnih zadataka odabrane struke. Među istaknutim vještinama, usvajanje vještine ili umijeća programiranja računala značajno je zbog toga što već duži niz godina omogućava povećanu zapošljivost. Kako u osnovnim školama usvajanje algoritamskog načina razmišljanja i stjecanje osnovnih vještina programiranja još uvijek ne obuhvaća čitavu populaciju, pohvalno je i za učenike korisno što pristup sadržan u novim kurikulima daje veći naglasak na usvajanje ovih temeljnih koncepata. U radu se ističe važnost odvajanja dovoljnog broja sati za te prve, vrlo važne korake za ulazak u svijet ispravno razvijenog algoritamskog načina razmišljanja i usvajanje vještine programiranja, uspoređuju se primjeri i sadržajni obuhvat u postojećim odobrenim udžbenicima, te analiziraju mogućnosti koje za podučavanje razvoja algoritamskog načina razmišljanja nude neka kvalitetna web sjedišta odnosno nacionalni sustavi natjecanja. U zaključku se daju prijedlozi za primjenu i poboljšanja.

I. UVOD

Svakodnevni je život neprekidno obilježen mnogim rutinskim nizovima aktivnosti stvorenim izvođenjem pripadajućih algoritama tijeka akcija i informacija. Takav složen svijet na odgovarajući način postaje shvatljiv samo onima kojima su koncepti takvih aktivnosti bliski, odnosno onima koji posjeduju potrebne vještine za njihovo stvaranje, izvođenje ili praćenje, a obuhvaćaju algoritamsko razmišljanje, logičko zaključivanje i strukturirano rješavanje problema.

S ciljem postizanja važnih kompetencija 21. stoljeća [1] svojim je ishodima poučavanje ICT-a u primarnom i sekundarnom obrazovanju obično usmjereno primarnom stjecanju spomenutih koncepata i vještina, odnosno osiguravanju i ostvarivanju sposobnosti učenika da probleme rješavaju poduzimajući odgovarajuće akcije.

Pri tom je sposobnost algoritamskog načina razmišljanja jedna od najvažnijih kompetencija koja se sve više utemeljuje upravo na tim razinama obrazovanja. Za ilustraciju, ciljevi koje postavlja Model Curriculum for K–12 Computer Science su predstavljanje „osnovnih koncepata računalne znanosti svim učenicima, počevši od razine osnovne škole" [2] pa se tako zahtijeva da "do završetka petog razreda učenici trebaju razviti jednostavno razumijevanje pojma algoritma.", što je ujedno i osnova i preduvjet za usvajanje jednog od najtežih ishoda učenja o ICT-u - programiranja.

Na sličan se način i u kurikulumu obrazovnog sustava Australije očekuje kako će učenici petog i šestog razreda biti sposobni dizajnirati, mijenjati i slijediti jednostavne algoritme (prikazane dijagramima i riječima) koji uključuju nizove koraka, grananja i iteracija (ponavljanja), a u osmom bi trebali implementirati i mijenjati programe koji uključuju grananja, iteracije i funkcije u nekom programskom jeziku opće namjene [3].

Kod nas se prvi koraci u učenju programiranja u novom strukovnom kurikulumu za zanimanje Tehničar za računalstvo odvijaju kroz predmet Algoritmi i programiranje. Nastava ovog predmeta podijeljena je na uobičajeni način na predavanja i prateće laboratorijske vježbe, odnosno usvajanje vještina kroz praktičan rad u laboratoriju, pri čemu je u okviru redovne nastave poželjno predvidjeti i vrijeme namijenjeno učenicima bez dovoljnog predznanja.

II. AKTIVNO UČENJE U NASTAVI ICT-A

Tijekom predavanja nastavnik obično daje naglasak na prezentiranje teoretskih osnova. Stoga je takav način uglavnom usmjeren na nastavnika uz minorizirane učeničke aktivnosti, pa se traže načini uvođenja aktivnog učenja.

Naime, učenici aktivnije uključeni u vlastiti proces učenja motiviraniji su, razvijaju kvalitetnije vještine u povezivanju predznanja, novih ideja i prisjećanja informacija [4]. U okolinama aktivnog učenja učenici su aktivni u procesu učenja: osim što slušaju, oni i reflektiraju vlastiti proces učenja, razmišljaju o rješenjima problema i diskutiraju u grupama [5] [6].

U takvim, okolinama usmjerenim na učenika, učenici su u žarištu procesa učenja, postaju intrinsično motiviraniji, proaktivni su i iziskuju više informacija vezanih uz njihove osobne strategije učenja. Pri tom se uloga nastavnika mijenja u vođu koji im je podrška, pa kad imaju neka pitanja, vođa im daje sugestije, ali ne i konačno rješenje. Po potrebi im dodatno opisuje vježbe i postavlja im kritična pitanja kako bi im pomogao da počnu razmišljati o njihovim problemima.

S obzirom se kod poučavanja informacijskih tehnologija u srednjim školama (i u višim razinama obrazovanja) znanja mijenjaju i šire vrlo brzo, pokazuje se neadekvatnim žarište staviti na učenje i reprodukciju faktografskog znanja. Neizbježno i nastavnici i učenici neprestano trebaju obnavljati svoje predmetne vještine i

znanja. U takvoj se situaciji, stoga, adekvatnijim čini konstruktivistički naglasak na poučavanje vještina rješavanja problema umjesto na inzistiranje na faktografskom znanju.

Za ostvarenje takve nastave preporučene smjernice uključuju pristupe kao što su postavljanje autentičnih zadataka koji potiču radoznalost učenika, korištenje pogrešaka u smislu produktivne komponente procesa učenja, naglasak na konstrukciju, a ne reprodukciju znanja i ohrabrivanje dijaloga i kolaborativnog učenja [7].

Obećavajući pristup razvoju konstruktivističkih strategija unutar bihevioristično sustava je minimalistički pristup [8] koji podupire prirodne strategije učenika [9], a obilježavaju ga navedene odrednice:

• okolina učenja treba biti usmjerena na korisnika;

• učenici trebaju što prije početi na stvarnim zadacima;

• osigurati potporu za istraživanje, zaključivanje i improvizaciju;

• pogreške su neophodan dio procesa učenja;

• potrebno je snažno podržati prepoznavanje i popravljanje pogrešaka;

• na najmanju mjeru treba svesti ometajuće nastavne materijale;

• nastavni materijali trebaju biti strukturirani i modularni;

• korisnici ne bi smjeli biti ograničeni na predodređeni slijed učenja;

• korisnici bi trebali imati slobodan pristup onim nastavnim materijalima koje trebaju i ignorirati ostale.

Dodatno, sugestije nastavnicima koji žele prihvatiti konstruktivističke strategije, odnosno konstruktivistički (minimalistički) način poučavanja ICT-a bi bile:

• hrabriti i očekivati od učenika preuzimanje odgovornost za vlastito učenje;

• njegovati radoznalost i interes učenika;

• upotrebom suvremenih alata postavljati stvarne zadatke u autentičnim kontekstima;

• radije oblikovati doživljaje i okoline učenja nego birati nastavne strategije koje vode specifičnim ishodima učenja;

• postavljati otvorene zadatke očekujući da će ih učenici modificirati;

• u opisu zadataka koristiti različite medije i prikaze (priče, brojeve, pravila, statističke sažetke, fotografije, zvuk i video);

• koristiti stvarne, sirove podatke i primarne izvore i osigurati mnoštvo analitičkih alata;

• dozvoliti učenicima razvoj vlastitih razumijevanja iz različitih perspektiva, odnosno prihvatiti višestruke perspektive;

• zahtijevati od učenika „oluju mozgova“, stvaranje, otkrivanje, propitkivanje, klasificiranje, analiziranje i predviđanje;

• zahtijevati od učenika elaboraciju njihovih inicijalnih reakcija;

• usmjeravati učenike prema zadacima koji im mogu pomoći identificirati pogreške, suočavati se sa zabludama ili izazivati kontradikcije sa njihovim inicijalnim hipotezama;

• uvijek ispitivati razumijevanje učenika, čekati reakciju učenika i prihvatiti njihove odgovore prije dijeljenja opće prihvaćenih koncepata (naglašavati konstrukciju, a ne reprodukciju znanja);

• poticati dijalog i kolaborativno učenje;

• podupirati razvoj kognitivnih strategija i ponašanja kao i memoriranje verbalnih ili činjeničnih informacija, motoričkih i intelektualnih sposobnosti (Gagne, 1992);

• ocjenjivati i procese i ishode;

• više pomagati i voditi nego podučavati;

• zadržati otvoren um i prihvaćati da učenici neće uvijek učiti ono što nastavnik namjerava.

U obzir ipak treba uzeti i to da postoje sugestije kako konstruktivistički pristupi ne funkcioniraju za sve učenike, „malo je vjerojatno da su svi učenici jednako podesni da vrše vlastitu kontrolu, stimulacije i usmjeravanja“ (Davidson, 1995), no potreba za boljim utemeljenjem, istraživanjima i opisivanjem nove pedagogije poučavanja i učenja ICT-a kako bi se pomoglo nastavnicima primijeniti adekvatnije strategije u učionici, više je nego očita.

III. POUČAVANJE ALGORITAMSKOG RAZMIŠLJANJA

U širem smislu, algoritam može biti definiran kao niz “uređenih koraka koje treba poduzeti kako bi se riješilo problem ili dostiglo neki završetak.” (CSTA/ISTE, 2011a, p. 15). Prema toj definiciji bilo koji opis niza koraka za izvođenje bilo kojeg zadatka je algoritam (matematički dokazi, laboratorijski postupci, poslovni procesi i upute za sastavljanje proizvoda, bilo koji skup uputa koji može biti izražen dijagramom tijeka). Sukladno tome, algoritamsko razmišljanje primjenjivo je na širok raspon različitih domena: poslovnu, znanstvenu, matematičku, tehnološku i tehničku i time važno za poučavanje u školama te se nužnim pokazuje oblikovati kurikulum i pedagogiju poučavanja algoritamskog razmišljanja. U tablici u nastavku je primjer podskupa projekata predviđenih za K-12 stupnjeve.

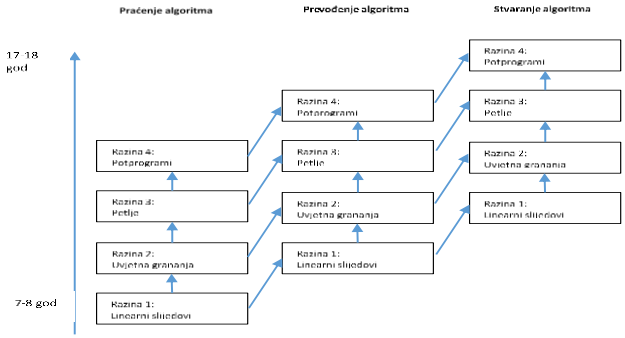
Pri tom je u procesu rješavanja problema potrebno osigurati da se “problemi oblikuju na način koji omogućuje korištenje računala i drugih alata koji će ih pomoći riješiti… automatiziranjem rješenja kroz algoritamsko razmišljanje” [10] što implicira da agentu koji će rješenje izvoditi (računalu ili osobi) ono treba biti jasno prenijeto.

Zbog toga možemo razmišljati o poučavanju algoritamskog razmišljanja kao poučavanju učenika da budu sposobni stvoriti niz uređenih koraka za izvršavanje zadatka i jasno komunicirati te korake drugoj osobi ili stroju koji će ih automatski izvoditi.

TABLICA I. KAKO POUČAVATI ALGORITAMSKO RAZMIŠLJANJE?

Starost	Algoritmi i postupci
7-8	Kreiraj grupu smjerova od škole do glavnih točaka za orijentiranje u susjedstvu.
8-11	Dizajniraj igru na ploči i napiši upute za igranje. Ispitaj upute na kolegama koji će pokušati igrati igru. Razradi upute na temelju povratnih informacija.
11-14	Programiraj robota da pronađe put iz labirinta, tako da iz bilo kojeg zadanog labirinta može u određenom vremenskom periodu uspješno izaći.
14-18	Diskutiraj proces donošenja odluke odabira fakulteta pa kreiraj algoritam koji opisuje taj proces. Algoritam treba biti u mogućnosti rukovati nepoznatim varijablama (npr. dostupnost financijske pomoći, uspjeh na prijemnom i sl.) kako bi doveo do nedvosmislene odluke.

Time se ujedno vrši dekompozicija algoritamskog razmišljanja na tri povezane vještine učenja koje učenici trebaju zadobiti: 1. Razumijevanje i ispravno praćenje algoritma (niza instrukcija rastuće složenosti); 2. Jasno izražavanje poznatog rješenja u obliku algoritma drugoj osobi ili računalu da ga izvede (prevođenje algoritma); 3. Stvaranje algoritma koji izvodi zadatak (vještina dizajniranja niza uređenih koraka za izvođenje zadataka.



Slika 1 Detaljna struktura plana učenja algoritamskog razmišljanja [11]

Na slici se vidi kako se na početno učenje linearnih nizova naredbi obično nadovezuju tri glavne upravljačke strukture koje modificiraju podrazumijevani niz: uvjetna grananja, petlje i potprogrami. Ostale specifične strukture i koncepti naprednih vještina algoritamskog razmišljanja (rekurzija, mjerenje brzine algoritama, dužine koda, različite optimizacije, konkurentni, paralelni i nedeterministički algoritmi) nadogradnja su na spomenute osnovne i mogu biti dodane kao nove razine povrh ovih.

U slučajevima kad poučavanje algoritamskog razmišljanja započinje prije poučavanja vještine programiranja isključena je upotreba programskih jezika za izražavanje algoritama [6], pa se koriste različiti drugi načini kao što su dijagrami tijeka (česti za izražavanje poslovnih procesa i koraka u računalnom programu), pseudokod (neformalni jezik koji programeri često koriste) ili riječi govornog jezika kojima se također mogu opisati nizovi koraka, zatim tehnički opisi karakteristični za priručnike o korištenju ili piktogrami (slični uputama za sastavljanje namještaja) kada nije poznat govorni jezik korisnika.

IV. RAZINE KOMPETENCIJE ALGORITAMSKOG RAZMIŠLJANJA

A. *Prepoznavanje i razumijevanje algoritama*

Najelementarnija razina algoritamskog razmišljanja je prepoznavanje algoritama i problema za čije rješavanje mogu poslužiti. Kako prepoznati što je algoritam? To je postupak koji može biti podijeljen na korake; moguće ga je implementirati (i postoji implementator kojem pripada); ima precizno određen poredak operacija koje izvodi; za vrijeme koraka nešto se s nečim događa; koraci su bilo neke elementarne akcije (koje implementator razumije) ili drugi algoritmi (što podrazumijeva daljnje specifikacije). Pri tom se razumijevanje odvija na dvije razine: razumijevanje onog što se treba učiniti i razumijevanje zašto se mora učiniti to, a ne nešto drugo.

Pitanje "zašto" pripada višim razinama razmišljanja, analizi algoritama, što znači prepoznavanje, poricanje, varijacije i izbor alternativa. Slično, sposobnost razumijevanja poznatog (već objašnjenog) i sposobnost razumijevanja apsolutno novog algoritma također predstavljaju različite razine znanja.

B. *Implementacija algoritama*

Sposobnost implementiranja algoritama je razina viša od razine razumijevanja, jer uključuje nadzor nad međufazama procesa za vrijeme implementacije (pamćenje, registriranje itd.). Pažnja se ne treba usmjeravati na ono što se događa, već na ono što treba učiniti slijedeće ovisno o određenim faktorima.

C. *Analiziranje algoritama*

Analiziranje algoritama dijelom obuhvaća prepoznavanje osnovnih pravila stvaranja algoritama: svaki se osnovni korak izvodi (danim redoslijedom); treba izabrati jedan od osnovnih koraka i izvesti ga; osnovni se koraci trebaju izvesti više puta ponavljajući ih.

Analiziranje algoritama uključuje i razumijevanje uloge njihovih dijelova, razumijevanje cilja prilikom njihove izrade i razumijevanje načina kako je čitav proces rješavanja problema rastavljen na manje podzadatke. Tu također spada i sposobnost čitanja algoritama, što znači sposobnost razumijevanja složene aktivnosti oblikovane od strane nekog drugog nekim algoritamskim jezikom: uviđanje svrhe dijelova, njihovih veza sa drugim dijelovima i odgovarajućih objašnjenja.

D. *Izrada algoritama*

Uključuje razmatranje: što je poznato; što bi trebalo postati poznato; što će se dogoditi; sa kojim podacima treba raditi; kako razbiti zadatke u manje podzadatke.

Pri tom je potrebno nalaziti načine sužavanja beskonačnog skupa algoritama na relativno manji. Kreativni proces ovdje je izbor i spajanje odgovarajućih algoritamskih shema i njihovo prilagođavanje konkretnim aktivnostima. Uspostava sustava shema zahtjeva razmišljanje o analogijama i apstraktno razmišljanje, razlikovanje između esencijalih i irelevantnih obilježja, apstrakciju, prepoznavanje sličnosti, prepoznavanje analogija.

E. *Realizacija algoritama*

Algoritam je potrebno opisati alatom i na način pogodan za izvođenja računalom. Podrazumijeva se potreba učenja upotrebe alata (programskog jezika) za zapisivanje algoritma. Pri tom pojedini alati također imaju svoje specifične načine razmišljanja koje treba usvojiti.

Kako se besprijekorne stvari rijetko izvedu odmah, potrebno je uočiti da li je stvoreni algoritam ispravan i prepoznati i ispraviti pogreške ako ih ima. Programska okolina učinit će ovu aktivnost učinkovitijom, no ispitivanje ipak zahtjeva dosta razmišljanja. Nakon otkrivanja pogreške, potrebne su analitičke sposobnosti za njihovo uspješno otklanjanje.

F. *Modifikacija i promjena algoritama*

Za razumijevanje algoritama drugih autora potrebno je shvatiti implementaciju, razumjeti način razmišljanja i razloge za baš takav način stvaranja, prepoznati mogućnosti izmjena i učinkovitih intervencija itd. kako bi ih se prilagodilo ili učinilo upotrebljivim.

G. *Dizajniranje složenih algoritama*

U ovim postupcima uloženi rad ne raste linearno s rastom veličine algoritma, a važno je uočiti i da cjelokupan zadatak može biti obavljen postizanjem podciljeva i dobrom sintezom [12].

V. RAZINE UČENJA PROGRAMIRANJA

Na usvajanje vještine algoritamskog razmišljanja tijekom usvajanja ICT kompetencija nadovezuje se učenje programiranja. Opsegom ono je najzastupljenije u strukovnim školama u sektoru Elektrotehnika i računalstvo i to za zanimanje Tehničar za računalstvo (programerski izborni modul novog kurikuluma).

Za učenje programiranja može se definirati skup važnih kompetencija koje se mogu klasificirati u razine:

Slika 2. Razine učenja programiranja

Simulacija algoritama znači „igranje“ danim algoritmom (npr. brojevima). To je korak u kojem svi učenici ne moraju u potpunosti razumjeti dani algoritam. Kako bi se utvrdilo razumije li stvarno učenik algoritam može se od njega tražiti da ga objasni nekom drugom.

Dopunjavanje algoritama je kompetencija u kojoj učenici trebaju biti sposobni dopuniti neke nedostajuće informacije u nedovršenim algoritmima.

Pisanje algoritama znači kompetenciju nalaženja i zapisivanja rješenja problema. Pri tom se zapisivanje može vršiti riječima govornog, materinjeg jezika, pseudokodom ili naredbama specifičnog programskog jezika.

Poboljšavanjem se primjeri algoritama popravljaju prepoznavanjem redundatnog koda ili traženjem učinkovitijeg rješenja.

U tablici je naveden primjer ciljeva učenja za temu varijable i pridruživanje [13].

TABLICA II. RAZRADA CILJEVA UČENJA

Koraci	**Cilj učenja: Upotreba varijabli**	**Objašnjenje**
Simuliranje	Simuliranje pridruživanja varijabli	Simuliranje pridruživanja upotrebom jedne ili dvije varijable.
Razumijevanje	Razumijevanje pridruživanja	Učenik razumije jednostavne algoritme u kojima se koristi do pet varijabli.
Upotpunjavanje	Upotpunjavanje pridruživanja	Učenik je sposoban dopuniti nepotpune ili izostavljene naredbe pridruživanja varijabli.
Pisanje	Pisanje pridruživanja	Učenik je sposoban pisati jednostavan algoritam u kojem se na odgovarajući način koristi do tri varijable.
Poboljšanje	Poboljšanje pridruživanja	Učenik je u stanju poboljšati dana pridruživanja u aspektu izbjegavanja redundantnog koda ili da bi pronašao brže rješenje problema.

Pri učenju programiranja učenici trebaju razviti vještinu sustavnog otkrivanja preciznih koraka za rješavanje problema i savladati tri tipa programerskog znanja: sintaktičko, konceptualno i strategijsko [5]. Sintaktičko znanje odnosi se na razumijevanje značenja izraza u nekom programskom jeziku i usporedivo je sa poznavanjem riječi i gramatičkih pravila bilo kojeg govornog jezika. Konceptualno znanje tiče se konstrukata i principa programiranja s ciljem razvoja odgovarajućih mentalnih modela. Strateško znanje odnosi se na vještine razumijevanja i strukturiranja problema i rješavanja problema konstruiranjem upotrebljivog algoritamskog rješenja.

Kroz povratnu vezu važno je učenike motivirati, davati im naputke za poboljšanje njihovog rješenja i upute za druge vrste vježbi čijim bi rješavanjem poboljšali svoje kompetencije u programiranju.

Uz to, sadržaje predavanja poželjno je harmonizirati i produbiti predviđenim pratećim laboratorijskim vježbama namijenjenim prakticiranju odgovarajućih vještina na različitim razinama, najbolje u trajanju 45 do 60 minuta uz individualne načine, procese i strategije učenja i to nakon što se prodiskutiraju otvorena pitanja i nakon objašnjavanja novih zadataka. Posljednjih petnaestak minuta može se predvidjeti za prezentiranje rješenja, odnosno rezultata.

VI. SADRŽAJI IZ UDŽBENIKA KAO POTPORA RAZVOJU ALGORITAMSKOG NAČINA RAZMIŠLJANJA

U svrhu uvida koliko pristupom, koncepcijski i sadržajno udžbenici iz informatike pomažu razvoju algoritamskog načina razmišljanja izvršen je uvid u pet odobrenih udžbenika različitih autora i nakladnika.

- Galešev, Korać, Soldo, Sokol, Kocijan: Informatika i računalstvo, udžbenik za srednje strukovne škole, SysPrint Zagreb, 2014.
- Galešev, Brođanac, Dmitrović, Korać, Sokol, Babić, Soldo, Kovač: Informatika i računalstvo, udžbenik za gimnazije i srednje škole, SysPrint Zagreb, 2014.
- Grundler, Šutalo: Računalstvo, udžbenik za 1. i 2. razred četverogodišnjih strukovnih škola, Školska knjiga, Zagreb, 2008.
- Gvozdanović, Ikica, Kos, Milijaš, Milijaš, Srnec, Šekulić-Štivčević, Zvonarek: Računalstvo/Informatika udžbenik za 1., 2.. i 3. razred strukovnih škola, PRO-MIL Varaždin, 2009.
- Kralj, Linardić, Sudarević: www informatika, udžbenik informatike i računalstva za gimnazije i srednje škole, Profil, Zagreb, 2013.

Pregledana su poglavlja koja obrađuju srodne sadržaje sa nazivima: Rješavanje problema programiranjem, Agoritmi i osnovni algoritamski postupci, Uvod i osnove programiranja, Programski jezici i načela programiranja, Vrste instrukcija i računalni program, Rješavanje problema i programiranje, Programiranje i programski jezici.

Svi udžbenici korektno slijede nastavni plan, odnosno kurikulum i faktografski objašnjavaju ideje, pristupe i znanja o pojmovima i povezanosti algoritama, programskih jezika i načelima programiranja.

Razlike najčešće proizlaze iz opsežnosti stranica namijenjenih određenim temama čemu su ponajviše razlog razlike u trajanju i vrstama škola za koje su namijenjeni (srednje strukovne škole trogodišnjeg i četverogodišnjeg trajanja, gimnazije), tako da primjerice pojedini udžbenici osnove razvoja algoritama ne vežu uz određeni programski jezik nego samo uz odgovarajući tekstualni ili slikovni zapis (pseudokod, dijagrami tijeka), dok drugi uključuju poglavlja sa objašnjenjima naredbi odabranog programskog jezika (C++, C#, Python).

Iako korektni u svom pokrivanju važećih kurikuluma (ne sasvim i za nove eksperimentalne programe), moguće je u njima otkriti iznošenje činjenica koje bi mogle izazvati polemiku kao što je npr. usporedba djeteta sa računalom, činjenica da gotove dijelove programa zovemo objektima, zatim da definirati varijablu znači pridružiti joj vrijednost ili termin „petlja s uvjetom na vrhu“, te da li je strukturno programiranje isto što i top-down programiranje.

Opći je dojam da prezentiranim pristupom sam razvoj algoritamskog razmišljanja u pregledanim udžbenicima nije odgovarajuće zastupljen, da ima dobrih primjera i zadataka no da se o svim relevantnim područjima još uvijek piše uglavnom faktografski bez dovoljno potpore uvođenju suvremenijih nastavnih metoda i nuđenja učenicima aktivnije uloge u nastavnom procesu.

VII. RAZVOJ ALGORITAMSKOG NAČINA RAZMIŠLJANJA BEZ RAČUNALA NA NATJECANJIMA UČENIKA

Natjecanja u programiranju podupiru razvoj vještina algoritamskog razmišljanja i programiranja, no prilagođena su grupi učenika koji znaju i mogu pisati programe i koji su upoznati s bar nekim tehnikama programiranja. Kako bi privukli učenike koji programiranju (još) nisu vješti, trebalo bi im omogućiti rješavanje zadataka koji traže određeno algoritamsko razmišljanje, ali ne i programiranje. Popularizacija učenja programiranja među takvim učenicima može se izvesti dobro izabranim zadacima koji zahtijevaju različite razine algoritamskog razmišljanja bez da im se prezentiraju kao zadaci za programiranje. Ujedno, takvi zadaci najčešće su vrlo pogodni za inicijalnu edukaciju vještine algoritamskog razmišljanja.

Dobro je da su zadaci utemeljeni na jednostavnim konceptima, po mogućnosti popraćeni crtežom kako bi im se povećala atraktivnost i da imaju kratku formulaciju. Učenik bi trebao biti sposoban jedinstveno rješenje dobro formuliranog zadatka s minimalnim brojem proračuna pronaći u 5 minuta. Zaključno, poželjno je da rješenje uključuje neke od ključnih koncepata računalne znanosti i algoritama, no iz same formulacije zadatka treba izuzeti korištenje bilo kojeg koncepta programiranja. Također, prihvatljivi su i zadaci koji ohrabruju učenike u izvođenju verifikacije ispravnosti njihovih rješenja [14].

Posljednjih godina niz država prihvatio je slične pristupe (South Africa od 2003. sa značajnim stupnjem sudjelovanja učenika, Australia od 2005., Litva kroz Bebras (Beaver) u 2004. i otada se širi u mnoge europske države). Bebras kontest jedna je od važnih međunarodnih aktivnosti koje promoviraju računalnu znanost u primarnim i sekundarnim školama (the Beaver competition, Beaver of Informatics [15]). Žarište natjecanja nije na korisničkom pristupu i informacijskim tehnologijama, nego preferira pitanja i teme iz osnova područja računalne znanosti, kao što su npr. algoritmizacija, razumijevanje informacija i njihovog predstavljanja, kao i matematičke i logičke osnove računalne znanosti. Natjecanju pristupaju i učenici u kategoriji osmogodišnjih.

Već spomenuti Australian Informatics Competition (AIC) je natjecanje sa zadacima koji se rješavaju bez računala i koji ne zahtjevaju programersko iskustvo ni poznavanje pseudokoda. Većina pitanja fokusira se na ispitivanje algoritamskih sposobnosti, dok se ostatak odnosi na primjenu pravila i upotrebu logike u rješavanju problema. Algoritamska pitanja uključuju standardne algoritme kao što su pretraživanje u širinu, dinamičko programiranje i igre za dvije osobe, kao i ad-hoc algoritme specifične za određeni scenario. Podatak koji ne uključuje on-line natjecatelje govori o 7000 učenika koji pristupaju natjecanju. Dodatno, AIC je postao relevantniji uvođenjem algoritamskog razmišljanja kao komponente predmeta kurikuluma za digitalne tehnologije.

Sustavan pristup rješavanju problema na natjecanju se promovira zadacima u tri stupnja predviđenih rješavanju malog problema sa tri skupa podataka. Prvi je skup podataka mali ili dovoljno jednostavan kako bi bio osjetljiv na ad-hoc tehnike, uz nadu da će biti dovoljno dobra baza kako bi učenici dobili osjećaj za problem i razvili algoritam koji se može upotrijebiti u preostalim skupovima podataka.

Najveći broj pitanja ulazi u četiri široke kategorije: primjena pravila, logika, analiza i algoritmi. [16].

i) Primjena pravila - zahtjeva od učenika da primjenjuju dobro definirana pravila na skup podataka. Uglavnom su to jednostavni zadaci koji od učenika traže da prolaze kroz zadani postupak ili slijede dobro definirani skup naredbi. Time se ispituje sposobnost učenika da razumiju i slijede zadani algoritam, što je važan preduvjet razvoja vlastitih algoritama.

ii) Logika - uključuje nealgoritamske zagonetke koje mogu zahtjevati prilično rigorozno rasuđivanje i analizu slučaja, esencijalnih vještina za dizajn algoritama.

iii) Pitanja analize - od učenika traže da određuju broj operacija koje određeni algoritam na skupu podataka iziskuje. Učenici pri tom ispituju dobre strane i slabosti danog algoritma ili problema što im omogućuje upoznavanje sa analizom složenosti algoritma. Također, učenici trebaju analizirati ponašanje danog algoritma i/ili problema koji je u pozadini algoritma. Takav zadatak može tražiti i približan broj koraka ili scenarij najgoreg slučaja, ohrabrujući tako razmišljanje o računskoj složenosti i patološkim slučajevima. Zatim, od učenika se može tražiti da nađu pogrešku u nizu naredbi *("debugging")* ili da upotpune iscrpan skup ulaznih scenarija *("testing")* i tako razviju odgovarajuće vještine. Svrha zadataka analize je ohrabrivanje vještina važnih za dizajn algoritama jer programeri trebaju biti sposobni analizirati ispravnost, učinkovitost i robustnost njihovog vlastitog koda [17]. Popularno pitanje analize je brojanje različitih puteva u mreži.

iv) Algoritamska pitanju su centralna i sva su optimizacijska. Učenike se ohrabruje da razviju neformalni, ali učinkovit i ispravan algoritam kako bi riješili zagonetku. Popularna su pretraživanja u širinu, a uobičajeno je i dinamičko programiranje kao i igre pitanja za dvije osobe te dobri ad-hoc problemi koji zahtjevaju vlastite algoritme posebne namjene.

Bugarsko natjecanje Chernorizets Hrabar uključuje zanimljive zadatke analize različitog tipa. Za dani algoritam izražen kodom, pseudokodom ili dijagramom tijeka od učenika se zahtjeva da razumiju algoritam i otkriju koji on zadatak izvodi (tipično neka vrsta numeričkog zadatka, kao što je potenciranje, zbrajanje ili traženje korijena). Žarište je na algoritmima i algoritamskom razmišljanju.

ZAKLJUČAK

Ovaj je rad pokušaj naglašavanja kako i kurikulum i pedagogija poučavanja važnih vještina u području informacijskih tehnologija, osobito algoritmskog razmišljanja, možda središnje komponente računalske znanosti, zahtjevaju više pažnje i bitnije mjesto u obrazovanju učenika za izazove tehnološki naprednog društva.

Upravo je kod poučavanja informacijskih tehnologija posebno očit konflikt između tradicionalnog i suvremenog pristupa obrazovanju učenika. Obrazovanje upotrebom modela poučavanja temeljenih na linearnim i konačnim konceptima znanja i razumijevanja neće im pomoći da uspiju u globalno tehnološki bogatoj budućnosti. Sasvim konkretno, učenje i poučavanje ICT-a inherentno su konstruktivističke aktivnosti. Nova bi pedagogija (u kurikulumu, izvođenju nastave i pratećim nastavnim materijalima) trebala voditi nastavnike u upotrebi konstruktivističkih pristupa i osigurati učinkovitije strategije poučavanja.

Zato ne čudi zabrinutost zbog toga što je usvajanje algoritamskog načina razmišljanja podzastupljeno u školskim kurikulima mnogih država, a i tamo gdje se pojavljuje postoje poteškoće u implementaciji zbog nedostatka potpore ili resursa.

Kriteriji vrednovanja rada nastavnika od strane njihovih studenata

Mandi Orlić Bachler* i Marija Marinović **
*Tehničko veleučilište u Zagrebu, Zagreb, Hrvatska
**Odjel za informatiku, Sveučilište u Rijeci, Rijeka, Hrvatska
morlic1@tvz.hr, marinm@inf.uniri.hr

Sažetak - Proteklih nekoliko godina, putem ISVU sustava, na visokim učilištima Repubike Hrvatske provodi se anketiranje studenata u svrhu utvrđivanja stupnja zadovoljstva ili nezadovoljstva radom nastavnika i asistenata koji sudjeluju u realizaciji njihova nastavnog procesa. U ovome radu prikazujemo rezultate ankete, koju smo proveli među studentima sa Odjela za informatiku Sveučilišta u Rijeci i studentima Tehničkog veleučilišta u Zagrebu. Istražili smo koji čimbenici i u kojoj mjeri utječu na valorizaciju rada nastavnika od strane njihovih studenata.

I. UVOD

U Pravilnik o mjerilima i kriterijima za vrednovanje kvalitete i učinkovitosti visokih učilišta i studijskih programa iz 2004. godine, Ministarstvo znanosti, obrazovanja i sporta Republike Hrvatske uvrstilo je anketiranje studenta kao obvezni unutarnji mehanizam za osiguranje kvalitete na visokim učilištima [1]. Međutim, uz tu zakonsku odredbu, anketiranje studenata nužno je provoditi i stoga što je pozitivna ocjena nastavnika od strane studenata, dobivena na osnovi analize rezultata *Ankete za procjenu rada nastavnika*, jedan od uvjeta za izbor u više znanstveno-nastavno zvanje. Posljednjih nekoliko godina visoka učilišta anketiranje studenata provode jednom semestralno putem ISVU sustava. Na taj način studentima je omogućeno da potpuno anonimno iskažu svoje zadovoljstvo ili nezadovoljstvo kvalitetom rada nastavnika i asistenata na svakom pojedinom kolegiju. Međutim, na rezultate ankete djeluju brojni čimbenici, poput zainteresiranosti studenata za određeni kolegij, redovitost pohađanja nastave, uspjeh (ocjena) postignut na kolokvijima ili završnom ispitu, percepcija da se ispunjavanjem anketa ništa ne postiže, zadovoljstvo komunikacijom na relaciji nastavnik student i sl.

Cilj ovoga rada je na osnovi provedene ankete među studentima sa Odjela za informatiku Sveučilišta u Rijeci i studentima Tehničkog veleučilišta u Zagrebu, istražiti koji čimbenici i u kojoj mjeri utječu na valorizaciju rada nastavnika od strane njihovih studenata.

II. METODOLOGIJA ISTRAŽIVANJA

Rad se temelji na empirijskom istraživanju, koje je provedeno tijekom siječnja 2015. godine među studentima Odjela za informatiku Sveučilišta u Rijeci i studentima Tehničkog veleučilištu u Zagrebu. Ispitivanjem je obuhvaćeno ukupno 227 studenata (80% muškaraca i 20% žena), od čega ih je 80 sa Odjela za informatiku, a 147 s Tehničkog veleučilišta u Zagrebu.

Anketom su bili obuhvaćeni samo studenti viših godina jer studenti prve godine u siječnju 2015. godine još nisu imali mogućnost putem ISVU sustava popuniti *Anketu za procjenu rada nastavnika*.

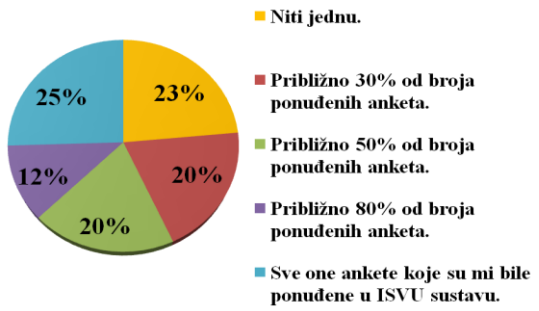
Anketni upitnik koji smo koristili sačinjen je isključivo za potrebe ovog istraživanja, a sastoji se od ukupno 13 pitanja. Od tog broja 10 pitanja je zatvorenog tipa dok su tri pitanja poluzatvorenog tipa, jer pored ponuđenih odgovora studenti imaju mogućnost dopisivanja odgovora po želji. Rezultati su se ovisno o tipu pitanja dobivali zaokruživanjem jednog ili više ponuđenih odgovora ili pak slobodnim upisivanjem odgovora na za to predviđeno mjesto. Popunjavanje anketnog lista provedeno je individualno, a ispitanicama su upute za popunjavanje te objašnjenje o svrsi uporabe dobivenih podataka dane u pismenom obliku u prilogu anketnog lista.

III. REZULTATI ISTRAŽIVANJA

Zbog lakšeg snalaženja i bolje preglednosti, u ovom djelu radu svako je pitanje pojedinačno obrađeno.

U prethodnom poglavlju navedeni su rezultati prva dva pitanja iz ankete, koja se odnose na spol studenta i visoko učilište kojeg pohađa.

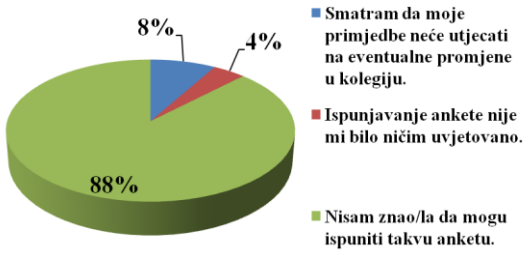
Pitanjem broj tri (**Koliko *Anketa o procjeni rada nastavnika* ste do sada ispunili?**) željeli smo utvrditi koliko često studenti popunjavanju *Anketu za procjenu rada nastavnika*, odnosno koliko ih nikad nije ispunilo takvu anketu. Na grafu sa Slike 1. vidi se da 53 (23%)



Slika 1. Koliko *Anketa o procjeni rada nastavnika* ste do sada ispunili?

ispitanika nikad nije sudjelovalo u vrednovanju rada nastavnika, dok je njih 58 (25%) ispunilo sve Ankete o procjeni rada nastavnika koje su bile ponuđene u ISVU sustavu. Približno 30% od broja ponuđenih anketa ispunilo je 45 (20%) studenta. Isto toliko studenata odgovorilo je da je ispunilo približno pola od ponuđenog broja anketa. Njih 27 (12%) procjenjuje da je odogovorilo na oko 80% od broja ponuđenih anketa.

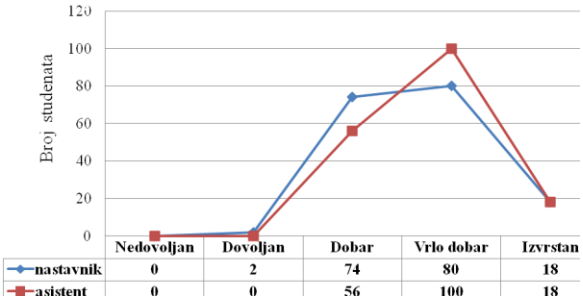
Četvrtim pitanjem (***Anketu o procjeni rada nastavnika* nikada nisam ispunio/la iz sljedećeg razloga: (a) Nisam bio/la raspoložen/a za ispunjavanje ankete. (b) Smatram da moje primjedbe neće utjecati na eventualne promjene u kolegiju. (c) Ispunjavanje ankete nije mi bilo ničim uvjetovano. (d) Nisam znao/la da mogu ispuniti takvu anketu. (e) Držim da anketa nije u potpunosti anonimna, jer se ispunjava putem ISVU sustava. (f) neki drugi razlog**) pokušali smo utvrditi razloge eventualnog neodazivanja studenata popunjavanju ankete. Od 53 studenta, koji nikada nisu popunili *Anketu za procjenu rada nastavnika*, njih čak 88% odgovorilo je da to nisu načinili jer nisu znali da takvu anketu uopće mogu ispuniti. Nadalje, 8% od tog broja studenta to nije napravilo jer smatra da njihove primjedbe neće utjecati na eventualne promjene u kolegiju, dok dva (4%) studenta kao jedini razlog navodi da im popunjavanje ankete nije bilo ničim uvjetovano (Slika 2.). Preostale ponuđene odgovore nije zaokružio niti jedan student.



Slika 2. *Anketu o procjeni rada nastavnika* nikada nisam ispunio/la iz sljedećeg razloga: (a) Nisam bio/la raspoložen/a za ispunjavanje ankete. (b) Smatram da moje primjedbe neće utjecati na eventualne promjene u kolegiju. (c) Ispunjavanje ankete nije mi bilo ničim uvjetovano. (d) Nisam znao/la da mogu ispuniti takvu anketu. (e) Držim da anketa nije u potpunosti anonimna, jer se ispunjava putem ISVU sustava. (f) neki drugi razlog

Na peto pitanje (**Koje od sljedećih tvrdnji najbolje pojašnjavaju razloge zbog kojih ste ispunili *Anketu o procjeni rada nastavnika*? (a) Ankete sam ispunio/la samo zato što mi je to bilo uvjetovano u ISVU sustavu, inače ne bih. (b) Ankete sam ispunio/la uglavnom zato što sam želio/željela pohvaliti rad nastavnika/asistenta. (c) Ankete ispunio/la uglavnom zato što sam želio/željela iskazati nezadovoljstvo radom nastavnika/asistenta. (d) Ankete sam ispunio/la jer to smatram svojom dužnošću. (e) Ankete sam ispunio/la jer ih držim dobarim načinom za iskazivanje svoga mišljenja o radu nastavniku/asistentu te sadržaju kolegija. (f) Neki drugi razlog**) odgovorila su 173 studenta. U ovom pitanju studenti su mogli zaokružiti više ponuđenih odgovora. Odgovor da je *Anketa o procjeni rada nastavnika* dobar način za iskazivanjem mišljenja o radu nastavnika/asistenta te sadržaju kolegija misli 74 studenta, dok je 62 studenata ispunilo ankete samo zato što im je to bilo uvjetovano. Pohvaliti rad nastavnika/asistenta ispunjavanjem ankete željelo je 49, dok je svoje nezadovoljstvo njihovim radom na isti način željelo iskazati 42 studenata. Popunjavanje ankete 74 studenata smatra svojom dužnošću. Nitko od ispitanika nije naveo niti jedan drugi razlog.

Odgovori na pitanja broj šest (**Zaokružite ocjenu kojom ste najčešće ocijenili rad nastavnika?**) i sedam (**Zaokružite ocjenu kojom ste najčešće ocijenili rad asistenta?**) prikazani su grafički na Slici 3. Prosječna ocjena kojom studenti, neovisno o kolegju, ocjenjuju rad asistenta iznosi 3.78, a nastavnika 3.66.



Slika 3. Zaokružite ocjenu kojom ste najčešće ocijenili rad nastavnika/asistenta?

U osmom pitanju (**Na ocjenu rada nastavnika/asistenta utjecalo je sljedeće: (a) Pokušala sam biti objektivn/a te dati ocjenu koja najbolje opisuje njegov rad; (b) Zadovoljstvo konačno postignutim rezultatom; (c) Jednostavnost odnosno složenost nastavnog sadržaja; (d) Jednostavnost odnosno složenost polaganja ispita; (e) Zadovoljstvo odnosno nezadovoljstvo komunikacijom na relaciji nastavnik student; (f) nešto drugo.**) studenti su odgovorili koji čimbenici utječu na njihovu ocjenu o radu nastavnika/asistenta. Na ovo pitanje studenti su mogli odgovoriti zaokruživanjem više ponuđenih odgovora. Od 173 studenta, koja su dala odgovor na ovo pitanje, njih 141 smatra da je bilo objektivno pri ocjenivanju rada nastavnika/asistenta. Na danu ocjenu kod 45 ispitanika utječe kvaliteta komunikacije na relaciji nastavnik/asistent student, dok ih 31 ocjenu temelji na zadovoljstvu svojim konačnim uspjehom na kolegiju. Jednostavnost, odnosno složenost, nastavnog sadržaja kod njih 29 utječe na ocjenu danu nastavniku/asistentu, a kod 18 je to jednostavnost, odnosno složenost, polaganja ispita.

Na pitanje broj devet (**Imate li saznanja o tome kako se vaši kolege dogovaraju da određenog nastavnika/asistenta treba negativno ocijeniti?**) odgovorilo je 174 studenata. Od toga broja 64% dalo je negativan odgoovor. Preostala 62 (36%) studenata odgovaralo je na deseto pitanje (**Jeste li i koliko često sudjelovali u načinu ocjenjivanja rada nastavnika/asistenata na način opisan u pitanju broj 9?**). Odgovor "Nikad" zaokružilo je 18 (29% od 62), "Ponekad" 44 (26% od 62) studenta, dok odgovore "Uvijek" i "Ne želim odgovoriti na ovo pitanje" nije zaokružio nitko.

Na posljednja tri pitanja odgovorilo je svih 227 anketiranih studenata.

Pitanjem broj 11 (**Znate li da je pozitivna ocjena o radu nastavnika, temeljena na rezultatima Ankete za procjenu jedan od uvjeta za njegov izbor ili reizbor u znanstveno-nastavno zvanje?**) željeli smo ispitati koliko su studenti informirani tome na koji način i u kojoj mjeri rezultati *Ankete za procjenu rada nastavnika* utječu na ocjenjene nastavnike, odnosno asistente. Pozitivan odgovor na postavljeno pitanje dalo je 30% od ukupnog broja anketiranih studenata.

Osim putem službenih Anketa za procjenu rada nasatvnika visokih učilišta, studenti imaju mogućnost, potpuno anonimno i javno, iskazati svoje mišljenje o radu nastavnika, odnosno asistenata, putem web stranice www.studokracija.com, a koju uređuju bivši i sadašnji studenti [2].

S posljednja dva pitanja u anketi željeli smo ispitati jesu li studenti upoznati s navedenom web stranicom te kolika je njihova zainteresiranost za takav način iskazivanja mišljenja o svojim nastavnicima/asistentima. Na pitanje broj 12 (**Jeste li čuli za web stranicu studokracija.com?**) pozitivno je odgovorilo samo 20 (9%) anketiranih studenata. Od tog broja 78% pozitivno je odgovorilo na pitanje broj 13 (**Jeste li ikada ocijenili ili komentirali rad nastavnika/asistenta putem web stranice studokracija.com?**).

IV. ZAKLJUČAK

Na temelju rezultata, dobivenih ovim istraživanjem, proizlazi da je relativno mali broj studenata zainteresiran za ispunjavanje Anketa o procjeni rada nastavnika. Iz čega posljedično slijedi da se na temelju studentskih anketa, za samo mali broj nastavnika (odnosno kolegija) mogu dobiti relevantni podaci o kvaliteti njihova rada.

Iako smo utvrdili da na kriterije vrednovanja rada nastavnika od strane njihovih studenata utječu brojni čimbenici, rezultati dobiveni analizom studentskih anketa predstavljaju jedan od bitnih elemenata za postizanje odgovarajuće razine kvalitete visokih učilišta.

Budućnost eUčenja

Martina Sertić
Industrijsko-obrtnička škola Slavonski Brod, Republika Hrvatska
Klasična gimnazija Slavonski Brod, Hrvatska
sertic_79@yahoo.com

Sažetak - Ovaj rad trebao bi predstaviti neke od sadržaja vezanih uz eUčenje. Navedeni sadržaji mogli bi i trebali bi se u budućnosti sve više razvijati, a potom i koristiti u obrazovne svrhe kod budućih naraštaja učenika, studenata i obrazovanja odraslih. Kroz kraće istraživanje, u radu će se provjeriti stavovi učenika srednjih škola i polaznika obrazovanja odrasli o ovoj temi. U navedenom istraživanje iznijeli bi se stavovi učenika, polaznika obrazovanja odraslih o upotrebi obrazovnih sadržaja u njihovom školovanju i budućem zanimanju. Obrazovni sadržaji obuhvatili bi dobar dio *online* alata koji se danas koriste u nastavi kao dio potrebe globalnog umrežavanja društva i gospodarstva.

I. UVOD

Za Web 2.0 može se reći da je to interaktivni i društveni web čija je funkcija olakšati suradnju među ljudima. On se razlikuje od ranog Weba 1.0 koji je bio statična informacija i mjesto gdje se web stranice samo čitaju, ali rijetko kada ostvaruju bilo kakve interakcije s njima. A što je zapravo Web 3.0? To je sljedeća temeljna promjena na razini interneta i informacija koje će se prenositi i trebale bi se prenositi kao web stranice u interakciji s ljudima.
U radu će se ukratko definirati pojam informacije, informacijske infrastrukture bez koje ne bi bilo ni Weba 1.0, 2.0, 3.0. Ponajviše će se osvrnuti na razvoj Web 2.0 usluga, njihovih osnovnih svojstava, načina primjene i razvoja tehnologije.

Podrobnije će biti navedeni neki Web 2.0 servisi na društvenim mrežama, servisi za obradu fotografija, video zapisa i ostalih grafičkih sadržaja. Tako će se spomenuti i nešto ukratko reći o YouTubu, Vimeu, Slidesixu, Masheru, Stupeflix servisima, web sadržajima za razmjenu fotografija Aviary; sadržajima društvenih mreža Linkedlnu, Deliciousu, Diigou i StumbleUponu.

U zadnjem poglavlju navedeno je nekoliko osnovnih svojstava i razloga moguće primjene Web 3.0 tehnologije. [1]

II. WEB 2.0

Web 2.0 ostvaruje se kroz World Wide Web tehnologiju koja se zasniva kao društvena veza s korisnicima i omogućava sudjelovanje u stvaranju sadržaja weba, te podržava interaktivnu komunikaciju između korisnika, računala, korisnika i drugih korisnika, čime korisnik od pasivnog postaje aktivni sudionik. Društveno umrežavanje osnova je Web 2.0 tehnologije, pri čemu je korisnik u središtu pozornosti kao individua koja kreira sadržaje pomoću raznih mrežnih servisa *blogova,* foruma, fotografija, mrežnih enciklopedija, društvene mreže, video zapisa i dr. [1]

Osnovne karakteristike Web 2.0 su otvorenost, sloboda, cjelovitost i praktična primjena. Korisnici mogu koristiti programe preko web preglednika, a sama arhitektura Weba 2.0 u osnovi potiče korisnika da za vrijeme korištenja aktivno sudjeluje u stvaranju novih sadržaja. [1]

Web 2.0 kao primijenjena *online* tehnologija zahtijeva objavljivanje i aktivan rad. Većinom su to *hosting* usluge s dovoljno prostora za objavu sadržaja. Internet je postao otvoreno tržište na kojem možemo pristupiti bilo čemu kad god želimo. Koncept današnjeg interneta potpuno je drugačiji nego u početku. Današnje Internet usluge neprestano potiču svoga korisnika na interakciju i kreiranje sadržaja kojem pristupa. Najatraktivniji sadržaji nastali primjenom web 2.0 alata su: *blogovi, wiki* sadržaji, *podcastovi*, društvene mreže i slične usluge. [2]

Web 2.0 alati skupina su društvenih programskih alata koji korisnicima omogućavaju interakciju i razmjenu podataka te objavu i izmjenu internetskog i drugog digitalnog sadržaja pri čemu korisnik sam stvara svoje sadržaje. Podržavaju *online* učenje, kupovinu, prodaju, oglašavanje, distribuciju i na taj način potiču veću razinu kreativnosti i interakcije. Mnoštvo besplatnih sadržaja i alata na jednome mjestu, te inovativno korištenje tehnologije, zajednički pristup internetu i informacijama učinili su web 2.0 popularnim kod mnogobrojnih korisnika. [2]

Web 2.0 stvorio je novog čovjeka koji je spreman kvalitetno koristiti sve što mu web 2.0 tehnologija nudi. On postaje konzument onoga što stvara, usavršava se i oblikuje u skladu s novim mogućnostima i zahtjevima

tržišta i korisnika. Stvorena je neka nova internet Google generacija stvaralaštva, komunikacije i kreacije.

III. WEB SADRŽAJI ZA PRIKAZ GRAFIČKIH APLIKACIJA

Web sadržaji koji omogućavaju prikaz grafičkih aplikacija pružaju korisniku interneta velike mogućnosti. Ovi web sadržaji dopuštaju na jednostavan način pregledavanje, postavljanje, kreiranje zvučnog, video i ostalih grafičkih sadržaja. Neki od takvih alata navedeni su dolje u tekstu. Jednostavni su i praktični za korištenje, a nalaze se većinom na navedenim web adresama. Ovi sadržaji pružaju razne mogućnosti npr. *tagiranje* ili označavanje pojedinog sadržaja, kreiranje biblioteka i profila sličnih interesnih mogućnosti. Korisnici isto tako mogu organizirati rezultate pretraživanja po kategorijama i grupama relevantnosti pojedinog sadržaja. [3]

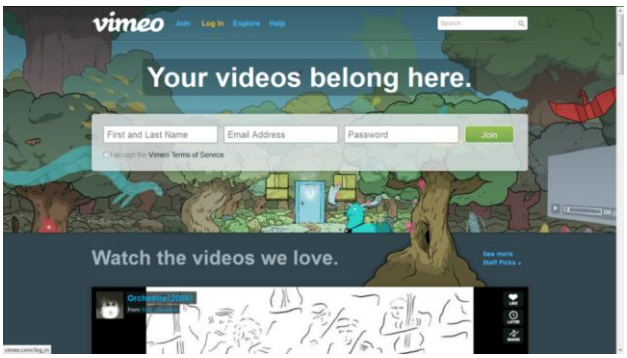
A. Youtube

YouTube su osnovali Chad Hurley, Steve Chen i Jawed Karim, svi rani zaposlenici PayPala. Riječ je o poznatoj web stranici na kojoj korisnici mogu gledati, postavljati i komentirati video sadržaje.
Za komentiranje i postavljanje sadržaja korisnik mora imati otvoren račun, a gledanje video sadržaja je slobodno. Web adresa YouTube stranice je http://www.youtube.com/.
YouTube sadržaji podijeljeni su po kategorijama, a korištenjem YouTube tražilice korisnicima je olakšano pronalaženje video sadržaja na kanalu.

B. Vimeo

Vimeo je *online* video servis, tj. *video sharing* web stranica na kojima korisnici mogu postavljati, dijeliti i gledati video sadržaje raznih profila i kategorija. Osnovali su je Jake Lodwick i Zach Klein u studenom 2004. Web adresa stranice je http://vimeo.com/.

Vimeo je zapravo druga verzija dobro poznatog YouTube kanala, sa malo ljepšim i izraženijim dizajnom samog weba, ali složenijom navigacijom i zahtjevnijom pretragom i postavljanjem sadržaja.



Slika 1. Vimeo web stranica

C. SlideSix

SlideSix je web stranica na kojoj možemo pronaći sav potreban alat za izradu i uređivanje multimedijalnih prezentacija. Ova web stranica daje korisnicima mogućnost prezentacije materijala uživo i to u virtualnom svijetu u stvarnom vremenu širom svijeta. To znači da se korištenjem pojedinih program može predstaviti neki materijal baš kao što bi to učinili koristeći recimo Power Point. Jedina velika razlika je u tome što se postavljeni materijal može uživo prezentirati i uređivati koristeći savjete ostalih sudionika weba.
Za početak je potrebno preuzeti SlideSix Presenter i instalirati ga prateći upute (zahtijeva najnoviju verziju Adobe AIR koji treba biti instaliran na računalu). Nakon preuzimanja programa i pozornog slušanja uputa moguće je krenuti s radom. [3]

D. Masher

Masher je web stranica koja pruža laku izradu video sadržaja, obradu video isječaka, izradu glazbenih zapisa (pjesama i spotova) te obradu i izradu fotografija.
Masher je izrađen 2008. godine i posjeduje poveću bazu raznovrsnih snimki glazbe, koju možemo koristiti u svojim kreacijama besplatno. Besplatni video arhiv - baza ima tisuće kvalitetnih spotova, uključujući i snimke iz CBS News, BBC Motion Gallery, Kine, Japana, Australian Broadcasting Corporation, Rip Curl, Huntley arhiva i još mnogo toga. Web adresa je http://www.masher.com/.

E. Yodio

Yodio je web stranica preko koje se mogu postavljati slike ili koristiti već postojeće slike priložene na webu. Yodio također omogućava prijenos zvuka kojeg možete snimiti putem interneta ili telefona (samo SAD) ili odabrati iz glazbene biblioteke weba koja je podijeljena po kategorijama. Moguće je organizirati vlastite medije u mape ako se namjerava stvoriti više projekata. Web stranica na kojoj se može pronaći ponuđeni sadržaj je http://www.yodio.com/.

Slika 2. Yodio web servis

F. *Aviary*

Aviary je koristan i zabavan web editor za izradu slika koji se koristiti na mobitelima, računalima, tabletima i iPhone uređajima. Praktičan je i efikasan za osnovnu obradu slika i za manipuliranje fotografijama kroz web preglednik. Jednostavan je za korištenje i pristupačan za druge aplikacije koje omogućavaju još veću kreativnost i rad nad fotografijama.
Korištenjem Aviary editora možemo izraditi i čestitke, razglednice, plakate, pozadine za Power Point prezentacije i dr.
Besplatan je za sve korisnike, a pristupamo mu putem web adrese http://www.aviary.com/. [4]

Slika 3. Aviary web servis

IV. WEB SADRŽAJI DRUŠTVENIH MREŽA

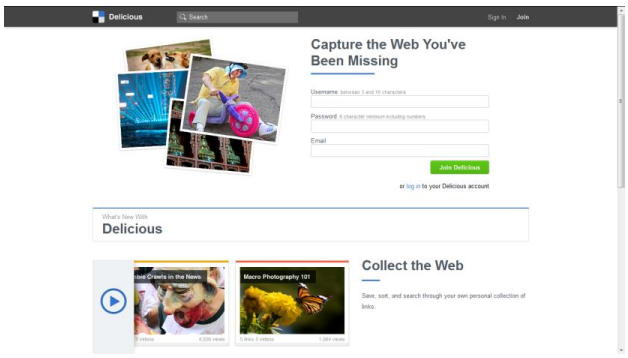
Danas je gotovo nemoguće ne spomenuti alate za društvene mrežne stranice raznih sadržaja. Društvene mrežne stranice postale su neizostavni trenutak života svake mlađe osobe, a i starijih generacija koje sve više počinju koristiti i primjenjivati ovakve sadržaje u svojem životu ili radi zabave ili radi posla. One korisnicima omogućavaju različite poglede na podatke i resurse, ali i pronalaženje pojedinaca s istim područjem interesa što dovodi do društvenog umrežavanja. Dalje u tekstu navesti ću neke od tih mrežnih sadržaja koji se danas koriste. [4]

Društvene mreže omogućavaju korisnicima spremanje i uređivanje svojih podatka u obliku profila, postavljaju *tagove* (oznake) na pojedine sadržaje i tako ih čine aktivnima. Jedan od primjera je i Amazon gdje korisnici mogu označiti proizvode i postaviti ih u košarice, te predložiti ih drugima. [4]

A. *Delicious*

Delicious je društvena mreža za spremanje, dijeljenje i otkrivanje zanimljivih sadržaja. Stranicu je osnovano Joshua Schachter 2003. godine, a 2005. preuzeo ju je Yahoo. Do kraja 2008. stranicu je posjetilo više od 5,3 milijuna korisnika koji su označili oko 180 milijuna raznih URL adresa. Sjedište tvrtke je grad Sunnyvale u Kaliforniji.

Sadržajima na Deliciousu pristupa se preko korisničkog računa kojeg se kreira na stranicama weba. Nakon kreiranja računa možemo pretraživati nove web sadržaje, označavati zanimljive stranice, razmjenjivati mišljenje s drugim korisnicima i dr. Web adresa stranice je: http://www.delicious.com/. [5]

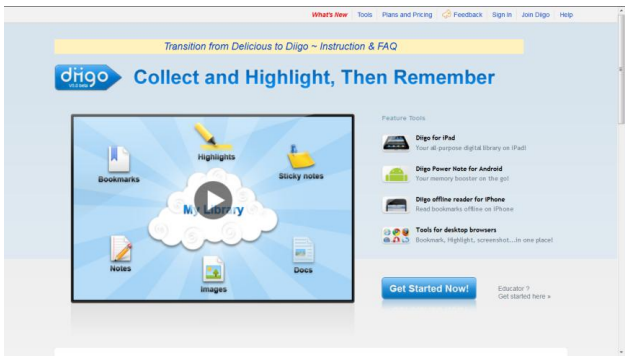


Slika 4. Delicious društvena mreža

B. *Diigo*

Diigo je društvena mreža koja radi na principu oblaka i omogućava svojim korisnicima stvaranje univerzalne vrste sadržaja do kojeg taj isti korisnik na jednostavan način može pristupiti s nekog drugog uređaja. Zasnovana je na principu upravljanja informacijama i alatima koji omogućavaju korisnicima da prikupe, označe, pristupe i dijele razne sadržaje na različitim uređajima.

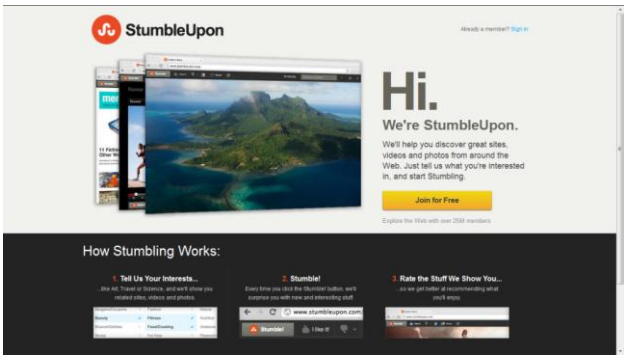
Diigo je zapravo odličan alat koji omogućava svojim korisnicima označavanje *(tagiranje)* traženog sadržaja. Osim toga on omogućava označavanje bilo kojeg dijela web stranice i kopiranje bilješke na određene dijelove neke druge stranice ili kreirane mape. Web adresa Diigo stranice je: http://www.diigo.com/. [3]



Slika 5. Diigo društveni servis

C. *StumbleUpon*

StumbleUpon je prema mnogim statistikama jedna od stranica koja ima najveću posjetu nakon Googla. Stranica je zamišljena tako da se instalira StumbleUpon Toolbar te da se pomoću njega pronalaze nove stranice koje još nitko nije otkrio. Kada te stranice budu pronađene, korisnik će zauvijek biti označen kao korisnik koji ih je pronašao. Web adresa ove stranice je: http://www.stumbleupon.com/. [6]



Slika 6. StumbleUpon društveni servis

D. *Linkedln*

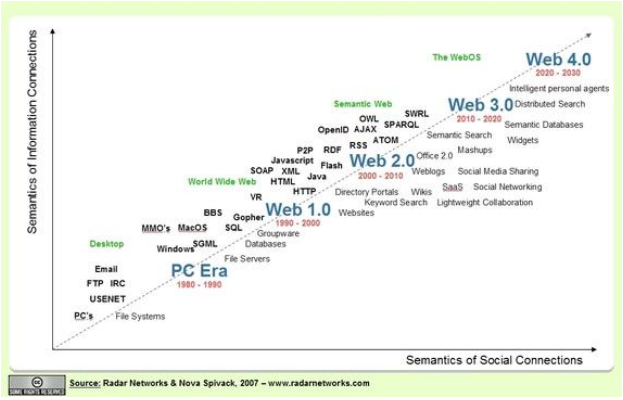
Linkedln je društvena mreža orijentirana više prema poslovnim i profesionalnim korisnicima nego prema mladeži i zabavi. Pristupom na ovu mrežu preko web adrese http://www.linkedin.com/.

Korisnik kreira Linkedln profil koji zapravo predstavlja svojevrsni virtualni poslovni životopis. Oko 175 miliona profesionalnih korisnika koristi ovu društvenu mrežu kako bi efikasnije i efektivnije razmijenilo poslovne informacije, stvorilo kreativne ideje o napredujućim projektima ili tek planiranim projektima i šansama o potencijalnom ostvarivanju ekonomske dobiti.

V. WEB 3.0

Što je to zapravo Web 3.0 i kako bi on trebao izgledati? Je li to inteligentni web i što to znači? Mnogi ljudi razmišljaju o korištenje napredne umjetne inteligencije kao sljedećeg velikog koraka razvoja weba. No, ideja da će cijeli web prerasti u jednu virtualnu zajednicu svijeta sa zgradama, trgovinama i drugim područjima za istraživanje i to sve u interakciji s ljudima nije tako ni nevjerojatna u tehnološkom smislu. [7]

Virtualni web bi trebao biti napravljen od mnoštva web stranica koje bi bile podržane jednim standardom na globalnoj razini i prihvaćene kao glavni medij/servis koji će omogućiti korisnicima dostupnost informacija svugdje i u svakome trenutku. Nešto poput današnjeg računalstva u oblacima. [7]



Slika 7. Prikaz evolucije Weba [7]

Predstavljanjem elektroničkih uređaja i interneta kao izvora za glazbu, filmove, trgovinu, poslovanje, platnu transakciju i još mnogo toga u središtu rada i igre našao bi se Web 3.0.

Unutar jednog desetljeća, pristup internetu na našim mobilnim uređajima (mobiteli, SmartPhone, Pocket PC) bit će (već je i postao) popularan kao SMS poruka. To će učiniti internet uvijek prisutnim u našim životima: na poslu, kod kuće, na putu, na odmoru gdje god idemo, Internet će biti tamo, a samim tim i Web 3.0. [7]

VI. REZULTATI ISTRAŽIVANJA

A. *Anketni upitnik*

Zanimanje:_____
Dob: _____
Spol: _____

1. Što su za Vas elektronički sadržaji/web alati za eUčenje?_____

2. Možemo li elektroničke sadržaje/web alate koristiti u nastavi? Zašto? Na koji način?
_____

3. Koje elektroničke sadržaje/web alate treba koristiti u nastavi? _____

4. Koristite li Vi elektroničke sadržaje/web alate?
da ne

5. Koje elektroničke sadržaje/web alate koristite?
_____

6. Zbog čega i zašto koristite navedene elektroničke sadržaje/web alate u nastavi?
_____

7. Jeste li ikada čuli za web alat *Vimeo* ili za alat *Aviary*?_____

8. Ako ste koristili gore navedene web alate što mislite o njima, njihovom dizajnu, primjeni, praktičnosti?_____

9. Koristite li web sadržaje na *Youtub-u*?
da ne

10. Za što koristite *Youtube*?
_____

11. Znaš li što je web alat *Delicious*, a što *web alat Diigo*? _____

12. Koriste li neki od alata iz 11.pitanja? Ako da, napišite zašto i navedite na koji način koristite navedeni alat.
_____

13. Po Vašem mišljenju koji je od dva navedena web alata kvalitetniji i zašto?
    a) *StumbleUpon* _____
    b) *Linkedln* _____

14. Što mislite o korištenju web alata u nastavi?
    a) neizostavni su dio mojeg obrazovanja
    b) vjerujem da će u budućnosti postati glavni sadržaji u nastavi
    c) mislim da nisu značajne za moje obrazovanje

15. Što mislite o korištenju elektroničkih sadržaja/web alata u nastavi računalstva?
_____

B. Prikaz rezultata istraživanja

Istraživanje je provedeno na uzorku od 50 ispitanika. Od toga je 19 ispitanica ženskog spola i 31 ispitanik muškog spola. Ispitanici su u prosjeku imali od 15 do 25 godina (Tablica I.).

Istraživanje je provedeno u dvije skupine. Prva skupina su bili učenici, a druga skupina odrasli. U prvoj skupini sudjelovalo je 30 ispitanika, a u drugoj skupini sudjelovalo je 20 ispitanika. Obje skupine popunile su anketni upitnik. Kroz anketni upitnik dobiveni su podaci koji su predstavljali stavove polaznika o gore navedenim web alatima za eUčenje. Anketni upitnik sastojao se od 15 pitanja raznih oblika.

Tablica I. Prikaz broja ispitanika po skupinama i spolu

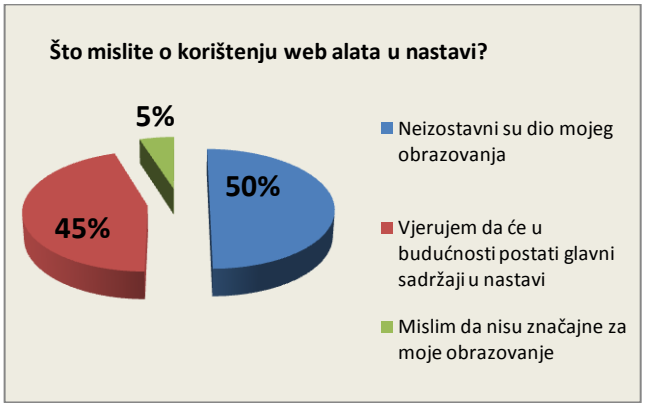
	Žene	**Muškarci**	**Ukupno**
Učenici	**19**	**21**	**30**
Odrasli	**10**	**10**	**20**
Ukupno	**19**	**31**	**50**

Cilj istraživanja je istražiti mišljenje o korištenju i primjeni besplatnih web alata za eUčenje u nastavnom procesu učenika, pa tako i odraslih. Rezultati anketnog upitnika su zanimljivi.

U ostatku teksta ovoga poglavlja navedeno je nekoliko značajnijih primjera odgovora iz anketnog upitnika prikazanih u brojčanim i grafičkim vrijednostima.
Svakoj od skupina postavljena su pitanja vezana uz korištenje web sadržaja kao što su društvene mreže, web alati, web video kanali i dr.

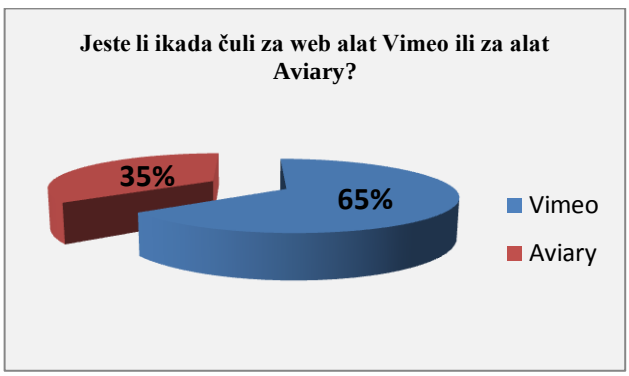
Kroz postavljena pitanja trebali su se provjeriti stavovi obje skupine. Na ovaj način pokušalo se doći do potrebnih informacija vezanih uz mišljenje ispitanika o korištenju, primjeni i funkcionalnosti gore navedenih web sadržaja i alata.

Grafikon I. Prikaz rezultata o korištenju web alata u nastavi



Iz sveukupne analize rezultata anketnih vrijednosti, vidljivo je da veći broj učenika, polaznika prihvaća ovakav rad i pristup nastavnim sadržajima.
Na 14. pitanje: "Što mislite o korištenju web alata u nastavi?" 50% polaznika odgovorilo je da su web alati neizostavni dio njihovog obrazovanja, 45% polaznika odgovorilo je kako vjeruje da će u budućnosti web alati postati glavni sadržaj u nastavi, a svega 5% polaznika da web alati nisu značajni za njihovo obrazovanje. (Grafikon I.).

Grafikon II. Prikaz rezultata o korištenju web alata Vimeo i Aviary



Kod pitanja vezanih uz konkretne primjere korištenja web alata u nastavi odgovori polaznika bili su očekivani.

Na 7. pitanje: Jeste li ikada čuli za web alat Vimeo i Aviary odgovori izraženi u postotnim vrijednostima prikazani su Grafikonom II.. Polaznici nastave, njih 65% odgovorilo je da su čuli za Vimeo, a njih 35% da su čuli za Aviary.
Rezultati odgovora na 11, 12 i 13 pitanje anketnog upitnika bili su slični rezultatima iz 7. pitanja. Dio polaznika napisao je da koristi web alate Delicious, Digo, StumbleUpon i Linkedln. Na 12. pitanje: "Zašto i na koji način koristite navedene alate?" polaznici su odgovorili da navedene alate koriste u svoje slobodno vrijeme za komunikaciju s prijateljima i rodbinom. Dio polaznika je napisao da ih koristi za traženje posla (odrasli polaznici), te za poboljšanje svojeg obrazovanja i efikasnijeg učenja nastavnih materijala.

Rezultati istraživanja su očekivani i zadovoljili su postavljenu hipotezu.
Hipoteza je glasila: Veliki dio web sadržaja danas se koristi u obrazovne i komunikacijske svrhe kao jedan od modela cjeloživotnog obrazovanja budućnosti.

Iz prikazanoga je vidljivo da ispitanici obje skupine koriste razne web sadržaje u svojem obrazovanju i da imaju pozitivne stavove prema korištenju navedenih sadržaja.

VII. ZAKLJUČAK

Web 1.0 definiran je kao standard objavljivanja sadržaja ljudima kako bi ih u što kraćem vremenu obavijestili i informirali o događanjima na globalnoj razini.

Web 2.0 definiran je kao standard objavljivanja sadržaja i informacija na globalnoj razini, ali sa nakanom međusobnog informiranja, novčanih transakcija, rada na projektima, stvaranja novih ideja i druženja jednih s drugima.
Iz navedenih primjera u poglavlju o Web 2.0 tehnologiji vidljivo je da su sadržaji weba postali interaktivni. *Podcasting*, Wikipedia, društvene mreže, razni *online* servisi te *online* prezentacije postali su neizostavni alat koji omogućava jednostavno i brzo stvaranje *online* sadržaja.
Tim sadržajima moguće je pristupiti u bilo koje vrijeme, preuzeti ih na bilo koje računalo ili drugi digitalni uređaj te pomoću njih prezentirati složen ili zanimljiv interaktivni sadržaj na efikasniji način.

Što je zapravo Web 3.0?, Što nam donosi budućnost? Istina je da je predviđanje budućnosti Web 3.0 čisto nagađanje i igra analize postojećih sadržaja. Web 3.0 definiran je kao spoj ljudi i strojeva s velikom razinom interakcije, korištenjem umjetne inteligencije i to ponajprije za objavljivanje i interakciju jednih s drugima, informiranje i povećanje efikasnosti i ljudske efektivnosti u radu na globalnoj razini.
Temeljnih promjena u načinu na koji koristimo web sigurno će biti, ali kako će se one odvijati i u kojem pravcu krenuti može se samo pretpostaviti. Web će se možda temeljiti na virtualnoj stvarnosti i većoj količini interakcije među korisnicima, složenijoj primjeni umjetne inteligencije. U svakom slučaju doći će do još većeg proboja web tehnologije u ljudske živote. Sve to moglo bi se razviti na neki zanimljivi način, prema kojem će umjetna inteligencija kreirati svijet i tržište kapitala.

Sažetak—**Rad prezentira analizu osnovnih metoda i programa koji se koriste u odgojno-obrazovnim ustanovama. Analiza je provedena na primjeru rješavanja sustava linearnih jednadžbi koje su nezaobilazni faktor izučavanja od osnovne škole, srednje škole, fakulteta a kasnije i u samom području djelovanja. Na primjeru sustava linearanih jednadžbi sa tri nepoznanice kroz programe Excel, FORTRAN, PASCAL i Matlab vršena je analiza rješavanja navedenog problema od strane učenika i studenata različitim metodama. Analizira se jedan segment tijesno povezanih i srodnih predmeta matematike i informatike kroz navedene računalske programe, da bi se i u budućem radu pravila paralela između ovih programa.**

I. UVOD

Kada je u pitanju obrazovanje kroz informatiku, računalo se koristi kao sredstvo za dublju analizu razumijevanja predmeta i pronalaženja novih pristupa rješavanju određenih problema, pri čemu važno mjesto zauzima u učenju i rješavanju matematičkih problema. Koliko će određena osoba iskoristiti računalo i dostupne programe zavisi od same osobe i njezine informatičke pismenosti. Pod pojmom informatičke pismenosti (eng. Computer literacy) definiše se sposobnost korištenja računala i programa.

Programi koji se najčešće koriste u osnovnim školama su BASIC, srednjim FORTRAN ili PASCAL, dok izučavanje na fakultetima zavisi od samog nastavnog plana i programa i kreće se od FORTRANA, PASCALA, Matlaba, C, C++ itd. Ono što je karakteristično za svo obrazovanje jeste korištenje uredskog programa Microsoft Excel, koji se izučava u osnovnim i srednjim školama, kao i na pojedinim fakultetima.

Svi programi imaju za cilj da polaznike nauče osnove programiranja i logičkog razmišljanja, kroz algoritme, a nakon toga i kroz kod datog programa. Pronalaženjem metoda za rješavanje određenog problema razvija se kreativnost i apstraktno mišljenje, te produbljuje intuicija osoba. Traži se put kako najefikasnije, praktično i kreativno riješiti određeni problem. Shvatanjem osnove programiranja, razvijanjem logičkog razmišljanja, postavljanja, analiziranja i rješavanja problema, učenici će naučeno moći primijeniti na bilo kojem području djelovanja. Edukacija polaznika mora posjedovati metode za razvoj vještina za rješavanje problema, logičkog zaključivanja, programiranja i ispravljanja pogrešaka [1]. Navedeni problem rješavanja sustava linearnih jednadžbi u nekom od programskih jezika bit će napravljen i analiziran jednom od direktnih metoda sistemskih procedura koje se zasnivaju na principu eliminacije, odnosno mogućnosti pronalaska inverzne matrice A^{-1}. U slučaju neregularnog sustava, odnosno sustava koji nema jedinstveno rješenje, neće postojati inverzna matrica. Cilj analize je pokazati različitost ~~prihvatanja~~ ponuđenih metoda rješavanja i ponuđenih programskih jezika, odnosno programa od strane učenika i studenata.

II. OSNOVE PROGRAMA ZA RJEŠAVANJE SUSTAVA LINEARNIH JEDNADŽBI

Odgovori na rješavanje sustava linearnih jednadžbi nisu jednostavni niti jednoznačni. Oni se mogu tražiti različitim analizama i na različite načine. Ovo je samo jedan od načina analize navedenih programa na primjeru koji se vrlo često spominje kako u obrazovanju tako i u samom praktičnom radu. Programer prilikom programiranja će definirati konačan cilj, koji će se ogledati kroz stvaranje aplikacije koja će služiti određenoj grupi korisnika, pri čemu se nastoji prilagoditi aplikacija domenu krajnjeg korisnika.

Problem koji se javlja kod krajnjeg korisnika programa je da oni ili nemaju vremena ili nemaju interesa naučiti programski jezik. Kada je u pitanju primjena proračunskih tablica ističe se jednostavnost i formula i ugrađenih funkcija. Jednostavnost se ogleda kroz omogućavanje svega što se radi u svakodnevnom obrazovanju:, zbrajanje, oduzimanje... Podaci su složeni u dvodimenzionalnu mrežu koja je korisnicima laka za pregled i izmjenu. Isti se mogu osjećati kao programeri jer direktno rade na određenom problemu, pri čemu vide aritmetičke operatore i funkcije koje pozivaju, kao i manipulirati radom bez uobičajnih aktivnosti programiranja. Može se reći da je lakše shvatiti proračunsku tablicu od općenitosti namjene programskog jezika. Iz istih razloga se koristi u velikom broju različitih aplikacija, od financijskih, administrativnih i sl.

FORTRAN (Formula Translation) je jezik za programiranje prvenstveno namijenjen rješavanju numeričkih problema. Najčešće je sastavljen od:

- glavnog programa;
- podprograma;
- funkcijskog podprograma i
- bloka podataka.

Pascal je programski jezik razvijen za učenje strukturiranog programiranja, kod koga algoritam mora biti dobro razrađen i podijeljen na jednostavnije cjeline, a strukturu programa određuje struktura podataka.

Matlab – matrični laboratorij omogućava brzo i lako programiranje. Način zapisivanja je blizak načinu na koji se inače zapisuju matematičke formule. Ima mnoge prednosti u odnosu na konvencionalne programske jezike (Fortran, C) za rješavanje tehničkih problema [2]. Često jedna naredba u Matlab-u mijenja stotine redova koje su napisane u nekom programskom jeziku opće namjene (Fortran, C-a). Matlab čini skup funkcija za jednostavno, prirodno i efikasno manipuliranje matricama. Određene funkcije su pisane u C-u, pri čemu izvorni kod nije dostupan. Programski jezik koji sa svojim skupovima ugrađenih funkcija većinu problema puno jednostavnije rješava u odnosu na programske jezike Fortran, Pascal, C, ...

Microsoft Excel je program za tablično računanje, uglavnom rješavanje problema matematičkog tipa pomoću tablica i polja koje je moguće povezati različitim formulama. Kada je u pitanju bilo kakvo jednostavnije istraživanje, analiza je pokazala prednosti korištenja Excela koji omogućuje jednostavno integriranje i transformiranje podataka u jednu cjelinu koja je pogodna za analizu računalom. Najčešće se ti podaci prikazuju u obliku tablica. Proračunske tablice se koriste u velikom broju različitih aplikacija. Najčešće su to financijske aplikacije poput proračuna i administrativne aplikacije kao što su upravljanje malim tvrtkama. Ovakve tablice su sadržavale vrlo mali broj proračuna.

Excel ima kompletnu paletu funkcija koje uz određena objašnjenja daje rezultate. Korištenjem odgovarajuće tablice razvijamo kod učenika sposobnost rada sa standardnim alatom današnjeg poslovnog svijeta [3].

Ono što je karakteristično za proračunske tablice jeste da je kvanitativnom analizom na 135 proračunskih tablica prikupljenih od Finskih poslovnih tvrtki i vladinih agencija pokazalo da su tablice sadržavale vrlo malo proračuna. 90% slučajeva su korišteni aritmetički operatori (+, -, *, /), a od 80% upotrebljenih funkcija su korištene funkcije IF i SUM [4]. Snaga trenutnog modela proračunske tablice je direktna manipulacija njegovog interfejsa.

Navedenim programskim jezicima operacije su sagrađene od operacija nižih razina i kontrolnih struktura, pri čemu programeri moraju imati puno veće znanje o osnovama programiranja. Mnogi problemi prilikom projektiranja i analize će proizvesti niz složenih linearnih sustava jednadžbi, kod kojih se algoritmi razvijaju da bi se riješili određeni sustavi.

III. NAČIN RJEŠAVANJA I PROGRAMSKI KOD LINEARNE JEDNADŽBE

Promatramo sustav linearnih jednadžbi sa tri nepoznate

$$a_{11}x_1+a_{12}x_2+a_{13}x_3=b_1$$
$$a_{21}x_1+a_{22}x_2+a_{23}x_3=b_2$$
$$a_{31}x_1+a_{32}x_2+a_{33}x_3=b_3$$

- Ako navedeni sustav jednadžbi rješavamo pomoću FORTRANA, primjenićemo Cramerovo pravilo. Cramerovo pravilo nije efikasno za rješavanje velikih sustava jednadžbi, što u obrazovanju i nije čest slučaj.

$$x_i=\frac{\det A_i}{\det A}$$

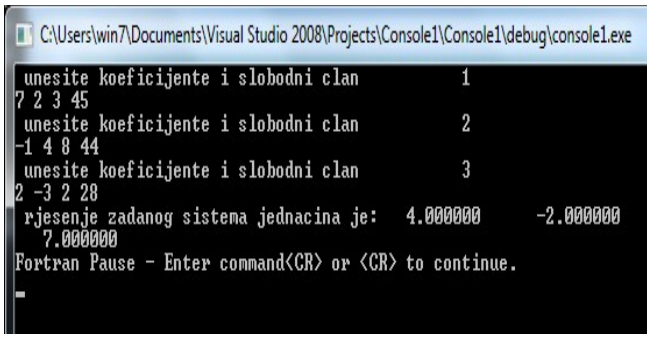
$$\det A=\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

$$\det A_1=\begin{vmatrix} b_1 & a_{12} & a_{13} \\ b_2 & a_{22} & a_{23} \\ b_3 & a_{32} & a_{33} \end{vmatrix}$$

$$\det A_2=\begin{vmatrix} a_{11} & b_1 & a_{13} \\ a_{21} & b_2 & a_{23} \\ a_{31} & b_3 & a_{33} \end{vmatrix}$$

$$\det A_3=\begin{vmatrix} a_{11} & a_{12} & b_1 \\ a_{21} & a_{22} & b_2 \\ a_{31} & a_{32} & b_3 \end{vmatrix}$$

Pomoću podprograma za računanje determinante, i Cramerovog pravila koji mijenja kolone $a(I,1)$ za prvu determinatu, $a(I,2)$ za drugu determinatu i $a(I,3)$ za treću determinatu pomoću DO petlje za $I=1,3$ vrijednostima $B(I)$, dobijamo rješenja X_I [5].



Slika 1. Prozor Fortran-a rješenog navedenog problema

Kod kojim se rješava navedeni problem u fortranu je:

```
program sustav_linearnih_jednadzbi
real A(3,3), X(3), B(3)
```

```
      do I=1,3
      Print*,'unesite    koeficijente    i
slobodni clan', I
      read*,(A(I,J), J=1,3), B(I)
      end do
call CRAMER (A,X,B)
print*,'rjesenje      zadanog      sustava
jednadzbi je:', (X(I), I=1,3)
end

function DET(A)
 real A(3,3)
                  DET=A(1,1)*(A(2,2)*A(3,3)-
A(2,3)*A(3,2))-&
 A(1,2)*(A(2,1)*A(3,3)-A(2,3)*A(3,1))+&
 A(1,3)*(A(2,1)*A(3,2)-A(2,2)*A(3,1))
 return
 end

subroutine CRAMER (A,X,B)
real   A(3,3),   X(3),   B(3),   A1(3,3),
A2(3,3), A3(3,3)
 DENOM=DET(A)
 A1=A
 A2=A
 A3=A
    DO I=1,3
    A1(I,1)=B(I)
    A2(I,2)=B(I)
    A3(I,3)=B(I)
    END DO
 X(1)=DET(A1)/DENOM
 X(2)=DET(A2)/DENOM
 X(3)=DET(A3)/DENOM
 return
 end
```

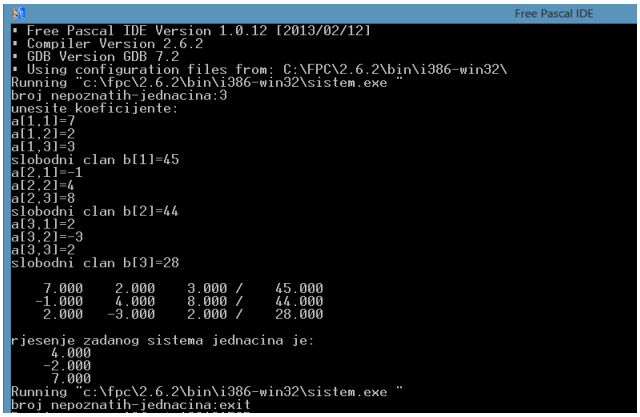
- Navedeni problem u Pascalu ćemo riješiti pomoću Gauss-Jordanove metode eliminacije u kojoj se elementi iznad kao i elementi ispod glavne dijagonale eliminiraju (izjednačavaju sa nulom).

Suština navedenog algoritma je da se učitaju koeficijenti, izvrši proširivanje matrice slobodnim članovima a zatim se nizom transformacija navedena matrica *A* transformira u dijagonalnu matricu, odnosno jediničnu matricu. Vektor *b* tada postaje vektor rješenja *x*. Kod koji je iskorišten za rješavanje problema sustava linearnih jednadžbi i koji je iskorišten u obrazovanju učenika i studenata je:

```
program sustavjednadzbi( input,output );
type matrica = array [1..6,1..7] of real;
var a:matrica;
    n:integer;
 procedure citaj (n:integer;var
a:matrica);
 var i,j:integer;
 begin
    writeln('unesite koeficijente:');
    for i:=1 to n do
        begin
           for j:=1 to n do
                begin
                 write
('a[',i,',',j,']=');
                 readln (a[i,j]);
                end;
           write('slobodni clan
b[',i,']=');
           readln(a[i,n+1])
          end
 end;
 procedure pisi(n:integer;a:matrica);
 var i,j :integer;
 begin
    writeln;
    for i:=1 to n do
        begin
           for j:=1 to n do
write(a[i,j]:9:3);
           writeln(' / ',a[i,n+1]:9:3);
        end
  end;
  procedure ga(n:integer; var a:matrica);
  var i,j,k:integer;
      regularna:Boolean;
      function najveci:integer;
       var naj:real;
       i:integer;
         begin
          naj:= abs(a[k,k]);
          najveci:=k;
          for i:=k+1 to n do
              if (naj<abs(a[i,k])) then
              begin
              naj:=abs(a[i,k]);
              najveci:=i
              end
        end;
    procedure zamjenaredova(k,l:integer);
      var r:real;
      j:integer;
      begin
        for j:=k to n+1 do
            begin
             r:=a[k,j];
             a[k,j]:=a[l,j];
             a[l,j]:=r
            end
      end;

      procedure ispisrjesenja;
      var i:integer;
      begin
      writeln;
      writeln ('rjesenje zadanog sistema
jednacina je:');
```

```
      for i:=1 to n do
writeln(a[i,n+1]/a[i,i]:10:3)
      end;
      begin
        regularna:=true;
        k:=1;
        repeat
         if (k<>najveci) then
zamjenaredova (k,najveci);
         if (a[k,k]<>0) then
         begin
          for i:=1 to n do
            if i<>k then
                 for j:=k+1 to n+1 do
                  a[i,j]:=a[i,j]-
a[i,k]*a[k,j]/a[k,k]
         end
         else regularna:=false;
         k:=k+1
         until (k>n) or not regularna;
         if regularna then ispisrjesenja
                       else   writeln
('neregularna matrica sistema')
      end;
```



Slika 2. Prozor Pascal-a rješenog navedenog problema

- Navedena jednadžba u Excelu bi se predstavila u obliku $Ax=b$ pri čemu bi matrica sustava imala oblik:

$$\begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix}$$

Navedeni sustav jednadžbe bi riješili računanjem inverzne matrice A^{-1}, tako da je $x=A^{-1}b$

B9 {=MINVERSE(B1:D3)}

	A	B	C	D
1		7	2	3
2	[A]=	-1	4	8
3		2	-3	2
4				
5		45		
6	[b]=	44		
7		28		
8				
9		0,130612	-0,05306	0,016327
10	Inv[A]=	0,073469	0,032653	-0,24082
11		-0,02041	0,102041	0,122449
12				
13			4	
14	[x]=Inv[A][b]=		-2	
15			7	

Slika 3. Prozor Excel-a rješenog navedenog problema

Inverznu matricu A^{-1} u Excelu bi dobili pomoću funkcije MINVERSE, a množenje matrica pomoću MMULT. Uvrštavanjem određenih promjenjivih dobijamo rješenja X_1. Ubacivanjem određenih parametara sustava linearne jednadžbe u Excel dobija se rješenje navedene jednadžbe (Slika 3.).

- I u Matlabu, rješavanje sustava linearnih jednadžbi može se izvršiti pronalaženjem inverzne matrice *inv(A)*. Jednostavniji način rješavanja je primjenom operacije dijeljenja s lijeve strane, pri čemu se koristi pristup Gaussove eliminacije (*x=A\b*).

```
>> A=[7 2 3;-1 4 8;2 -3 2]
     A =
       7     2     3
      -1     4     8
       2    -3     2
>> b=[45;44;28]
     b =
      45
      44
      28
>> x=inv(A)*b
     x =
      4.0000
     -2.0000
      7.0000
```

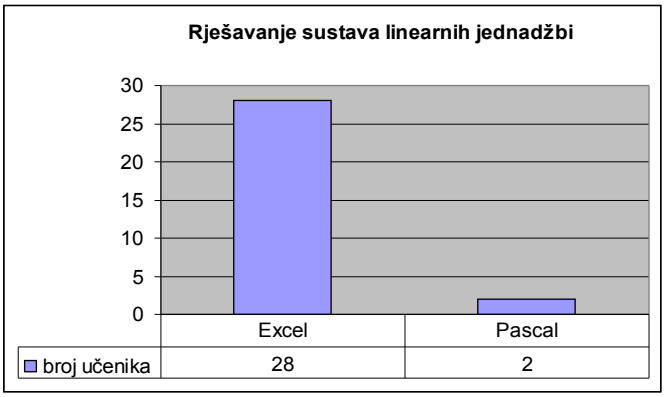
Jednostavniji način je:

```
>> A=[7 2 3;-1 4 8;2 -3 2]
     A =
       7     2     3
      -1     4     8
       2    -3     2
>> b=[45;44;28]
     b =
      45
      44
      28
>> x=A\b
     x =
      4.0000
     -2.0000
      7.0000
```

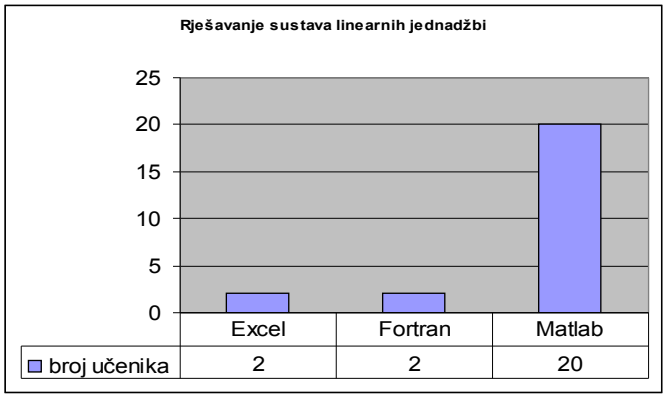
IV. ANALIZA NAVEDENIH PROGRAMA U OBRAZOVANJU

Analizirajući rješavanje navedenih problema linearnih jednadžbi sa učenicima srednje škole koji izučavaju Pascal i Excel, i studentima II godine koji izučavaju i poznaju rad u Fortran-u, Excel-u i Matlab-u,ostavljena im je mogućnost da prilikom rada izaberu metodu i programski jezik (grafikon 1., grafikon 2.). Zahtijevano je da obrazlože zašto su izabrali određeni program i način rješavanja.

Analiza urađenih zadatka sustava linearnih jednadžbi sa tri nepoznanice i dobivenih odgovora je pokazala da su učenici izabrali Excel a studenti Matlab zbog jednostavnosti i bržeg načina rješavanja. I učenici i studenti koji su dati problem rješavali u drugim programima su naveli razlog samo izazova da navedeni problem riješe na drugi način, pri čemu je komentar bio da je lakše riješiti pomoću Excela, odnosno Matlaba. Prednost je bila u tome što su se morale znati samo dvije formule MINVERSE i MMULT u Excel-u i operacija dijeljenja s lijeve strane u Matlab-u, dok kod ostalih programa uvijek postoji mogućnost pogreške prilikom unosa podataka, DO ili FOR petlji, IF naredbi kao i samim podprogramima.



Grafikon 1. Rješavanje sustava linearnih jednadžbi kroz programe Excel i Pascal



Grafikon 2. Rješavanje sustava linearnih jednadžbi kroz programe Excel, Fortran i Matlab

V. ZAKLJUČAK

Proračunske tablice-Excel je program koji je dobro prihvaćen i koji se često koristi. Zbog jednostavnosti većina korisnika iz promatranih grupa će koristiti navedeni program, jer se njime navedeni problemi rješavaju najjednostavnije. I učenici i studenti su pokazali da će rješavati određeni problem korištenjem najjednostavnijeg načina i programa, a suštinu programiranja ne žele i neće da znaju. Međutim, i pored odgovarajuće funkcionalnosti izazov programiranja leži u razvoju alata i metodologija koje mogu pomoći krajnjim korisnicima. Na taj način korisnici će pored programiranja i shvaćanja programskog koda imati mogućnost shvatiti i matematski način rješavanja određenog problema određenim metodama. Koliko će sve to imati pozitivnog efekta na same korisnike zavisi i od njihove zainteresiranosti kao i od nastavnog plana i programa na osnovu kojeg je potrebno predstaviti načine riješavanja navedenih problema, ili objasniti suštinu samog programiranja. Tako se postiže dvostruki cilj: razvija se kreativnost i sposobnost logičkog razmišljanja korisnika u izboru najefikasnijih metoda pronalaska rješenja problema, i istovremeno se ostvaruje kvalitetna veza između matematike i informatike kao srodnih predmeta.

Sažetak – Novi tip učenja zove se e-učenje, odnosno kombinacija e-učenja i računarstva u oblaku (cloud). Bazirana je na velikom širenju računarstva koje se oslanja na dijeljenje računalnih resursa, a uključuje isporuku sadržaja, aplikacija, infrastrukture i platforme kao usluge. Padom cijena internet usluga kao i golemim vremensko – troškovnim uštedama e-učenje postaje dio naše svakodnevnice. Mogućnost gotovo trenutne disperzije novih znanja u praktički prostorno neograničenim uvjetima (decentralizirani sustavi, udaljene destinacije, nemogućnosti prisutva nastavi). Ova fleksibilnost je ono što privlači učenike, studente, nastavni kadar da koriste sustave e-učenje. U radu je dan pregled rješenja usluge u oblaku za implementaciju sustava e-učenja. Analizirane su platforme i mogući sustavi koje pružaju Hrvatski Telekom (HT) i Sveučilišni računski centar (srce) za implementaciju sustava E-učenja. Znanje koje dobiveno ovakvim načinom edukacije ekvivalentno je onome u učionici, te ima brojne prednosti.

I. UVOD

E-učenje je učenje uz pomoć računala i, vrlo često, Interneta. E-učenje je prisutno u klasičnom obrazovanju u školama i na fakultetima, tako da se računalo i Internet koriste za vrijeme nastave ili u izradi domaćih zadaća. U drugim slučajevima se obrazovni programi djelomično izvode online, tj. uz pomoć Interneta, a djelomično na standardni način. E-učenje često se primjenjuje u izvođenju stručnih seminara i ostalih obrazovnih programa za koje bi bilo preskupo ili nemoguće okupiti polaznike na dulje vrijeme. Moguće je postojanje obrazovnih programa koji se u potpunosti izvode online, što znači da se od upisa do diplome, sva komunikacija između polaznika i organizatora obrazovanja odvija putem Interneta. Kad se neka ustanova odluči svoje obrazovne programe ponuditi putem e-learninga, treba pretpostaviti da pritom ima kao cilj poboljšati kakvoću obrazovanja ili omogućiti pohađanje onim polaznicima kojima bi to inače bilo onemogućeno ili omogućiti pristup izvorima i stručnjacima koje je nemoguće imati u blizini. Znanje dobiveno ovakvim načinom edukacije ekvivalentno je onome u učionici, te ima brojne prednosti u odnosu na nju, kao npr: nema izostanaka s nastave ili radnog mjesta, nema neadekvatne edukacije, jer možete odabrati odgovarajući sadržaj za svakog korisnika, nema nametnutog tempa učenja, jer ga svaki korisnik bira za sebe, troškovi su znatno niži od klasične obuke, voditelj ima potpuni pregled nad svim aktivnostima i rezultatima edukacije, polaznici imaju mogućnost osvježavanja znanja kroz duži period i nakon kompletiranja seminara. Također, potreba za pristupom svim podacima sa bilo koje lokacije, bez korištenja računala ili hard diska omogućava računarstvo u oblaku ili programska rješenja u oblacima (Cloud computing). Uvođenjem cloud tehnologije studentima i djelatnicima omogućujemo e-učenje, pristup sa bilo koje lokacije, te studenti imaju mogućnost aplikacijama rješavanje zadataka i seminara u bilo kojem trenutku sa bilo koje lokacije korištenjem potrebnih alata. Rješavanjem zahtjevnijih zadataka potrebne su zahtjevnije aplikacije, a samim time i veći resursi samog računala tj. hardvera i licenci za program što utječe na cijenu samog računala. Hrvatski Telekom (HT) je danas jedan među rijetkim telekomunikacijskim operatorima u Hrvatskoj koji je u mogućnosti pružiti kompletno ICT cloud rješenje – od pristupa internetu do razvoja i implementiranja aplikacije i korisničkih zahtjeva.

II. MODELI RAČUNARSTVA U OBLAKU

A. Javni cloud

Davatelj usluga omogućava pristup resursima kao što su aplikacije, skladišta za podatke i drugi resursi dostupni za javnost, nezavisno da li se radi o pojedincima ili organizacijama, putem interneta. Infrastruktura se nalazi u vlasništvu operatora i nije dostupna za uvid ili kontrolu korisnicima. Infrastruktura javnog clouda podrazumijeva dijeljene resurse za korisnike. Dijelovi javnog clouda mogu biti i pod isključivom upotrebom samo jednog korisnika, čineći tako privatni centar podataka [1], [2], [6].

B. Privatni cloud

Privatni cloud je napravljen isključivo za upotrebu jednog klijenta, rezerviran centar podataka za klijenta, koji može biti unutar organizacije ili na serveru od strane cloud davatelja usluga. IT odjeli kompanija ili davatelj cloud usluga grade privatne cloude i upravljaju njima.

Organizacije koje poseduju privatni cloud imaju potpunu kontrolu nad strukturom oblaka.

C. Zajednički cloud

Zajednički cloud je cloud koji se djeli na nekoliko organizacija. Infrastruktura podržava posebne zajednice koje imaju zajedničke potrebe, zahtjeve sigurnosti i slično. Njima mogu upravljati same organizacije ili drugi pružatelj usluga. Ovdje se troškovi dijele između nekoliko klijenta tako da su mogućnosti uštede ograničene.

D. Hibridni cloud

Strukturu clouda čine dva ili više različitih oblaka (privatni, zajednički ili javni) koji ostaju jedinstveni entiteti, ali su međusobno povezani standardiziranim ili prikladnim tehnologijama koje omogućavaju efikasan prijenos podataka ili aplikacija. Hibridni cloud povezuju javne i privatne modele clouda. Mogućnost proširivanja privatnog clouda s resursima javnog clouda može se koristiti za održavanje nivoa kako bi se lakše izdržala velika opterećenja. Hibridni cloud se također može koristiti za upravljanje planiranim velikim opterećenjima. Hibridni cloudi susreću se sa složenosti određivanja kako raspodijeliti aplikacije po javnom i privatnom cloudu.

III. CLOUD USLUGE ZA IMPLEMENTACIJU E-UČENJA

U ovom poglavlju dan je pregled cloud usluga za implementaciju sustava e-učenja. Analizirane su cloud usluge koje pružaju Hrvatski Telekom (HT) i Sveučilišni računski centar (srce). Na temelju analize usluga na hrvatskom tržištu potrebno se opredijeliti za cloud rješenja za koje se smatra da će na najbolji način zadovoljiti potrebe e-učenja tj. održavanja nastave i praktičnog laboratorijskog rada studenata u narednom razdoblju. Sustavi e-učenja pomoću rješenja računarstva u oblaku detaljnije su opisani u poglavlju IV.

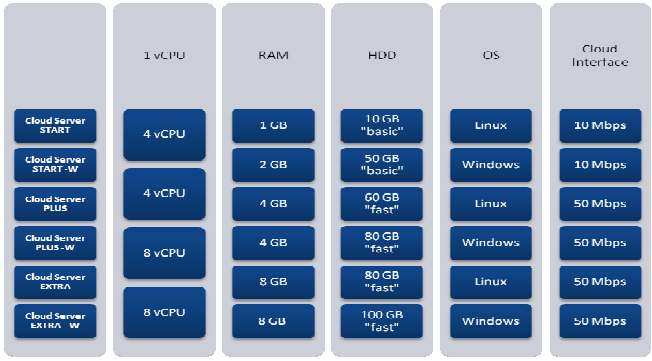
A. Cloud Virtula Private Server

Ustanovama iz sustava znanosti i visokog obrazovanja uslugu korištenja virtualnih poslužitelja (VPS) pruža Sveučilišni računski centar (srce). Usluga Cloud VPS omogućava zadovoljavanje potreba visokoškolskih ustanova za poslužiteljskim kapacitetima uz sljedeću specifikaciju standardnog poslužitelja:

- 2 procesora (vCPU) [Intel Xeon E7-4830 ~2 GHz]
- 8 GB radne memorije (vRAM)
- 100 GB diskovnog prostora
- jedna IPv4 adresa u javnom adresnom prostoru rezerviranom za pružanje usluge.

Ovisno o svojim potrebama ustanove mogu zatražiti dodatne računalne resurse, te tako kreirati optimalnu poslužiteljsku okolinu koja može zadovoljiti sve njihove zahtjeve.

Uslugom Cloud Server HT-a omogućuje se krajnjim korisnicima najam virtualnog poslužitelja smještenog u Data centru. Virtualni poslužitelji su dio virtualne platforme, čija iskoristivost i fleksibilnost čine uslugu prilagodljivom potrebama korisnika. Virtualni poslužitelji adekvatna su zamjena za fizičke poslužitelje, a korisniku omogućuju transparentno upravljanje troškovima bez kapitalnih investicija i potrebe za vlastitom IT infrastrukturom. Prebacujući brigu o IT infrastrukturi na ICT operatora korisniku je omogućeno fokusiranje na svoju primarnu djelatnost. Usluga Cloud Server nudi se u obliku nekoliko paketa određene procesorske snage, radne memorije i diskovnog prostora. Svi paketi uključuju operacijski sustav, pristup prema Internetu te uslugu sigurnosne pohrane podataka. Pristup prema privatnoj mreži korisnika također je moguće ostvariti putem L2 ili L3 veze. Na svakom odabranom virtualnom poslužitelju (Cloud Serveru) moguće su mjesečne promjene u smislu nadogradnje procesorske snage, radne memorije i diskovnog prostora. Sa stanovišta korisnika bitno je da poslužiteljima može pristupiti u bilo koje vrijeme, s bilo kojeg mjesta i preko bilo koje platforme, a cjelokupno korištenje uslugom naplaćuje se mjesečno [3].



Slika 1. Pregled Cloud Server paketa

B. Cloud Virtual Computing Lab

Usluga Virtual Computing Lab (VCL) je usluga koja djelatnicima ustanova iz sustava znanosti i visokog obrazovanja omogućava upotrebu skupova virtualnih poslužitelja. Usluga VCL omogućava korisnicima fleksibilno zadovoljavanje njihovih dinamičkih potreba kao što su virtualne učionice za potrebe nastave ili virtualni laboratoriji u nastavi ili istraživanjima. Usluga osigurava značajne uštede ustanovama, ali i ukupne uštede na razini sustava znanosti i visokog obrazovanja u odnosu na nabavu i održavanje fizičkih poslužitelja. Usluga nije namijenjena zahtjevnom računanju i ostalim oblicima intenzivnih obrada podataka, i ne zamjenjuje usluge sustava visoke učinkovitosti, poput računalnih klastera ili drugih specijaliziranih poslužiteljskih sustava Usluzi mogu pristupiti isključivo djelatnici akademskih i istraživačkih ustanova (odnosno oni koji su tako identificirani u sustavu AAI@EduHR). Korisnik pristupa usluzi korištenjem svog identiteta u sustavu AAI@EduHR [4].

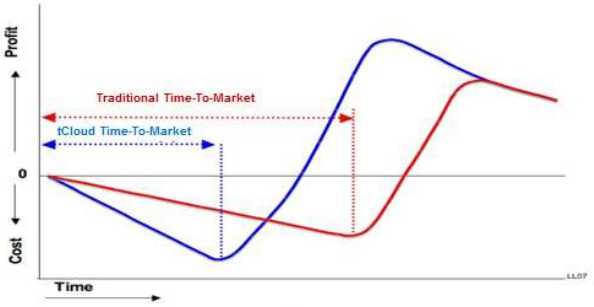
Standardni virtualni poslužitelj u okviru usluge je sljedećih svojstava:

- 1 procesor (vCPU),
- 2 GB radne memorije (vRAM),
- 20 GB diskovnog prostora,
- jedna IPv4 adresa u javnom adresnom prostoru rezerviranom za pružanje usluge.

Usluga cloud računalo (Virtual Desktop) HT-a je usluga koja korisniku osigurava u svakom trenutku, gdje god se nalazio, pristup svim svojim podacima kao da je za računalom, ali bez troškova kupnje računala, instalacije skupe opreme, softvera i održavanja. Ova usluga omogućuje efikasno korištenje računala i računalne infrastrukture bez troškova kupnje računala, instalacije skupe opreme, brige o održavanju IT infrastrukture, kapitalnih ulaganja. Pristup računalu je omogućen sa bilo kojeg uređaja koji je povezan na Internet. Cloud Računalo sastoji se od sljedećih komponenata: Windows OS, Antivirusna zaštita, 50GB HDD prostora, Flash player, Media Player, Internet Explorer, Integrirani backup, SMS autentifikacija.

Slika 2. Pristup virtualnom poslužitelju omogućen je sa bilo koje platforme

Cloud Računalo je DaaS (Desktop as a Service) platforma, proizvod u koju su integrirane Citrix, Cisco i NetApp komponente. Rješenje uključuje Cisco Unified Computing System (USC) komponente, konvergiranu Data Centar platformu sa NetApp sustavom za pohranu podataka te multiprotokolarnu povezivost koja koristi CIFS, NFS i Fibre Channel okruženje na jedinstvenoj platformi za pohranu podataka. Rješenje povezuje NetAppSnapshot i SnapRestore tehnologije. Za povećanja performansi instaliran je NetApp Flash Cache, inteligentni sustav koji ubrzava boot-up proces, ubrzava performanse samih aplikacija i omogućava brži pristup bogatom sadržaju platforme te zbog toga drastično povećava korisničko iskustvo. Sigurnost podataka počiva na NetApp FA6000 sustavu za pohranu podataka, zaštite na mrežnom nivou, layer 7 vatrozidu, integriranoj antivirusnoj i antispam zaštiti, SMS verifikaciji, višestrukim mehanizmima na svim aplikacijskim nivoima te integrirani backup podataka. Za optimizaciju performansi koristi se više tehnologija: NetApp Flash Cache uparen sa "Golden Image-om" koji ubrzavaju boot-up process, blade šasije visoke propusnosti osiguravaju da neće nastati nikakvo "usko grlo" u svakodnevnom radu te je omogućena brza migracija samih servera u slučaju hardverskog zastoja. Integrirani su napredni load balanceri za optimalno korištenje servera i optimizaciju TCP prometa unutar samog proizvoda. Platforma nudi visoko kvalitetno korisničko iskustvo neovisno da li je na krajnjem uređaju Windows, Apple, Android ili Linux operativni sustav [3].



Slika 3. DaaS značajno skraćuje vrijeme implementacije i prelaska na novi sustav

C. Smještaj i upravljanje mrežnim poslužiteljima

Sveučilišni računski centar omogućava fizičko, električko i komunikacijsko udomljavanje mrežnih poslužitelja u svojoj sistem dvorani. Od dodatnih usluga pružaju se usluge vezane za upravljanje mrežnim poslužiteljima kao što je instalacija operacijskih sustava i pomoćnih programa, sistemsko održavanje operacijskih sustava, nadzor računalnih resursa i backup [4].

Ustanove koje žele izbjeći kapitalna ulaganja po pitanju tehničke i sigurnosne infrastrukture, a pri tome žele koristiti svoju opremu, odnosno tvrtke koje imaju postojeću serversku infrastrukturu smještenu u neadekvatnim prostorima, mogu koristiti uslugu kolokacije koja omogućuje smještaj korisnikove opreme u primjerenom tehničkom prostoru ICT pružatelja usluga (Data centru). Kolokacija je posebno zanimljiva financijskim ustanovama koje žele implementirati Disaster Recovery Site, a žele izbjeći kapitalna ulaganja i koristiti svoju opremu.

Sa stanovišta sigurnosti poželjno je da Data centar podržava sljedeće funkcionalnosti i standarde:

- Redundantna klimatizacija
- Objekt otporan na velika opterećenja i utjecaj voda
- Neprekidno napajanje (UPS, generatori)
- Fizička zaštita (kontrola pristupa, upozoravajući sustavi)
- Zaštita od požara (vatrodojavni sustav i automatsko gašenje požara plinom)
- Nadzor 24/7 (napajanja, klimatizacije, dostupnosti)
- Fizički i konzolni pristup kolociranoj opremi
- TIER 3 (raspoloživost 99,982%; 1,6 sati dozvoljenih nenajavljenih prekida godišnje; redundancija (N+1))

Cloud Storage usluga omogućuje korisnicima zakup diskovnih prostora, koji su smješteni u HT Data centru, te koji su dostupni putem Interneta. Uslugom se omogućava jednostavno upravljanje i administracija zakupljenog diskovnog prostora (upravljanje resursima, pravima i brojem korisnika). Prednosti za korisnike su prilagodba troškova trenutnim potrebama, korištenje diskovne infrastrukture bez kapitalnih investicija, potpuna kontrola diskovnog prostora i sadržaja putem korisničkog portala, brže i učinkovitije upravljanje resursima nadogradnje prema stvarnim potrebama [3].

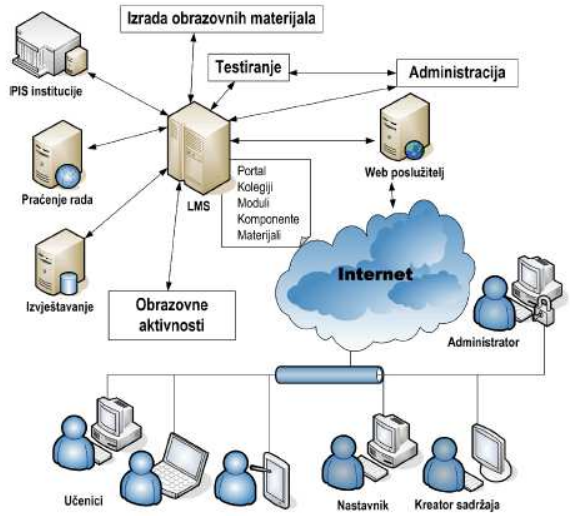
Slika 4. Cloud Storage u konekciji sa ostalim Cloud uslugama

IV. SUSTAVI E-UČENJA

Ne postoji standardna ili prihvaćena definicija što čini jedan e-kolegij. Općenito možemo reći da su to kolegiji koji koriste mogućnosti novih tehnologija za poboljšanje kvalitete izvedbe nastavnog programa i procesa učenja. Razlikujemo više oblika ili razina e-kolegija, od onih jednostavnih koji imaju samo nastavne materijale i informacije o kolegiju dostupne na lnternetu, pa do kompleksnih koji su osmišljeni upravo za internetsko, interaktivno i suradničko okruženje, te spajaju nekoliko obrazovnih sastavnica u jedinstven studijski kolegij ili program. Primjer sustava za e-učenje „Merlin“ (srce) omogućava ustanovama iz visokoga obrazovanja i znanosti, ali i pojedincima iz akademske zajednice da u srcu aktiviraju svoje e-kolegije i koriste zajedničke resurse za potrebe e-učenja. Pri tome srce osigurava i preuzima brigu o tehničkoj pouzdanosti i stalnoj i neprekidnoj dostupnosti toga servisa, a korisnici koriste sustav, brinu se i odgovaraju za sadržaj i podatke, kao i za administriranje podataka o kolegijima i njihovim polaznicima.

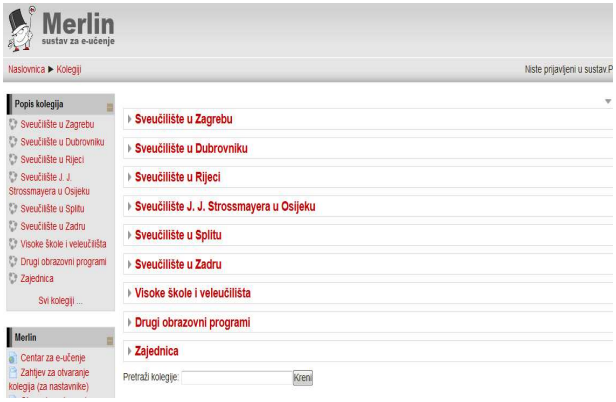
Sustav za e-učenje Merlin bazira se na sustavu otvorenog koda Moodle koji se kontinuirano razvija i prilagođava potrebama korisnika. Sustav održavaju djelatnici centra za e-učenje, a omogućuje ustanovama, nastavnicima i studentima pouzdanu platformu za e-učenje. Korisnicima sustava dostupni su razni standardi kao i dodatni moduli sustava Moodle koji su nadograđeni i prilagođeni za potrebe korisnika. Sustav Merlin je povezan sa e-portfolio sustavom, čineći virtualno okruženje za e-učenje. Također, sustav Merlin je povezan i sa sustavom ISVU čime je omogućeno otvaranje kolegija te upis nastavnika i studenata iz sustava ISVU na sustav Merlin. Pored postavljenih modula u sustavu Merlin, nastavnici mogu zatražiti i uključivanje drugih modula sustava Moodle.

LMS je krovna aplikacija u modelu e-učenja. Najčešće je to Internet aplikacija smještena na određenom Web serveru kojoj mogu pristupiti različiti korisnici preko nekog od mnogobrojnih Web pretraživača. LMS vrši konstantnu evaluaciju percepcije polaznika o efektivnom obrazovanju i učenju različitih procesa te kontrole voditelja tečaja. Glavni cilj LMS-a je upotreba dostupnih ljudskih i tehnoloških resursa kako bi se omogućila najveća kvaliteta, fleksibilnost, adekvatan način učenja te najbolje okruženje za voditelje tečaja, ali i polaznike.



Slika 5. Primjena LMS modela

Moodle - Open Source Course Management System (CMS), također poznat i kao Learning Management System (LMS) ili čak Virtual Learning Environment (VLE). Izuzetno je popularan među brojnim predavačima diljem svijeta kao alat za kreiranje dinamičnog web sadržaja. Vrlo je popularan budući da se može instalirati na bilo koje cloud rješenje ili na jednom od vlastitih računala ili kod neke od web hosting tvrtki. Moodle je vrlo primamljiv za uvođenje u pojedinu poslovnu organizaciju jer ima odlike koje dopuštaju objavu velike količine podataka, a istodobno ga mogu koristiti na stotine ili čak tisuće polaznika. Sustav sadržava forum, omogućuje stvaranje različitih baza podataka, kvizova, zadataka, resursa i sl. Moodle je programski paket koji nam nudi uređivanje i upravljanje tečajevima preko mreže. Alat Moodle nam nudi mogućnost postavljanja virtualne učionice, tj. e-učionice. U virtualnim učionicama učitelji mogu dodavati gradivo, najaviti različite aktivnosti, testove, provjeravati znanje, komunicirati s ostalim sudionicima. Studenti, učenici mogu gledati gradivo, prenositi ga na svoje računalo, rješavati testove, pisati zadaće, komunicirati s nastavnim osobljem i drugim studentima. Ideja Moodlea temelji se na tome da učenici najviše nauče, ako nastavni materijal aktivno koriste. Znači, ne samo učenjem gradiva, već i aktivnim raspravljanjem o njemu te izrađivanjem novog. nastavnog materijala u suradnji sa drugim studentima i nastavnicima [4], [5].



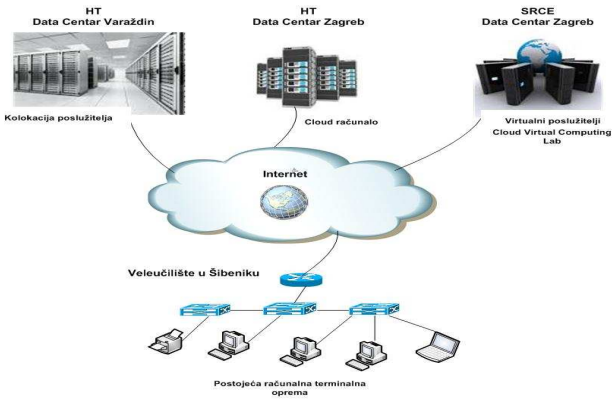
Slika 6. Sustav za e-učenje “Merlin”

Jedna od najvećih koristi e-učenja pomoću cloud rješenja za sve djelatnike i studente su nove mogućnosti u radu. Jednostavna razmjena podataka i zajednički rad na dokumentima povećava fleksibilnost i brže izvršavanje zadataka. Pristup podacima sa bilo koje lokacije olakšavaju rad od pripreme predavanja za stručno osoblje, te odradu vježbi i projekata za studente. Imaju pristup svojim datotekama neovisno o mjestu gdje se nalaze. Rad na projektima je olakšan jer zahtjeva mnogo zaposlenika, odjela i lokacija. Projekti zahtijevaju puno individualnih zadataka i obaveza koji su u međusobno zavisnoj vezi. Sudionici projekta se mogu uključiti sa bilo koje lokacije kako bi upravljali rasporedom, zadacima i informacijama. Promjene se vide u realnom vremenu, što ubrzava proces i lakše se držati rokova na projektu. Svakom djelatniku i studentu omogućen je pristup edukativnim alatima bilo gdje i bilo kada, te će na vježbama moći koristiti i vlastita prijenosna računala. Studentima dostupnost osigurava i moguća podrška sustava za tablete, te druge prijenosne uređaje. Tehnologija virtualnog računala će nam omogućiti veliko poboljšanje nastavnog procesa kroz održavanje interaktivne nastave korištenjem prijenosnika i tableta, te mogućnost izvođenja nastave na daljinu.

Također, mogućom primjenom virtualnih računala pristupamo svom desktopu preko Interneta, pritom sve izgleda kao da radimo na svom računalu, no operativni sustav, aplikacije i podaci nisu smješteni lokalno “na disku”, već na udaljenom serveru gdje su sigurni. Upravljanje virtualnim računalima i aplikacijama s jednog mjesta, produljavamo životni vijek računala, jer usluga cloud računalo ne ovisi o sklopovskoj snazi vašeg računala. Ukoliko posjedujete određenu vlastitu poslužiteljsku infrastrukturu koja je za sada smještena u prihvatljivoj okolini, ali uskoro će trebati raditi povećavanje kapaciteta poslužiteljske infrastrukture. Time bi se smanjila raspoloživost trenutnih prostora i

poslovanje i izvođenje nastave bi moglo biti ugroženo. Korištenjem kolokacije opreme u Data centru Hrvatskog Telekoma bilo bi nam omogućeno da umjesto ulaganja u uređenje vlastitog Data centra za koji trebamo osigurati prostor, napajanje, hlađenje, u potpunosti osiguramo svoje poslovanje kolokacijom u HT Data centar. Na ovaj način elimirali bi sve moguće probleme uzrokovane varijacijama napona zbog grmljavine te potrebe za hlađenjem poslužitelja što je izraženo naročito u ljetnim mjesecima. Tada bi postojeća poslužiteljska infrastruktura bila premještena u neki Data centar(npr.HT data centar u Varaždinu). Time bi se oslobodio prostor ustanove, koji bi se preuredio za dodatne učionice/pomoćne prostorije. Istovremeno korištenjem virtualnih poslužitelja u SRCU imali bi infrastrukturu smještenu na dvije nezavisne lokacije i na različitim tektonskim pločama (Varaždin i Zagreb) čime bi dobili maksimalnu sigurnost podataka, naročito u slučaju prirodne nepogode/katastrofe kao što je npr. potres.

Korištenjem kolokacije vlastitog poslužitelja i Cloud virtualnog poslužitelja od SRCA zadovoljene su trajne potrebe za poslužiteljskim kapacitetima i to s razinom podrške standardnom za moderni podatkovni centar (visoka raspoloživost, pouzdanost, skalabilnost, fleksibilnost upravljanja) uz eliminiranje potrebe investiranja u vlastiti poslužitelj. Također primjenom Cloud Virtual Computing Lab povećavamo kvalitetu i efikasnost izvedbe same nastave [7].



Slika 7. Primjena Cloud rješenja u Veleučilištu Šibenik

Korištenjem navedenih cloud rješenja SRCA i Hrvatskog Telekoma, ustanove ostvaruje velike uštede i sigurnost podataka, te maksimalnu iskoristivost vlastite postojeće infrastrukture na zadovoljstvo studenata i stručnog osoblja.

V. ZAKLJUČAK

Razvoj i napredak društva nameću nužnu potrebu da se obrazovni proces usmjeri ne samo na prijenos znanja, nego i na istraživanja. ICT daje svoj doprinos u svakodnevnoj organizaciji obrazovnog procesa, u vremenskoj fleksibilnosti te neograničenoj dostupnosti obrazovnih sadržaja. Primjenom cloud tehnologije, omogućava se kvalitetna i jednostavna komunikacija nastavnika i studenata u obrazovnom procesu. Najrazličitiji nastavni materijali polaznicima mogu biti dostupni uvijek, kao i pristup s bilo kojeg dislociranog mjesta. Organizacija nastave zasniva se na aktivnoj suradnji između nastavnika i polaznika, te je prilagođena potrebama polaznika s jasno postavljnim obrazovnim ciljevima. Naime, budući da postavljanje web-sustava za e-obrazovanje zahtijeva znatno uloženo vrijeme te računalne i druge resurse, potrebno je u fazi pripreme napraviti procjenu ciljeva i željenih učinaka on-line obrazovnog sustava. Ukoliko se većina nastave izvodi na klasičan način u predavaonici ili laboratoriju, a korištenje materijala na webu je samo dopuna takvoj nastavi, u pravilu nije potrebno kreirati kompleksan sustav za on-line edukaciju jer se većina obrazovnih sadržaja dobiva tijekom klasične nastave i iz tiskane literature, a savjetovanje s predavačem moguće je u osobnom kontaktu, tj. licem u lice. Međutim, ako polaznici najvećim dijelom pristupaju obrazovnim sadržajima on-line te su vrlo rijetko u neposrednom kontaktu licem u lice s nastavnikom, obično je potrebno uložiti vrlo mnogo truda i sredstava u oblikovanje sustava koji će biti jednostavan za korištenje i barem donekle ispuniti potrebu korisnika za socijalnim kontaktom s predavačem i drugim polaznicima. Primjena određenih metoda u e-obrazovanju u vrlo velikoj mjeri ovisi o raspoloživoj tehnologiji. Polaznici mogu koristiti brze širokopojasne internetske veze, a predavač može snimiti predavanja te ima na raspolaganju poslužitelj odgovarajućeg memorijskog kapaciteta i brzine pristupa Internetu. Obrazovni je sadržaje moguće pohraniti i u obliku videozapisa predavanja. Ako korisnici pristupaju obrazovnim sadržajima putem sporijih veza ili ukoliko server kojim raspolaže predavač ima slab kapacitet veze prema Internetu, tada je vjerojatno najbolje sadržaj predavanj pripremiti u obliku pisanog teksta i statičnih vizualnih ilustracija koje ne zauzimaju mnogo memorijskog prostora. Primjenom rješenja javnog clouda i e-učenja omogućava se ustanovama fokusiranje na njihovu osnovnu djelatnost (stručno i znanstveno obrazovanje studenata). Cloud rješenja se svakodnevno sve više i više koriste u osobne, edukacijske i poslovne svrhe. Primjenom cloud rješenja korisnicima se omogućava pristup putem niza web usluga koje upravljaju računalnim resursima kao što su na primjer: računala, mreža, sustav za pohranu podataka, operativni sustav, okružje za razvoj aplikacija, aplikacijski programi. Implementacijom e-učenja pomoću cloud rješenja bez većih ulaganja, te uz postizanje maksimalne sigurnosti podataka na adekvatan način povezati ćemo postojeću poslužiteljsku infrastrukturu (postojeće

poslužitelje koji se planiraju premjestiti u Data centar) i nove cloud servise koji će omogućiti napredna rješenja e-učenja, te fleksibilnije održavanje nastave i vježbi (virtualna računala, virtualni poslužitelji i virtualni laboratorij). Fleksibilnost održavanja nastave i vježbi ogleda se u tome što je pristup podacima omogućen s bilo koje platforme i u bilo koje vrijeme.

Primjena virtualne (VR) i proširene stvarnosti (AR) postaje sve popularnija u mnogim granama znanosti i obrazovanja. Štoviše primjena virtualne stvarnosti u edukacijske svrhe koristi se već dulje vrijeme. Mnoga istraživanja pokazuju kako unatoč evidentnim nedostacima primjena virtualne stvarnosti povoljno utječe na rezultate učenja. Tome pridonosi velika sloboda bez fizičkih ograničenja stvarnog svijeta što djeluje motivirajuće u odnosu na klasične metode učenja. Potrebno je istaknuti važnost i složenost izrade sadržaja za sustave virtualne stvarnosti prilagođene učenju. Među oblicima sadržaja koji čine virtualnu stvarnost suvremeni trend su trodimenzionalni modeli koji stvaraju doživljaj tzv. uranjanja u virtualni svijet. U radu se navode i komentiraju rezultati postojećih istraživanja sustava učenja pomoću virtualne stvarnosti s osvrtom na njihove nedostatke, te će se nakon toga prikazati postupak stvaranja virtualnog trodimenzionalnog sadržaja od početka nastajanja pa do njegove realizacije. Tijek izrade virtualnog objekta započinje procesom modeliranja, koje je moguće provesti s nekoliko različitih tehnika ili njihovom kombinacijom. Ukoliko se radi o statičnom modelu, poput objekta ili stvari, tada je završna faza izrade modela teksturiranje ili bojanje objekta te priprema za animiranje koja se izvršava izradom skeleta.

I. UVOD

Učenje je sposobnost bez koje nema napretka. Ono počinje od vrlo ranog djetinjstva, rani stadiji učenja počinju kroz igru. Takvo je učenje najbrže, najzanimljivije i najefikasnije [1].

Nove metode i alati za učenje evoluiraju i olakšavaju učenje. Time se ne dovodi u pitanje efikasnost tradicionalnih metoda učenja, međutim često su nove metode učenja zanimljivije od dobro poznatih [1,2]. Novi pristup učenju kroz virtualnu stvarnost potiče zainteresiranost, motiviranost i mnoge druge pozitivne učinke.

Tehnologija računalne grafike napreduje velikom brzinom, te omogućuje stvaranje sadržaja gotovo bezgraničnih mogućnosti. Mnogo takvog sadržaja može poslužiti za unapređenje procesa učenja [3]. Mnogo je praktičnih primjera korištenja tehnologija VR i AR za učenje u širem smislu. Primjerice, primjena u vojne svrhe gdje se pomoću vrlo preciznih simulacija leta trenira pilote u bezopasnom virtualnom okruženju i olakšava upravljanje letjelicom pomoću kacige sa proširenom stvarnošću [7]. Veliki uspjeh i pozitivne reakcije virtualna stvarnost postiže u umjetnosti i prikazu kulturološkog naslijeđa u smislu virtualne restauracije i rekonstrukcije umjetničkih djela bez fizičkog utjecaja na original. Nadalje, virtualna stvarnost omogućuje osobama s poteškoćama da nadomjeste onemogućena osjetila. „The Museum of Pure Form“ je projekt koji daje mogućnost slijepima da opipom dožive izgled određene statue ili umjetničkog djela [6]. Također, AR se koristi u medicini za vizualizaciju i treniranje operativnih postupaka, te za treniranje manufakturne proizvodnje i popravak uređaja i strojeva. Najčešće je korištenje AR i VR namijenjeno zabavi [7] a postoje razni projekti koji ujedinjuju AR ili VR sa učenjem. Efikasnost učenja astronomije u osnovnoj školi pomoću virtualnog modela naprama fizičkog modela testirali su S. Fleck i G. Sinom [8]. Isto tako je tim u Španjolskoj istražio kako se VR može upotrijebiti u stvaranju trodimenzionalne umjetnosti [9]. Osim samostalnog učenja unutar virtualnog okoliša, poprilično interesantna okolina za učenje ostvarila bi se mogućnošću suradnje unutar virtualne stvarnosti. Takav aspekt učenju istražili su R. L. Jackson i E. Fagan u svom radu [10]. Virtualna stvarnost otvara nove mogućnosti te novi pogled na svijet i njegovu percepciju.

Integracija virtualne stvarnosti u edukacijske primjene ima pozitivnih i negativnih konotacija. Prema pretpostavkama, nova metoda učenja djeluje pozitivno na rezultate učenja, tako prednost primjene tehnologije VR može poboljšati performanse učenja i konceptualnog razumijevanja pri određenim zadacima. Mnoge činjenice koje učimo teško je smisleno razumjeti, virtualna stvarnost omogućuje vizualizaciju koja olakšava poimanje i shvaćanje. Međutim, razumijevanje načina i modaliteta primjene tehnologije VR u smislu unaprjeđivanja ishoda učenja je za sada razmjerno ograničeno [4].

Upotrebom kacige (engl. Head gear) s audio-vizualnim zaslonom, senzorima za pozicioniranje i uređajem s taktilnim sučeljem moguće je potpuno uranjanje (engl. immersion) u virtualni svijet u kojem možemo vidjeti, čuti, pa čak i stvarati, izmijeniti i manipulirati virtualnim objektom te tako učiti o njemu bez zapreka fizičkog svijeta [3].

Problematika VR-a u edukaciji je odvraćanje pozornosti. Bogati sadržaj i mogućnost manipuliranja potiču na ponekad pretjerano istraživanje unutar sustava, te tako sudionik bude preplavljen mogućnostima, informacijama i sadržajem te lako izgubi primarni cilj [5].

Također, da bi se izbjegle negative konotacije potrebno je razriješiti barem tri primarna problema prije integracije sustava virtualne stvarnosti u edukacijske svrhe: (i) cijena, (ii) funkcionalnost, (iii) strah od tehnologije [3].

Troškovi za nabavku opreme potrebne za komercijalni virtualni sustav dovoljno sofisticirane za složene modele i zahtjevnije operacije relativno su viši od troškova nabavke prosječnog računala za osobnu upotrebu. Međutim, razvojem tehnologije računalna snaga postaje te sklopovska oprema visoke kvalitete i performansi postaje sve dostupnija te se ujedno se razvijaju pristupačniji i efikasniji sustav virtualne stvarnosti.

Slijedeća prepreka je funkcionalnost. U stvarnom svijetu zakone fizike ubrajamo u svojstvene elemente prirode. Gravitaciju, svjetlosti, Newtonove aksiome podrazumijevamo kao normalnu pojavu, no u virtualnom svijetu je potrebno sve te pojave uzeti u obzir i simulirati kako bi se ostvario što bolji dojam uranjanja u virtualni svijet. Dobro oblikovanje je temelj funkcionalnosti takvog sustava, oblikovanje mora slijediti mnoge zahtjeve. Primjerice, u učionici gdje je mnogo učenika potreban je veliki broj senzora i ostale opreme, podešavanje velikog broja parametara, te značajna ulaganja i promišljanje o načinu primjene kako bi se takav sustav polučio pozitivne rezultate.

Posljednji izazov za prihvaćanje VR i AR tehnologije za širu upotrebu, pa tako i u školstvu, je strah od računalne tehnologije. Brenda Laurel istražila je strah od računalne tehnologije i identificirala njegove komponente [3]:

- tabu imitacije boga,
- strah od pogrešivosti: inteligentni softverski entiteti će možda postati bezosjećajni i beživotni stvorovi koji posjeduju računalnu tehnologiju, započinju rat i uništavaju okoliš,
- strah od gubljenja identiteta: nastanak ovisnosti o tehnologiji, robovi kibernetske simbioze,
- strah gubljenja kontrole nad stranim entitetom: softverski entiteti će možda razviti osjećajnost te prevladati.

Nadalje, kao produkt straha računalne tehnologije pojavili su se strahovi od VR kao što je [3]:

- strah od gubljenja kontrole nad drugima: kako možemo znati tko stoji iza virtualne osobe, kako će se afirmirati prava pojedinca, kako će se rješavati konflikti, te tko će vladati,
- strah od odbijanja pristupa: kada se kreira VR bez obzira na njezinu izvedbu i oblik, tko će imati pravo biti u njoj i kako će ući u nju,
- strah od konfuzije: što ako izgubimo osjećaj razlike između virtualnog i stvarnog svijeta,
- strah od napuštenosti: što ako se većini društva svidi virtualna svijet i ono zanemari stvarnost. Hoće li pojedinci koji će ostati u stvarnosti biti zanemareni i odbačeni.

U konačnici realna zabrinutost s kojom se sučeljavaju nastavnici je nedostatak istraživanja koja jasno ukazuju na prednosti primjene ove tehnologije te jasne pedagoške paradigme i načine njene primjene u procesu podučavanja.

II. OBLIKOVANJE TRODIMENZIONALNOG OBJEKTA

Ukoliko bi se razriješio barem jedan dio problematike implementacije sustava virtualne stvarnosti u primjenama pogodnim za učenje, povećala bi se učinkovitost podučavanja. Jedna od tri primarne prepreke je strah od tehnologije, strah koji proizlazi iz nedostatka znanja i informacija te posljedičnog nerazumijevanja tehnologije. S ciljem povećavanja razine znanja o procesu stvaranja sadržaja za sustave virtualne stvarnosti, u ovom radu je prikazan proces nastanka sadržaja za virtualni sustav, točnije proces oblikovanja trodimenzionalnog objekta. Programski alat koji je pri tome korišten je Blender, verzije 2.73a.

A. Modeliranje

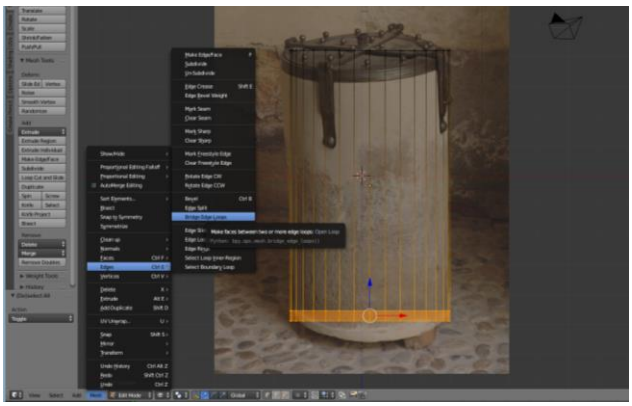
Stvaranje objekta započinje korakom modeliranja. U glavnom prozoru u kojem će se modelirati pogled definiran se tip pogleda na „Front Ortho“, odnosno na prednji, ortogonalni pogled na objekt.

Radi lakšeg modeliranja potrebno je umetnuti sliku objekta koji se modelira u pozadinu tako da se kursor namjesti na glavni prozor za modeliranje i pritisne tipka „N“ koja otvora prozor s detaljima i opcijama. U tom prozoru potrebno je omogućiti pozadinsku sliku pritiskom na ikonu pokraj „Background Images“ kako bi se aktivirala slika te u istom prozoru odabrati datoteku slike pomoću „Add Image“. Otvorit će se dodatni prozor u kojem se odabire slika pomoću naredbe „Open“. Na pozadini prozora s pogledom pojavit će se odabrana slika. Ukoliko se promijeni pogled iz primjerice „Front Ortho“ u „Top Ortho“ ili „User Persp“ ili bilo koji drugi, slika se neće prikazivati. Da bi se pozadinska slika prikazivala u svim pogledima potrebno je otvoriti prozor postavki (prečac: tipka N), te u postavkama pozadinske slike za opciju „Axis“ odabrati „All Views“.

Objekt koji je odabran za izradu ovog primjera je kamena kasa iz razdoblja stolovanja Nikole Zrinskog Sigetskog (16. stoljeće), stajala je na mostu te je služila za uplatu takse prilikom ulaska u grad Čakovec (slika 8).

Izrada kamene kase počinje dodavanjem jednostavnog valjka pomoću „Add-Mesh-Cylinder“ (prečac: Shift + A) koji se preoblikuje naredbama „transformation manipulators“ koje uključuju translaciju (g), rotaciju (r) i skaliranje (s). Kako bi ga se detaljnije preoblikovalo, potrebno je promijeniti način rada u uređivanje, odnosno „Edit mode“ (prečac: Tab). Potrebno je skalirati valjak po z osi tipkama „S“ pa „Z“ te pomicanjem pokazivača miša.

Način rada za uređivanje, tzv. „Edit mode“ pruža mogućnost oblikovanja objekta sa točkama „vertices“, bridovima „edges“ i plohama „faces“. Nakon što valjak prebacimo u „Edit mode“ u kojem možemo manipulirati točkama, bridovima i plohama, potrebno je dodati još bridova kako bi napravili prsten na dnu objekta. Kako bi dodali bridove koji se protežu oko cijelog objekta, potrebno je odabrati funkciju „Edge Loop“ kao što je



Slika 1. Dijeljenje objekta funkcijom “Edge loop”

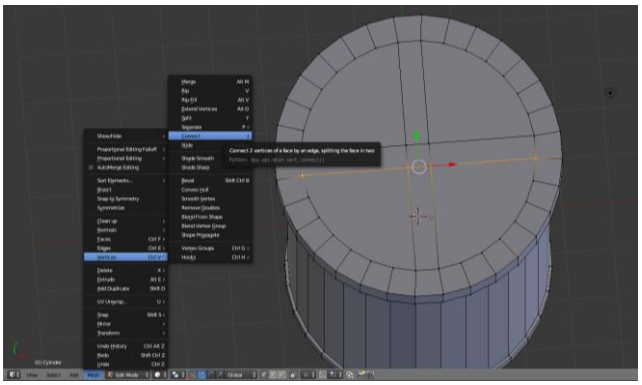
prikazano na slici 1.

Osim funkcija translacije, rotacije i skaliranja postoji još jedna osnovna funkcija naziva „Extrude“. Ta funkcija omogućava izvlačenje dijelova mreže površine.

Nakon što se izradi „Edge loop“ i pomoću funkcije „Edge Slide“ izrađeni element se postavlja na željeno mjesto, odabiru se plohe te se povlače opcijom „Extrude“ a veličina im se prilagođava skaliraju tako da se izradi izbočeni prsten na donjem dijelu objekta. Na jednak način. kombinacijom izvlačenja, skaliranja i translatiranja ploha objekt se udubljuje. Ovim postupcima izrađeno je tijelo kase.

Sljedeći korak je izrada poklopca za kasicu pomoću novog valjka. Skaliranjem je potrebno spljoštiti valjak te kombinacijom funkcija skaliranja, translacije i dodavanja materijala izvlačenjem („Extrude“) tako da valjak prianja na tijelo kase. Kako bi se izradio metalni križ tj. okov na poklopcu kase, najprije je potrebno označiti brid na gornjem dijelu poklopca, te funkcijom „Select – Edge Loops“ (prečac: Alt + Shift + desna tipka miša) označiti sve bridove u krug funkcijom „Extrude“. Potrebno je odabrati nasuprotne točke koje se spajaju funkcijom „Mesh – Vertecies-Connect“ tako da na tvore križ. Kada je na taj način gornja ploha poklopca definirana, odabiru se plohe koje tvore oblik križa te im se treća dimenzija dodaje funkcijom „Extrude“. Na isti način stvaraju se bočne plohe na poklopcu koje se nastavljaju na križ s gornje strane, kako je prikazano na slici 2.

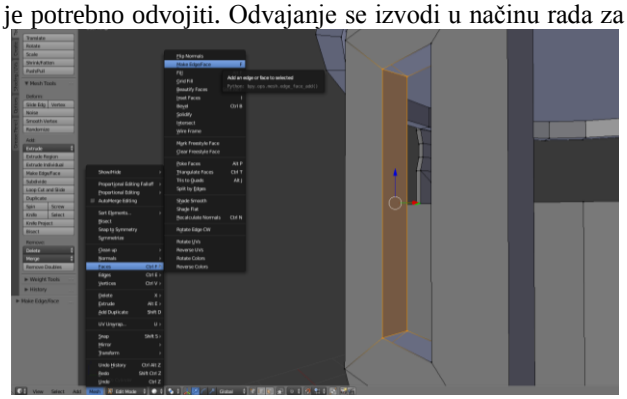
Kako bi se izradile cilindrične spojnice na okovima, dodaju se bridovi funkcijom „Edge Loop“, označavaju se određene plohe koje se tada mogu izbočiti funkcijom „Extrude“. Kako bi se bolje oblikovale spojnice, moguće je ručno namjestiti točke za manipulaciju.



Slika 2. Spajanje točaka funkcijom “Connect”

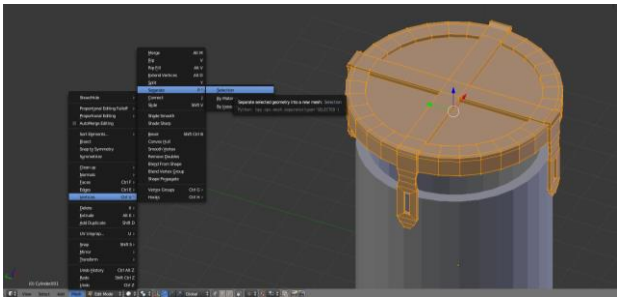
Okovi u obliku križa nastavljaju se niz tijelo kase te čine četiri zatvarača. Oni se izrađuju kao i prethodno izrađeni dio okova, kombinacijom funkcija i alata „Extrude“, translacijom, rotacijom i skaliranjem. Kako bi se izradili otvori, koristi se funkcija „Knife tool“, koja se nalazi u prozoru „Tools“ čiji prečac je „T“. Zbog simetričnosti otvora, prvo je potrebno funkcijom „Extrude“ i skaliranjem unutar plohe izraditi manju plohu te tu manju plohu obrisati. Odabirom najmanje triju točaka i funkcijom „Mesh – Faces – Make Edge/face“ spajaju se točke te nastaje nova ploha. Unutar nastale praznine uslijed brisanja plohe potrebno ih je popuniti tako da se ne vidi šupljina unutar objekta, a ostane otvor kao na slici 3.

Poklopac kase i tijelo kase čine jedan objekt, što onemogućava manipuliranjem svakim posebno. Stoga ih je potrebno odvojiti. Odvajanje se izvodi u načinu rada za



Slika 3. Spajanje točaka funkcijom “Connect”

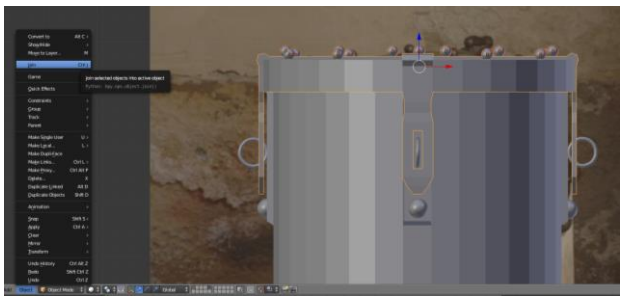
uređivanje, tzv. „Edit mode“ gdje se označe točke poklopca te upotrijebi funkcija „Mesh - Vertices – Separete - Selection“ te na taj način poklopac učini zasebnim objektom. Kako bi se jasno moglo razaznati koji cilindar čini poklopac, a koji tijelo kasice u prozoru „Outlineru“ dvostrukim pritiskom na ime objekta otvaramo opciju preimenovanja. Poklopac se preimenuje iz „Cylinder“ u „Poklopac“, a tijelo kasice u „Tijelo“. Poklopac je potrebno namjestiti na tijelo kasice translacijom i skaliranjem. Potrebno je dodati „Edge Loop“ na tijelo kasice kako bi izradili metalne podloge na koje prianjaju okovi poklopca kao što je prikazano na slici 4.



Slika 4. Odvajanje objekata funkcijom "Separate"

Zakovice i otvor za novčiće na kasici moguće je izraditi na jednostavan način. Potrebno je dodati sferu „Add – Mesh – UV Sphere" i namjestiti je na željeno mjesto. Zakovice na tijelu kasice izrađuju se tako da se u načinu rada uređivanja označi pola sfere i obrišu odabrane točke pomoću tipke „Delete" i „Delete Vertices".

Prsten za učvršćivanje okova izrađuje se dodavanjem jednostavnog oblika, primitiva torusa „Add – Mesh-Torus", te se u prozoru „Tools" (prečac: T) mijenja polumjer „Major Radius" i „Minor radius" tako da prsten bude tanji. Mali dijelove poput zakovica i prstena spajaju se sa poklopcem ili tijelom funkcijom "Object – Join" (prečac: Ctrl + J) kao na slici 5.



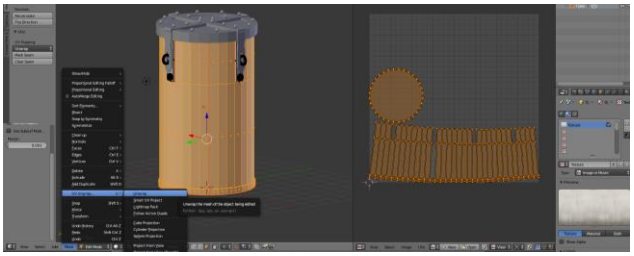
Slika 5. Spajanje detalja na poklopac funkcijom "Join"

Slika 5 pokazuje oštre bridove na kasa što izgled čini razmjerno umjetnim. Kako bi se izgled učinio što realističnijim, potrebno je zaobliti cjelokupan model, jednostavnom funkcijom "Smooth" koja se nalazi u prozoru "Tools" (prečac: T) te je time modeliranje kasice završeno.

B. Teksturiranje

Teksturiranje se u prvom koraku provodi dodjeljivanjem materijala određenoj skupini ploha. U prozoru „Properties – Material" potrebno je odabrati „New material", te podesiti parametre sjaja, disperzije svjetla, boje i slično. Međutim, umjesto boje biti će dodana tekstura, odabirom teksture prljavog, starog kamena ili betona te teksture starog metala. Potrebno je označiti plohe na koju se želi postaviti tekstura betona. U prozoru „Properties - Texture" kod parametra „Type" potrebno je odabrati „Image or Movie" te niže, u prozoru „Image" dodati sliku teksture korištenjem naredbe „Open". Otvara se prozor u kojem je potrebno pronaći putanju mjesta gdje se nalazi željena tekstura.

Kako bi tekstura bila primijenjena na objekt potrebno je izraditi radni prozor povlačenjem crta u gornjem desnom kutu. Tada se u tom prozoru u lijevom donjem kutu mijenja tip iz „3D View" u „UV/Image Editor". Na tijelu kase je potrebno označiti bridove po kojima će se izrezati tj. stvoriti kreirana UV mapa označavanjem bridova koje je potrebno izdvojiti te odabirom opcije „Mesh – Edges - Mark Seam". Bridovi će postati crveni te je nakon toga potrebno „odmotati", odnosno projicirati sve površine trodimenzionalnog objekta na dvodimenzionalnu površinu, odnosno UV mapu što je moguće izvršiti naredbom „Mesh – UV Unwrap -

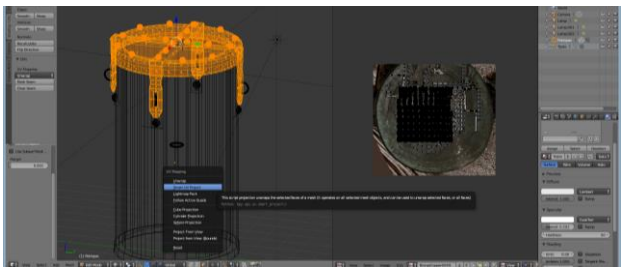


Slika 6. Projeciranje UV mape tijela kasice

Unwrap" kao na slici 6.

U prozoru „UV/Image Editor" odabire se tekstura betona te se namještaju točke objekta koje se približno poklapa s teksturom u UV mapi.

Isti postupak primjenjuje se za poklopac i metalne dijelove kase. Dakle, u „Edit mode-u" označavaju se bridovi po kojima se želi razrezati objekt za UV mapu te ga je potrebno projicirati pomoću „Mesh – UV Unwrap –



Slika 7. Projeciranje UV mape poklopca kasice funkcijom "Smart UV Project" za konju nije potrebno označiti bridove rezanja

Smart UV project" opcije kako je prikazano na slici 7.

U prozoru svojstava potrebno je dodati novi materijal pritiskom na tipku označenu simbolom „plus". Na taj materijal dodaje se nova teksturu i odabire se tekstura metala. Nadalje, u prozoru „UV/Image Editor" otvara se tekstura metala i podešavaju se točke tako da pokrivaju željeni dio teksture na način da na objektu ne bude iskrivljena na teksturi. Time model kase poprima izgled koji je vrlo sličan početnom modelu temeljem kojeg je nastao.

Kako bi se kasa dobro vidjela sa svih strana, potrebno ju je odgovarajuće osvijetliti. Osvjetljenje se podešava prema izboru s ciljem što boljeg isticanja pojedinih detalja, pri čemu je najbitnije uzeti u obzir da jedan izvor svijetlosti nije dovoljan. Razmislimo li o fizici svjetlosti u stvarnosti, ono se raspršuje i reflektira od predmeta tako da sjena nikada nije stopostotan nedostatak svjetla što znači da je s one strane modela koji nije osvjetljen potrebno postaviti dodatan izvor svjetlosti manjeg intenziteta.

Dodavanje izvora svjetlosti vrši se postavljanjem opcije „Object mode" i odabirom „Add – Lamp - Sun".

Postavke izvora svjetlosti podešavaju se u prozoru "Properties". U ovisnosti o izvoru svjetla potrebno je postaviti odgovarajući intenzitet i boju. Izvori svjetla u sjeni postavljaju se na blago plavo svjetlo s malim intenzitetom, a glavni izvor svjetla blago žutu boju i veći intenzitet.

Nadalje, osim svjetlosti potrebno je namjestiti kameru, tj. točku pogleda na objekt. Uz zadovoljavajuće osvjetljen 3D model kase i namještenu kameru, model je spreman za postupak renderiranja tj. postupak izrade slike modela. Ikona alata za renderiranje predstavljena je slikom fotoaparata i nalazi se u prozoru „Properties". Prozor za renderiranje posjeduje razne parametre za renderiranje od kojih su najbitniji „Output", dakle mjesto gdje želimo pohraniti renderiranu datoteku i „Dimensions" gdje postavljamo rezoluciju datoteke. Kada su parametri

Slika 8. Konačna slika modela kasice

namješteni, potrebno je pritisnuti tipku „Render" u istoimenom prozoru čime se stvara slika slična slici 8.

III. ZAKLJUČAK

Virtualna i proširena stvarnost su nove tehnologije smještene u centar mnogih istraživanja njihove primjene. Radi iznimnih mogućnosti koje će te tehnologije otvoriti u skoroj budućnosti, uz konstantno usavršavanje i napredak, nije upitno njihovo integriranje u gotovo sve aspekte društva.

Ideju implementacije tehnologija virtualne i proširene stvarnosti u edukacijske sustave je potrebno temeljito istražiti, štoviše ona se već provodi u obrazovanju u određenim granama znanosti. Mnogo je konkretnih primjera praktične primjene tehnologija virtualne i proširene stvarnosti.

Pitanje na koje je potrebno odgovoriti je koliko je takva tehnologija poželjna, odnosno jeli je moguće i koliko je isplativo integrirati je u široj primjeni u komercijalnije edukacijske sustave. Podijeljena su mišljenja između dobrih i loših konotacija koje nosi takva tehnologija. Kako bi društvo prihvatilo takvu tehnologiju u edukacijske sustave potrebno je razriješiti negativne strane tehnologije kao što su: cijena, korištenje, strah od tehnologije i poticati pozitivne strane kojih je mnogo.

Cijena tehnologije pada kada ona napreduje do određenog stupnja usavršavanja za primjenu u komercijalnije svrhe. Primjena u komercijalne svrhe te široka dostupnost tehnologije VR i AR povećava i širi područja njezine primjene. Širokom primjenom tehnologije umanjuje se njezino nepoznavanje te ona postupno postane prihvaćena što rezultira smanjenjem ili potpunim nestankom straha od njena korištenja.

Ulaganje u tehnologiju virtualne i proširene stvarnosti rezultirat će njenim eksponencijalnom rastom u razvitku i korištenju što jedino može rezultirati napredovanjem edukacijskih sustava te izravno utjecati na napredak i evoluciju ljudskog društva.

Ovim radom je prikazan postupak stvaranja jednostavnog trodimenzionalnog modela kase iz 16. stoljeća. Unatoč razmjerno jednostavnom modelu, potrebno je istaknuti kako je praćenje ovdje iznijetog postupka njegovog stvaranja razmjerno složeno. Mnogo bolji način prikaza ovog postupka je izrada video materijala kojim će postupak biti prikazan a što autori rada uključuju u buduća nastojanja prema stvaranju novih spoznaja o primjeni tehnologija virtualne i proširene stvarnosti u procesu stjecanja znanja.

Sažetak

Rezultati ovog istraživanja na malom broju ispitanika mogu predstavljati indikativne pokazatelje stanja i odnosa između nastave informatike u osnovnim i srednjim školama

Iako je nastava informatike u osnovnim školama prisutna preko 20 godina još uvijek se provodi kao izborna nastava. Dok se u svim gimnazijama (osim malog broja PMG) i većini trogodišnjih i četverogodišnjih strukovnih škola informatika provodi jednu ili dvije godina kao redovni predmet. Nameće se pitanje iz kojih razloga učenici osnovnih škola odabiru informatiku kao izborni predmet i koliko im to pomaže ili ne u daljnjem školovanju kroz srednju školu. Isto tako je pitanje kakvi su izgledi ovako obrazovanog učenika sutra u životu, privredi, Europi i svijetu?

Ako usporedimo izbornu nastavu informatike u osnovnim školama sa redovnom nastavom informatike u srednjim školama dolazimo do saznanja da je se osnovnoškolskom planu i programu izborne nastave informatike svladavaju osnovna znanja i vještine korištenja informacijsko komunikacijske tehnologije, kako za svakodnevne potrebe tako i za potrebe budućih zanimanja. Ali isto tako se i u srednjoškolskom planu i programu redovne nastave informatike svladavaju **osnovna znanja i vještine korištenja informacijsko komunikacijske tehnologije**. Na žalost radi se po planovima (plan i program) starim dvadesetak godina na području gdje se ideje i potrebe mijenjaju i razvijaju iz dana u dan.

Možemo uočiti sličnost između programa ovom grubom usporedbom svrhovitosti i provedbe nastave informatike u osnovnim i srednjim školama

1. Uvod

Kako je danas lako ispitati i anketirati određenu skupinu ispitanika pojavila se želja i potreba za saznavanjem odgovora na prethodno navedeno pitanje: Iz kojih razloga učenici osnovnih i srednjih škola odabiru informatiku kao izborni predmet i koliko im to pomaže ili ne u daljnjem školovanju?

Svjedoci smo da je u osnovnim školama osjetni pad zainteresiranosti učenika za izbornu nastavu općenito, pa tako i za izbornu nastavu informatike. Do toga je dovelo nekoliko činjenica. Svjesni samo da današnji osnovnoškolci, skoro svi, imaju „svoja“ računala. Sami svladavaju dijelove osnova rada s računalima, upotrebe Interneta i internetskih servisa, ali je to znanje, kod velikog djela učenika, na niskoj razini znanja. Nezainteresiranost za svladavanjem veće i svrhovitije količine znanja i vještina predstavlja jedan od problema manje zainteresiranosti za izbor informatike kao izbornog predmeta. Učenici koji ipak odabiru izborni predmet informatike u osnovnoj školi u srednjoškolskom dobu susreću se s drugim problemom: uče većinu znanja i vještina koje su već savladali za vrijeme osnovnog školovanja u izbornoj nastavi informatike – te im stoga informatika postaje dosadna.

Ova saznanja su nas potakla da napravimo istraživanje, bolje rečeno da se približimo mislima i razmišljanjima učenika. Iako je istraživanje rađeno na malom broju učenika i samo u jednom dijelu Lijepe naše može se smatrati indikativnim za probleme koji se mogu uočiti u analizi ankete.

Razlozi odabira ili ne odabira izborne nastave u osnovnoj školi mogu se povezati s nekima od slijedećih razlog.

2. Provedba istraživanja

Istraživanje je zamišljeno tako da se kroz jednu grupu pitanja ispitaju trenutni učenici osnovnih škola, a kroz slična pitanja s pogledom „u natrag“ ispitaju učenici srednjih škola. Usporedbom razmišljanja i stavova o istim problemima iz dva različita životna perioda dobit će se jasniji rezultati o izbornoj nastavi informatike u osnovnoj školi.

Danas se ankete mogu vrlo lako napraviti uz uzimanje vrlo malo slobodnog vremena ispitanika, a također i uz minimalne troškove – online. Najjednostavniji način provedbe ankete je izrada anketnog ispitnog obrasca u digitalnoj formi i postaviti ga na web poslužitelj te u odgovarajuće vrijeme i poveznicu do dokumenta napraviti dostupnu ispitanicima. Nakon anketiranja odabrane populacije učenika sumirati podatke, a onda izraditi zaključke.

3. Izrada anketnih pitanja

Za izradu anketnih pitanja oformili smo tim sastavljen od učitelja informatike osnovnih i srednjih škola, psihologa i pedagoga osnovnih i srednjih škola. Zadatak članova tima je bio da kroz neformalne razgovore sa malim brojem učenika otkrijemo neke od razloga odabira ili ne odabira nastave informatike u osnovnoj školi (npr. Slika 1). Članovi tima pedagoške službe imali su zadatak kontrolirati izradu pitanja na osnovi prikupljenih informacija.

Neki od razloga za odabir izborne nastave informatike u osnovnoj školi:

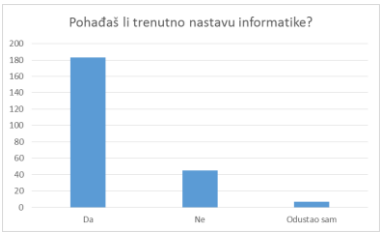
- Izbor izborne nastave informatike zbog velikog interesa rada s računalom,
- Izbor izborne nastave informatike zbog svladavanja određenih znanja i vještina koje ne mogu svladati

sam ili ih je lakše svladati uz vodstvo nastavnika informatike,
- Izbor izborne nastave informatike zbog toga što i druga djeca iz ulice/naselja idu na informatiku,
- Izbor izborne nastave informatike zbog toga što su to htjeli ili preporučili roditelji,
- Izbor izborne nastave informatike zbog povećanja ukupne prosječne ocjene (blaži kriteriji u izbornoj nastavi) te
- Izbor izborne nastave informatike zbog lakšeg svladavanja obaveznog predmeta informatike u srednjoj školi.

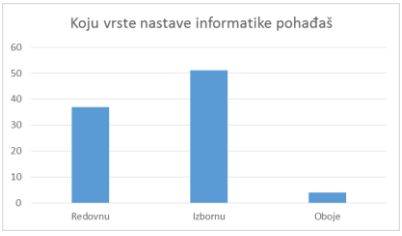
Neki od razloga za ne odabir izborne nastave informatike u osnovnoj ili srednjoj školi:

- Imam svoje računalo i znam se služiti s njime,
- Imam previše obveza i drugih nastavnih i izvan nastavnih obveza te bi to bilo dodatno opterećenje slobodnog vremena,
- Ne zanimaju me druga znanja i vještine, računalo koristim kao komunikacijski uređaj (facebook, mail, youtube, …),
- Ne želim učiti znanja i vještine koje djelomično znam, a koje se ponovno uče u srednjoj školi kroz redovni predmet informatike,
- Ne želim se dovesti u mogućnost smanjenja ukupne prosječne ocjene zbog lošijeg znanja i zalaganja i
- Ne želim učiti znanja i vještine za koje ne znam hoće li će mi u daljnjem školovanju trebati.

Ovo su samo neka od anketnih pitanja s kojima su ispitani osnovnoškolski i srednjoškolski učenici.



Slika 1. Informatika u osnovnoj školi



Slika 2. Informatika u srednjoj školi

Zadatak nastavnika informatike osnovne i srednje škole bio je digitalizirati kreiranu anketu postaviti je na web poslužitelj, omogućiti njeno korištenje odgovarajućim skupinama učenika te prikupljati rezultate ankete. Svi članovi tima zajedno su pregledali rezultate ankete te nakon analize rezultata izvukli zaključke ankete.

4. Rezultati ankete - ?

Trenutni rezultati ankete pokazuju da Informatika kao izborni predmet dodatno ne opterećuje učenike i da im većinom popravlja ukupnu prosječnu ocjenu. Iz srednjoškolske ankete je vidljivo da je gradivo informatike prelagano, ponavlja se, dok jedan dio učenika uviđa da im je informatika u osnovnoj školi trebala kao temelj. Iako je anketa još uvijek u aktivna, i bit će tijekom mjeseca ožujka i travnja 2015. godine, nameće se zaključak da bi ujednačavanju kvalitete nastave informatike u srednjoj školi doprinijelo uvođenje redovne nastave informatike u osnovnim školama.

Anketa će se provoditi tijekom ožujka i travnja 2015. godine u školama Osječko-baranjske županije, te će se tada vidjeti rezultati ankete na većem broju škola i ispitanika.

5. Zaključak

Iako je ova anketa napravljena na malom broju ispitanika i na malom geografskom području može biti indikativna za generaliziranje stavova o statusu nastave informatike u osnovnoj školi.

Iz ankete je vidljivo da je vrijeme za promjenom statusa nastave informatike u osnovnim školama iz izbornog u redovni predmet već odavno došlo. Učenici se iz raznih, opravdanih i neopravdanih razloga ne uključuju u izbornu nastavu informatike. Takav odnos prema informatičkim znanjima i vještinama za današnje i buduće shvaćanje načina života i rada predstavlja dodatnu kočnicu.

Nastava informatike u osnovnim školama trebala bi postati redovnim predmetom, što bi automatski značilo i promjene u planu svladavanja znanja i vještina u nastavi informatike u srednjim školama. Na ovaj bi se način izbjeglo da učenici završavaju osnovu školu na totalno različitim razinama znanja i vještina i informatike. Izbjegla bi se, također i mogućnost da nekim učenicima u nastavi informatike u srednjoj školi dijelovi gradiva budu preteški, a nekima prelagani ili dosadni.

Vrijeme je da nastava informatike u osnovnim školama iz statusa izborne nastave dobije status redovne nastave.

E-učenje i europsko vojno obrazovanje

Vlasta Zekulić i Darko Možnik
Ministarstvo obrane Republike Hrvatske
Hrvatsko vojno učilište „Petar Zrinski“
Ilica 256B, Zagreb, Republika Hrvatska
Telefon: 01-3786 840 Fax: 01-3786 466 E-mail: vzekulic@gmail.com
Telefon: 01-3784 613 Fax: 01-3784 210 E-mail: dmoznik@xnet.hr

Sažetak - Rad opisuje i objašnjava teorijski koncept i praktične primjene odnosno primjere e-učenja u europskom vojnom obrazovanju. Navode se procesi i tehnologije e-učenja kao i primjeri primjene e-učenja u vojnom obrazovanju nekih zemalja članica EU.

Opisuje se, inspiriran programom ERASMUS (engl. *European Community Action Scheme for the Mobility of Univer-sity Students*) inicijativa i program *ERASMUS militaire* po-znat po kratici EMILYO (engl. *Exchange of Military Young Officers*) - razmjena kadeta i mladih časnika među vojnim akademijama zemalja članica EU.

Osnovan je u skladu s Europskom sigurnosnom strategi-jom (engl. *European Security Strategy* - ESS) i djeluje kao jedan od modela implementacije europske Zajedničke sigur-nosne i obrambene politike (engl. *Common Security and Defence Policy* - CSDP) s primarnim ciljem promicanja eu-ropske kulture sigurnosti i obrane tijekom inicijalnog vojnog obrazovanja i obuke budućih nacionalnih vojnih elita. Podređen je Europskom sigurnosnom i obrambenom fakultetu (engl. *European Security and Defence College* - ESDC).

Objašnjena su četiri oblika implementacije inicijative i programa EMILYO kao i sadašnje stanje odnosa i integracije MORH-a i OS RH u EMILYO kroz razmjenu kadeta i mladih časnika među vojnim akademijama nekih zemalja članica EU.

Objavljen je i intervju sa zapovjednikom ESDC-a gsp. Hans Bernhard Weisserth-om.

Kroz pogled u budućnost prikazano je mjesto, uloga i značenje e-učenja u transformaciji Hrvatskog vojnog učilišta (HVU) „Petar Zrinski“ u visoko obrazovnu i znanstveno-istraživačku ustanovu u OS RH i MORH-u , tj. HVU kao sastavnicu akademske zajednice u RH i punopravnu aktivnu članicu europskog vojnog obrazovanja.

Na kraju su navedena zaključna razmatranja.

I. UVOD

Zbog višestrukih prednosti koje pruža e-učenje sve se više primjenjuje i u europskom vojnom obrazovanju.

E-učenje je vrsta komunikacijskog kanala, kanala kroz koji se odvija učenje.

ERASMUS *militaire*, poznat po kratici EMILYO (engl. *Exchange of Military Young Officers*) - razmjena kadeta i mladih časnika među vojnim akademijama zemalja člani-ca EU. To je jedan od modela implementacije europske Zajedničke sigurnosne i obrambene politike (CSDP).

Objašnjena su četiri oblika implementacije inicijative i programa EMILYO.

I MORH i HV su se integrirali u navedeni program razmjenom kadeta i mladih časnika.

Za provedbu e-učenja na HVU koriste se LMS sustavi: ILIAS i MOODLE.

Dio programa EMILYO i e-učenje provode se na HVU koji je u fazi transformacije u visoko obrazovnu i znanstveno-istraživačku ustanovu u MORH-u. HVU će biti sastavnica akademske zajednice RH. HVU je punopravna aktivna članica europskog vojnog obrazovanja.

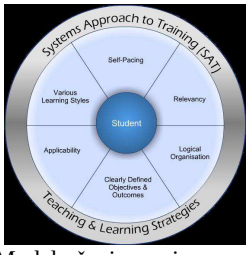
II. KONCEPT, UPRAVLJANJE PROCESIMA I TEHNOLOGIJE E-UČENJA

a) KONCEPT E-UČENJA

Danas je sveprisutna potreba ali i želja da se unaprijedi kvaliteta i dostupnost različitih obrazovnih programa. Pri tome je obrazovanje postalo *cjeloživotnim procesom* i potrebom, pa se briga o dostupnosti i kvaliteti odnosi na sveukupni ciklus *cjeloživotnog obrazovanja*. E-učenje je proces obrazovanja (proces učenja i pouča-vanja) uz uporabu informacijske i komunikacijske tehno-logije, koja pri tome doprinosi unaprjeđenju kvalitete toga procesa i kvalitete ishoda obrazovanja.

E-učenje omogućava: učenje prilagođeno individualnim potrebama studenta (bilo kada, bilo gdje), aktivno sudjelovanje i aktivnu ulogu studenata, aktualnije i ažurnije obrazovne materijale, globalni pristup različitim obrazovnim sadržajima, smanjenje „pritiska“ na fizičke resurse (omogućavajući virtualne učionice, virtualne laboratorije), više komunikacije nastavnik-student i student-student, timski rad, projektni rad nastavnika i studenta, bolju iskorištenost vremena (za kvalitetnije sadržaje) pri kontaktima nastavnik-student, samostalnu provjeru znanja i kontinuirano mjerenje i praćenje napretka studenta [5].

To je učenje i poučavanje koje je usmjereno na studente.



Slika 1. Model učenja usmjeren na studenta

b) UPRAVLJANJE PROCESIMA E-UČENJA

Model upravljanja procesom e-učenja se sastoji od 3 faze: *planiranje, organiziranje i kontroliranje* procesa e-učenja. Proces upravljanja e-učenjem napreduje kroz slijedeće faze: *planiranje* procesa e-učenja (izrada operativnog plana odnosno scenarija e-učenja), *organiziranje* odnosno implementacija procesa e-učenja (uz provedbu scenarija e-učenja u praksi), *kontroliranje* procesa e-učenja (tj. vrednovanje različitih aspekata procesa) i *poboljšanje procesa i platforme*. Osnovni princip ovog procesa je

ponavljanje - jednom kada se potvrde ili odbace početne pretpostavke kroz fazu vrednovanja, ciklus se ponavlja uz primjenu poboljšanja [6].

PLANIRANJE procesa e-učenja je iznimno bitan za cjelokupni uspjeh e-učenja, a najčešće obuhvaća aktivnosti od analize suvremenih trendova u obrazovanju i identificiranje karakteristika polaznika tečajeva za e-učenje; zatim osmišljavanje okoline za učenje koja odgovara sadržaju, ciljanoj publici i tehničkoj platformi te odabira odgovarajuće platforme za e-učenje; pa sve do formuliranja očekivanih ishoda e-učenja i izrade operativnog plana odnosno scenarija e-učenja. Cilj faze planiranja procesa e-učenja je osmišljavanje ishoda i scenarija e-učenja prema određenom kontekstu. Ishodi učenja predstavljaju instrument razvoja plana i programa, te provjere njegove konzistentnosti. Na razini programa preporučeno je definirati 15 do 30 ishoda učenja, na razini predmeta 5 do 10, a na razini nastavne cjeline 5 do 15 ishoda učenja [7].

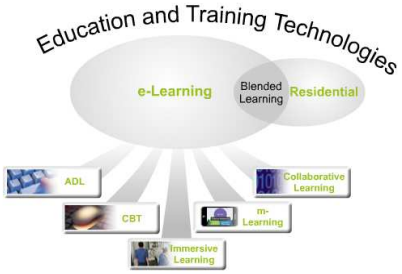
ORGANIZIRANJE osnovnog sadržaja e-učenja
LMS sustavi omogućuju polaznicima da kolegije istražuju nelinearno, a isto tako i nastavnicima omogućuju izradu tečajeva na fleksibilan način, nelinearno. Redoslijed dodavanja materijala i funkcionalnosti u sam kolegij ovisi isključivo o nastavniku. Ako nastavnik i ne zna gdje započe-ti, npr. nije siguran treba li organizirati kolegij oko tjed-nog ili tematskog oblika, treba ipak odabrati jedan oblik i početi s dodavanjem materijala. U obrazovnom okruženju gdje se koriste LMS-ovi nastava se može odvijati i u potpunosti *online*.

KONTROLIRANJE napretka i ponašanja polaznika
Pri kontroliranju je nužno postaviti standarde mjerenja, izmjeriti performanse, usporediti performanse sa standardima te poduzeti potrebne korektivne akcije u svrhu poboljšanja cjelokupnog procesa e-učenja. Svrha faze kontroliranja e-učenja može se najbolje izraziti kao promatranje i procjena cjelokupnog procesa e-učenja i očekivanih rezultata u odnosu na postavljene ciljeve.

c) TEHNOLOGIJE E-UČENJA

Postoji više tehnologija obrazovanja i obuke primjenom e-učenja, a prema NATO-voj podjeli, to su:

1. združeno napredno distribuirano učenje - JADL (engl. *Joint Advanced Distributed Learning*) i napredno distribuirano učenje - ADL (engl. *Advanced Distributed Learning*),
2. učenje pomoću ICT-a odnosno CBT (engl. *Computer-Based Training*),
3. „uronjeno“ učenje (engl. *Immersive learning*),
4. mobilno učenje (engl. *M-learning*),
5. suradničko ili kolaborativno učenje (engl. *Collaborative learning*) i
6. kombinirano ili hibridno učenje (engl. *Blended learning*) [5].



Slika 2. Tehnologije e-učenja prema NATO-u

1. JADL i ADL

a) JADL

Slika 3. Oznaka za JADL

b) ADL

Slika 4. Oznaka za ADL

ADL (engl. *Advanced Distributed Learning*) proizvod je *ADL inicijative* uspostavljene 1997. godine u Ministarstvu obrane SAD-a za standardizaciju i modernizaciju upravljanja „treninzima“ i „edukacijama“ te načinima poučavanja. ADL koristi strukturne i suradničke (engl. *Collaboration*) metode iz industrije, akademskih zajednica i vlada koji razvijaju standarde, alate i sadržaje učenja.

Zemlje članice NATO saveza i EU mogu koristiti izrađene obrazovne on-line tečajeve za različita područja u obrambenim i vojnim sustavima.

Više o JADL i ADL nalazi se na: https://jadl.act.nato.int

2. CBT (engl. *Computer Based Training*)

CBT je obrazovni ili obučni tečaj dostavljen direktno na studentsko računalo putem CD-ROM-a ili nekog drugog uređaja za pohranu. On se razlikuje od ADL-a po tome što se ne isporučuje preko weba ili putem sustava za upravljanje učenjem.

Slika 5. Oznaka ili logo za CBT

3. „URONJENO“ UČENJE (engl. *Immersive learning*)

„Uronjeno“ (engl. *Immersive*) učenje koristi računalno simulirano okruženje koje se događa u stvarnom životu ili hipotetsku situaciju u grafički bogatom i dinamičnom okruženju. Studenti su stavljeni u situaciju i uključeni su u proces učenja kroz interaktivne simulacije i igre temeljene

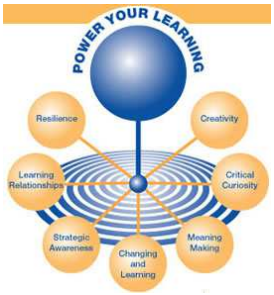
na *game-based* aplikacijama. *Immersive* učenje podupire jednog učenika ili više malih timova da rade zajedno kako bi riješili problem, uvježbali tehnike ili poboljšali svoje vještine.

4. MOBILNO UČENJE (engl. *m-learning*)

Slika 6. Mobilno učenje (engl. *m-learning*)

Mobilno učenje (engl. *m-learning*) je uporaba prijenosnih računalnih uređaja, kao što su različiti iPad-i i drugi tableti, prijenosna računala, osobni digitalni pomoć-nici (PDA) i pametni telefoni povezani s bežičnim mreža-ma. To omogućuje da se podučavanje i učenje proširi i na prostore izvan tradicionalne učionice te daje nastavnicima i polaznicima povećanu fleksibilnost i nove mogućnosti za interakcije koje su prikladne i dostupne virtualno s bilo kojeg mjesta.

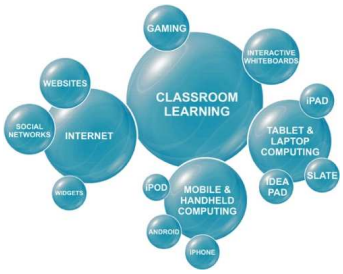
5. SURADNIČKO ILI KOLABORATIVNO UČENJE



Slika 7. Suradničko ili kolaborativno učenje

Suradničko ili kolaborativno učenje (engl. *Collaborative learning*) podupire nastavu kroz interaktivne metode ili online komunikacije koristeći društvene medijske alate kao što su chat sobe, tribine i video alate kao što su webi-nari i web-emitiranja. Ovi alati se mogu implementirani u učionici i online okruženju kako bi podržali tijek nastave. Oni daju mogućnost velikom broju polaznika da rade zajedno s nastavnikom-instruktorom.

6. KOMBINIRANO ILI HIBRIDNO UČENJE (engl. *blended learning*)



Slika 8. Kombinirano ili hibridno učenje

U zemljama članicama NATO saveza i EU koriste se LMS-ovi: ILIAS i MOODLE.

III. EUROPSKO VOJNO OBRAZOVANJE

EMILYO - RAZMJENA KADETA I MLADIH ČASNIKA MEĐU VOJNIM AKADEMIJAMA EU

10. studenog 2008. godine, tijekom francuskog presjedanja EU-om, 27 ministara obrane EU jednoglasno su podržali osnivanje „Europske inicijative za razmjenu mladih časnika“ inspirirana programom ERASMUS (engl. *European Community Action Scheme for the Mobility of University Students). ERASMUS militaire* je ubrzo postao poznat po kratici EMILYO (engl. *Exchange of Military Young Officers*). Od rujna 2009. do rujna 2013. godine EMILYO je omogućio razmjenu 630 kadeta i mladih časnika te znatno ojačao europeizaciju visokog vojnog obrazovanja.

U suvremenom sigurnosnom okružju biti časnik podrazumijeva iznimnu međunarodnu aktivnost, gotovo od prvog dana aktivne službe. Ovaj poziv zahtijeva ne samo razumijevanje kompleksnosti područja operacija i razumijevanje opcija međunarodnog odgovora, nego također poznavanje rada, običaja i standarda drugih nacija i partnera u misijama i operacijama. Dvoje renomiranih europskih vojnih stručnjaka, Hans Wiedner i Herald Gell, navode kako “časnici trebaju kreativnost, prilagodljivost i ostale instrumente vođenja kako bi mogli na pravi način odraditi zadaću… Ako ih moramo učiti vođenju u ekstremnim uvjetima, koja je razlika da li ih to učimo u pustinji, džungli ili na Arktiku? Ako ih moramo učiti radu u međunarodnom okruženju, moramo ih tijekom obuke poslati u inozemstvo. Budući časnici moraju gledati preko horizonta, a profesori i obučavatelji na prvoj razini vojnog obrazovanja moraju ih ohrabriti i učiti tome. Samo tada možemo opravdano reći da smo pružili najbolje moguće obrazovanje našim budući časnicima.“

Ovakve opće težnje razvoja vojne obuke, dodatno su usložene intenziviranjem zahtjeva za stvaranjem prepoznatljivog europskog vojnog identiteta i veće vidljivosti europskog odgovora na međunarodne krize. EMILYO je stoga osnovan u skladu s Europskom sigurnosnom strategijom (*ESS)* i djeluje kao jedan od modela implementacije europske Zajedničke sigurnosne i obrambene politike (*CSDP*) s primarnim ciljem promicanja europske kulture sigurnosti i obrane tijekom inicijalnog vojnog obrazovanja i obuke budućih nacionalnih vojnih elita.

Danas se smatra neophodnim, već na prvoj razini časničkog obrazovanja, upoznati buduće časnike s konceptima interoperabilnosti i to:

- Interoperabilnost njihove nacionalne vojske s europskim načinom sigurnosnog promišljanja i djelovanja,
- Interoperabilnost unutar savezničkih grana, rodova i struka jer kompleksne krize i misije, traže kompleksne odgovore i
- Interoperabilnost s civilnim instrumentima potpore upravljanja krizama u skladu sa suvremenim sveobuhvatnim odgovorom na krize.

Kako bi se ovi višeslojni ciljevi mogli ostvariti, a mladi časnici bili spremni odgovoriti na njih neposredno po stu-

panju na prvu časničku dužnost, potrebno ih je već tijekom njihovog školovanja izložiti radu, uvježbavanju i zapovijedanju u međunarodnom okružju sukladno europskim načelima i standardima. S tim ciljem razvijeni su, akreditirani i provedeni zajednički vojni obučni moduli diljem europskih vojnih akademija.

IV. EMILYO PROGRAMI

EMILYO je načelno podređen Europskom sigurnosnom i obrambenom fakultetu (*ESDC*) te Implementacijskoj grupi (engl. *Implementation Group - IG*) za EMILYO. Ove institucije razvile su način europeizacije visokog vojnog obrazovanja s posebnim naglaskom na poticanje zajedničke kulture sigurnosti i obrane, kroz dvije glavne smjernice razvoja:

1. Obveza obrazovanja i obuke mladih časnika o svim aspektima CSDP-a i
2. Nužnost stavljanja mladih časnika u europsko okruže-nje tijekom raznih faza inicijalne časničke obuke.

Naime, cijela inicijativa je izgrađena na dvije glavne pretpostavke: prva je da mladi časnici sve češće rade u međunarodnom okruženju već u inicijalnim fazama svoje karijere. Ovo se vidi na terenu u mirovnim i humanitar-nim misijama i operacijama, posebno u vojskama zapad-nih zemalja. Druga pretpostavka je da će mladi časnici pu-no bolje raditi na terenu u međunarodnom okružju, ako su već tijekom školovanja bili izloženi radu, obuci i koopera-ciji s pripadnicima drugih nacija. Na taj način se već u najranijoj fazi kulturološki senzibiliziraju, prilagođavaju svoja znanja i vještine primjeni na stranom jeziku, te ubr-zano uče kako ono što je „normalno“ u jednoj državi čla-nici, nije neophodno „normalno“ i u drugoj.

Temeljem ovih smjernica u proteklih pet godina razvijena su četiri oblika implementacije EMILYO inicijative:

1. Zajednički i međunarodno akreditirani akademski moduli u trajanju od tjedan dana. Moduli su razvijeni kao krucijalno važni za sve mlade europske časnike, a to su:

a) „Common module on CSDP“ - jednotjedni ključni zajednički modul koji upoznaje polaznike s konceptom, mehanizmima i izazovima CSDP-a i služi europeizaciji inicijalne časničke obuke. Prvi put je proveden 2009. godine u Vojnoj akademiji Portugala, a danas se provodi u 8 zemalja članica EU za sve ostale države Unije. Iz njega je proizašla i CSDP Olimpijada na kojoj se kadeti i mladi časnici natječu u poznavanju tematike Europske sigurnosne i obrambene politike. Održava se jednom godišnje na Cipru.

b) „Common module on media training“ - jednotjedni, akreditirani, zajednički modul koji upoznaje polaznike kako raditi i ponašati se s medijima u području operacija. Modul je razvila Vojna akademija Belgije.

c) *„Common module on Crisis Management and Peace Support Operations “* - najzahtjevniji zajednički modul koji se provodi u četiri dijela, svaki u trajanju od tjedan dana: Pod-modul A - Temelj upravljanja krizama i međunarodne vojne operacije; Pod-modul B: Vježba na zemljovidu na temu iz PSO; Pod-modul C: Taktička vježba bez postrojbi na temu iz PSO; Pod-modul D: Tečaj za zapovjednike vodova u PSO, a neophodno je važan za uvježbavanje mladih časnika za sudjelovanje u međunarodnim vojnim operacijama. Razvila ga i je i provodi Terezijanska vojna akademija svake godine tijekom veljače.

d) „Common module on Law of Armed Conflict“ - jednotjedni zajednički modul o ratnom pravu koji je razvila Vojna akademija Francuske. Iznimno važna tema obuke i daje neophodna znanja za sve mirovne misije i operacije.

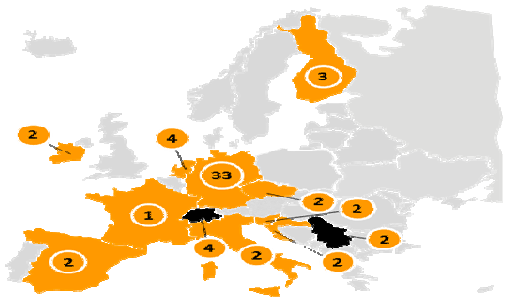
e) „Common module on Maritime Leadership“ - jednotjedni zajednički modul osmišljen za buduće časnike ratnih mornarica EU. Razvila ga je Mornarička akademija Francuske i spada u domenu obuke za „zapovijedanje u ekstremnim uvjetima.“

f) „Common module on Maritime Navigation“ - jednotjedni modul razvijen za upoznavanje sa specijaliziranim mornaričkim procedurama donošenja odluka. Razvila ga je također Mornarička akademija Francuske. Svi ovi moduli se sastoje od obveze polaganja ADL tečaja prije jednotjednog boravka i praktične obuke na akademiji koja je nositelj obuke, te se vrednuje s 2-5 ECTS bodova.

2. Akademski moduli u trajanju 3-6 mjeseci

Svaka od akademija razvija određene semestralne programe koji su otvoreni za međunarodne studente. Npr. Austrija ima razvijen cijeli zimski semestar iz vojnog vođenja *„Bachelor Program Military Leadership“*, Španjolska nudi ukrcaj stranih kadeta na svoje školske jedrilice i brodove u trajanju do 6 mjeseci s ciljem uvježbavanja procedura mornaričkog vođenja i zapovijedanja, Kopnena vojna akademija Poljske također nudi semestar za strane studente iz područja sigurnosnih strategija i međunaro-dnih odnosa, a Francuska vojna akademija u Rennesu za EU vojne kadete nudi *„International political science semester“* u trajanju od 3 mjeseca i nosi 30 ECTS bodova.

Dio zemalja je razvio i vlastite nacionalne programe razmjene, poput austrijskog *„International Training for Job - ITJ“*. Ovaj program obvezuje SVE austrijske kadete da moraju 6 tjedana stručne prakse provesti u stranoj zemlji kao zapovjednici vodova. Na slici 12. prikazane su države koje sudjeluju i broj kadeta koji su upućeni u njih.



Slika 9. Broj austrijskih kadeta na praksi (ITJ) u državama EU

3. Završetak cjelokupnog vojnog obrazovanja u jednoj državi je moguć u Austriji, Poljskoj, Češkoj, Slovačkoj i Francuskoj, ali se rjeđe događa zbog usklađivanja sa standardima civilnog obrazovanja i dijela vojne obuke.

4. Razmjena kadeta i mladih časnika u vojnoj obuci.

Ove se razmjene najčešće događaju tijekom ljetnih i zimskih kampova, vojnih obuka ili stažiranja. Razmjene su intenzivne s preko 100 obučnih aktivnosti godišnje.

Samo u ovom trenutku ponuđeno je više od 36 oblika vojnog obrazovanja i obuke u 10 europskih vojnih akademija u trajanju od tjedan do 6 mjeseci. Zemlja primateljica najčešće snosi sve troškove školovanja, smještaja i prehrane, dok matična zemlja snosi troškove putovanja i dnevnica.

Pet godina programa EMILYO omogućio je razmjenu 630 kadeta i mladih časnika diljem europskih vojnih akademija, te se iz godinu u godinu, broj dana razmjene intenzivno povećavao.

Iako je EMILYO primarno orijentiran na kadete i mlade časnike, on je značajno utjecao i na same vojne obrazovne institucije koje su se morale prilagoditi akreditiranim programima, sadržajima i standardima obučavanja, provođenju obučnih sadržaja na stranom jeziku (najčešće engleskom ili francuskom), apsorbirati strane polaznike i vrjednovati vlastite programe i kroz njihova iskustva, viđenja i stavove.

V. RAZGOVOR SA ZAPOVJEDNIKOM EUROPSKOG SIGURNOSNOG I OBRAMBENOG FAKULTETA (ESDC) gsp. Hans Bernhard Weisserth-om

1. *Možete li pojasniti razloge i prednosti osnivanja "European Security and Defence College" (ESDC)*

ESDC je osnovan 2005. godine s ciljem pružanja zemljama članicama, EU institucijama i agencijama školovano osoblje sposobno učinkovito raditi u području CSDP-a. Od tada smo obučili gotovo 6000 diplomata, policajaca, civilnih administratora i vojnih osoba. Više od 500 polaznika je došlo iz partnerskih zemalja i međunarodnih organizacija, posebno onih koje s EU rade na upravljanju krizama. Ovo je moguće zbog toga što su se 74 nacionalne obučne institucije, uključujući diplomatske akademije, civilni obučni instituti, policijske akademije i nacionalne vojne akademije kao i drugi obrambeni studijski centri i nevladine organizacije, aktivno predale izradi i provedbi tečajeva pod okriljem ESDC-a, s usmjerenjem na CSDP i vezane teme.

Pod ESDC-om, zajednički se razvijaju rasporedi tečajeva u intenzivnoj suradnji sa stručnjacima i relevantnim službama u EU institucijama, koji su certificirani da na najbolji način održavaju EU politike i koncepte. Ovo je i razlog da certifikate svih naših tečajeva potpisuje Visoki predstavnik EU za vanjsku i sigurnosnu politiku.

Gotovo svi ESDC tečajevi spajaju diplomate, policajce, pravne stručnjake, civilne administratore i vojne stručnjake, kako bi se poboljšalo njihovo međusobno razumijevanje i omogućilo im bolji i učinkovitiji zajednički rad prema istim političkim i operativnim ciljevima. Na taj način ESDC aktivno i značajno utječe na razvoj zajedničke europske sigurnosne kulture.

2.*Kako vidite daljnji razvoj ESDC*

U travnju 2013., Vijeće je odobrilo novi pravni dokument za ESDC ("Council Decision 2013/189/CFSP") koji daje sveučilištu pravni okvir djelovanja, proračun i dopunsko osoblje. Kada bude u cijelosti implementiran, ojačati će sveukupne kapacitete sveučilišta i omogućiti daljnju sinergiju obuke u EU kroz modele „*pooling and sharing*". Moguće je još više se posvetiti obuci civila u upravljanju krizama, a u potpori realizacije CSDP-a.

3. *Što to čini europski pristup vojnom obrazovanju toliko drugačijim i jedinstvenim*

Jedna važna činjenica je da vojna obuka i obrazovanje mora biti sagledano u kontekstu zajedničke Europske sigurnosne kulture. Ona je obilježena shvaćanjem da niti jednu krizu danas ili u neposrednoj budućnosti ne može riješiti samo jedna zemlja i to samo samo svojim oružanim snagama. Rješenje leži u uporabi različitih instrumenata koji uključuju političke, diplomatske, razvojne, ekonomske i druge civilne i vojne mjere. Stoga je civilno-vojna suradnja ključna odrednica europskog pristupa i posljedično iznimno utječe na vojno obrazovanje. Drugi važan aspekt su dugoročni ciljevi izloženi u Ugovoru iz EU vezanim za razvoj CSDP-a koji tijekom vremena mogu dovesti do stvaranja zajedničke europske obrane - cilj koji u ovom trenutnu ne dijele sve zemlje članice, ali većina njih ozbiljno promišlja o konceptu. Stoga je iznimno važno da se unutar zemalja članica uspostavi bliska suradnja u području obuke i izobrazbe, ne samo stožernog osoblja, već na samom početku časničkog obrazovanja, tijekom njihove inicijalne integracije u vojni sustav. Europska inicijativa za razmjenu mladih časnika inspirirana Erasmusom, EMILYO je stoga iznimno važan korak u pravom smjeru.

VI. ORUŽANE SNAGE RH I EMILYO inicijativa i program

Osnivanjem programa „Kadet" 2003. godine, RH je dobila mogućnost sudjelovanja u razmjenama i obukama kadeta i mladih časnika diljem Europe. Aktivnosti su se intenzivirale 2008. godine, a Terezijanska vojna akademija iz Bečkog Novog Mjesta formalno je započela ovu suradnju pozivajući hrvatske kadete da po prvi put sudjeluju na austrijskom časničkom balu. Hrvatima u čast, dozvoljeno je da naši kadeti i kadetkinje otvore bal uz zvukove Jelačićevog marša. Bal je označio i simbolički ulazak RH i OS RH u europske sustave vojnog obrazovanja jer od tada kadeti započinju sa sudjelovanjem u vojnim obučnim modulima (C i D) austrijske vojne akademije. S druge strane, Austrija je izabrala OS RH kao mjesto za provođenje stručne prakse svojih kandidata za časnike (programa ITJ), te se svake godine 2 kadeta upućuju u postrojbe hrvatske kopnene vojske na 6 tjedna, gdje uz nadzor našeg mentora zapovijedaju i rade s vodom OS RH.

Uz aktivnosti u Austriji, hrvatski kadeti sudjeluju i u EMILYO inicijativi Njemačke časničke škole u Dresdenu, koja organizira jednotjedne module upoznavanja s njemačkom kopnenom vojskom, postrojbama, opremom i sustavom obuke.

Od 2013. godine OS RH su se i uključile po prvi put u Konferenciju mladih vojnih znanstvenika CEFME, koja se održala u Budimpešti. Na konferenciji se prezentiraju vojno-stručni društveni i tehnički radovi. Navedena konferencija održana je u svibnju 2014. u Slovačkoj i 2015. u Poljskoj. Konferencija uvezuje i rad iMAF-a (engl. *International Military Academic Forum*) i njenog znanstvenog

odbora čiji članovi ocjenjuju dostavljene i prezentirane radove.

Tijekom 2015. godine očekuje se i prvo upućivanje hrvatskih kadeta na jednotjedni EU CSDP modul u Vojnu akademiju Italije u Turin, koji bi im omogućio sudjelovanje i na sljedećoj CSDP olimpijadi koja će se održati 2016. godine na Cipru.

Slika 11. Hrvatski i njemački kadeti na međunarodnom tjednu u Dresdenu

VII. POGLED U BUDUĆNOST

Slika 12. Hrvatsko vojno učilište „Petar Zrinski“

Slika 13. Primjena elemenata e-učenja na terenu

HVU je u procesu transformacije u visoko obrazovnu i znanstveno-istraživačku vojnu ustanovu odnosno instituciju tj. sastavnicu sveučilišne zajednice. Od 2014. godine provodi dva nova preddiplomska sveučilišna studijska programa za potrebe OS RH. Vizija je da se uvođenjem e-učenja želi u procesu obrazovanja ostvariti aktivan partnerski odnos nastavnika i polaznika, prilagođen osobinama i potrebama svakog polaznika, s jasno postavljenim obrazovnim ciljevima i jasno dodijeljenim odgovornostima za postizanje tih ciljeva. Uvođenjem i aktivnom primjenom e-učenja HVU namjerava ostvariti četiri strateška cilja: unaprijediti kvalitetu obrazovanja, omogućiti nastavnicima i studentima ostvarivanje novih uloga u obrazovnom procesu, povećati konkurentnost i dostupnost učilišta i učilišnih programa i osposobiti studente za uporabu tehnologija cjeloživotnog učenja.

I u europskom vojnom obrazovanju ponuđen je određeni broj tečajeva i zajedničkih modula u području e-učenja. Svaki od njih obuhvaća IDL i f2f fazu. Sadašnje sposobnosti su na zavidnoj razini, a njihovim daljnjim razvojem, koje su precizirane Smjernicama za daljnje unapređenje sustava e-učenja, osnažit će se novim sposobnostima, a polaznici će sistematizirati postojeća i usvojiti nova znanja, vještine i sposobnosti kojima će biti osposobljeni za još učinkovitiju njihovu primjenu u svakodnevnim zadaćama.

VIII. ZAKLJUČAK

U informacijskom društvu i vremenu *e-učenje* dobiva sve više na značenju poglavito u europskom vojnom obrazovanju. Može se zaključiti kako je i u europskom vojnom obrazovanju napravljen značajan pomak u razvoju i uporabi sustava e-učenja, ali zbog važnosti stalnog izlaganja međunarodnom okruženju tijekom obuke i obrazovanja, većina ih ipak uvezuje ADL i f2f module u vojnom obrazovanju svojih pripadnika. Razvijen je i ponuđen veliki broj „gotovih“ *online* tečajeva za potrebe obrambenog i vojnog sustava. Stvoreni su potrebni preduvjeti za implementaciju *e-učenja* i u obrambenom i vojnom sustavu RH.

„Znanjem u budućnost“ moto je sadašnjih naraštaja i ostat će moto i naraštajima koji će doći na vojno obrazovanje u škole Hrvatskog vojnog učilišta „Petar Zrinski“ u Zagrebu.

Integriranje eTwinning projekata u nastavu informatike i engleskog jezika

Branka Lamza*, Iva Naranđa**
* II. osnovna škola Čakovec, Čakovec, Hrvatska
** II. osnovna škola Čakovec i OŠ Vladimira Nazora Pribislavec, Čakovec, Hrvatska
branka.lamza@skole.hr
iva.naranda@skole.hr

Sažetak - Rad predstavlja pregled iskustava i ideja stečenih provođenjem dvanaest eTwinning projekata u protekle tri školske godine u II. osnovnoj školi Čakovec: jedanaest projekata nagrađeno je Nacionalnom oznakom kvalitete, pet projekata nagrađeno je Europskom oznakom kvalitete i jedan projekt nacionalnom nagradom Comet 2013 u kategoriji viših razreda osnovne škole. eTwinning je portal koji služi za sklapanje kontakata između učitelja širom Europe i pokretanje zajedničkih projekata. Sve se odvija uz podršku Agencije za mobilnost i programe EU, odnosno odgovarajućih institucija u svakoj zemlji. U članku ćemo se baviti integriranjem eTwinning projekata u nastavu informatike i engleskog jezika. Kvalitetan eTwinning projekt treba zadovoljiti kriterije pedagoške inovativnosti i kreativnosti, integracije u kurikulum, razmjene i suradnje među partnerskim školama i kreativne uporabe informacijsko-komunikacijske tehnologije u izradi sadržaja sukladno s dobi učenika. Ostvareni rezultat i učinak vrlo je važno dokumentirati. Kvalitetni projekti uključuju aktivnosti izvan učionice koje su sastavni dio školskih aktivnosti i obrazovnih ciljeva škole te suradnju s roditeljima i lokalnom zajednicom. Projektne aktivnosti osmišljavaju se tako da svim učenicima omoguće aktivno sudjelovanje na način koji im najbolje odgovara te im pruže mogućnost izražavanja kreativnosti, osjećaj uspjeha i učenje uz zabavu. Ukratko, ovi projekti imaju zadaću razvijati i jačati kod učenika vještine 21. stoljeća.

I. UVOD

Integracija eTwinning projekta u kurikulum jedan je od šest kriterija prema kojima Nacionalna služba za podršku iz Agencije za mobilnost i programe EU vrši evaluaciju projekata. Uz integraciju projekta u kurikulum, bitna je i kreativna uporaba informacijsko-komunikacijske tehnologije, također jedan od kriterija vrednovanja projekata.

Integriranje eTwinning projekata u nastavu informatike i engleskog jezika uključuje nov način učenja i podučavanja, poticanje kreativnosti kod učenika te ostvarivanje ciljeva kako samog projekta tako i cjelokupne nastave informatike i engleskog jezika. Pri osmišljavanju projektnih aktivnosti posebnu pažnju posvećujemo odabiru alata primjerenih aktivnostima i ciljevima projekta u odnosu na dob učenika. Radom na eTwinning projektima učenici usvajaju pravila uljudnog ponašanja na internetu, važnost poštivanja autorskih prava i kritičko odabiranje sadržaja pronađenih na internetu, razvijaju vještine timskog rada i samostalnog učenja. Za očekivati je da će im sve navedeno biti od koristi u daljnjem životu.

Uz sve navedeno, aktivnosti na eTwinning projektima pružaju odličnu priliku za izlazak iz informatičke učionice i povezivanje nastavnih sadržaja predmeta informatika s raznim aktivnostima organiziranim na razini škole i u suradnji s lokalnom zajednicom kao što su obilježavanja važnih datuma i obljetnica, ekološke akcije, nacionalne kampanje i slično.

II. INTEGRIRANJE ETWINNING PROJEKATA U NASTAVU

A. Integriranje eTwinning projekata u izbornu nastavu i izvannastavnu aktivnost iz informatike

U provedenim projektima integriranje eTwinning projekata u izbornu nastavu informatike realizirano je u sklopu nastavnih cjelina Osnove crtanja, Multimedija, Izrada prezentacija, Programiranje i Internet te u okviru projektnih zadataka. U petom razredu u cjelini Osnove crtanja učenici su se uvodili u eTwinning projekte izradom crteža na razne teme projekata te prigodnih čestitaka za eTwinning partnere. U šestom razredu projektne aktivnosti izvodile su se u sklopu ponavljanja gradiva iz cjelina Multimedija i Izrada prezentacija. U sedmom i osmom razredu eTwinning projekti integrirani su u nastavni plan informatike u sklopu cjeline Internet i projektnih zadataka koji su planirani kako bi se učenicima omogućilo proširivanje i povezivanje vještina uporabe informacijske tehnologije i upoznavanje s korištenjem raznih Web 2.0 alata. Učenicima su se zanimljivim načinom rada pokazali satovi u obliku radionice na kojima bi jedan od učenika svojim razrednim kolegama pokazao i objasnio rad u nekom Web 2.0 alatu po svom izboru.

eTwinning projekt „E-waste - What Can Citizens Do?“ skrenuo je pozornost na sveobuhvatnost društvenog, ekološkog i ekonomskog aspekta e-otpada, globalnog izazova i podcijenjenog ekološkog problema. Ciljevi projekta bili su dijeljenje informacija o e-otpadu, objasniti i približiti osnove društvenih, ekoloških i ekonomskih aspekata e-otpada i razumjeti mogućnosti za smanjenje, ponovno korištenje i recikliranje e-otpada te podići svijest učenika, njihovih roditelja i lokalne zajednice o problemu

e-otpada i potaknuti ih na odgovorno ponašanje s njime. Jedan od rezultata projekta je zajednička online brošura pod nazivom "E-otpad i ja".

Na satovima informatike učenici sedmog i osmog razreda napravili su animacije alatom Gickr, multimedijske online postere alatom Glogster na temu smanjivanja, ponovnog korištenja i recikliranja e-otpada, prezentacije alatom Prezi na teme vezane uz Svjetski dan zaštite okoliša, održivi razvoj, smanjivanje ugljičnog otiska i e-otpada, upoznati su sa socijalnim aspektima e-otpada te su vodili diskusiju o toj temi koristeći alat TodaysMeet i nakon toga napravili su PowerPoint prezentacije na teme vezane uz socijalni aspekt e-otpada.

Članovi školskog web-tima aktivno su sudjelovali u svim fazama projekta, izradili su mentalne mape alatom bubbl.us te redovito pratili i objavljivali članke i materijale o projektnim aktivnostima na Twinspaceu projekta i školskom webu.

Na početku projekta proveden je upitnik među učenicima četvrtog razreda polaznicima izvannastavne aktivnosti iz informatike II. osnovne škole Čakovec kako bi se ustanovilo inicijalno stanje i dobio uvid u to jesu li učenici već upoznati s pojmom e-otpada. Rezultati su pokazali opravdanost provođenja projekta o ovoj temi jer je od 32 učenika samo njih 7 odgovorilo da je već čulo za e-otpad (Slika 1). Učenici četvrtog razreda zajedničkom prezentacijom predstavili su se partnerima, napravili mentalne mape alatom bubbl.us, oblake riječi alatom Wordle, crtali simbol za odvojeno sakupljanje otpada u programu Bojanje, rješavali online igre vješala, osmosjerke i slagalice.

Tri mjeseca nakon završetka projekta, u prosincu 2014. anketirani su učenici II. osnovne škole Čakovec kako bi se vidjelo je li projekt postigao promjenu ponašanja učenika prema postupanju s e-otpadom. Obuhvaćeno je 54 učenika koji su prethodne školske godine sudjelovali u projektu i koji su još uvijek u osnovnoj školi, dakle učenike petog i osmog razreda školske godine 2014./2015. Iz rezultata može se zaključiti da je provođenje projekta na temu e-otpada bilo opravdano te da je projekt ostvario pozitivan učinak na odnos učenika prema e-otpadu (Slika 2).

Slika 1. Inicijalno stanje u 4. razredu II. OŠ Čakovec

Mogućnost suradnje sa europskim vršnjacima pokazala se vrlo poticajnom za učenike te su aktivnosti na eTwinning projektima korištene i kao pomoć u motiviranju učenika za programiranjem, dijelom gradiva koje učenici često doživljavaju najtežim. Ove aktivnosti su povezane i s profesionalnom orijentacijom učenika te bi trebale potaknuti interes za odabirom daljnjeg školovanja u nekom od informatičkih područja. Primjeri projektnih aktivnosti u kojima smo se u II. osnovnoj školi Čakovec bavili i programiranjem su projekt „2014 Winter Olympics, Sochi, Russia“ i projekt „Safe Internet – A Bridge Between Us“. Osnovni cilj projekta „2014 Winter Olympics, Sochi, Russia“, promicanje ideje olimpizma, povezan je s još jednim događanjem, proslavom Europskog tjedna programiranja 2013. organiziranjem radionica za učenike sedmog i osmog razreda „Create logo using Logo“ i Skype susreta s eTwinning partnerima. Ideja je izuzetno jednostavna, izrada programa u Terrapin Logu koji crtaju logo olimpijskih igara i razmjena iskustava s partnerima. U kurikulumu izvannastavne aktivnosti iz informatike za učenike viših razreda planiran je rad u Scratchu što se realiziralo aktivnošću na projektu „Safe Internet – A Bridge Between Us“ u kojoj su učenici imali mogućnost kreativno izraziti svoje ideje izradom animiranih priča na temu sigurnosti na internetu te razmijeniti iskustva i dojmove s partnerima iz Grčke.

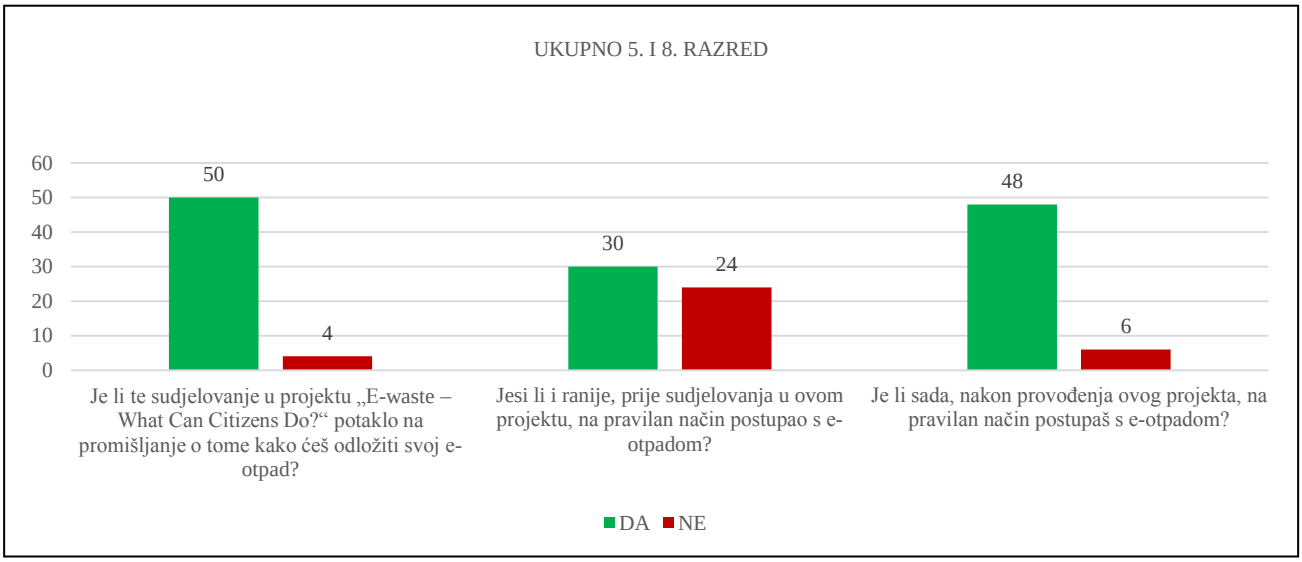
B. Integriranje eTwinning projekata u nastavu engleskog jezika u osnovnoj školi

Iako je portal eTwinning većim dijelom prilagođen za korištenje na većini jezika zemalja Europe činjenica je da je kao i mnogim drugim područjima života engleski jezik postao nezaobilazni jezik sporazumijevanja među većinom korisnika. Samim time on je i radni jezik većine projekata.

Uzevši u obzir navedeno, integriranje eTwinning projekata u nastavu među prvima su prigrlili učitelji engleskog jezika. Naime, integriranje projekata na engleskom jeziku na teme koje svatko može sam izabrati i prilagoditi nacionalnom obrazovnom standardu i vlastitom planu nameće se kao nešto prirodno u nastavi engleskog jezika.

S druge strane, suvremena nastava engleskog jezika ne može se ostvariti bez informacijsko-komunikacijske tehnologije. eTwinning omogućuje učiteljima da usavršavaju svoje informatičke vještine i uče o novim internetskim alatima jedni od drugih.

Možemo reći da se kroz eTwinning pojavila naša ideja o suradnji učiteljica engleskog jezika i informatike. Neodvojivost engleskog jezika i informacijsko-komunikacijske tehnologije, odnosno sadržaja engleskog jezika i informatike kao nastavnih predmeta pružaju jaku podlogu za njihovo uspješno integriranje u praksi.



Slika 2. Rezultati ankete provedene među učenicima petog i osmog razreda tri mjeseca nakon završetka projekta E-waste – What Can Citizens Do?.

C. Integrirana nastava informatike i engleskog jezika u eTwinning projektima

„Safe Internet: A Bridge Between Us“ projekt je koji smo proveli u suradnji s partnerskom školom iz Grčke. Ciljevi su bili potaknuti svijest učenika o važnosti što sigurnijeg korištenja interneta, zaštite osobnih podataka kao i zaštite i poštivanja autorskih prava. Naš učenički tim predvodile su učiteljice engleskog jezika i informatike. Iako je voditeljica grčkog tima bila učiteljica informatike, i ona je tijekom cijelog projekta surađivala s učiteljicama engleskog jezika, tako da možemo reći da je u oba tima ostvarena uska korelacija između ova dva nastavna predmeta. U projektu su sudjelovali učenici starosti od 13 do 14 godina. U našem timu radilo se o učenicima 7. i 8. razreda.

U početnoj fazi svakog eTwinning projekta uobičajeno je predstavljanje i međusobno upoznavanje škola sudionica. Mi smo dogovorili upoznavanje putem videokonferencije koristeći program Skype. Osim nekoliko rečenica koje su obje ekipe trebale pripremiti o svojoj školi, gradu i zavičaju dogovoreno je da se održi i kratki kviz na temu našeg projekta. Učenici su istražili općenita pravila sigurnosti na internetu i najvažnije činjenice o zaštiti autorskih prava i pripremili „točno/netočno“ pitanja za partnersku ekipu. Primjer pitanja bio je: „Preuzimanje glazbe s iTunes portala je nezakonito.“ (netočno).

Kviz je protekao u vrlo ugodnom ozračju na zadovoljstvo obje ekipe. Svaka ekipa postavljala je pitanja drugoj ekipi a rezultat je bio izjednačen. Osim provjere znanja kviz je ispunio sljedeće ciljeve: poticanje učenika na razmišljanje o temi te razvijanje motivacije za daljnji rad na projektu.

Mogućnost korištenja Skypea kao sredstva komunikacije pokazala se kao prava blagodat moderne tehnologije u nastavi. Ne iziskuje nikakve dodatne troškove u odnosu na uobičajene troškove korištenja interneta, a motivacijski učinak ovih susreta je velik.

Videokonferencija putem Skypea bila je uvod u obilježavanje Dana sigurnijeg interneta 2014. koji se u II. osnovnoj školi Čakovec unazad nekoliko godina obilježava uređivanjem prigodnih panoa, izradom prezentacija i njihovim prikazivanjem u holu škole, predavanjima i radionicama u sklopu sata razrednika i na nastavi informatike te sličnim aktivnostima. U veljači 2014. središnja aktivnost bila je integrirana nastava engleskog jezika i informatike za učenike 7. i 8. razreda.

Integrirana nastava provedena je u obliku blok-satova a bila je podijeljena na pretežno teoretski i pretežno praktični dio. Iako se niti u jednom dijelu ne može potpuno razdvojiti nastavne predmete (a to nam i nije bila namjera), možemo zaključiti da u prvom dijelu prevladava engleski jezik, a predvodi ga učiteljica engleskog jezika, dok u drugom dijelu prevladava informatika. Poučavanje o korištenju računalnih programa i/ili Web 2.0 alata odvija se pod vodstvom učiteljice informatike, dok u praktičnom dijelu podjednako sudjeluju obje učiteljice. Budući da se u ovom dijelu nastoji postići što veća samostalnost učenika u radu, učiteljice se uključuju i pomažu samo po potrebi.

Stoga, možemo zaključiti da se ovaj oblik nastave može uspješno provoditi samo ukoliko su oba učitelja upućena minimalno u osnove struke svoga kolege. Ukoliko se zajedničkim radom kolege zainteresiraju za predmet onog drugog i sami prošire svoja znanja, uspjeh budućih zajedničkih projekata zasigurno neće izostati.

U sklopu integrirane nastave povodom Dana sigurnijeg interneta 2014. u prvom dijelu čitalo se na tekstove na engleskom jeziku (u elektronskom i tiskanom obliku), nakon čega su slijedile vježbe razumijevanja i proširivanje vokabulara. U drugom dijelu učenici su se upoznavali s novim Web 2.0 alatom te uz pomoć njega izrađivali radove na engleskom jeziku.

Učenici 7. razreda uz pomoć učiteljice engleskog jezika istražili su savjete kako biti što sigurniji pri korištenju interneta. Dobili su zadatak izdvojiti i napisati savjete koje smatraju najkorisnijima. Nakon toga učiteljica informatike upoznala ih je s mogućnostima Web 2.0 alata Glogster pomoću kojeg mogu izraditi online postere. Nakon toga prionuli su izradi vlastitih radova s prethodno izdvojenim savjetima.

Učenici 8. razreda kroz prezentaciju na engleskom jeziku upoznali su se s najvažnijim odredbama hrvatskog zakonodavstva o zaštiti autorskih prava koje je većim dijelom usklađeno s europskim zakonodavstvom. Posebno su istaknute sljedeće odredbe:

1) Autorsko pravo pripada autoru djela samim stvaranjem.

2) U autorska djela spadaju: jezična djela (pisana djela, govorna djela, računalni programi), glazbena djela, djela likovne umjetnosti, fotografska djela, audiovizualna djela i dr.

3) Za obrazovanje je vrlo važan članak 85 Zakona o autorskom pravu i srodnim pravima: Dopušteno je reproduciranje na papir ili sličan medij i distribuiranje pojedinih odlomaka zakonito objavljenih autorskih djela koja su po svojem sadržaju i sistematizaciji isključivo namijenjena nastavi ili znanstvenom istraživanju uz navođenje izvora, osim ako to autor izričito ne zabrani.

4) Fizička osoba može reproducirati autorsko djelo ako to čini za privatno korištenje, kao i reproducirati autorsko djelo u obliku fotokopije i za drugo vlastito korištenje, koje nema komercijalnu svrhu i nije namijenjeno ili pristupačno javnosti.

Nakon provedenih vježbi razumijevanja i proširivanja znanja neophodnim leksikom engleskog jezika učenici su dobili zadatak izdvojiti po njihovom mišljenju najvažnije zakonske odredbe o zaštiti autorskih prava. U drugom dijelu nastave upoznali su se s Web 2.0 alatom Emaze. Ovaj alat omogućuje izradu prezentacija s 3D efektom. Pomoću njega učenici su prethodno izdvojene odredbe o zaštiti autorskih prava pretvorili u vrlo atraktivne prezentacije.

Praktični dio nastave izgleda tako da učenici samostalno ili u parovima rade na računalima a obje učiteljice nenametljivo obilaze i po potrebi pomažu – svaka vezano uz svoj predmet. Na ovaj način postiže se neformalni oblik nastave kojim se postiže maksimalna moguća samostalnost i kreativnost učenika.

Na sličan način proveli smo aktivnosti u sklopu projekta o održivim izvorima energije „Sustainable Energy – Clean Energy for the Future“. Glavni cilj ovog projekta bio je upoznati se s mogućnostima korištenja energije sunca, vode, vjetra, biomase i geotermalne energije. U projektu su sudjelovali učenici 6. i 8. razreda (12 i 14 godina).

Nakon što su učenici dobili zadatak istražiti ove izvore i upoznati se s najvažnijim činjenicama održana je integrirana nastava engleskog jezika i informatike. U teoretskom dijelu učenici su gledali tematski animirani film na engleskom jeziku. Nakon toga uslijedili su vježbe razumijevanja i proširivanje vokabulara. Učenici su zatim dobili zadatak pismeno izraditi zadatke uparivanja i kvizove.

Učiteljica informatike upoznala je učenike s programom HotPotatoes. U praktičnom dijelu nastave prethodno izrađene zadatke pretvorili su u elektronski oblik.

U narednim satovima informatike učenici su upoznati sa sve popularnijim Web 2.0 alatom Zondle te su i njega iskoristili za izradu kvizova o održivim izvorima energije u elektronskom obliku.

U ovom projektu (kao i u kvizu o korištenju programa Terrapin Logo) parterska škola bila je tehnička škola iz Španjolske. Zbog različite strukture obrazovanja učenici su bili slične dobi (14). Naši partneri posvetili su se temi unutar programa strukovnih predmeta svoje škole, a upravo od nas dobili su ideju za korištenjem alata Zondle.

Kao i u projektu „Safe Internet: A Bridge Between Us“ održali smo tematski kviz putem videokonferencije a pitanja koja su ekipe pripremile objavili smo na školskim web stranicama u obliku Zondle kviza kako bi ga svi zainteresirani mogli rješavati.

Sljedeći primjer uspješne integracije nastave engleskog jezika i informatike je prethodno spomenut projekt „Winter Olympics, Sochi, Russia“. U ovaj projekt bili su uključeni učenici četvrtog i sedmog razreda. Tema sporta sastavni je dio nacionalnog plana i programa nastave engleskog jezika za 7. razred, te je ovaj važni događaj poslužio kao korisna poveznica s temom. Učenici su u sklopu nastave engleskog jezika proširili vokabular vezan uz zimske sportove. U sklopu komunikacijskih aktivnosti dobili su zadatak sastaviti dijaloge na temu omiljenog zimskog sporta i praćenja Zimskih olimpijskih igara.

Na nastavi informatike učenici su se upoznali s Web 2.0 alatom Go!Animate koji služi za izradu kratkih animiranih filmova. Već u 6. razredu učenici su se upoznali s osnovnim mogućnostima ovog alata. Naučili su izraditi animirani film odabiranjem likova i pozadine i unosom željenog teksta. Na ovaj način vježbali su uporabu pravopisa. Naime, neispravno unesene riječi program interpretira jednako neispravnim izgovorom, što učenici u pravilu prepoznaju i ispravljaju pravopisne greške.

Ovaj put učenici su proširili svoja znanja o alatu Go!Animate i upoznali se s dodatnim opcijama: unosom teksta u oblačićima, reguliranjem pokreta likova, izborom izraza lica i pozadinske glazbe. Svoje prethodno sastavljene dijaloge uspješno su pretvorili u zanimljive kratke animirane filmove koji su se izuzetno svidjeli našim projektnim partnerima.

D. eTwinning projekti i aktivnosti izvan učionice

Kao primjere školskih aktivnosti izvan učionice navodimo aktivnosti u sklopu projekta „E-waste - What Can Citizens Do?“: organiziranje predavanja za učenike povodom obilježavanja Dana planeta Zemlje u travnju 2014. u suradnji s Gradskim komunalnim poduzećem Čakom, sudjelovanje u nacionalnoj akciji Zelena čistka

kada je u travnju 2014. organizirano prikupljanje električnog i elektroničkog otpada u dvorištu škole u suradnji s GKP Čakom te obilježavanje Svjetskog dana zaštite okoliša 2014 (World Environment Day – WED).

III. ZAKLJUČAK

Prednosti eTwinning projekata u nastavi 21. stoljeća neupitne su. Rad na ovim projektima nedvojbeno razvija informacijsko-komunikacijske vještine učenika i njihovu svijest kao europskih građana te služe razvijanju kreativnosti i značajno doprinose izrastanju učenika u samostalne i odgovorne osobe sklone timskom radu.

Ono što čini razliku između tradicionalne nastave i nastave u koju su integrirani eTwinning projekti jest mogućnost da učenici rezultate svoga rada prezentiraju ne samo izvan učionice nego izvan svoje zemlje bez ikakvih dodatnih troškova i dobiju povratne informacije. Učenici i učitelji su u mogućnosti iz prve ruke doznati kako se uči širom Europe i koliko ima sličnosti i razlika među obrazovnim sustavima. Provođenje ovih projekata moguće je u okviru bilo kojeg nastavnog predmeta i ne zahtjeva osmišljavanje dodatnih tema pored onih već predviđenih nastavnim planom i programom. U svaku temu unosi interkulturalnost, interaktivnost i toliko potrebnu svijest o činjenici da razlike nisu nešto negativno, naprotiv, one obogaćuju Europu budućnosti.

Stručno usavršavanje nastavnika putem e-učenja

Marina Mirković, dipl. inženjer elektrotehnike
Tehnička škola, Požega, Republika Hrvatska
marina.mirkovic@po.t-com.hr

Sažetak

Društvo u kojem živimo je informatički orijentirano s neprestanim rastom potrebe za cjeloživotnim učenjem. Online učenje je izazov i alat za poboljšanje i unapređenje obrazovnih procesa. Mogućnosti e-učenja povećavaju dostupnost stručnog usavršavanja svim odgojno obrazovnim djelatnicima koji su ujedno potaknuti na uporabu informacijsko komunikacijske tehnologije.

U radu se opisuju mogućnosti i iskustva primjene online tečajeva za stručno usavršavanje nastavnika u Republici Hrvatskoj. Agencija za odgoj i obrazovanje razvila je šest programa e-učenja za stručno usavršavanje koji se odnose se na teme vrednovanja, individualizacije rada, strategije učenja i poučavanja, mentorstva, profesionalnog razvoja i programa Pestalozzi.

CARNetov masovni online tečaj - CARNet Moodle MOOC namijenjen je svima koji žele naučiti kako samostalno osmisliti i izraditi online tečaj u Moodle-u. Slovenska akademska istraživačka mreža - Arnes organizira besplatni masovni online tečaj namijenjen svima koji žele naučiti više o sigurnom korištenju Interneta i suvremenih informacijskih tehnologija.

Stručno usavršavanje za online nastavu omogućuje nastavnicima da postanu svjesni kako učenici doživljavaju e-učenje, a to najbolje mogu postići uključivanjem nastavnika u ulogu polaznika različith online tečajeva. Ovaj oblik iskustvenog učenja izaziva refleksiju na dubokoj razini i poboljšava praksu. Nastavnici pri tome rade na napredovanju svoje stručnosti, poboljšavaju svoje obrazovne i tehnološke vještine.

I. UVOD

Intenzivno uvođenje informacijskih tehnologija u obrazovne procese postao je prioritet modernih visokoobrazovnih institucija diljem svijeta. E-učenje utječe na različita područja društva, a time i na ekonomiju što se odnosi na usavršavanje zaposlenih. Omogućuje uštede vremena i novca. Sredstva koja škole mogu trošiti na stručna usavršavanja nastavnika, nažalost su sve manja, a programi e-učenja ne zahtijevaju dodatna plaćanja. Time se čuva novac koji bi se izgubio na troškove smještaja i prijevoza koji se javljaju prilikom stručnog usavršavanja zaposlenih. Ušteda radnog vremena je značajan čimbenik. Nisu potrebne zamjene zaposlenika jer nastavnici mogu pristupiti online programima poslije njihove nastave. Vrijeme stručnog usavršavanja prilagođava se nastavnikom željama, potrebama i mogućnostima.

Praktičan rad nastavnika sa različitim tehnologijama uz stjecanje informacija o temi e-programa, pruža i dodatna znanja i vještine o uporabi različitih tehnologija, omogućuje nastavnicima da postignu i zadrže razinu infomatičke pismenosti, samostalno učenje i interakciju.

II. PROGRAMI E-UČENJA ZA STRUČNO USAVRŠAVANJE NASTAVNIKA

Agencija za odgoj i obrazovanje u sklopu projekta „Poboljšanje sustava stručnog usavršavanja odgojno-obrazovnih djelatnika“ razvila je pet programa e-učenja za stručno usavršavanje koji su od proljeća 2014. godine dostupni putem interneta. Interdisciplinarni programi e-učenja odnose se na teme vrednovanja, individualizacije rada, strategije učenja i poučavanja, mentorstva, profesionalnog razvoja i Pestalozzi vijednosti i načela. Kreirani programi su:

- Vrednovanje učeničkih postignuća
- Individualizacija u odgojno-obrazovnom procesu
- Strategije učenja i poučavanja
- Izazovi mentorstva
- Putem profesionalnog razvoja
- Učenje i življenje Pestalozzi vrijednosti i načela u odgoju i obrazovanju.

Programi e-učenja Agencije za odgoj i obrazovanje smješteni su na CARNetovom poslužitelju, a verzija Moodle-a koja se koristi u CARNetu nazvana je Loomen [1]. Nalaze se u kategoriji Programi e-učenja AZOO-a. Prijava za sudjelovanje izvodi se putem sustava www.ettaedu.eu. Veliki je broj zainteresiranih za pohađanje programa, te se vrlo brzo popuni broj prijava (50 ili 100 polaznika). Za pohađanje programa e-učenja dovoljne su osnovne vještine korištenja računala i interneta kao što su: korištenje elektroničke pošte, pregledavanje web stranica, upravljanje datotekama na računalu te korištenje programa za obradu teksta i/ili tabličnih kalkulatora.

Odabranom programu može se pristupiti i nesmetano raditi u bilo koje vrijeme, odnosno kada polaznicima najviše odgovara. Ne moraju se odjednom proći svi njegovi dijelovi. Sustav bilježi vrijeme provedeno na

tečaju i mjesto na kojem je polaznik zastao i treba nastaviti kad se ponovno uključi.

Predviđeni oblik rada je individualni. Korisnici se koriste sljedećim strategijama: vizualizacija, sumiranje, stvaranje analogija, popunjavanja ponuđenih obrazaca; postavljanja vlastitih ciljeva učenja i rokova izvršavanja aktivnosti zadanih programom; odabir i primjena odgovarajućih strategija s obzirom na materijale i alate programa te samovrednovanje i samorefleksija. U sadržajima se mogu naći različiti materijali za čitanje, upitnici i kratki filmovi za samorefleksiju i samoprocjenu, alati i aktivnosti za usvajanje, ponavljanje i uvježbavanje. Svaki tematski dio sadrži poveznice na različite alate i obrasce.

Program „Vrednovanje učeničkih postignuća“ omogućuje polaznicima da usvoje osnovne koncepte vrednovanja. Posebna pažnja dana je zakonima i pravilnicima vezanim za ovo područje. Polaznici će upoznati moderne koncepcije vrednovanja u kojima učenik postaje aktivni sudionik vlastitog vrednovanja pri čemu je ono sastavni dio učenja i poučavanja. Prikazano je zanimljivo predavanje dr. sc. Borisa Jokića o kvaliteti vrednovanja. Kroz program, sudionici će osvijestiti važnost dobro definiranih odgojno-obrazovnih ishoda te moći oblikovati različite vrste zadataka otvorenog i zatvorenog tipa.

Program e-učenja „Individualizacija u odgojno-obrazovnom procesu“ pruža polaznicima temeljna znanja o individualiziranim odgojno obrazovnima programima te potrebi i obvezi individualizacije u odgojno-obrazovnom radu. Nužno je razvijati sposobnost prepoznavanja potreba učenika, kako onih s posebnim obrazovnim potrebama, odnosno s teškoćama u učenju, tako i darovite djece.

Svim odgojno obrazovnim djelatnicima preporučujem program „Strategije učenja i poučavanja“ koji će ih kroz razne sadržaje uvesti u svijet suradničkog učenja (slika 1). Polaznici će upoznati nužnost promjene u pristupu učenju i poučavanju te usvojiti osnovna načela poučavanja

Slika 1. Naslovnica programa e-učenja „Srategije učenja i poučavanja“

usmjerenog na učenika. Razrađene su faze suradničkog učenja, posebno opisan rad u paru. Polaznici će upoznati nove uloge učitelja, analizirati primjere aktivnosti učitelja i učenika, proučiti poticanje samostalnosti učenika u učenju i njegove motivacije za učenje. Za lakši rad u aktivnostima, polaznici koriste dnevnike refleksije i radne bilježnice za učitelje.

Program „Izazovi mentorstva“ namijenjen je odgajateljima, učiteljima, nastavnicima i stručnim suradnicima koji se nalaze u ulozi mentora ili to mogu postati. Polaznici tečaja upoznati će i razumjeti uloge i karakteristike mentora, faze mentorskog rada i zadatke te izazove s kojima se susreću u pojedinoj fazi da bi se prikladno pripremili za njih. Osvijestiti će i razumjeti komunikacijske vještine važne za uspješnu interakciju i komunikaciju između mentora i pripravnika te će moći primijeniti različite komunikacijske tehnike za uspješno rješavanje mogućih problema u komunikaciji u mentorskom odnosu.

Zanimljivi su i korisni prijedlozi obrazaca dnevnika stažiranja, plana i programa pripravničkog staža, obrazaca za analizu potreba pripravnika i mentora, refleksiju i samorefleksiju. Zasebni dio je „Kutak za čitanje“ koji sadrži primjere iz prakse i dodatne materijale.

U programu „Putem profesionalnog razvoja“ polaznici se informiraju o konceptu profesionalnog razvoja, cjeloživotnom učenju i ciklusima profesionlane karijere. Kroz različite zadatke, aktivnost promišljanja vodi ih kroz analizu profesionalne uloge i omogućuje razvoj kompetencija samorefleksije profesionalnog razvoja. Predstavljen je kotač ravnoteže (životni i profesionalni) kao alat za planiranje, evaluaciju, provjeru i refleksiju o zadovoljstvu našim radom. Polaznik reflektira vlastito iskustvo na osnovi različitih alata i metoda, istražuje svoje potencijale i područja vlastitog razvoja. Kroz intervju u paru, polaznici razmijenjuju iskustva s kolegama. Svoj profesionalni razvoj polaznici prikazuju putem e-portfolia.

Cilj programa „Učenje i življenje Pestalozzi vrijednosti i načela u odgoju i obrazovanju“ je da polaznici saznaju koje su vrijednosti i načela Programa Pestalozzi Vijeća Europe te da uoče važnost usvajanja i primjene tih vrijednosti i načela u odgoju i obrazovanju. Polaznici će saznati osnovne informacije o organizaciji Vijeća Europe, osnovne podatke o Europskoj kulturnoj konvenciji, teme i aktivnosti stručnih usavršavanja u Programu Pestalozzi. Naglasak je na razvoju interkulturalne kompetencije u nastavi kao i transverzalnih stavova, vještina i znanja. Njih nastavnici razvijaju u nastavi kroz pet područja djelovanja: raznolikost i empatija; suradnja i sudjelovanje; ljudska prava i jednakost; stvaranje znanja i epistemologija; osobnost i interakcija. U programu polaznici kroz radionicu izrađuju i objavljuju svoje primjere primjene transverzalnih stavova, vještina i znanja te ih kroz forum komentiraju u raspravi.

Polaznici na kraju pohađanja pojedinog programa ispunjavaju evaluacijski upitnik te njime autorima daju povratnu informaciju o programu. To je ujedno i preduvjet za dobivanje potvrde o sudjelovanju u programu e-učenja. Programi će se kontinuirano usavršavati i nadopunjavati. Nedostaje kontakt polaznika s trenerima i drugim

sudionicima te se predlaže da budući programi e-učenja budu kombinirani a da se komunikacija ostvaruje putem foruma [2].

III. MASOVNI ONLINE TEČAJEVI

MOOC (Massive Open Online Course) je online tečaj ili predavanje s neograničenim sudjelovanjem i slobodnim pristupom preko interneta. Ovaj oblik edukacije je prilagodljiv rasporedu, potrebama i interesima polaznika. Omogućena je interakcija i razmjena znanja i mišljenja s kolegama diljem svijeta koji pohađaju isti tečaj. Uz internetsku vezu, za učenje je važna i osobna motivacija kao i odgovornost sudionika. Neispunjavanje obveza ne nosi sankcije slične onima u formalnom sustavu obrazovanja.

Prvi CARNetov masovni otvoreni online tečaj - Moodle MOOC do sada je organiziran i održan u dvije grupe polaznika (oko 900 sudionika) koji su željeli naučiti kako samostalno osmisliti i izraditi online tečaj u Moodle-u. Tečaj je podijeljen na sedam tematskih cjelina:

- Upoznajte se sa sučeljem i ulogama u Moodle-u
- Prvi koraci u izradi tečaja
- Izradite sadržaj svog tečaja
- Uključite aktivnosti za vaše polaznike
- Vrednujte znanje svojih polaznika
- Upravljajte polaznicima i tečajem
- Vaš osvrt na tečaj i što nakon tečaja?

Online tečaj traje šest tjedana, tijekom kojih polaznici mogu pristupiti tečaju i nesmetano raditi na njemu u vrijeme kada to njima najviše odgovara. Za svladavanje gradiva, izradu zadataka te sudjelovanje u ostalim nastavnim aktivnostima pretpostavljen je angažman polaznika od šest do osam sati tjedno, ovisno o predznanju i afinitetima polaznika. Polaznici pri tome izrađuju vlastiti online tečaj čiju sigurnosnu kopiju mogu koristiti za kasniju uporabu.

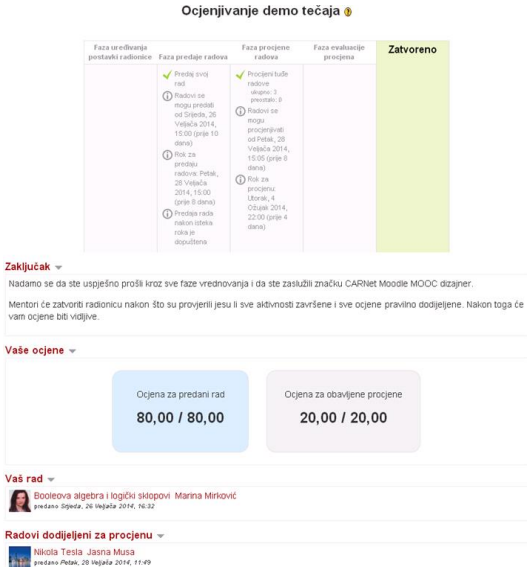
Tijekom trajanja cijelog tečaja polaznici individualno savladavaju gradivo, izrađuju individualne zadatke, ali sudjeluju i u zajedničkim aktivnostima s ostalim polaznicima: diskusijama u forumima i međusobnom vrednovanju postignuća, odnosno izrađenim tečajevima.

Komunikacija s drugim polaznicima omogućena je putem foruma u tečaju s ciljem upoznavanja i razmjene ideja u online okruženju. Mentori polaznicima tijekom pohađanja pružaju minimalnu podršku u savladavanju nastavnih sadržaja i ne sudjeluju u evaluaciji znanja. Ako je potrebno, komunikacija s mentorima može se odvijati putem foruma tečaja.

U tečaju je implementiran novi sustav evaluacije znanja putem Moodle digitalnih znački. Značka je dokaz da je polaznik online tečaja završio zadane aktivnosti i ostvario planirane ishode učenja [3].

Ukoliko uspješno završi neke od jednostavnijih aktivnosti prema definiranim kriterijima, polaznik dobiva značku CARNet Moodle MOOC - Polaznik. Polaznici koji se uključe u aktivnosti dijeljenja znanja i iskustava prema definiranim kriterijima dobit će značku CARNet Moodle MOOC - Istaknuti polaznik. Ukoliko izradi osnovni tečaj pomoću Moodle-a prema definiranim kriterijima, polaznik dobiva značku CARNet Moodle MOOC – Dizajner. Polaznici međusobno vrednuju svoje tečajeve prema unaprijed zadanim kriterijima i uz pomoć odgovarajućeg alata (slika 2).

Kada CARNet kao organizator tečaja dodijeli polazniku značku, ona se pojavljuje u profilu polaznika unutar sustava. Polaznik značku može koristiti kao dokaz određenih znanja i vještina, prenijeti je u svoj profil na sustavu Loomen ili objaviti na drugim web stranicama.



Slika 2. Radionica ocjenjivanja tečajeva polaznika

Slovenska akademska istraživačka mreža - Arnes tijekom studenog je organizirala besplatni masovni online tečaj namijenjen svima koji žele naučiti više o sigurnom korištenju interneta i suvremenih informacijskih tehnologija [4]. Tečaj je trajao tri tjedna a teme proučavanja bile su:

- Zaštita uređaja
- Zaštita podataka i digitalni identitet
- Zaštita zdravlja i okoliša.

Za uspješan završetak tečaja trebalo je postići 75% bodova na kvizovima i izvršiti sve aktivnosti u tečaju, posebno sudjelovati u forumima. U tečaju je sudjelovalo više od 750 sudionika iz Slovenije i inozemstva, odnosno susjednih zemalja. Oko 400 sudionika je uspješno završilo tečaj s odradom svih propisanih aktivnosti. Tečaj je održan na slovenskom jeziku.

U tečaju su sudionici upoznali kako se zaštititi od virusa te što su dobre lozinke zaštite. Analizirani su primjeri slučajeva prijevara i prijetnji s kojima se susrećemo online. Velika pozornost posvećena je privatnosti na internetu. Prikazani su slučajevi objavljivanja osobnih podataka na internetu kao i moguće posljedice takvog ponašanja. U tečaju je također prikazana ovisnost o internetu, igrama i mobitelima te načini zlostavljanja putem interneta i mobilnih uređaja, kao i budući izazovi u korištenju suvremenih tehnologija.

U tečaju su sadržaji proučavanja bili dokumenti, videozapisi, ankete, kvizovi. Forumi su bili vrlo aktivni. Sudionici su raspravljali o brojnim zanimljivim temama u kojima su podijeliti svoje iskustvo o sigurnoj upotrebi interneta.

Zanimljivi su bili brojni kvizovi, među njima i kviz o Web detektivu, s primjerima prepoznavanja problema u uporabi interneta. Kviz je dostupan na mrežnoj stranici: http://www.spletni-detektiv.si/.

Za uspješno sudjelovanje u tečaju polaznici su dobili Mozillinu značku "Pametan korisnik interneta" (slika 3).

Online tečaj koji se temelji na Europskom okviru za razvoj i razumijevanje digitalnih kompetencija (DIGCOMP), završio je sastankom uživo sudionika koji su to željeli. Pri tome su se problemi koji se javljaju "on-line", riješavali "off-line". Nastavnici su analizirali složene probleme sigurnijeg interneta i modernih tehnologija, s kojima se danas vrlo često susreću učitelji, ravnatelji i stručni suradnici u slovenskim, ali i školama ostalih zemalja. Koncept tečaja predstavljen je na konferenciji Arnes 2014. Opisao ga je gospodin Domen Božeglav, voditelj/mentor tečaja. Videozapis prezentiranja možete pogledati na mrežnoj stranici: https://video.arnes.si/portal/asset.zul?id=c1XBVpcAklCaLWTKjSzHkXMg.

Uz CARNetov Moodle MOOC i Arnesov „Sigurno korištenje interneta i modernih tehnologija", vjerujem da će se njihova uporaba i popularnost širiti i na druge organizacije a time promijeniti struktura obrazovanja.

Slika 3. Mozillina značka "Pametan korisnik interneta"

IV. TEČAJEVI UDRUGE „ZVONO"

Učitelji razredne nastave okupljeni na Forumu razredne nastave i u Udruzi hrvatskih učitelja razredne nastave „Zvono" u svom radu i razmjenom iskustva pokušavaju unaprijediti svoj rad pa tako i informatička znanja i vještine. U svrhu edukacija uže vezane za programe i alate koji bi bili korisni učiteljima za izradu nastavnih materijala, pokrenuli su besplatne informatičke online tečajeve za učitelje razredne nastave kao oblik neformalnog učenja [5].

Pri udruzi „Zvono" oformljena je radna skupina Informatički tečajevi čiji članovi sudjeluju u izradi i vođenju online tečajeve u LMS sustavu Moodle. Tako su nastali slijedeći tečajevi:

- Upotreba MS PowerPointa
- Izrada razredne web stranice
- Izrada nastavnih materijala
- Web 2.0 u nastavi
- Programiranje u nastavi likovne kulture
- Izrada kviza Hot Potatoes
- Zondle- igre kao podrška učenju

Tečajevi se odvijaju online što znači da se savladavanje sadržaja odvija u vrijeme kada polaznicima odgovara. Mišljenja polaznika o tečaju su puna pohvala i preporuka za uključivanje i ostalih nastavnika u ovaj oblik stručnog usavršavanja koji pridonosi stjecanju informatičkih kompetencija učitelja. Radionice/tečajevi su dobro organizirani, zanimljivi, primjenjivi u nastavi. Preglednu, jasnu i zanimljivu građu polaznici postupno usvajaju uz konkretne vježbe s preciznim uputama. Vježbe ocjenjuju i komentiraju mentorice tečaja.

V. TEČAJEVI BRITISH COUNCILA

British Council Hrvatska kao međunarodna organizacija vodi brigu o razvijanju vještina koje mogu doprinijeti ekonomskom rastu i pomoći u razvoju otvorenog i kreativnog društva. U svom radu organiziraju online tečajeve koji pomažu nastavnicima razviti razumijevanje konteksta unutar kojeg učenici uče engleski jezik te upoznati načela i praksu učinkovitog podučavanja [6].

Online tečajevi British Councila dostupni su kao moderirani tečajevi i kao tečajevi za samostalno učenje. Prikladni su za nastavnike početnike koji trebaju steći znanje iz osnovnih pojmova u poduci engleskog jezika, kao i za iskusne nastavnike koji žele osuvremeniti svoju metodiku. Polaznicima se nude slijedeći tečajevi:

- Tečaj o posebnim obrazovnim potrebama
- Tehnologija u učionici
- Komunikacijski pristup ocjenjivanju

- Osnove integriranog učenja jezika i nastavnog sadržaja
- Osnove stručnog testa za nastavnike
- Osnove poduke engleskog u nižim razredima osnovne škole

Cijena pojedinog tečaja je od 300,00 do 900,00 kuna, a trajanje najduže do 12 tjedana. Diplomu tečaja polaznici primaju nakon uspješnog ispunjavanja svih zadataka i aktivnosti u tečaju.

Povremeno su dostupni i besplatni online programi British Councila koji omogućuju nastavnicima da poboljšaju engleski jezik i saznaju više o britanskoj kulturi. Zainteresirani polaznici imaju mogućnost istražiti i prijaviti se prema različitim područjima i kategorijama na besplatne online tečajeve u organizaciji vodećih sveučilišta i kulturnih institucija.

VI. POUČAVANJE O E-TEČAJEVIMA

Nastavnici osnovnih i srednjih škola koji u svoju nastavu žele primjeniti e-učenje putem online tečajeva ili online komunikaciju s učenicima moraju steći vještine i znanja koja treba imati online mentor-nastavnik. U tome im pomaže CARNetov E-tečaj za e-mentore.

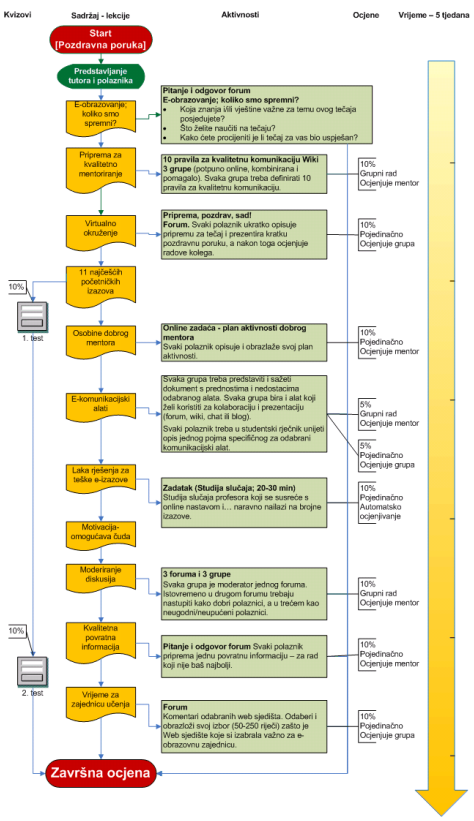
Sadržaj tečaja obuhvaća teme:

- priprema mentora i polaznika za tečaj
- uvođenje polaznika u virtualno okruženje
- 11 najvećih početničkih izazova
- osobine dobrog mentora
- odabir i prednosti pojedinog komunikacijskog alata
- motivacija polaznika
- moderiranje diskusija
- povratne informacije
- mogućnosti i potrebe osobnog razvoja nakon tečaja.

Tijekom održavanja tečaja, polaznici sudjeluju u brojnim aktivnostima (slika 4) sličnim onima koje će kasnije sami provoditi kao mentori: diskusije na relevantne teme, grupni radovi (pravila za kvalitetnu online komunikaciju, prednosti i mane pojedinog komunikacijskog alata i dr.), izrada pripreme za tečaj i pozdravne poruke, studija slučaja, moderiranje foruma, ocjenjivanje kolega i drugo .

Studija slučaja opisuje primjer uvođenja e-obrazovanja u nastavu. Polaznik prolazi kroz određene tipične situacije, te nakon svake bira koji sljedeći korak će napraviti kako bi što kvalitetnije uveo e-learning u nastavu [7].

Tečaj je implementiran u open source alat Moodle pri čemu su korišteni alati koje Moodle nudi, kao što su forum, wiki, blog, chat, lekcije, testovi i dr.



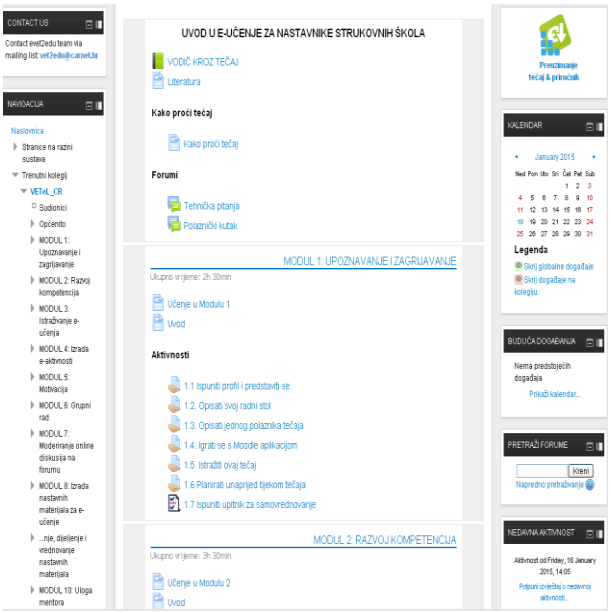
Slika 4. Raspored aktivnosti i zadataka u E-tečaju za e-mentore

Tečaj "Uvod u e-učenje za nastavnike strukovnih škola" koji je nastao u okviru projekta eVET2EDU, namijenjen je nastavnicima strukovnih škola i organizacija koji se žele upoznati s osnovama e-učenja. Tečaju je moguće pristupiti preko naslovnice CARNetovog sustava Loomen.

Sadržaj tečaja je prilagođen nastavnicima strukovnih predmeta koji žele svoju nastavu obogatiti elementima e-učenja pomoću kojih bi se nastava tih predmeta učinila tehnološki unaprijeđenom pomoću alata i metodike pogodne strukovnim područjima. Time nastava postaje usmjerena na učenika, interaktivnija i zanimljivijima današnjim generacijama učenika i polaznika u sustavu obrazovanja odraslih [8].

Tečaj se sastoji od 10 modula (slika 5) koji ukupno traju oko 60 sati učenja:

- Modul 1: Predstavljanje i zagrijavanje
- Modul 2: Razvoj kompetencija
- Modul 3: Istraživanje e-učenja
- Modul 4: Izrada e-aktivnosti
- Modul 5: Izrada nastavnih materijala za e-učenje
- Modul 6: Nastavni materijali na internetu – preoblikovanje, dijeljenje i vrednovanje
- Modul 7: Motivacija



Slika 5. Prikaz sadržaja iz tečaja "Uvod u e-učenje za nastavnike strukovnih škola"

- Modul 8: Grupni rad
- Modul 9: Moderiranje online forumskih diskusija
- Modul 10: Uloga tutora.

Jedna od osnovnih komponenti sadržaja tečaja je tablica za procjenu usvojenosti kompetencija, koja predstavlja svojevrstan alat za procjenu znanja u strukovnim predmetima. Nastavnicima bi takav alat omogućio lakše praćenje realizacije ishoda učenja kroz evidentiranje usvajanja svake pojedine kompetencije potrebne osobama koje se bave određenom strukom.

Svrha ovog tečaja je steći osnovna znanja o e-učenju i uvođenju tehnologije u nastavu strukovnih predmeta. Polaznici će prepoznati vlastite nastavničke kompetencije i planirati načine postizanja strukovnih kompetencija svojih učenika, razlikovati oblike e-učenja u kontekstu strukovnog obrazovanja, osmisliti i izraditi e-aktivnosti, organizirati grupni rad u online okruženju, planirati i voditi online diskusije te organizirati svoj rad kao tutora e-tečaja s temom iz strukovnog obrazovanja te vrednovati vlastite vještine.

VII. ZAKLJUČAK

Važna je promocija i upoznavanje nastavnika s mogućnostima e-učenja. Teme o tehnologijama i pedagoškim/metodološkim aspektima e-učenja potrebno je uvrstiti u programe usavršavanja nastavnika. Stručno i metodički pripremljeni programi pružaju mnogo korisnih sustavnih i temeljitih materijala i informacija u digitalnom obliku na jednom mjestu. Sadržaji se mogu pregledati više puta. Polaznici interdisciplinarnim programima obogaćuju svoje stručno usavršavanje i osposobljavaju se za kvalitetnije provođenje nacionalnog kurikuluma. Potrebna je velika samosvijest i motivacija polaznika u primjeni online programa koji su nadogradnja dosadašnjim načinima stručnog usavršavanja, stručnim predavanjima i radionicama.

Stručno usavršavanje za online nastavu omogućuje nastavnicima da postanu svjesni kako učenici doživljavaju e-učenje, a to najbolje mogu postići uključivanjem nastavnika u ulogu polaznika različith online tečajeva. Ovaj oblik iskustvenog učenja izaziva refleksiju na dubokoj razini i poboljšava praksu. Nastavnici pri tome rade na napredovanju svoje stručnosti, poboljšavaju svoje obrazovne i tehnološke vještine.

Programi e-učenja ispunjavaju potrebe polaznika za stručnim usavršavanjem. Omogućuju nadogradnju znanja, iskustava i vještina. Aktivnosti su usklađene s ciljevima programa i olakšavaju učenje. Produbljuje se razumijevanje teme i potiče razvoj kritičkog promišljanja o vlastitoj praksi. Polaznici su motivirani koristiti u praksi znanja i vještine stečene u programu, te imaju potrebu dijeliti ih sa svojim kolegama. Korisni su kontakti s drugim polaznicima i voditeljem/mentorom tijekom programa učenja. E-učenje omogućuje učinkovit pristup osobnom profesionalnom razvoju te kod polaznika pobuđuje interes da iskušaju program e-učenja u vlastitoj praksi.

Nedostaci koji bi sudionike mogli odvratiti od pohađanja online tečajeva su nedostatak vremena i motivacije, nedovoljno poznavanje tehnologije kao i nemogućnost kvalitetne komunikacije u tečajevima gdje je veliki broja polaznika. Potreban je visok stupanj aktivnosti i discipliniranosti polaznika kako ne bi odustali od pohađanja programa e-učenja. Važno je da imaju sposobnost brzog učenja kako se koristi nova tehnologija i prilagođavanja kod javljanja tehničkih problema.

Impress.js - open source prezentacijski okvir u nastavi uvoda u web tehnologije

E. Ciriković *, D. Suk *
* Visoka škola Virovitica, Virovitica, Republika Hrvatska
enes.cirikovic@vsmti.hr, dominik.suk@vsmti.hr

Sažetak - U nastavi uvoda u web tehnologije često nije problem privući pažnju studenata atraktivnošću prezentacije samog sadržaja, međutim u pozadini svega stoji u izvjesnoj mjeri standardizirana jezična struktura koja podsjeća na programske jezike te kao takva studentima instinktivno djeluje upozoravajuće. Zato je u traženju motivacije potrebno pronaći ravnotežu između ponekad suhoparne suštine određene tematike i atraktivnosti te korisnosti konačnog ishoda učenja. U radu se prikazuje pregled java script biblioteke otvorenog koda, impress.js, orijentirane izradi web stranica te interaktivnih web prezentacija, kao motivacijskog alata pri svladavanju kolegija koji studente uvode u web tehnologije. Dobra ravnoteža između zahtjevnosti koda te mogućnosti potpuno personalizirane izrade web prezentacija te samih stranica, praktično se pokazalo kao povoljno u prikazu potencijala integracije zasebnih web tehnologija poput HTML-a, CSS-a i JavaScript-a.

I. UVOD

U nastavi uvoda u web tehnologije, vrlo važnu ulogu imaju HTML i CSS kao okosnice dizajna svih web stranica. Iako su navedene tehnologije izrazito vizualno orijentirane, često su i zahtjevne po pitanju količine pravila koje je potrebno usvojiti prije konkretnih rezultata. Tako svaka HTML web stranica prati standardnu početnu strukturu, na koju se potom nadopunjuje sav ostali kod iz kojega proizlazi ukupna i konačna realizacija svih želja dizajnera. Srećom, motivacija za usvajanje makar osnovnih principa i sintakse navedenih jezika pronalazi se u brojnim potpornim alatima za izradu i oblikovanje web stranica koji svaki na svoj način korisnicima pružaju kreativnu slobodu, u smislu izravne interakcije sa kodom, uz određene pogodnosti raspoloživosti automatiziranih funkcija u slučajevima neophodnih, često ponavljajućih linija koda**.** U skupu potpornih alata, osim komercijalnih rješenja, nalaze se i brojna korisna i zanimljiva rješenja otvorenog koda. Zastupljenost alata otvorenog koda svih vrsta i namjena bilježi znakovit rast te privlači pozornost sve šireg kruga korisnika, među kojima su i studenti, koji se s takvim rješenjima osim privatno susreću i u nastavi. Time se pruža vrlo dobra i prihvatljiva alternativa ustaljenim komercijalnim rješenjima, najčešće zatvorenih prema mogućnosti izravne korisničke interakcije s jezgrenim komponentama sustava te su upravo u tom smislu rješenja otvorenog koda bliža korisnicima od kojih su ustvari i potekla te zbog kojih opstaju i razvijaju se. Upravo takav alat je impress.js, razvijen kao JavaScript biblioteka, koji je kao suvremeni prezentacijski okvir nastao na temeljima CSS3 svojstava transformacija i tranzicija. Za razliku od ustaljenih prezentacijskih desktop alata, poput Microsoft Power Point-a ili Apache OpenOffice Impress-a, impress.js okvir pruža besplatnu izradu web prezentacija s mnoštvom nestandardnih i vizualno atraktivnih mogućnosti. Tako se koraci prezentacije, poznati i kao slajdovi u desktop prezentacijskom okruženju, mogu istovremeno pojavljivati s prikazom u trećoj dimenziji te s mnoštvom primijenjenih efekata nastalih na pravilima dizajna web stranica. Primjenom naprednih svojstava na postojeće CSS transformacije postiže se većina željenih efekata koji se do pojave ovoga okvira nisu mogle često vidjeti među prezentacijama. Tako se pomoću svojstava pozicioniranja prezentacijski elementi mogu smještati u željene dijelove okvira web preglednika, čime se ostvaruje dobra platforma za navigaciju između slajdova, odnosno prezentacijskih koraka. Obraćanje pozornosti na detalje unutar elemenata i općenito upravljanje veličinom prikaza objekata, tzv. skaliranjem, otvaraju se dodatne mogućnosti za pregled i prikaz slajdova, a rotacijom oko zadanih osi uvodi se nova dimenzija i interaktivnost prikaza. Na to se nadovezuje i mogućnost izrade web stranica koje iskorištavaju navedena prezentacijska svojstva i tako postižu dodanu vrijednost u smislu povoljnog odnosa uloženog truda i konačnog rezultata.

Najveća i najvažnija prednost ovog prezentacijskog okvira je njegova licenca koja podliježe MIT i GPLv2+ licenčnim uvjetima, a koja omogućuju besplatno i neograničeno korištenje cijelog okvira kao i slobodnu promjenu izvornog koda. Osim toga, impress.js se u odnosu na većinu današnjih komercijalnih prezentacijskih rješenja također ističe uporabljivošću te međuplatformskom kompatibilnošću. Tako je znatno jednostavnija mogućnost prezentacije i portabilnost materijala u odnosu na klasična desktop rješenja jer se prilikom pregleda prezentacijskog sadržaja ne zahtijevaju posebne prezentacijske aplikacije već je za tu svrhu dovoljan bilo koji web preglednik. Budući su web preglednici dio uobičajene aplikacijske podrške gotovo svih operacijskih sustava jasno je zašto impress.js odskače u smislu portabilnosti i dostupnosti aplikacijske podrške. S druge strane, mogućnost izbora tehnika prezentacije sadržaja znatno premašuje ponudu

mogućnosti desktop aplikacija, a za promjene sadržaja nije potrebno imati instalirane specijalizirane uređivače prezentacijskog sadržaja, već je potreban najosnovniji uređivač teksta kakav je obično prisutan u svim operacijskim sustavima.

II. OPIS IMPRESS.JS PREZENTACIJSKOG OKVIRA

Prije same uporabe potrebno je dohvatiti kopiju impress.js biblioteke smještene na lokaciji *https://github.com/bartaz/impress.js*. Na istoj lokaciji moguće je pronaći prateću dokumentaciju i podršku zajednice okupljene oko projekta te dodatna funkcionalna proširenja.

Da bi se impress.js prezenentacijski okvir mogao koristiti potrebno je iz prethodno raspakirane .zip datoteke izdvojiti datoteku impress.js koja upravo predstavlja biblioteku prezentacijskog okvira. Potom se raspakirana datoteka u stukturi HTML dokumenta navodi kroz referencu na lokaciji gdje je smještena i tako se uključuje u sam sadržaj učitanog web dokumenta. Preporuka je referencu ubaciti na kraj <body> sekcije HTML dokumenta kako bi se datoteka impress.js učitala nakon svih drugih elemenata strukture i dizajna.

```
<!DOCTYPE html>
<html>
<head>
      <title>impress</title>
<meta http-equiv="Content-Type" content="text/html; charset=UTF-8">
      </head>
<body>
<script src="impress.js"></script>
<script>impress().init();</script>
</body>
</html>
```

Slika 1. Inicijalizacija impress.js biblioteke u kontekstu osnovne strukture HTML dokumenta

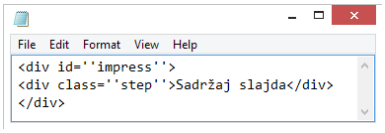
Nakon toga slijedi inicijalizacija impress.js biblioteke unosom sljedećeg koda:

<script>impress().init();**</script>**

Time se pokreće prikaz svih impress.js prezentacija prisutnih u HTML dokumentu s kojega se funkcija poziva. Navedena skripta smješta se nakon skripte za referenciranje na datoteku impress.js, kao u slici 1.

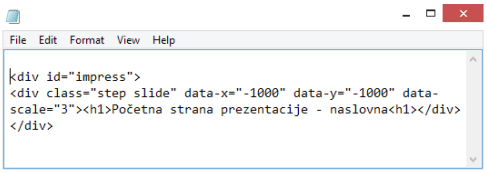
A. *Izrada prezentacija*

Za razliku od standardnih desktop prezentacijskih alata, impress.js zahtijeva prethodno planiranje razmještaja slajdova i općenito tijeka njihova prikaza jer se ovdje radi o neograničenom prostoru unutar kojega je smješten cjelokupan scenarij: slajd po slajd. Upravo taj moguće složen proces planiranja međuodnosa slajdova omogućuje veliku kreativnu slobodu te potiče studente, i općenito dizajnere, na razmišljanje o strukturi rada i planskom pristupu problemu. Za identifikaciju pojedinačnih komponenata prezentacije koriste se predefinirane ID oznake i klase, a sve korake prezentacije potrebno je smjestiti u roditeljsku sadržajnu sekciju (container) označenu ID oznakom ***impress***. Sadržaj pojedine prezentacije ili koraka smješta se unutar sadržajne sekcije s oznakom klase ***step***.



Slika 3. Definicija slajda unutar sadržajne sekcije ***#impress***

Na upravo stvoren slajd moguće je dodati osim samog sadržaja i efekte animacije, kroz HTML svojstva pozicioniranja (data-x, data-y i data-z), skaliranja (data-scale) te rotacije (data-rotate). Prikaz prezentacije ujedno je i prvi korak koji je prema nacrtu **sa slike X** pozicioniran u središtu zaslona te je nešto većih dimenzija u odnosu na ostale slajdove koji ga okružuju. Primjenom sljedećeg koda stvorit će se početni korak prezentacije iz primjera:

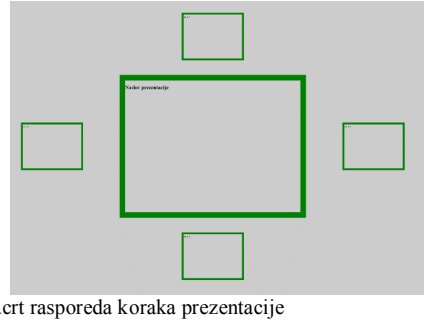


Slika 4. Definicija početnog slajda prezentacije iz primjera sa slike 2

U primjenenama gdje nisu eksplicitno navedene jedinstvene ID oznake sadržajne sekcije za pojedini slajd, za poziv slajdova kroz URL traku koriste se oznake #/step-N, gdje je N broj slajda koji se trenutno poziva na prikaz u prozoru web preglednika. Vodeći se istim principom, moguće je kreirati proizvoljan broj slajdova prezentacije uz potrebu obraćanja pažnje na redoslijed definiranja u kodu jer će se raspored kao takav pratiti i tijekom konačnog prikaza prezentacije.

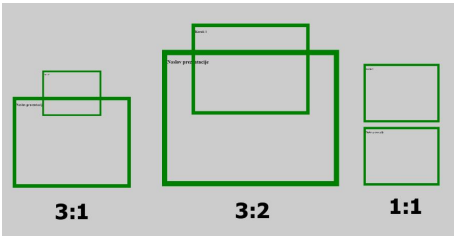
Sljedeći korak izrade prezentacije odnosi se na definiciju otiska ili razmještaja koraka na prezentacijskom prostoru zaslona. To se obavlja unosom *data* atributa *step* elemenata. Za potrebe prvog slajda korišteni su atributi *data-x*, *data-y* te *data-scale*, pa je tako dotični slajd pozicioniran na -1000 piksela na x-osi, te za isti iznos na y osi, što se uzima kao referentna točka ili ishodište za ostale korake prezentacije. Isti učinak na poziciju početnog slajda imala bi sljedeća definicija:

<div class="step slide" data-x="0" data-y="0" data-scale="3" **>**…



Slika 2. Nacrt rasporeda koraka prezentacije

Pretpostavljena vrijednost atributa *data-scale* za skaliranje prikaza slajdova je 1, a u primjeru početnog slajda sa slike 2, korišteno je trostruko skaliranje u odnosu na prethodno definirane dimenzije površine slajda. Time se također postiže povećanje u odnosu na ostale slajdove u prezentaciji i to relativno s obzirom na njihove vrijednosti skaliranja. Tako je moguće postići relativne odnose povećanja 3:2, 2:3 i bilo koji drugi racionalni odnos međusobnog prikaza u skaliranom prikazu koraka (slika 5).

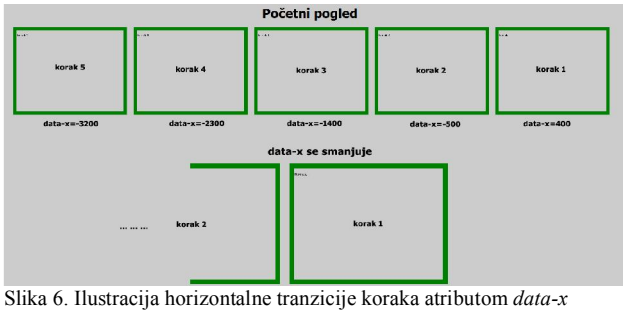


Slika 5. Prikaz različitih skaliranja i međusobnih odnosa dvaju slajdova

B. *Vizualni efekti*

Vizualni efekti ključne su komponente u izradi impress.js prezentacija, a zasnivaju se na temeljima CSS3 transformacija. Prostor efekata za izradu animacija u CSS3 vrlo je velik i u praksi se razlikuje ovisno o web preglednicima u kojima se interpretiraju. Zajednička osobina svih web preglednika praktično je neograničen prostor za izradu dizajna web stranica, no obično se od toga uzimaju dijelovi koji odgovaraju standardima prikaza ne različitim zaslonima. Uobičajena je upotreba grid-a širine 960 piksela neograničene visine, čime se automatski ograničava iskoristivost prostora iznad, lijevo i desno od pozicije grid-a**.** Impress.js, srećom, pruža mogućnost pozicioniranja elemenata izvan granica grid-a čime se ostvaruje bolja iskoristivost inherentnih mogućnosti prikaza web preglednika. Dodatna vrijednost nalazi se i u mogućnosti iskorištenja treće dimenzije što do sada nije bilo ostvarivo u klasičnim prikazima web stranica niti prezentacija.

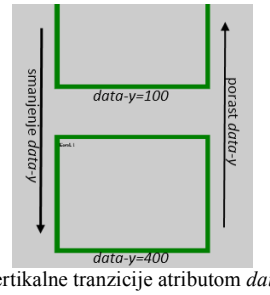
Horizontalno pozicioniranje elemenata prezentacijskog okvira postiže se primjenom atributa *data-x*, a učinak mu se ogleda efektom horizontalnog pomicanja slajdova u tranziciji i to u smjeru lijevo-prema-desno ili desno-prema-lijevo.



Slika 6. Ilustracija horizontalne tranzicije koraka atributom *data-x*

Na primjeru sa slike 6 prikazano je pet koraka svaki sa svojom pozicijom određenom atributom *data-x*. Budući su viši koraci smješteni lijevo od početnog, znači da im je vrijednost atributa *data-x* manja od vrijednosti koraka 1, što znači da se vrijednost atributa *data-x* smanjuje s desna na lijevo, odnosno povećava s lijeva na desno. U primjeru su istovremeno prikazani i ostali koraci za vrijeme prikaza trenutno aktivnog, no to je primjenom odgovarajućih CSS stilova moguće urediti prema želji. Tranzicijom iz koraka 1 u korak 2 dolazi do smanjenja vrijednosti parametra x te će se korak 2, s lijeve strane pomicati prema sredini zaslona dok će se korak 1 pomicati u desnu stranu kao sada već bivši korak. Pomicanje u suprotnom smjeru moguće je postići pridruživanjem većih vrijednosti parametra *data-x* koraku 2 i sljedećim višim koracima. Iz navedenog je moguće zaključiti kako bi se u slučaju istih vrijednosti parametra *data-x* susjedni koraci preklapali u svojem prikazu, što je svakako neprihvatljivo pa je potrebno voditi računa o pravilnom pozicioniranju koraka.

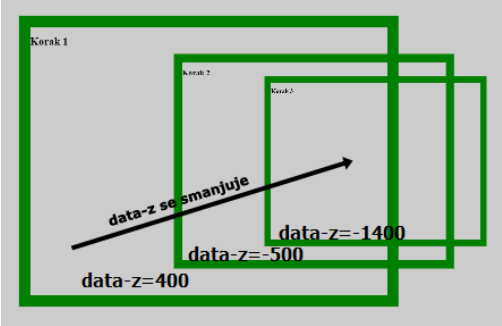
Koraci prezentacije pozicionirani po y-osi poravnavaju se vertikalno, jedan iznad, odnosno ispod drugoga. Primjenom atributa *data-y* određuju se položaji pojedinih koraka u vertikalnom smjeru, dok će se u postupku prijelaza između koraka pojaviti efekti pomicanja koraka odozdo prema gore ili odozgo prema dolje, ovisno o vrijednostima atributa pridruženih koracima.



Slika 7. Ilustracija vertikalne tranzicije atributom *data-y*

Proces vertikalne tranzicije koraka prema slučaju sa slike 7 provodit će se pomicanjem koraka 1, skupa s korakom 2 odozdo prema gore, a suprotan efekt bi se postigao primjenom manjih vrijednosti atributa *data-y* na korake iza koraka 1.

Svi dosadašnji efekti odvijali su se u ravnini x i y osi, a prelazak na trodimenzionalnu perspektivu započinje pozicioniranjem elemenata po z-osi, primjenom atributa *data-z*. Pogledom na ilustraciju pomicanja koraka po z-osi može se uočiti i promjena dimenzija prikaza pojedinih koraka prezentacije s obzirom na veličinu atributa *data-z*, što ujedno izravno utječe na iluziju treće dimenzije, tj. prostorne dubine.



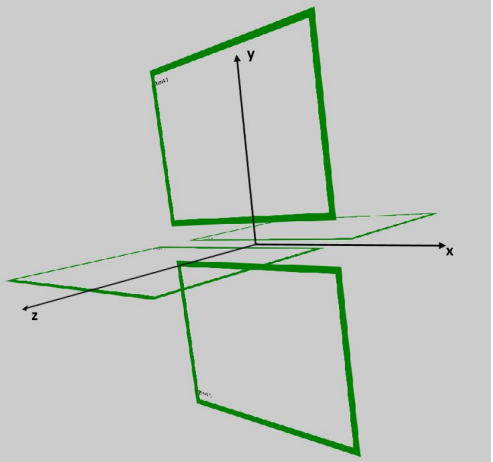
Slika 8. Ilustracija prostorne tranzicije atributom *data-z*

Iz slike 8 očigledno je da su koraci s većim vrijednostima atributa *data-z* prikazom istureniji, odnosno bliži gledatelju, dok su oni s manjim vrijednostima u odnosu na ostale korake udaljeniji i prikazom manji.

Pravu puninu u prostoru trodimenzionalnog dojma pružaju efekti rotacije i skaliranja koraka. Rotacija oko osi x moguća je primjenom atributa *data-rotate-x*.

Primjena efekata pozicioniranja po osi y i osi z, te rotacije oko osi x na četiri uzastopna slajda poredanih na koraku pregleda u kvadraturnom odnosu radi bolje preglednosti prikazana je slikom 9.

```
<div id="impress">
<div class="step slide" data-x="0" data-y="-400" data-z="0" data-rotate-x="0"><h2>Korak 1</h2></div>
<div class="step slide" data-x="0" data-y="0" data-z="-400" data-rotate-x="-90"><h2>Korak 2</h2></div>
<div class="step slide" data-x="0" data-y="400" data-z="0" data-rotate-x="-180"><h2>Korak 3</h2></div>
<div class="step slide" data-x="0" data-y="0" data-z="400" data-rotate-x="-270"><h2>Korak 4</h2></div>
<div id="overview" class="step" data-x="0" data-y="0" data-rotate-x="10" data-rotate-y="45" data-scale="2"></div>
</div>
```



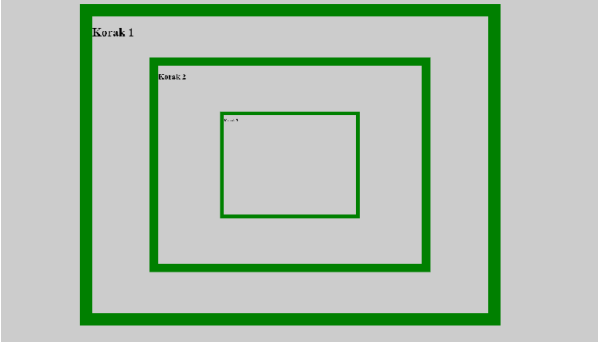
Slika 9. Ilustracija primjera rotacije koraka primjenom atributa *data-rotate-x*

Korištenjem negativnih vrijednosti kutova u primjeru sa slike 9 postignuta je rotacija koraka od dna prema vrhu zaslona, a za suprotan efekt potrebno je promijeniti predznake kutovima atributa *data-rotate-x*. U prikazu je predstavljena bočna perspektiva radi lakše predodžbe međusobnih odnosa između koraka prezentacije koji su, prema definiciji u kodu iznad ilustracije, u kvadraturnom odnosu, što znači da je svaki slajd okomito postavljen na susjedni. Prikazana perspektiva definirana je u posljednjem koraku prezentacije, tzv. koraku pregleda, s postavljenim nagibima ravnina *xy* za 45^0 te ravnine *xz* za 10^0.

Na sličan način postiže se rotacija oko osi y, čime je praktično moguće postići gotovo suprotne efekte onima pri rotaciji po osi x, dok kombinacija navedenih rotacija unosi dodatne prezentacijske mogućnosti uz nešto složenije početne postavke aritmetičkih odnosa.

Posljednja mogućnost rotacije elemenata ostvariva je atributom *data-rotate-z* ili samo *data-rotate* i kao takva ne unosi trodimenzionalne efekte u same prezentacije.
Za razliku od prethodnih efekata, skaliranje se svodi samo na dvije jednostavne funkcije: povećanje (tzv. *zoom-out*) i smanjenje (tzv. *zoom-in*). Skaliranje se definira atributom *data-scale*. Normalan prikaz elemenata prezentacije podrazumijeva skaliranje vrijednošću 1 te ju nije potrebno navoditi prilikom definicije takvih koraka. U primjeru sa slike 10 zadano je skaliranje na tri koraka prezentacije, i to s vrijednostima 1, 2 i 4, redom za korake 1, 2 i 3. Svakom koraku prezentacije pridijeljena je ista vrijednost atributa *data-x*, čime je postignuto poravnanje po središnjoj vertikalnoj osi. Kako bi se izbjeglo preklapanje sadržaja slajdova tijekom prikaza prezentacije, na svaki korak je primijenjena drugačija vrijednost atributa *data-y*.

```
<div id="impress">
<div class="step slide" data-x="400" data-y="300" data-scale="3"><h2>Korak 1</h2></div>
<div class="step slide" data-x="400" data-y="300" data-scale="2"><h2>Korak 2</h2></div>
<div class="step slide" data-x="400" data-y="300" data-scale="1"><h2>Korak 3</h2></div>
<div id="overview" class="step" data-x="400" data-y="300" data-scale="3"></div>
</div>
```

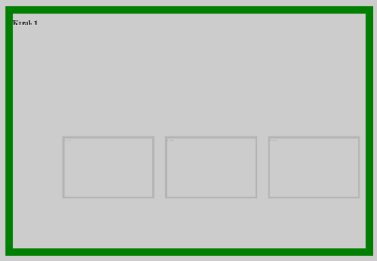


Slika 10. Prikaz efekta skaliranja na primjeru tri slajda

Na početnom koraku prezentacije prikazat će se sadržaj koraka 1 u punoj veličini, dok se ostali koraci neće vidjeti zbog većih iznosa skaliranja. U tranziciji između koraka 1 i 2 dolazi do približavanja koraka 1 prema gledatelju, čime se stvara efekt „*izlaženja iz zaslona*“, odnosno *zoom-out* efekt, a na kraju tranzicije ostaje prikaz sadržaja koraka 1 u koraku 2. Na sličan način odvijaju se i ostale tranzicije i prikazi koraka iz primjera sa slike 10. Bitno je naglasiti kako skaliranje ne podrazumijeva izravne odnose u dimenzijama susjednih elemenata, odnosno koraka, već isključivo na odnose u veličini elementa za koji se atribut *data-scale* određuje. Iako se efekt pozicioniranje može koristiti samostalno, bez primjene ostalih efekata, pravi smisao hijerarhijske organizacije koraka prezentacija postiže se tek primjenom odgovarajućih pozicioniranja koraka preostalim atributima za pozicioniranje. Time se prilikom prikaza određenog koraka postiže dojam podređenog odnosa trenutno neaktivnih koraka u odnosu na onaj koji se prikazuje. U posljednjem primjeru sa slike 11 to je

postignuto promjenom vrijednosti atributa *data-x* i *data*-y za svaki korak prezentacije, pa je tako dobiven efekt ugnježđivanja manjih (starijih) slajdova u veće (trenutno aktivne).

```
<div id="impress">
<div class="step slide" data-x="400" data-y="300" data-scale="4"><h2>Korak 1</h2></div>
<div class="step slide" data-x="-700" data-y="800" data-scale="1"><h2>Korak 2</h2></div>
<div class="step slide" data-x="700" data-y="800" data-scale="1"><h2>Korak 3</h2></div>
<div class="step slide" data-x="2100" data-y="800" data-scale="1"><h2>Korak 4</h2></div>
<div id="overview" class="step" data-x="400" data-y="300" data-scale="5"></div>
</div>
```

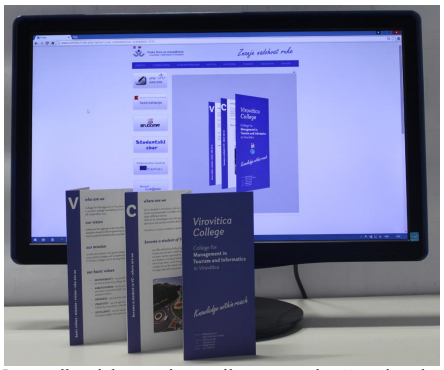


Slika 12. Ugnježđivanje koraka prezentacije primjenom skaliranja i pozicioniranja

Dodatan utjecaj na trodimenzionalne efekte u impress.js prezentacijskom okviru moguće je ostvariti atributom *data-perspective*. Ovim atributom određuje se udaljenost površine zaslona od ishodišta z-osi prezentacije, a utjecaj je kao takav primjenjiv samo na trodimenzionalne kompozicije koraka prezentacije. Osnovna vrijednost atributa *data-perspective* je 1000, dok se manjim, odnosno većim vrijednostima postavlja manja (elementi su bliže zaslonu), odnosno veća udaljenost zaslona od koraka prezentacije. Kako bi se isti efekt udaljenosti zaslona od z-osi istovremeno mogao primijeniti na sve korake prezentacije potrebno je atribut *data-perspective* primijeniti na element s ID oznakom #impress.

III. PRIMJENA U NASTAVI – OD PREZENTACIJE DO WEB STRANICE

Izrada promo brušure Visoke škole Virovitica bila je motivacija za studente da se tiskani proizvod upotpuni i web inačicom u sklopu vježbi iz kolegija E-Business. Tako je na temelju tiskanog predloška nastalo i web izdanje upotpunjeno, osim osnovnim HTML i CSS elementima, i efektima impress.js bilioteke. Usporedba tiskanog izvornika i web ekvivalenta prikazana je sljedećom slikom:



Slika 13. Usporedba tiskanog izvornika promo brošure i web ekvivalenta

Svaka stranica brošure predstavljena je jednim slajdom koji sadržajno i strukturno odgovara web stranici samoj za sebe. Web brošura sastoji se od ukupno jedanaest slajdova – web stranica, međusobno povezanih koracima naprijed-nazad, što je ostvareno navigacijom, posredstvom predefiniranih tipki „gore-dolje“, „lijevo-desno“ te tipke „space“. Redoslijed prikazivanja pojedinih stranica brošure određen je redoslijedom definiranja slajdova u sljedećem kodu:

```
<body>
<div id="impress">
<div id="overview" class="step" data-x="-1325" data-y="0" data-scale="0.9" data-z="600" data-rotate-y="-60" > </div>
<div  style="background-image: url(img/str0.png);" class="step slide" data-x="-940" data-y="0" data-z="-750" data-rotate-y="-150"> </div>
<div  style="background-image: url(img/str1.png);" class="step slide" data-x="-900" data-y="0" data-z="-600" data-rotate-y="0"> </div>
<div  style="background-image: url(img/str2.png);" class="step slide" data-x="-860" data-y="0" data-z="-450" data-rotate-y="-150"> </div>
<div  style="background-image: url(img/str3.png);" class="step slide" data-x="-820" data-y="0" data-z="-299" data-rotate-y="0"> </div>
<div  style="background-image: url(img/str4.png);" class="step slide" data-x="-780" data-y="0" data-z="-150" data-rotate-y="-150"> </div>
<div  style="background-image: url(img/str5.png);" class="step slide" data-x="-740" data-y="0" data-z="0" data-rotate-y="0"> </div>
<div  style="background-image: url(img/str6.png);" class="step slide" data-x="-740" data-y="0" data-z="-1" data-rotate-y="180"> </div>
<div  style="background-image: url(img/str7.png);" class="step slide"  data-x="-780" data-y="0" data-z="-150" data-rotate-y="30"> </div>
<div  style="background-image: url(img/str8.png);" class="step slide" data-x="-820" data-y="0" data-z="-300" data-rotate-y="180"> </div>
<div  style="background-image: url(img/str9.png);" class="step slide" data-x="-860" data-y="0" data-z="-450" data-rotate-y="30"> </div>
<div  style="background-image: url(img/str10.png);" class="step slide" data-x="-900" data-y="0" data-z="-601" data-rotate-y="180"> </div>
<div  style="background-image: url(img/str11.png);" class="step slide" data-x="-940" data-y="0" data-z="-750" data-rotate-y="30"> </div>
</div>
<script src="js/impress.js"> </script>
<script>impress().init(); </script>
</body>
```

Efekti prijelaza između slajdova ostvareni su primjenom atributa *data-x*, *data-y*, *data-z* te *data-rotate*. Radi preglednosti, izostavljene su definicije stilova oblikovanja slajdova, te je prikazan samo sadržaj HTML elementa <body>.

Za uspješnu primjenu navedenih svojstava bilo je potrebno prethodno odrediti apsolutne pozicije pojedinih slajdova te relativne odnose između njih, što je zahtijevalo osnovne trigonometrijske vještine i snalaženje u 3D prostoru. Cjelokupan dizajn brošure, odnosno, pojedinih stranica, određen je na temelju tiskanog izvornika, primjenom svojstava CSS-a. Po završetku projekta, brošura je objavljena na službenim stranicama Visoke škole Virovitica kao dio standardnog Joomla! članka.

IV. ZAKLJUČAK

Prikazom pregleda osnovnih svojstava jedne male biblioteke moćnog jezika JavaScript te pristupačnosti praktičnih mogućnosti koje početnicima entuzijastima pruža impress.js, otvorena je prilika za polivalentnu primjenu od desktop prezentacija do web stranica, bez ograničenih uvjeta korištenja.

Isto se pokazalo i tijekom studentskih vježbi iz uvoda u web dizajn, te je upravo jednostavnost integracije s

neophodnim elementima HTML-a i CSS-a bio poticaj za savladavanje učenja osnova navedenih jezika i motivacija za daljnje istraživanje područja brzo rastućih trendova i potpornih tehnologija. To svakako nije sve što se u ovome trenutku nalazi na tržištu web jezika i pratećih alata otvorenog koda, ali pruža uvid u snagu i potencijale modernih jezika orijentiranih na web i potiče studente i ostale korisnike na istraživanje i primjenu do sada neistraženog ili manje poznatog.

PAPERS

Design of a domain specific language and IDE for Internet of things applications

A.Salihbegovic*, T. Eterovic * , E. Kaljic* and S.Ribic*
* Faculty of Electrical engineering, University of Sarajevo, Bosnia Herzegovina
asalihbegovic@etf.unsa.ba , teo.eterovic@gmail.com, ekaljic@etf.unsa.ba, sribic@etf.unsa.ba

Abstract - With the goal of relieving the Internet of things (IoT)application designers of the complexities and heterogeneity of wireless sensory networks (WSNs), devices, communication media, protocols and operating systems, the development of higher level domain specific language has been undertaken. The result is DSL-4-IoT Editor- Designer, which is based on high level visual programming language, established on the class of visual domain specific modeling languages (VDSMLs). DSL-4-IoT is using formal presentations and abstract syntax in a metamodel. The visual front-end of the Editor has been developed in JavaScript language. The runtime execution of generated IoT application configuration files is done by the open source project "OpenHAB" runtime engine.
In order to demonstrate the viability and usability of the developed DSL-4-IoT visual model based language, an experimental IoT testbed including 15 heterogeneous wireless sensory devices spanning two application domain (smart home and remote patient monitoring), has been designed and deployed.

I. INTRODUCTION

Application development challenges, diversity of devices (physical variables sensors, biometrics sensors), different software implementation (Android, iOS, Linux), different interaction modes (pub/sub, request/response, command) and different engineering units (deg. C, deg. F, bar, N, etc.) are the ecosystem in which the designers of The Internet of Things (IoT) applications are creating their projects[1].

Designers of IoT applications should be relieved of most of these heterogeneity and specifics (wide range of hardware and software entities running on specific platforms, middleware specific features). They need to use integrated development environment (IDE) based on domain specific high level language which in its entities would abstract most of these intricacies and specifics in hardware, software, communication media and protocols. Furthermore, the language should be capable to support large scale design of these systems by combining several design blocks and saving them in application libraries, importing them, reconfiguring and parameter setting with ease for new tags and locations, enabling reusability and scalability [2].

II. DOMAIN SPECIFIC LANGUAGES IN IOT APPLICATIONS DEVELOPMENT

In this area of very intensive research and design, a short overview of the state of the art and approaches to empower IoT designers with higher level languages for their design and deployment is presented.

A. *PervML Language*

PervML is a Domain Specific Language (DSL) designed with the aim of providing the pervasive IoT system developers with a set of constructs that allow them to precisely describe the pervasive system in a technology independent way [3]. PervML promotes the separation of roles where IoT application developers can be categorized as system analysts and system architects.

B. *DiaSuite: a Tool Suite to Develop/Compute/Control Applications Language*

DiaSuite focuses on a specific domain, namely Sense/Compute/Control (SCC) applications [4]. It comprises of:

- Domain-specific design language,
- Compiler producing a Java programming framework,
- 2D-renderer to simulate an application,
- Deployment framework.

DiaSuite provides a design language, named DiaSpec that is dedicated to the SCC paradigm. The design language consists of two layers: taxonomy layer and application design layer.

The taxonomy layer allows a class of entities to be described. An entity is defined as a set of data sources and actuating capabilities, abstracting over devices, whether hardware or software.

Application Design Layer of DiaSpec allows the application logic to be decomposed into context and control operators. Sensors and actuators are the two facets of an entity described in the taxonomy.

C. *Node-RED*

Node-RED open source IBM Emerging Technology software is visual tool for wiring the Internet of things application configurations. It enables the designer to create IoT applications wiring together hardware devices, APIs and online services. Node-RED provides a browser based flow editor that supports wiring the flows using the wide range of sensory nodes in the palette. Created flows can then be deployed and executed in runtime with a single mouse click.

The paper has been prepared and written on the results achieved within the project that was financially supported by the Federal ministry for education and science, Federation of Bosnia Herzegovina.

Runtime engine is built on Node.js, making use of its event-driven, non-blocking model. Since this runtime module is of small footprint, it can run on low-cost hardware such as Arduino or Raspberry Pi as well as in cloud [5].

D. OpenHAB

OpenHAB represents general-purpose framework for smart home gateways and is fully based on the Eclipse SmartHome project, which allows building smart home solutions as the most common application area of IoT. The framework consists of a set of Java OSGi bundles that can be deployed on an OSGi runtime and which defines OSGi services as extension points, acting as middleware on the sever side of WSN (wireless sensory) network [6].

The project focuses on services and APIs for the following topics [7]:

- *Data Handling*: This includes a basic but extensible type system for smart home data and commands that provides a common ground for an abstracted data and device access, as well as event mechanisms to send this information around. Integration with other systems is done through so called bindings, which are a special type of extension.
- *Declarative User Interfaces*: A framework with extensions for describing user interface content in a declarative way. This includes widgets, icons, charts etc.
- *Rule Engines*: A flexible rule engine that allows changing rules during runtime and which defines extension types that allow breaking down rules into smaller pieces like triggers, actions, logic modules and templates.
- *Persistence Management*: Infrastructure that allows automatic data processing based on a simple and unified configuration persistence services are pluggable extensions, which can be anything from a log writer to an IoT cloud service.

Beside the runtime framework and implementation, Eclipse SmartHome has also its text Editors for editing configuration models and rules.

III. STRUCTURE AND FUNCTIONALITY OF DSL-4-IOT LANGUAGE

The vast versatility of the types of sensors and actuators as well as heterogeneity of communication media and protocols that are immanent when the standards are lagging behind, are facing design engineer within the domains of Internet of things applications. Understandably, all this is posing burden on designer to acquire knowledge and learn many specifics that are far beyond the functionality and application requirements that he/she wants to build into the system.

Therefore, there are many efforts going on among researchers and developers to develop high-level domain specific language that will abstract many of these specifics and peculiarities into building blocks and library modules. Then, he/she is designing its application, specifying the devices and hardware needed for designed system acquisition and deployment on the application site [8].

In this research project, we have opted for the development of one visual domain specific language that shall empower IoT application designer with a visual high level language and based on it, a design Editor named DSL-4-IoT. The Editor shall enable application designer to configure the system structure, select devices, sensors and actuators either from built-in library modules available in Designer itself, or enter the ones that he/she selects, parametrizing the metadata available from manufacturer's design literature. These device modules can then be saved and included in built-in library modules for future use, although for these later actions, more specific knowledge is required, and shall be accomplished by someone that shall be named DSL-4-IoT developer.

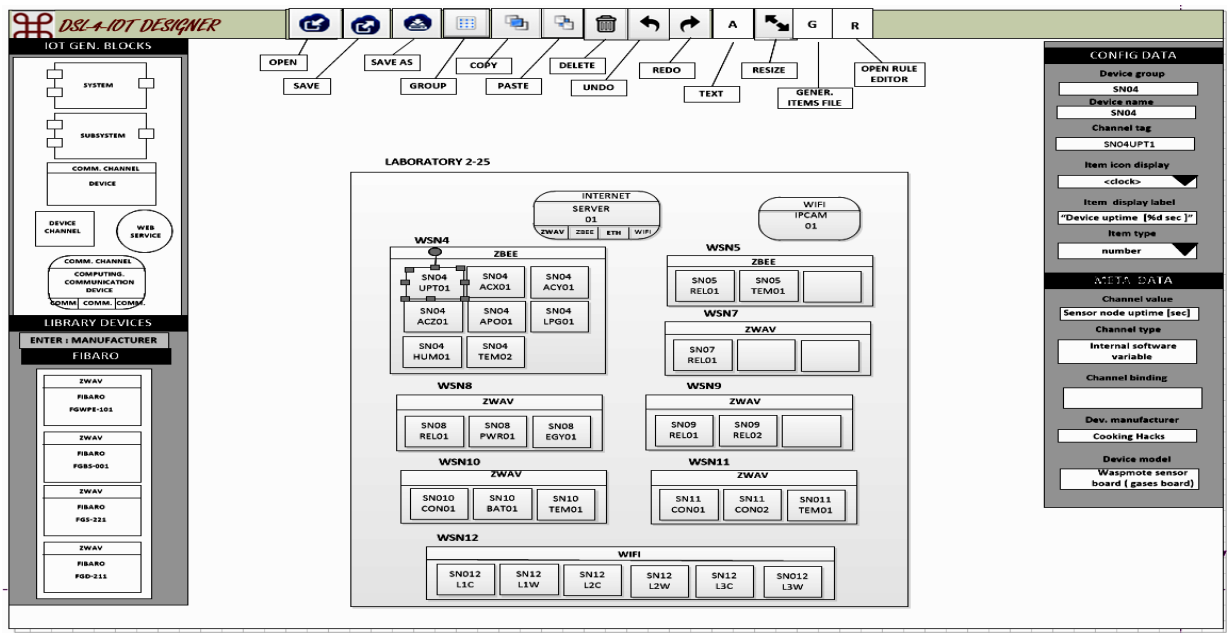

Fig.1 The layout of DSL-4-IoT Editor

The development of the DSL-4-IoT language is based on the class of visual domain-specific modeling languages (VDSMLs) that are using formal presentations and abstract syntax in a metamodel. The front end of the Editor has been developed in JavaScript. The layout of DSL-4-IoT Editor-Designer is shown on Fig. 1.

In the command bar, the Editor is providing the necessary tools for opening and saving the applications configuration, together with additional commands for manipulation of individual or groups of block structures (group, copy, paste, delete, undo, redo, resize, etc.).

Labeling and commenting of the block structures on the hierarchical level of generic blocks (system, subsystem, devices, device channels, etc.) is enabled using the "Text" button.

Two buttons further right, are intended for generation of textual configuration files with extension "items", and "sitemap" that are used directly in the runtime execution.

The last button is used to call an external program named "Rule editor", that enables the Designer to configure any combinatorial, sequential or temporal relationships between "items" created in previous step of entering configuration program. These „items" are the logical representation of physical channels of the configured devices (sensor inputs or actuator or command outputs), or variables associated with messages obtained via web services, SMS messages or emails. In broader terms, items are readable or write-able objects, in order to interact with them. Items can be bound to bindings, i.e. for reading the value or status from device channel input or for updating output channel going to some actuator device. More on this can be found in documentation on OpenHAB project [7].

Bellow the higher abstract layer of DSL-4-IoT domain specific language, additional glue code that is running in Openhab runtime is executing:

- Interfacing software components and middleware

- Interfacing with disparate hardware and software components.

- Mapping code for device and software components

This glue code running in runtime and executing DSL-4-IoT tools developed configuration files, has been selected as Java based OpenHAB 1.x open source project, widely popular in the IoT community.

In order to abstract mentioned heterogeneity of various IoT devices, sensing and actuating physical devices are described as entities in high level manner. These resources are instantiated as many times as necessary with the distinct tag names, to represent all physical and/virtual devices included in the particular project application.

To address scalable operations within the IoT system application logic that connects "items" in interconnected wireless sensory networks of devices and users, hierarchical clustering has to be specified consisting of:

- System
- Subsystem
- Device (autonomous and powered)
- Physical or virtual channel

Use of this hierarchical structure enables: project partitioning at physical level; project partitioning at functional level; defining scope from which software components shall produce or consume data. This multi-stage model driven approach for design of IoT applications supports all stages of the life cycle of these systems. Selected VDSML, model driven approach applied in development of DSL-4-IoT visual design environment, contributes to ongoing search for design tools that shall allow IoT application designers to model their systems at a higher abstraction level, providing them with automatic model transformations to incrementally refine abstract models into more concrete ones.

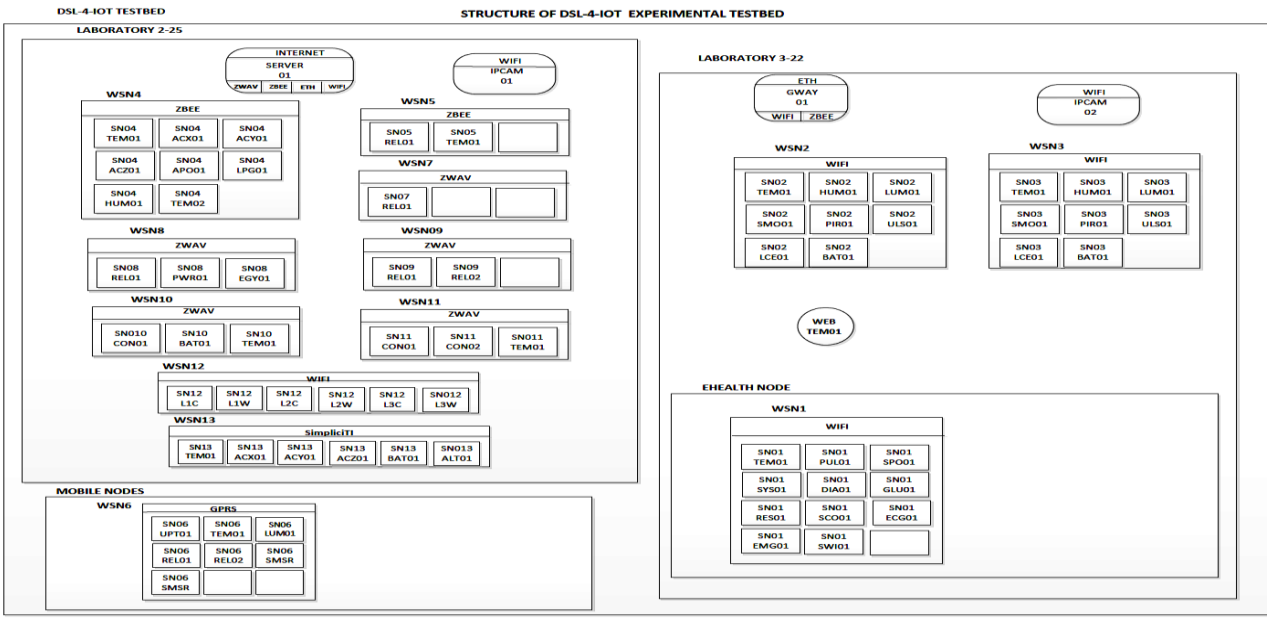

Fig. 2 The structure of experimental testbed generated with DSL-4-IoT Editor

In order to demonstrate the viability and usability of above described DSL-4-IoT model based language and tools, an experimental IoT testbed spanning two domain applications (smart home and remote patient monitoring), has been designed and deployed using the DSL-4-IoT language. The output configuration generated as the result of entering the structure of the experimental testbed is displayed on the Fig. 2.

DSL-4-IoT compiler within Designer is mainly composed of a parser and configuration files generator.

Configuration files generator (items, rules, sitemap) generates formatted text outputs that can be directly downloaded and executed within OpenHAB runtime engine.

Both tools rely on declarative domain-specific language used to graphically represent IoT system topology and "items" embedded in this topology.

Runtime libraries are JavaScript coded based on OpenHAB runtime engine used to execute application with generated configuration files.

DSL-4-IoT for configured IoT system structure, exports the data into one JSON array. This array keeps information about position of all the items within configuration, relationships between items and groups, value of all configured fields associated with items and of data types. JSON configuration array includes OpenHAB specific fields and associated rules. This array is typically huge in size, and is useful as container from which it is possible to restore the state for further editing and setting up of sensory network configuration.

From the configuration stored in JSON array format, it is possible to export data to wider scope of integration platforms for home automation, one of them being OpenHAB. OpenHAB runtime engine requires five kinds of configuration files: Items, Rules, Persistence, Scripts and Sitemaps. These text files differ by file extension and internal structure.

At the time of writing this paper, DSL-4-IoT Designer with visual Editor, parser and configuration files generator for two configuration files: items and sitemaps has been completed and tested, while development of visual Editor for rules configuration is underway.

Items in OpenHAB 1.x runtime can be defined using configuration files located in subfolder configurations/items, relative to OpenHAB installation directory. Item definition files have the file extension *.items. Groups are also defined in the *.items file.

A special conversion program scans the JSON document generated from the visual DSL-4-IoT configuration Editor. Each cell in this document, which is of type iot.device, becomes item, and cells which are recognized as embedding cells, became a group. The items are stored inside groups.

Sitemaps are used to create elements of a user interface. They are stored in OpenHAB runtime directory configurations/sitemaps. Each file has *.sitemap extension. The structure is similar to above described items configuration file. The very first line has an element called Sitemap, and it is followed in next lines by some of elements: Colorpicker, Chart, Frame, Group, Image, List, Selection, Setpoint, Slider, Switch, Text, Video, and Webview [7]. All of them, except Frame, describe user interface elements in single line.

The file which defines rules for IoT application configuration has extension *.rules. A rule file can contain multiple rules, and consists of three sections:

Imports, Variable Declarations and Rules.

The Imports section contains import statement, used to make the imported types available without need of fully qualified name for them. The Variable declaration section declares global variables (with or without initial values), accessible to all rules in this file. The Rules section contains a list of rules. After configuration files are generated, they can be transferred to the respective OpenHAB runtime directory manually or automatically downloaded, using simple web service. Manual transfers are carried out using Blob interface and download links [9].

Configuration files generator within DSL-4-IoT Designer creates these files in broader a more generic way, hence these configuration files are not confined only to OpenHAB runtime for deployment and execution. Since for development and coding of DSL-4-IoT Designer functionality, the interpreted language of JavaScript is used, it is possible to simply replace corresponding JavaScript file to generate and export configuration files for other IoT integration platforms and their runtime engines.

IV. EXPERIMENTAL TESTBED FOR PROOF OF DEVELOPED IDE

For proof of concept and versatility of developed visual domain specific language and development environment based on DSL-4-IoT Designer, the experimental testbed has been built and implemented composed of the variety of wireless static and mobile sensory nodes with multiplicity of sensors, actuators, communication channels and protocols from various manufacturers. From the point of view of IoT application domains, two most frequent domains were chosen to be presented, by selection of the types of sensors and their functionality: smart home and remote patient monitoring.

Sensors and actuators used in build-up of experimental testbed have been either autonomous with integral communication transceiver channel, or hooked up to large number of wireless devices (nodes), based on different communication technologies (Wi-Fi, ZigBee, Z-wave, Bluetooth, NFC) and protocols (HTTP, TCP/IP, UDP, MQTT, Modbus, SimpliciTI, serial protocols, etc.).

The topology of experimental testbed wireless sensor network is depicted on the following Fig. 3:

Experimental testbed is physically divided in several domains:

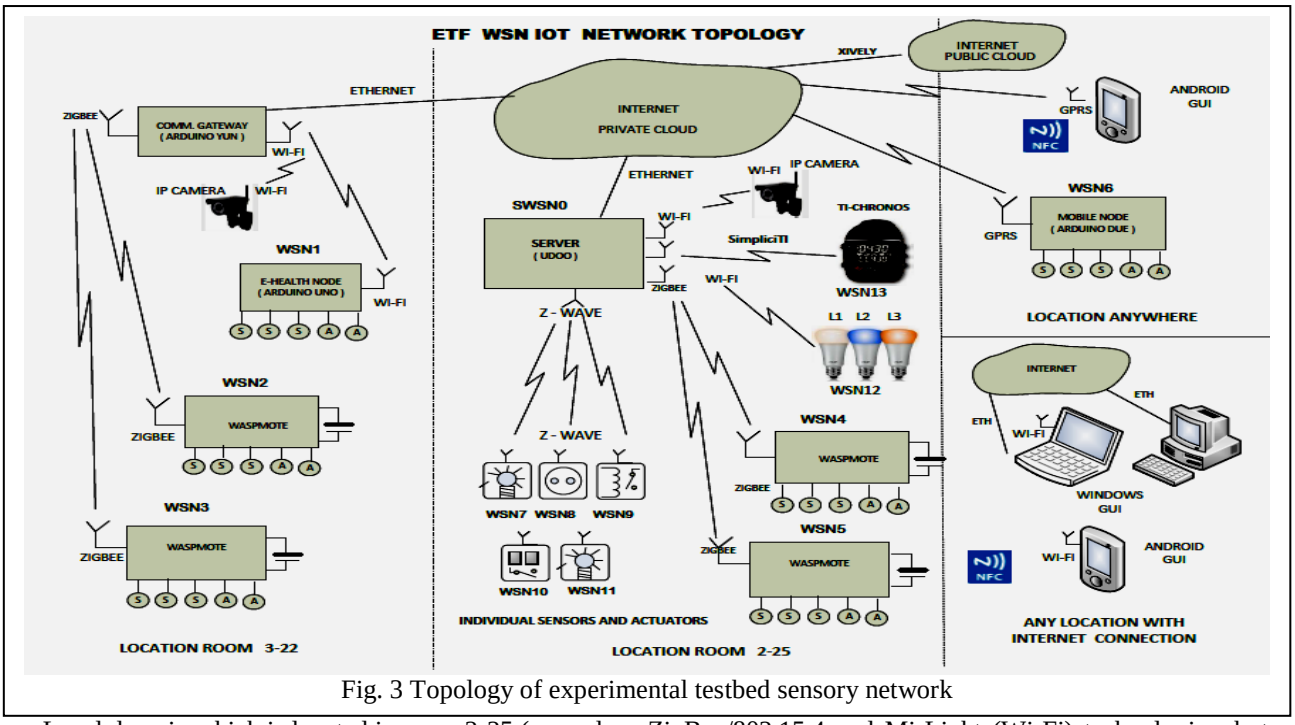

Fig. 3 Topology of experimental testbed sensory network

- Local domain which is located in room 2-25 (second floor within faculty building),

- Remote domain which is located in room 3-22 (third floor within faculty building)

- Mobile domain that can be located anywhere within the reach of mobile network signal.

Local domain (room 2-25) consists of several wireless sensor networks implemented using a variety of wireless accessing technologies (e.g. Wi-Fi, ZigBee, Z-Wave, etc.) and core server (SWSN0).

Z-Wave sensor network consists of a light dimmer (WSN7), window sensors (WSN10), relays (WSN9), outlet with electrical consumption metering (WSN8), and multi-purpose binary sensor (WSN11) connected to the door (open-close) and knock-knock sensor. ZigBee/ 802.15.4 wireless sensor network is implemented using Libelium Waspmote nodes (WSN4 & WSN5) [10]. On the input of the Waspmote nodes are connected various analogue and digital sensors from smart home variety. The sensors perform sensing and measurement of a large number of environmental parameters (e.g. temperature, humidity, luminosity, presence, position, proximity, air pollution with various pollutants, movement, weight, opened, closed, flood, etc.). They are capable, as well, for actuating and controlling functions (switching ON and OFF various electrical devices like lights, fans, heaters, solenoid valves, opening and closing or positioning in any intermittent position blinds, windows, doors, etc.). For control of LED lights including the RGB spectrum and intensity, the Mi-Light sensor network that consists of three RGB light bulbs is used in (WSN12) [11].

Core server (SWSN0) is built on Arduino compatible UDOO module based on embedded computer with Freescale i.MX 6 ARM Cortex-A9 1 GHz quad-core processor and 1 GB of RAM. UDOO server is connected to the communication modules for Z-Wave, ZigBee/802.15.4 and Mi-Light (Wi-Fi) technologies, but also includes the communication modules that make it also a gateway for non-IP devices. UDOO based server executes open source OpenHAB runtime software which is based on the OSGi container. To support the connected communication module protocols, OSGi plug-ins called bindings are used. For Z-Wave and Mi-Light there were already available bindings which have to be included as add-ons. However, for ZigBee/802.15.4 there was no binding readily available, so the support was provided within the Project implementation, developing a dedicated Java application that uses OpenHAB REST API on one side (server), and a serial connection to the ZigBee/802.15.4 module on the other side.

To test and experiment with wearable devices as IoT nodes, one Texas Instrument wristwatch model EZ430-Chronos was integrated with the UDOO server using proprietary SimpliciTI protocol over wireless RF link [12]. This wearable wireless sensor node offers the data on temperature, altimeter (absolute pressure), and three-axis accelerometer.

Remote domain, located in room 3-22, consists of ZigBee wireless sensor nodes (WSN2 & WSN3), of the same type as in the room 2-25 (Libelium Waspmote), Libelium e-Health wireless node (WSN1) and communication gateway (implemented on Arduino Yun embedded processor module). E-Health wireless node is based on the Arduino Uno board, e-Health sensor shield and Wi-Fi module [13]. The e-Health sensor shield empowers biometric and medical applications where human patient local and remote monitoring is needed, using 10 different biomedical sensors. They are: pulse (heartbeat rate), oxygen in blood (SPO2), airflow (breathing), body temperature, electrocardiogram (ECG), glucose meter, galvanic skin response (GSR-sweating), blood pressure (sphygmomanometer), patient position (accelerometer) and muscle/electromyography sensor (EMG). To enable connection of wireless nodes from a

remote domain in room 3-22 to the server in the local domain (room 2-25), the communication gateway is used. Communication gateway is implemented using Arduino Yún with Wi-Fi and ZigBee/802.15.4 communication modules [14].

Mobile domain is based on the GPRS mobile node, and Android based mobile phones and tablets. GPRS mobile node is implemented using Arduino Due board and GPRS shield. For communication between GRPS mobile node and server, OpenHAB REST API was used, utilizing my.openHAB cloud service [15].

Local and remote domains are covered by video surveillance serving as visual feedback of the activities performed in these two rooms, implemented with IR Led night vision IP cameras. Video streams from IP cameras are taken in MJPEG format and presented to the user inside openHAB web interface on desktop and laptop computers, or HABDroid application on Android based mobile phones [16].

User interface that provides monitoring as well as full control of all devices is provided as web application in any web browser that has JavaScript runtime engine included, connecting to IP address of the server (SWSN0). This interface can be accessed either on desktop or laptop computer or any smart phone or tablet with Android or Apple iOS Operating system, downloading the utility program.

V. CONCLUSION

The development of IoT application design environment based on the high level visual programming language in form of Editor within the class of visual domain specific modeling languages (VDSML) using formal presentations and abstract syntax, has been presented in this paper. The front end of the Editor is based on JavaScript language.

The runtime execution of IoT application configuration files, generated with this Editor is carried out by OpenHAB runtime engine developed within the framework of "OpenHAB" open source project.

Work in progress is development of visual rule editor based on Google Blockly blocks for building web based Editors [17]. The entered rules structure shall be converted to text file, compatible with *.rules file within OpenHAB runtime engine. Chris Jackson also announces similar work for OpenHAB project [18], and there is specific version for Vesternet smart home applications as Zipato rule creator [19].

Further extension in the development of IDE is planned on adding new IoT devices into DSL-4-IoT library, which is activity done by IoT developer rather than by IoT application designer. This shall remove the burden from IoT application designers to add new devices not available in the library, and together with devices dynamic discovery feature [20], shall fully automate application library extension in future applications.

Basic PHP implementations, opcodes, and internal work

dr. sc. Alen Šimec[1], Davor Lozić[2]
[1] Polytechnic of Zagreb, Informatics, Zagreb, Croatia,
[2] Polytechnic of Zagreb, Informatics, Zagreb, Croatia,
alen@tvz.hr, dlozic@tvz.hr

Abstract - The main purpose of this paper is to investigate how PHP works internally and how variables, arrays, objects, and other types are stored in memory. The paper will cover generated series of operation codes, commonly known as "opcodes", and why advanced PHP programmers should know the basics of PHP "under-the-hood". Additionally, it aims to show how function calls and classes work internally, basic concepts such as "pre-increment or post-increment speed comparison", and minor optimization recommendations.

I. INTRODUCTION

PHP is a server side, scripting languge created mostly for web development. It can be integrated with HTML code or it can be used with templating engines or web frameworks.

PHP source code is processed by an interpreter so having a deeper understanding about internals could be crucial for scripts which are executes by many users. When parsing PHP files, the engine generates a series of operation codes, commonly known as “opcodes” so it’s valuable to understand the meaning of basic opcodes.

PHP is written in the C programming language so it’s a mandatory for a reader to understand pointers, structures, unions and other basic constructs of the C language. As this is advanced topic about PHP, the reader must also have some experience with PHP.

II. VARIABLES

By definition, PHP is a dynamic, loosely typed language that uses copy-on-write and reference counting. Dynamic programming language is a term in computer science that describes a language that allows the definition of a program to be updated while the program is running. An example of loose types is defining a string variable and then multiplying the variable by 2. Now, the variable contains an integer instead of a string.

```
$x = "2"; // string
$x = $x * 2; // int (4)
```

In C, similar behavior exists via **unions**. Unions are values that may store different data in the same memory location. The current type of a union must be stored separately.

```
union car {
  char name[20];
  int price;
};
```

When created, the size of the variable will always be 20 bytes (since 1 character in this example is 1 byte long). The value of the variable in PHP is stored in a union like this:

```
typedef union _zvalue_value {
        long lval;
        double dval;
        struct {
                char *val;
                int len;
        } str;
        HashTable *ht;
        zend_object_value obj;
} zvalue_value;
```

Now, this gives a lot of options to PHP. In this union, the value could be stored as a long, double, string, hash table, or object. Notice that strings are represented as a structure where the actual value and the length of the string are stored. Hash tables are used for many things, not only for implementation of PHP arrays but for storing object properties and methods. “zend_object_value” stores an object store handle and handlers. This union

only saves the value of the variable; i.e. this union is actually a part of something bigger. Here is the full implementation of a PHP variable in C:

```
typedef struct _zval_struct {
    zvalue_value value;
    zend_uint refcount__gc;
    zend_uchar type;
    zend_uchar is_ref__gc;
} zval;
```

The code above shows the actual internal presentation of the variable. It contains the following: the value inside a union; the number of current references to that variable; the current type of the variable; and a reference flag. As mentioned previously, PHP uses reference counting, meaning that the engine itself is responsible for references between variables.

III. REFERENCES AND COPY-ON-WRITE

To avoid copying values, PHP utilizes reference counting. When one variable is assigned to another, it always just references the first until the values are changed. For example, a variable is declared and the value 5 is assigned to it. This variable's reference count will be equal to 1.

```
$x = 5;
// zval_1(value=5, ref=1)
```

Now, when two new variables are created with this variable as the value, the struct is not copied but instead the reference count will increment.

```
$y = $z = $x;
// zval_1(value=5, ref=3)
```

When the first variable changes its value, the PHP engine is smart enough to copy just the first variable instead of coping the last two variables.

```
$x = 3;
// zval_2(value=3, ref=1)
// zval_1(value=5, ref=2)
```

The PHP engine simply decremented reference count in zval_1 [($y, $z) => 2] and created a new zval variable for $x with reference count 1.

In the next scenario, variables will be destroyed with the *unset* function. The variable is destroyed when the reference count is equal to 0.

```
unset($y);
// zval_1(value=5, ref=1)
unset($z)
// zval_1(value=5, ref=0)
```

This is a simple example of how the variables are implemented internally. As the examples show, the PHP engine is efficient when it comes to saving memory and variable management.

IV. ARRAYS

Arrays in PHP are stored as hash tables. The C implementation of a hash table looks like this:

```
typedef struct _hashtable {
    uint nTableSize;
    uint nTableMask;
    uint nNumOfElements;
    ulong nNextFreeElement;
    Bucket *pInternalPointer;
    Bucket *pListHead;
    Bucket *pListTail;
    Bucket **arBuckets;
    dtor_func_t pDestructor;
    zend_bool persistent;
    unsigned char nApplyCount;
    zend_bool bApplyProtection;
#if ZEND_DEBUG
    int inconsistent;
#endif
} HashTable;
```

A simple explanation of variables inside a hash table:

- nTableSize specifies the actual size of the C array. Its size is always a power of 2. If there are 128 elements, array is 128 elements long. If there are 129 elements, array is 256 elements long;
- nTableMask is the table size minus 1. It is used for shrinking the hash value;
- nNumOfElements contains the number of elements inside the array;
- nNextFreeElement is the next free integer key for when the next value is added;
- pInternalPointer is a value which stores the current position in the array for iteration;
- pListHead stores the start of the array;
- pListTail stores the end of the array;
- arBuckets is defined as an array of bucket pointers and the bucket is a container that stores

information about each element in the array including: its key; where that key map to; and some other internal metadata such as shared hashes;

- pDestructor is a function called when a value is removed from the hash table. The function will reduce the reference count of the zval;
- persistent determines persistence between multiple requests;
- inconsistent is used in debug mode to catch incorrect uses of hash tables;

To really understand arrays, the bucket type must be explored. As stated above, bucket is a container that stores information about each element:

```
typedef struct bucket {
    ulong h;
    uint nKeyLength;
    void *pData;
    void *pDataPtr;
    struct bucket *pListNext;
    struct bucket *pListLast;
    struct bucket *pNext;
    struct bucket *pLast;
    const char *arKey;
} Bucket;
```

A simple explanation of variables inside a bucket:

- h stores the value of the hash without the mask. It's used when engine does a full search for key;
- nKeyLength is used to save the length of string keys but not used when keys are integers;
- pData and pDataPtr are used to store the actual value (zval);
- pListNext and pListLast specify the order of the array elements;
- arKey is an array that stores a pointer to the first bucket;

The main problem with this array implementation is there is a possibility for collisions on the hash of the key. In that case, buckets will be stored as a linked list, so keys in PHP arrays are actually pointers to a list of buckets [3]. The major drawback with linked list is search efficiency. If the engine sees more buckets in a linked list, it will start a full text search for the key inside that linked list. When classifying this algorithm, instead of O(1) for searching keys in a C array, there is O(n) for searching keys inside a linked list. In terms of security, this can be an exploit. If an attacker only inserts keys which collide, then the whole array would be one big linked list which is much slower and can exhaust CPU power. Developers should check that the *max_input_vars* inside *php.ini* is set to some reasonable number that will limit the number of allowed keys in one PHP array.

V. OPCODES

When parsing PHP files, the engine generates opcodes. These are not the same as bytecode in Java or CIL in .NET but instead they are a stepping stone between source code and execution. Here is a simple script:

```
<?php
$i = 0;
$j = 2;
$k = $i + $j;
```

Now, with the *vld* extension, it's possible to look at the generated opcodes. Instead of variables (*$i*, *$j*, *$k*) compiled variables are used (*!0*, *!1*, *!2*). Variables starting with tilde (~) are temporary variables. It's really simple to get opcodes in Linux with the *vld* extension inside PHP:

```
php -d vld.active=1 script.php
ASSIGN      !0, 0
ASSIGN      !1, 2
ADD     ~2  !0, !1
ASSIGN      !2, ~2
RETURN      1
```

As stated above, opcodes show compiled variables:

TABLE 1 – Variable in source and compiled variable

Variable in source	Compiled variable
$i	!0
$j	!1
$k	!2

The first two lines assign values to variables !0 and !1 ($i and $j). Then, a temporary variable (~2) stores the sum of the first two variables. Next, the value from the temporary variable (~2) is copied to the !2 variable ($k). Finally, as in many other languages, there is a return statement.

VI. CONCLUSION

Knowing about PHP internals can provide many advantages. Firstly, a person who knows about internals could program more securely in their applications, as shown in the array implementations. Secondly, they could create faster scripts, especially with the knowledge of opcodes. Furthermore, if a programmer has a deep understanding of PHP internals, they could more easily give back to the community with patches and improvements to the language that are appreciated and respected in many circles. Finally, it's a really great feeling having your scripts and PHP under control and feeling that your scripts are secure, fast and reliable.

sredojev.branislav@gmail.com

Abstract - This paper describes the WebRTC technology and implementation of WebRTC client, server and signaling. Main parts of the WebRTC API are described and explained. Signaling methods and protocols are not specified by the WebRTC standards, therefore in this study we design and implement a novel signaling mechanism. The corresponding message sequence chart of the WebRTC communication behavior describes a communication flow between peers and the server. The server application is implemented as a WebSocket server. The client application demonstrates the use of the WebRTC API for achieving real-time communication. Benefits and future development of the WebRTC technology are mentioned.

I. INTRODUCTION

WebRTC (Web Real-Time Communication) is a new web technology which allows browser and mobile applications with functionalities such as audio/video calling, chat, P2P (peer-to-peer) file sharing and all that without any additional third-party software or plugins.

It was published as an open source technology by Google in May 2011 and includes fundamental components for real-time communication on the web. With those components, that can be accessed via the JavaScript API (Application Programming Interface), developers have opportunity to create impressive web applications. Google, Mozilla and Opera support WebRTC and they will participate in the further development of this technology. At the moment, there are still platforms and browsers that either partially or do not support WebRTC [1]. Major components of the WebRTC API are:

- MediaStream - allows a web browser to access the camera and microphone;
- RTCPeerConnection - sets up audio or video calls;
- RTCDataChannel - allows browsers to send data through peer-to-peer connections.

It is important to know that WebRTC is not just a single API, but it is a collection of APIs and protocols defined by the various working groups such as W3C (World Wide Web Consortium) and IETF (Internet Engineering Task Force). Support for each of them develops in different browsers and operating systems [2].

A. *MediaStream*

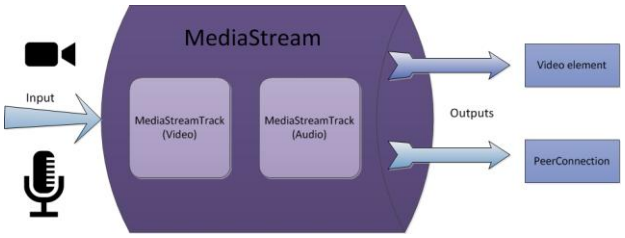

Figure 1. MediaStream

The MediaStream API has a control over the synchronized streams of media [3]. Each MediaStream has an input and output. The input source might be a physical device, such as the camera or microphone. The output might be forwarded to one or more destinations, such as video element or PeerConnection (Figure 1.).

The two main components in the MediaStream API are the MediaStream interface and MediaStreamTrack. The MediaStream interface represents a stream of media content. That media stream can have several parts. Those parts are called tracks and they have explicit type, such as audio and video. MediaStreamTrack represents a type of media that have been obtained from the input source. For example, if it is a microphone, we will get MediaStreamTrack (Audio).

B. *RTCPeerConnection*

The RTCPeerConnection API allows two peers to communicate directly, browser to browser. The WebRTC architecture diagram (Figure 2.) represents a very simple hierarchy. WebRTC provides a framework to make real-time communications possible.

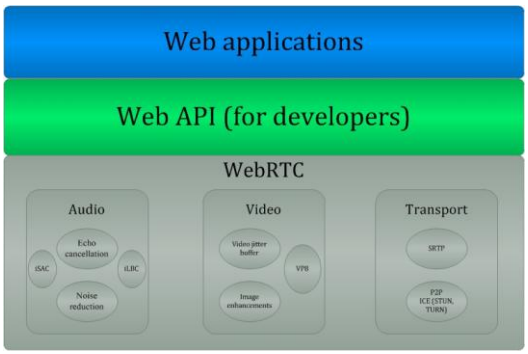

Figure 2. WebRTC architecture

The WebRTC architecture has three basic sections. The first section, WebRTC, consists of an audio, video and transport mechanism.

The main task of the audio mechanism is to handle echo cancellation and noise reduction. Echo cancellation is a method that improves the sound quality, removing the resulting echo or preventing its occurrence. Noise reduction is the process of removing noise from the signal. The audio mechanism contains iSAC and iLBC codecs. iSAC codec represents a wideband audio codec developed by Global IP Solutions. This codec is suitable for audio streams and in June 2011 became a part of the WebRTC technology. Global IP Solutions is also the creator of the iLBC codec. This narrowband audio codec is suitable for voice communication over IP.

The video mechanism is responsible for image enhancement and video jitter buffer. Image enhancement is the process of improving the quality of digital image by manipulation with a certain software. The video mechanism includes VP8 codec. VP8 codec is a video compression format. It was developed by On2 Technologies in September 2008 and is currently supported by Chrome, Mozilla and Opera.

The transport mechanism is responsible for SRTP (Secure Real-time Transport Protocol), P2P and ICE (Interactive Connectivity Establishment). P2P and ICE with STUN and TURN servers will be explained in the following chapter.

The Web API is on the top of the WebRTC section which shields developers from complexities and facilitates their work. The third and last section are Web applications, such as audio, video and chat applications with possibility of file sharing.

C. *RTCDataChannel*

The RTCDataChannel API represents a bi-directional data channel between two peers and enables exchange of arbitrary data between them. Each RTCDataChannel can be configured to provide:

- reliable or unreliable delivery of messages;
- in-order or out-of-order delivery of messages.

The reliable and in-order delivery is equivalent to TCP (Transmission Control Protocol). On the other hand, the unreliable and out-of-order delivery is equivalent to UDP (User Datagram Protocol). There are many potential use cases for the API, including:

- gaming;
- remote desktop applications;
- real-time text chat;
- file transfer.

D. *ICE*

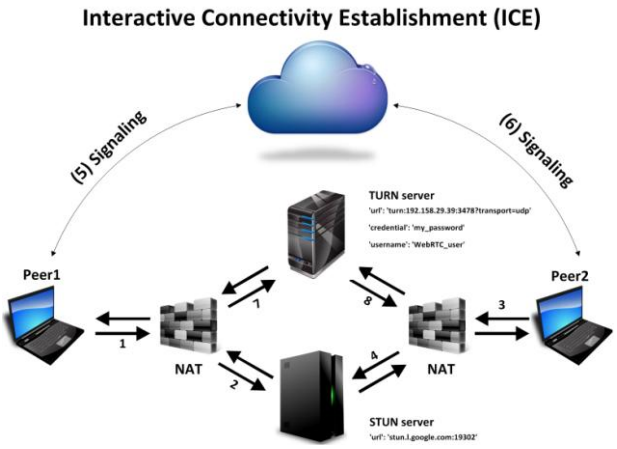

Figure 3. Interactive Connectivity Establishment (ICE)

The Internet addressing system is still using IPv4 (Internet Protocol version 4) and because of that, most of our devices are behind one or more layers of NAT (Network Address Translation). NAT is a mechanism of mapping private addresses to the public address changing address information within IP packets while it is in transit through the device for routing. NAT can be implemented with a home Wi-Fi router.

WebRTC technology developers can use ICE which will simplify complexity of the Internet addressing system. Developers need to pass the ICE server URLs to the peer connection. ICE will try to find the best path to connect two peers (Figure 3.). ICE is using two types of servers, STUN (Session Traversal Utilities for NAT) and TURN (Traversal Using Relays around NAT). ICE is using a STUN server to find out what external address is assigned to a specific peer. If that fails, the traffic is routed via a TURN server. Every TURN server supports STUN, a TURN server is a STUN server with added relaying functionality built in [4].

An analysis by webrtcstats.com in 2014, which lasted 6 months covering over 6 million minutes of one-to-one video calls, shows that 92% of WebRTC video calls are P2P without a relay and just 8% are over a TURN server (Figure 4.) [5].

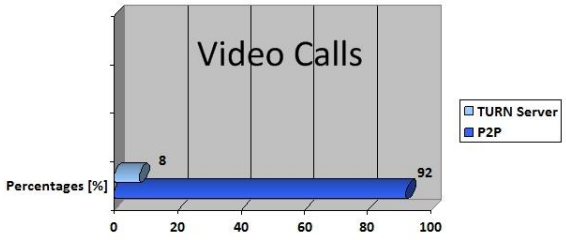

Figure 4. Video calls statistics

II. DESCRIPTION OF REALIZATION

In this section, we describe our implementation of a WebRTC client, server and newly-proposed signaling solution between them. Signaling is a process of exchanging system control information like session

control messages, media metadata, error messages and network data - information important to set up a call. This signaling process needs a two-way (bi-directional) messaging and therefore we have chosen to implement signaling using WebSocket. The server application is implemented as a WebSocket server. The client application demonstrates the use of the WebRTC API for achieving real-time communication.

A. Signaling

Signaling methods are not specified by WebRTC in order to avoid redundancy and to maximize compatibility with established technologies [6].

The signaling process corresponds to protocols such as SIP (Session Initiation Protocol), XMPP (Extensible Messaging and Presence Protocol), XHR (Xml Http Request), and SIP over WebSocket. In this study, the signaling implementation uses the WebSocket mechanism [7]. WebSocket is a relatively new addition to browsers, and it was standardized in 2011. The most important thing about WebSocket is that it opens a session from a peer to the server, leaving it open until the session is closed. Messages can be textual or binary. The message sequence chart of the WebRTC communication describes communication flow between the peers and server. The diagram is depicted in Figure 6.

In our signaling solution we made four types of the control messages: "initialize", "initiator", "got user media" and "peerChannel". Those control messages are textual and they are used to set up flags for certain mechanisms. At start, Peer1 will send "initialize" to the server, because it needs to find out whether it is the session initiator. If so, it will configure the user media after getting the control message "got user media" from the server. Now Peer1 is in a waiting phase until Peer2 appears. Upon its activation, Peer2 sends the equivalent signaling message, and when it finds out that it isn't the initiator, it will first get "peerChannel" and then "got user media". After that, both sides can start establishing a peer-to-peer connection.

The offer and answer messages are transmitted in the SDP (Session Description Protocol) format [8]. SDP plays a main role in the setup of WebRTC sessions. SDP is the protocol that has been chosen by IETF and W3C to exchange media information between peers in WebRTC. SDP carries information about media type, format, codecs, and all associated properties that will be used in the media session. The diagram shows that Peer1 will send the SDP offer and ICE candidates to the server and the server will pass that to Peer2. Peer2 will send the SDP answer and ICE candidates to the server and the server will pass that to Peer1.

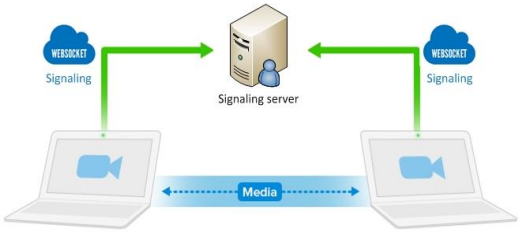

Figure 5. Signaling process

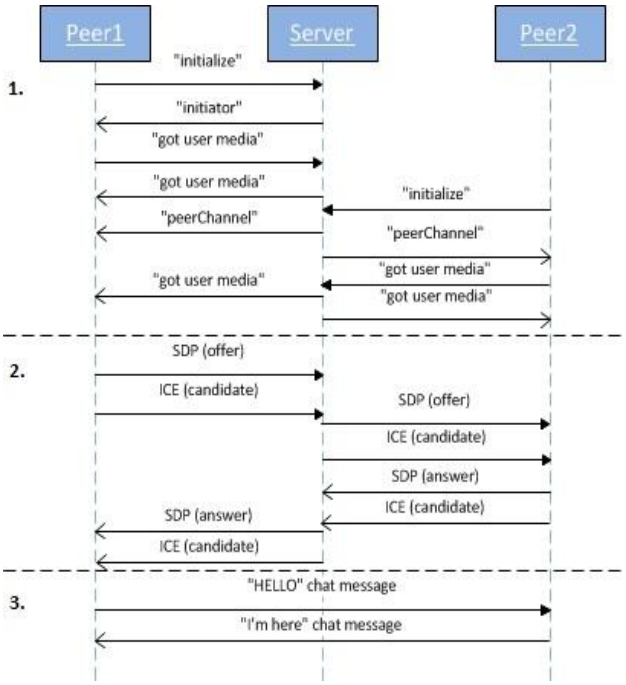

Figure 6. WebRTC message sequence chart

After this, the peer-to-peer connection is established. In addition, we have implemented a real-time text chat and now the peers can directly exchange messages without the server presence.

All signaling SDP and control messages, in our WebRTC application are transmitted as JSON (JavaScript Object Notation) objects (Figure 7.). JSON is a syntactic subset of JavaScript and has a great advantage of being natively interpreted by web browsers. JSON enables information exchange, as well as JSON objects generation and parsing.

In summary, there are three phases in Figure 6. The first phase – the peers are exchanging the control messages with the server, about the initiator, peer channel and user media. The second phase – creation of peer connection based on the SDP exchange. The third phase – the peer-to-peer connection is created and the peers can now exchange messages directly.

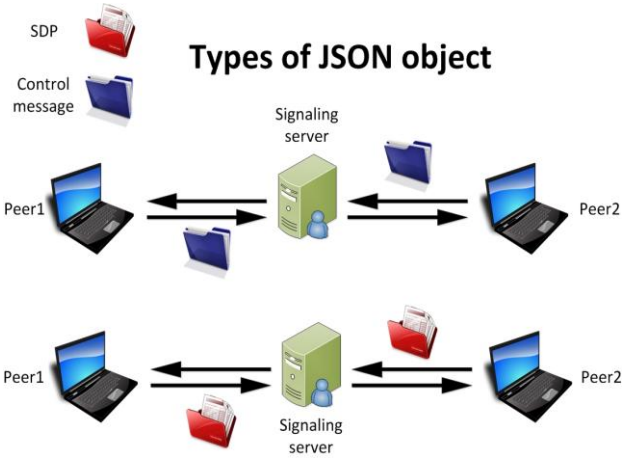

Figure 7. Types of JSON object

B. *Server application*

The server application is implemented as a WebSocket server written in Node and it can be used by any client or a server application. Node.js is an open source, cross-platform runtime environment for the server-side and networking applications. Node.js applications are written in JavaScript. It provides an event-driven architecture and a non-blocking I/O API that optimizes an application's throughput and scalability.

Our WebSocket server is using the WebSocket library. It is running on a localhost at port 2222 and it is available to anyone within the enterprise. The server implements the accepting, processing and forwarding message mechanism.

The WebSocket server is dealing with four types of control messages ("initialize", "initiator", "got user media" and "peerChannel"), two types of media information messages (SDP offer and SDP answer) and one type of network information messages (ICE candidate). Also it manages the number of clients, deciding whether a client is the initiator or should it be removed when the session is over.

C. *Client application*

The client application is implemented using the WebRTC API. The main task is to establish a peer-to-peer connection. Before a peer-to-peer connection gets established, the exchange of local and remote descriptions is performed (the audio and video media information).

In the following we will describe how the signaling offer and answer are exchange using the SDP. First, Peer1 runs the RTCPeerConnection createOffer() method. After that, it sets the local description using the setLocalDescription() method and then sends this session description to Peer2 via the signaling server. Then, Peer2 sets the description that Peer1 sent as a remote description using the setRemoteDescription() method. Peer2 runs the RTCPeerConnection createAnswer() method. In the createAnswer(), it sets the local description and sends it to Peer1. When Peer1 gets the Peer2 session description, it sets that as the remote description with the setRemoteDescription() method.

Figure 9. represents one snap shot of our application screen. Also there is the chat application extension, so peers can send text messages. For example, once installed within an enterprise network, our server (with URL http://localhost:2222/) will enable WebRTC peer-to-peer communication sessions.

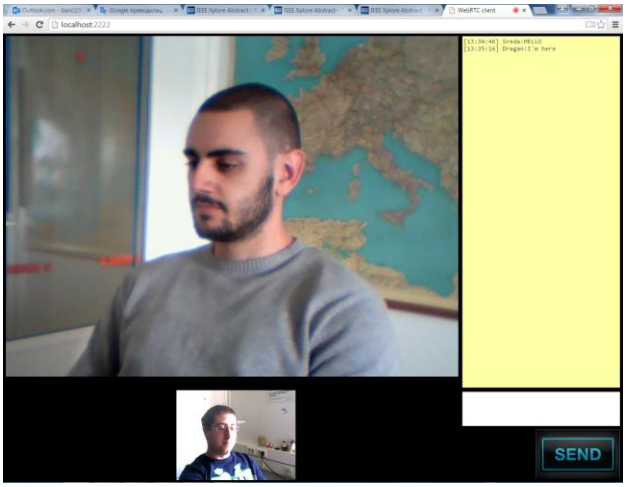

Figure 9. Our application

III. CONLUSION

WebRTC is a powerful technology that benefits all areas of communication accessibility and feature rich tool. This technology has a potential to improve enterprise communications. It can provide a lot of benefits for enterprises. WebRTC technology reduces the costs of using VPN (Virtual Private Network) to connect remote branches and real-time communication is supported without the need for additional third-party software or plugins. Secure communication with employees in within an enterprise and its remote branches is enabled by state of the art encryption standards.

In the future we will develop an additional file sharing option and we will use encryption for both the media and signaling.

ACKNOWLEDGMENT

Methods for Geotargeting Redirection in Corporate Wide Area Networks

Dubravko Miljković
Hrvatska elektroprivreda, Zagreb, Croatia
dubravko miljkovic@hep.hr

Abstract - In business organizations, particularly large ones, it is sometimes necessary to manage web users according to their geographic location. Final destination can be either business related web site or web application server. Such redirection can be accomplished in numerous ways. The choice depends on a goal one want to achieve: distribution of user load to optimal site, achieving high availability or both. Several interesting methods suitable for geographically dispersed clusters of web (and application) servers are presented and analyzed. This includes client side scripts, server side scripts, load balancers, multiple DNS records as well as combinations of these techniques. Reviewed methods are compared and their benefits and shortcomings are discussed.

I. INTRODUCTION

A corporate Wide Area Network (WAN) connects geographically dispersed corporate users across metropolitan, regional, national or international boundaries. It links Local Area Networks (LAN) in multiple locations using private or leased lines. Such network enables collaboration from all regional centers and branch offices. Geotargeting is a technique that determines the geographic location of the client and provides content to the user based on that location. Such content may be targeted advertisements, automatic language selection, content delivery based on user region, regulatory compliance, load balancing and resource allocation between available hosts and network resources, [1,2]. Geographic location of user is most often done using the Internet Protocol (IP) addresses associated with the user's Personal Computer (PC), although other means for accomplishing task exist (e.g. ping delay and traceroute), and some advanced [1-4]. In the corporate network there is a known network topology and full control of the allocated address space. Editing and maintaining of corporate Domain Name System (DNS) is also easy to accomplish on a DNS in corporate ownership. Simultaneous knowledge of IP addresses, locations of PCs and flexibility of maintaining own DNS servers makes geotargeting redirection within the corporate WAN much easier to achieve than geotargeting of general Internet users.

II. USER ADDRESS SPACE

When a corporate user accesses a corporate web page, request contains the IP address of his computer. If a corporate server is accessed from the user located outside the corporation, request will contain the IP address of the proxy server instead and this makes it much more difficult to properly locate such user. However, access to most corporate information services are restricted to users coming from within the corporate WAN. For general users coming from the outside untrusted network (usually the Internet), dedicated web servers are provided located in the demilitarized zone (DMZ). In case of corporate users connecting to the corporate network using the Virtual Private Network (VPN) similar problem appears, however this generally represents a very small share of total number of users. The IP address of these users doesn't correspond to their geographic location. Such users may connect to a particular web server directly, entering the web address of appropriate web server and bypassing redirection mechanisms. Usually a defined range(s) of user IP addresses are allocated to network switches within common corporate locations. In following example four corporate regional centers of Croatian Electricity Company (HEP) are illustrated in Fig. 1 with the network transmission backbone shown in Fig. 2. Each region (represented by the regional center) has defined its own address space as show in Table I.

Figure 1 Four corporate regional centers of HEP (Croatian Electricity Company)

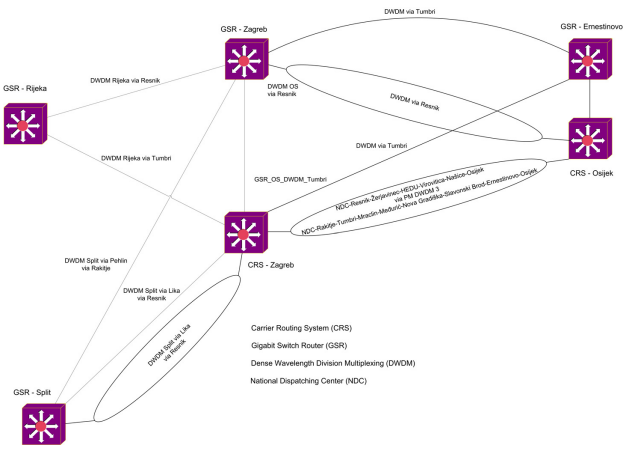

Figure 2 Network transmission backbone

TABLE I EXAMPLE OF CORPORATE ADDRESS SPACE (HEP)

Regions represented by regional center	IP address range
Osijek	10.0.0.0 – 10.63.255.255
Rijeka	10.64.0.0 – 10.127.255.255
Split	10.128.0.0 – 10.191.255.255
Zagreb	10.192.0.0 – 10.255.255.255

Address space shown in Table I provides a clear division of addresses across different geographic regions. Sometimes this division is not straightforward because instead of a single address range for each region, there may be two or more address ranges, e.g. one range including new IP addresses and one range for old addresses, e.g. starting in form of 22x.x.x.x. If this is the case simple DNS based geotargeting method must be augmented by some other technique. Exception must also be provided for users accessing corporate network using VPN which has its own address pool containing group of IP addresses, often from one region.

For most corporate uses there is no need to know the exact geographical location of each user, but only the user membership to a particular geographic region represented by one of corporate regional centers. This is enough in almost all uses. Address space is further divided and can provide necessary granularity as is illustrated in Fig. 3. The regional level that suffices for most uses is depicted by elliptic curve.

Sometimes users of business web applications in premises located near the border of two regions prefer to connect to the web application server in another region. In such rare cases when IP addresses from Table I don't provide enough information for separation each regional address space can be further divided in smaller subranges that correspond to subregions (consisting of cities and their surroundings) as illustrated in Table II. Similar subranges exist in all remaining regions. This additional information can be used for defining necessary exceptions. It is rarely needed to go beyond this level.

TABLE II ADDRESS SPACE OF ZAGREB REGION

Geographic subregion (city and surroundings)	IP address range
Zagreb	10.10.x.x - 10.10.255.255
Zabok	10.12.x.x - 10.12.255.255
Varaždin	10.13.x.x - 10.13 255.255
Čakovec	10.14.x.x - 10.14 255.255
Koprivnica	10.15.x.x - 10.15.255.255
Virovitica	10.16.x.x - 10.16.255.255
Bjelovar	10.17.x.x - 10.17 255.255
Križ	10.18.x.x - 10.18.255.255
Karlovac	10.19.x.x - 10.19.255.255
Sisak	10.20.x.x - 10.20.255.255

III. COMMON METHODS FOR GEOTARGETING REDIRECTION

Users can be geographically directed to the suitable web server in several ways. Here are briefly reviewed common methods for geotargeting redirection. In most cases redirection during the same user session must be tied to the same web (or application) server. First two methods use the application level geotargeting that depends on the application code installed as a script on the client side or server side. Last two methods use transport level geotargeting. Needless to say, common content of web (application) servers must be synchronizing among all servers providing the service to the user.

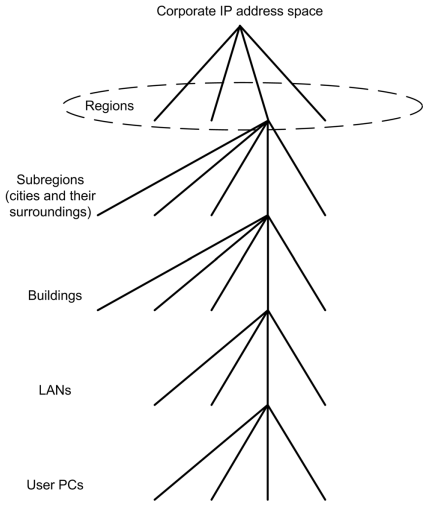

Figure 3 Address subranges down to individual user PCs

A. Client Side Script

In this approach a web server provides a client with the code (e.g. Java or Flash SWF) that contains geotargeting algorithm and a list of web addresses for all regional servers, [5]. Based on the IP address of the client PC the user is directed to the appropriate server, Fig. 4.

```
Fetch list of servers and address ranges
IF User_IP ∈ [Region_1] then redirect to Regional_Server_1
IF User_IP ∈ [Region_2] then redirect to Regional_Server_2
                        …
IF User_IP ∈ [Region_N] then redirect to Regional_Server_N
```

Script can be programmed to access web server data on load and availability for all web (application) servers (destination servers must make these data available) and make a smart choice in case of the overload or unavailability (when a server doesn't respond in a preset time period with the correct answer to a HTTP query).

```
Fetch list of servers and address ranges
IF User_IP ∈ [Region_1] AND IF Server_1 is available then
                        redirect to Regional_Server_1
IF User_IP ∈ [Region_2] AND IF Server_2 is available then
                        redirect to Regional_Server_2
                        …
IF User_IP ∈ [Region_N] AND IF Server_N is available then
                        redirect to Regional_Server_N
ELSE randomly chose one of remaining available servers
```

Disadvantage of the method is its dependence on the code located in a client PC where various browser types exist with the various security settings (that change from time to time via changes in group policy) and may interfere with the necessary (Java) privileges. Also, the end user may intentionally or unintentionally tweak these settings, hence there is a lack of full control in this method. It also poses some security risk because the client

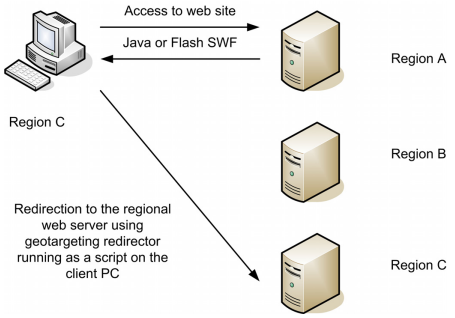

Figure 4 Client side script geotargeting redirection

script knows what lies beneath and infrastructure architecture of web servers (IP addresses of all servers) is revealed. Previous two disadvantages make the client based method an interesting but bad idea that is rarely (if ever) used in a corporate environment.

B. Server Side Script

This approach requires a geotargeting server side script, [6], running on, at least, one web server. User accesses this web server first. The script on the server considering the IP address of the user provides necessary redirection (using HTTP redirect command) to the same or another appropriate web (application) server, Fig. 5.

```
Fetch User_IP address
IF User_IP ∈ [Region_1] then redirect to Regional_Server_1
IF User_IP ∈ [Region_2] then redirect to Regional_Server_2
…
IF User_IP ∈ [Region_N] then redirect to Regional_Server_N
```

When a web browser attempts to open a web address that has been redirected, a page at a new, geotargeted web address is opened instead. Example of HTTP redirect command that redirects to http://destination.com/ immediately is illustrated bellow.

```
<meta http-equiv="refresh" content="0; url=http://destination.com/">
```

Just as in a client side script approach server side script can also have access to data on load and availability and make a smart redirection choice. Server side technique is the preferred approach because it adds negligible server overhead, simultaneously giving server administrators full control of redirection rules (that can be easily edited and changed with the immediate effect).

Common approach is the use of CGI/Perl, PHP or ASP.NET redirector. The IP address of the user is compared to the predefined address ranges for each

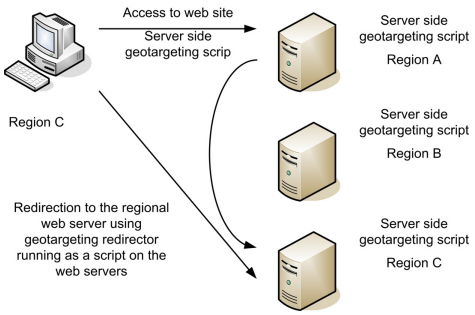

Figure 5 Server side script geotargeting redirection

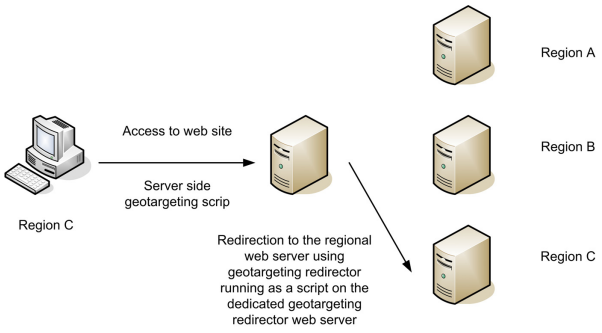

Figure 6 Server side script on a dedicated server

geographical region and the HTTP redirect command is issued toward the target web server (this can be original server too). On a web server one address is dedicated to the redirector script and another to web content. It is possible to dedicate a separate server for server side redirection script, as shown in Fig. 6. Use of additional addresses for redirector script on web servers is avoided.

Following two methods operate at the transport level. It includes TCP/IP level load balancing with the geotargeting redirection and DNS based approach.

C. Load Balancers with Geotargeting Capability

Load balancing is a technique to spread the work between two or more computers in order to get optimal resource utilization, [7-9]. Load balancers are generally hardware/software device combination that balances incoming traffic according to some predefined rules (most often defined by some load metrics). Some load balancers can direct traffic according to the user IP address (different destinations for different IP address ranges corresponding to different geographic locations), Fig. 7. They can handle hundreds of thousands of requests per second and are capable even for the most demanding global operations (generally only small part of their capacity is needed within a corporate WAN).

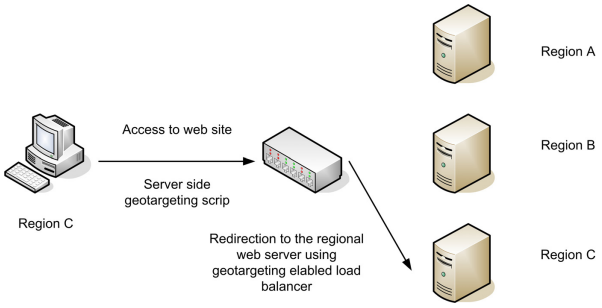

Figure 7 Network load balancer with geotargeting redirection capability

D. DNS Based Method

This method makes use of multiple A-records set for the same web address, [9-12]. It makes use of Subnet Prioritization and client's PC handling of multiple IP addresses defined for the same web address. With enabled Subnet Prioritization, the DNS server can check the IP address of a client requesting name resolution and sort the results it returns to the client according to the proximity of the host address to the querying client IP address. Subnet Prioritization recognizes when a host is

on the same subnet as the client and returns the local host's address first. Because subnets are restricted to particular locations, re-sorted results correspond to the geographically closest server, Fig. 8. By default, the DNS server uses Round Robin to rotate the order of A-records returned in answers to a client queries when multiple A-records exist for the same DNS web address, [7-9,13]. If Round Robin and Subnet Prioritization are disabled on the DNS server, the order in the answer list is based on a static ordering of A-records as they are stored in the DNS server zone file. On the DNS server Subnet Prioritization should be enabled and Round Robin disabled. If both Round Robin and Subnet Prioritization are enabled, Round Robin will supersede. Subnet Prioritization should preferably also be enabled on clients. Use of multiple A-records in the DNS for the geographically dispersed cluster of web application servers located at four corporate regional centers, [14,15], is shown in Table III, [9,14]. Under the web address *hepweb* there are four A-records.

TABLE III MULTIPLE A-RECORDS FOR THE SAME WEB ADDRESS

Web address (same for all users)	Multiple A-records in DNS	
hepweb	10.193.64.116	*heprediros*
	10.65.64.206	*hepredirri*
	10.129.64.116	*hepredirst*
	10.1.200.206	*hepredirzg*

Each A-record corresponds to the web address of one regional cluster server side script redirector (*heprediros*, *hepredirri*, *hepredirst* and *hepredirzg*), but could be server or cluster as well. If Round Robin is enabled, the DNS server will in its answers rotate IP addresses of four A-records in each subsequent query as shown in Table IV.

TABLE IV ROUND ROBIN ROTATION OF MULTIPLE A-RECORDS IN SUBSEQUENT CLIENT QUERIES

Query	DNS answer rotated by round robin
1	10 193 64 116, 10 129 64 116, 10 65 64 206, 10 1 200 206
2	10 129 64 116, 10 65 64 206, 10 1 200 206, 10 193 64 116
3	10 65 64 206, 10 1 200 206, 10 193 64 116, 10 129 64 116
4	10 1 200 206, 10 193 64 116, 10 129 64 11, 10 65 64 206
5	10 193 64 116, 10 129 64 116, 10 65 64 206, 10 1 200 206

However, if Subnet Prioritization is enabled and Round Robin is disabled (not to supersede Subnet Prioritization) DNS answer will depend on the user location. Based on IP proximity metrics it will return the IP address of the closest regional server first, as shown in Table V. In some implementations the IP address of the host closest to a client will appear at the first place while remaining entries will rotate in Round Robin fashion in subsequent answers to DNS queries. DNS based method works well if all regional servers are available and there are not many exceptions in regional IP address ranges.

TABLE V SUBNET PRIORITIZATION AND MULTIPLE A-RECORDS

User region	DNS answer sorted by subnet prioritization (IP metrics)
Osijek	10 193 64 116, 10 129 64 116, 10 65 64 206, 10 1 200 206
Rijeka	10 65 64 206, 10 1 200 206, 10 193 64 116, 10 129 64 116
Split	10 129 64 116, 10 193 64 116, 10 1 200 206, 10 65 64 206
Zagreb	10 1 200 206, 10 65 64 206, 10 129 64 116, 10 193 64 116

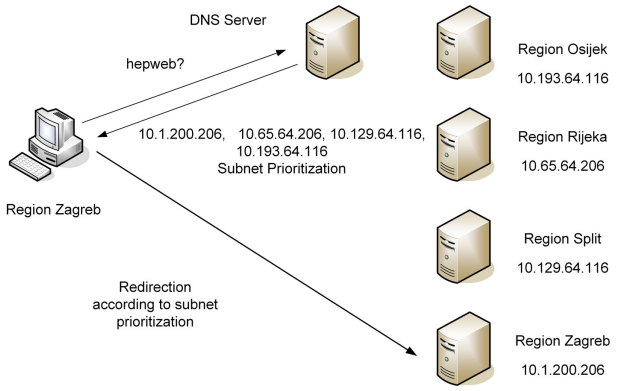

Figure 8 Geotargeting redirection with the DNS based method: multiple A-records and use of subnet prioritization

IV. SOLUTIONS FOR HIGH AVAILABILITY

The goal is to choose a solution that doesn't have single point of failure. It can be achieved by use of multiple servers/load balancers where the redirection takes place or DNS based method that inherently supports failover. This also presumes that DNS servers are redundant.

A. Dual Servers with Server Side Scripts

Server side geotargeting redirection script installed on a separate server presents a single point of failure. To achieve a High Availability two servers are used together, in the active-passive (failover) or active-active configuration (e.g. NLB), Fig. 9. Scripts put negligible overhead and servers can be used for other purpose as well.

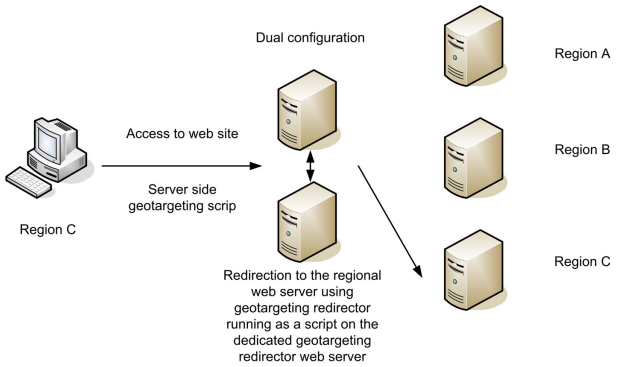

Figure 9 Geotargeting using dual servers with the server side script for the high availability

B. Dual Load Balancers with Geotargeting Capability

Load balancers present a single point of failure. If high availability is required two load balancers must be used

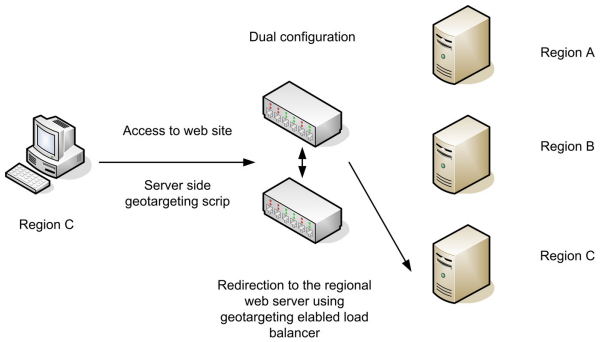

Figure 10 Two load balancers in the active-passive or active-active configuration

together, as illustrated in Fig. 10. In a past two load balancers were often configured in active-passive configuration, but today modern load balancers support load distribution in active-active configuration, [7,8].

C. *DNS Based Method*

Multiple A-records can be used not only for geotargeting redirection but also for automatic failover. This is achieved by the default behavior of the internet browser in the presence of multiple A-records. If multiple IP addresses are supplied for the same web address and browser can't access web site using the first IP address, it will after 20s automatically try the next IP address from the list returned by the DNS, Fig. 11. This works for following browsers: Opera, Safari, IE, and Firefox. Unfortunately it doesn't work with Google Chrome that failed to try the next IP address from the list, [16].

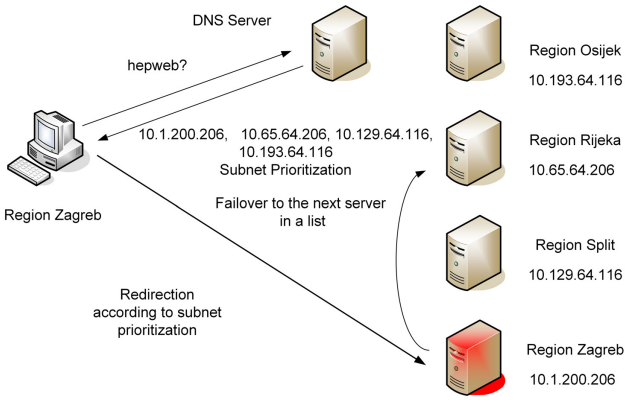

Figure 11 Failover in geotargeting redirection with DNS based method

To address the shortcomings of the DNS based method when High Availability is needed two additions to the method may be implemented. First addition gives the full control of the redirection in case of overloaded or unavailable server(s) and second address exceptions in the default browser behavior when confronted with multiple A-records.

1) *Use of Additional Server Side Script Redirector*

Two levels of user redirection can be implemented by the combination of multiple A-records and the server side script redirector. When the web server proposed by subnet prioritization is not available, the browser will automatically try the next server from the list returned by the DNS. In this way user from one region will be always directed to the second server in a list generating imbalance in the web server load. Better way of handling such situation is use of the additional server side script redirector installed on each web server (making two level redirection) that checks if the user IP address belongs to the intended range of that server. If so, user is served by that server, if not user is depending on the current load or randomly directed to one of remaining active web servers, Fig. 12, avoiding possible overload of the second server in a list. This to be accomplished, web servers must periodically check health and load of other web servers (by some kind of sentry software) and based on that info define a list of remaining choices to a server side script.

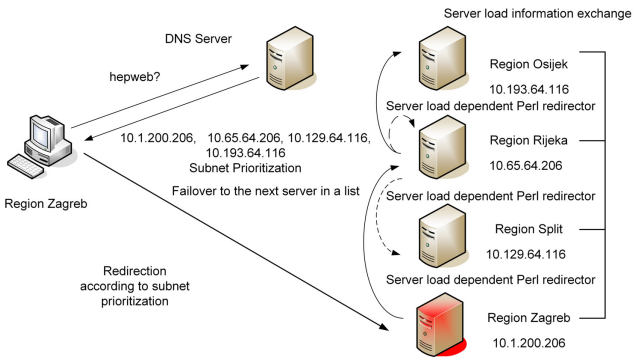

Figure 12 Failover in geotargeting redirection with DNS based method and additional server side script for equal load on remaining servers

2) *Dynamic DNS Entries*

In corporate environment it is relatively easy to dynamically change DNS addresses that can, within several minutes, propagate to all DNS servers in a corporate WAN. When using multiple A-records, user can encounter the situation when the web server that is listed first in an answer returned from a DNS server is not available, Fig. 13. In such case user must rely on the browser behavior where browser after 20s attempts the next IP address in a returned list (as already mentioned Google Chrome unfortunately doesn't work in such usual way). Also, small share of users are impatient to wait even 20s necessary for browser's second try. To address this problem A-record corresponding to the unavailable web server can be (temporarily) removed from the DNS. It can be achieved by a script or specialized small program, [17], installed on some server within a WAN. This script or program needs to periodically check the health (and hence availability) of web servers at all locations. When the particular server is not up and running, (remote) command to the DNS server is issued and A-record removed from the DNS, Fig. 14. Because clients store fetched IP addresses in a local DNS cache it is important that A-records are defined in the DNS with low Time To Live (TTL) values, e.g. few minutes. After the A-record corresponding to a failed server is removed from a DNS and the TTL period for cached entries expires, when users contact the DNS server again, they will get list of A-records corresponding to healthy web servers. When the web server becomes available again similar command can add corresponding A-record to the DNS.

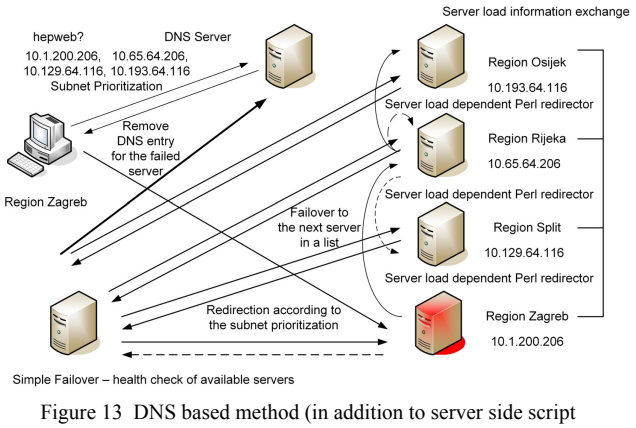

Figure 13 DNS based method (in addition to server side script redirector) and web server failure

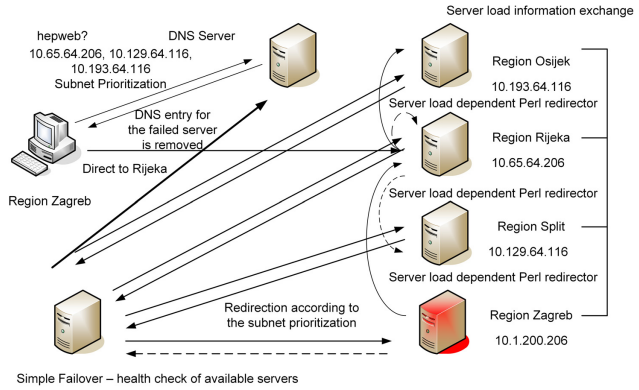

Figure 14 DNS based method with removed entry for failed web server

V. COMPARISON

Advantages, disadvantages and suitability for High Availability implementation is listed in Table VI. Client side script is just an interesting concept that is due the lack of full control of the behavior of client side script (e.g. Java version, security settings etc.) rarely used. Server side script is used much more often as it gives to the server administrator full control of the geotargeting redirection process. Geotargeting enabled load balancers are also not so common because such solutions are still expensive, offer much higher throughputs then necessary for most applications and often require the help of supplier contractors for the configuration. When high availability is required server side script and geotargeting enabled load balancer require dual installations to remove a single point of failure. DNS based method has clear advantage due to inherent internet browsers behavior in the absence of HTTP reply from the requested IP address, when confronted with multiple A-records defined for the same web address. Method is very easy to implement. The DNS based method may be combined with server side scripts installed on all web servers to allow a more balanced redirection to remaining available web servers. Failover behavior can be further enhanced by introducing dynamic changes to the DNS for failed web servers, hence removing even 20s delay for the failover to the operating web server.

TABLE VI COMPARISON OF METHODS

Method		Advantage	Disadvantage	High Availability
Client side script		Simple	Lack of full control on the client side, reveals addresses of the infrastructure	Combine with DNS method
Server side script		Simple, full control of redirection	Two urls, one for redirector, one for web content (use of virtual web server)	Dual server
Geotargeting enabled load balancer		High throughput	Expensive, often needs a help of specialized staff	Dual load balancer
DNS based method	Basic	Direct, Simple	20s delay failover, unequal load on remaining servers, reveals addresses of the infrastructure	Inherent, multiple A-records for same address
	With server side script	Direct, equal load on remaining servers	20s delay failover, reveals addresses of the infrastructure, medium complexity	Inherent, multiple A-records for same address
	With dynamic DNS entries	Direct, immediate failover to remaining servers*	Unequal load on remaining servers, reveals addresses of the infrastructure, medium complexity	Inherent, multiple A-records for same address
	With server side script and dynamic DNS entries	Direct, immediate failover to remaining servers*, equal load on remaining servers	Reveals addresses of the infrastructure, somewhat complex	Inherent, multiple A-records for same address

*access is immediate after the DNS record of the failed server is removed

VI. CONCLUSION

Several geotargeting redirection methods that redirect clients within a corporate WAN have been briefly reviewed. These methods are limited to cases when user IP address corresponds to the user's location. DNS based method is particularly attractive due to its simplicity and low cost. If combined with the second layer of redirection, using server side scripts (that consider availability and loads of regional servers) and dynamic DNS, this method provides quite smart geotargeting redirection. When high availability is not of paramount importance the server side geotargeting redirection script installed on one server can be used. Load balancing devices may be used in rare cases when very high throughput is required. Client side script is mentioned for the completeness despite of its disadvantages.

Geographically Dispersed Cluster of Web Application Servers on Virtualization Platforms

Dubravko Miljković
Hrvatska elektroprivreda, Zagreb, Croatia
dubravko miljkovic@hep.hr

Abstract - For business critical web applications high availability is of paramount importance and clusters of application servers are a viable solution. To achieve even higher availability cluster nodes should be geographically dispersed, i.e. deployed at multiple sites in two or more datacenter premises of a larger business system. In this paper solutions for geographically dispersed clusters of application servers installed on virtualization platforms are described. Most of the time geographically dispersed clusters are overprovisioned and as such are very expensive, considering cost of servers, network, maintenance and software licensing. Virtualization and the choice of appropriate solution can reduce this cost. Advantages and disadvantages of particular solutions are analyzed.

I. INTRODUCTION

Modern corporate businesses like banking, finance, public utility companies, internet sales, travel tickets and hotel reservations are increasingly dependent on highly available business web applications. Business-critical applications require maximum uptime and as such are excellent candidates for various clustering solutions, from conventional single site clusters to geographically dispersed clusters, [1,2]. Clustering can provide high availability and ensure continuous service to users. With cluster ownership (instead of using external cloud solutions) corporations remain under full control of its IT resources and can maintain high security of business data.

Web applications use a three-tier architecture, Fig. 1, [1]. Three-tier is a client-server architecture in which the user interface, functional process logic, computer data storage and data access are developed and maintained as independent modules, most often on separate hardware platforms.

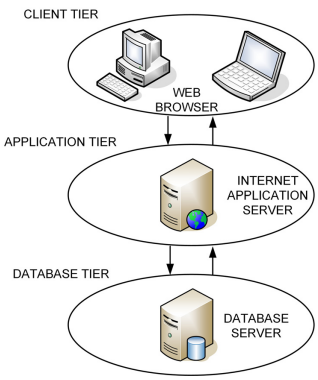

Figure 1 Three-Tier architecture

The Three-Tier architecture has the following tiers:

1.) Client Tier: client is an application that runs on a personal computer and accesses by means of network a server to perform some operation.

2.) Application Tier (Business Logic Tier, Middle Tier): consists of an application server that contains the bulk of the application logic. Application logic resides in a single tier and can be maintained easily at this one location. The architectural design of the application tier is optimized for server functions including access to a database.

3.) Database Tier: consists of one or more database servers, computers dedicated to database storage and retrieval. Upon request from application server, the database server searches the database for selected records and returns them over the network to middle tier.

This paper deals with clustering at the Middle Tier level. Clustering at Database Tier is not covered here.

II. HIGH AVAILABILITY

Let's clarify some basic terms and concepts regarding the high availability, uptime etc., [1,3].

Availability (inherent), A_I, is the probability that the system will be up and running correctly at a given time; this accounts for system operating time and corrective maintenance and excludes downtime associated with preventive maintenance, logistics, and administration, (1).

$$A_I = \frac{MTBF}{MTBF + MTBR} \tag{1}$$

MTBF denotes Mean Time Between Failures and MTBR denotes Mean Time Between Repairs.

Uptime is the time during which a computer system is operational and downtime when it isn't. Operational availability, A_O, is the ratio of system uptime and total time, (2).

$$A_O = \frac{Uptime}{Uptime + Downtime} \tag{2}$$

Values for A_I and A_O are always between 0 and 1, (3)

$$0 \le A \le 1 \tag{3}$$

When defining uptime various criteria may be used, e.g. system is up if all users can access and use applications or in another case when 50% (or some other number) of users can be served.

Downtime includes both planed and unplanned downtime. Planed downtime includes scheduled

maintenance activities, addition of hardware and software to improve availability and applying software and system upgrades. Unplanned downtime includes system failures, operating system crashes, application failures due to application bugs, unpredictable events such as viruses or power surges and human errors like unintentional application or system reset.

Highly available systems have set very tight criteria for permissible annual downtime as shown in Table I. If one aims at annual downtime of several minutes, geographically dispersed cluster should be used, [1-5].

TABLE I. AVAILABILITY, ANNUAL DOWNTIME AND GENERAL SOLUTION

Availability	Annual downtime	General solution
99%	87.6 hours	one server
99.9%	8.76 hours	one server, redundant design, very good configuration and maintenance
99.99%	52.5 minutes	cluster
99.999%	5.25 minutes	cluster, geographically dispersed cluster

High Availability (HA) is generally achieved by eliminating single points of failure. This is accomplished by adding redundancy to various parts of a system. When considering HA solution all components employed in process of providing service to user should be considered. This would include application servers, databases, networks (e.g. ring topology) and network equipment (routers and switches), uninterrupted power supply, air-condition, datacenter building safety and datacenter staff skills. In this paper concentration is on application servers.

HA at the level of application servers is solved by some kind of load balancing, often using Network Load Balancing (NLB) clusters. Nodes of a NLB cluster share among themselves common user load (load distribution) but also perform the failover in case of node failure.

Dispersing cluster nodes to two or more locations (multi site clusters) further eliminates the single point of failure. In case of a software or hardware failure at one location service continues to be provided from remaining locations. Such clusters provide maximum protection against physical disaster. For easier understanding concepts of geographically dispersed clusters map with four regional centers is shown in Fig. 2. Conventional geographically dispersed cluster that uses physical servers (no virtualization) is shown in Fig. 3, [1,5].

Figure 2 Four corporate regional centers of HEP (Croatian Electricity Company)

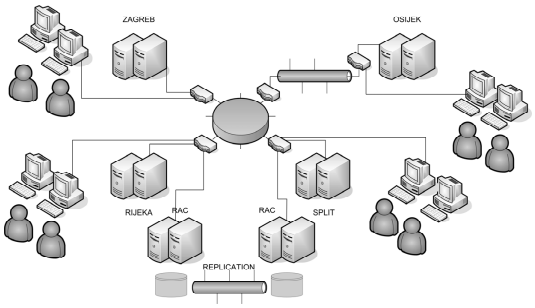

Figure 3 Geographically dispersed cluster

III. APPLICATION SERVER CLUSTERS ON VIRTUALIZATION PLATFORM

A. *Application Server Clustering*

Application server clustering is the use of a group of application servers that coordinate their actions in order to provide scalable, highly available services in a transparent manner. Geographically dispersed virtual clusters are considered in an example of a company with four regional centers.

B. *Virtual Clustering*

Virtual clustering is accomplished by connecting Virtual Machines (VMs) into a cluster, as shown in Fig. 4, [1,6,7]. Virtual machine is software layer which emulates the functionality of a certain machine or processor on a target machine. Main environments for virtual machines are VMware ESX and ESXi, Windows Hyper-V and recently Oracle VM VirtualBox. Type-1 hypervisors (native or bare metal) are commonly used for this purpose.

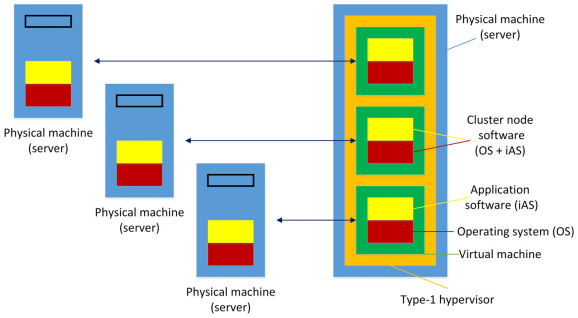

Figure 4 Virtual clustering (with cluster node software OS+iAS)

Clustering concepts considered in this paper use Oracle internet Application Server (iAS) 1.0.2 (could be some other version as well) and Microsoft Windows Server 2008 installed on Hyper-V virtual machines (VMs).

C. *NLB Cluster of Application Servers on Virtualization Platforms*

Application servers installed on virtual machines on the same virtualization platform can be connected in NLB in much the similar way as when installed on physical servers, Fig. 5 [5,8,9]. NLB is configured in Unicast mode, affinity Single (support stateful sessions) and uses virtual network, virtual network interface cards (vNICs) and virtual network switch within a virtualization platform. Each VM use two vNICs, one for the NLB and one for the administration and outgoing NLB traffic.

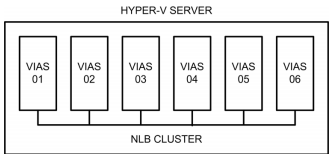

Figure 5 NLB cluster of application servers on a virtualization platform

For redundancy reasons a physical server where virtualization platform resides should be equipped with hard disks in RAID, multiple physical network interface cards (NICs) configured in network teaming and connected to redundant switch(es). Building a NLB cluster of application servers on virtual machines has some advantages. User capacity of the application server is limited by the application server itself and characteristics of an operating system. Single application server can serve few hundreds of users. On a virtualization platform, numerous instances of application server can be installed each on its own virtual machine, all on the same physical server, using less hardware resources and serving several thousands of users.

Different licensing models for application servers often exist (depending on a software provider). Two common models are per user and per CPU licensing. In per user model, licenses are charged according to the number of users. Per CPU licensing model charges are determined based on the number of CPUs on a physical server. The later favors use of virtualization, because multiple instances of application servers installed on virtual machines, are covered by the number of CPUs on a physical server with the virtualization platform (profitable for more than 50 users per CPU). Some providers support licensing per virtual CPU (vCPU) that adds flexibility if not all physical CPUs are needed.

Popular Oracle internet Application Server (iAS) used in considered concepts has very light CPU usage. If installed on a physical server processing power remains heavily underutilized. When application servers are installed on VMs and these VMs clustered using NLB utilization of processing power on a physical server is much better. Each VM with OS and installed iAS uses approx. 4 GB RAM. Even when clustered on the same virtualization platform CPU usage still remains low while RAM usage is the sum of all installed OS+iAS.

Adequate supervisory mechanism (some kind of Sentry) must be install on each virtualization platform. Its role is to supervise the operation of application servers and virtual machines by periodic checks and to ensure that only good instances of iAS/VM are included in a NLB cluster. It can also issue automatic corrective actions on iAS/VM (restart of iAS component or the whole iAS/VM).

IV. GEOGRAPHICALY DISPERSED CLUSTER ON VIRTUALIZATION PLATFORMS

By dispersing cluster nodes to two or more locations protection against the failure of one or more sites is achieved. Virtualization enables better utilization of resources at all location and consequently also at the level of the geographically dispersed cluster as a whole.

A. Integration of Geotargeting Redirection and NLB

Geographic dispersed clusters described here use independent NLB clusters of application servers on virtualization platforms and a single physical server at each location. Independent NLB clusters are integrated into one geographically dispersed cluster using the two level geotargeting redirection, [5,10]. First level is the DNS based redirection that suffice for most situations and is accomplished with multiple A-records for the geographically dispersed cluster web address. Subnet prioritization assigns a user to a regional NLB cluster closest in terms of the NLB cluster IP address. As these addresses are typically regionally assigned, user is directed to the closest (regional) NLB cluster. If that NLB cluster is not available, user browser will after 20s try to access next from the list, eliminating the single point of failure at the level of geotargeting redirection. Example of address space ranges is show in Table II. Addresses in Table III correspond to server side script redirectors and application servers. Same IP address can be used for iAS and redirection script using different address extensions.

TABLE II. EXAMPLE OF CORPORATE ADDRESS SPACE (HEP)

Regions represented by regional center	**IP address range**
Osijek	10.0.0.0 – 10.63.255.255
Rijeka	10.64.0.0 – 10.127.255.255
Split	10.128.0.0 – 10.191.255.255
Zagreb	10.192.0.0 – 10.255.255.255

TABLE III. MULTIPLE A-RECORDS FOR THE SAME WEB ADDRESS

Cluster address	**Multiple A-records in DNS (server side Perl script redirectors)**		
hepweb	IP address of NLB cluster	*url* for server side Perl script	*url* for applications (redirected from Perl script)
	10.193.64.116	*hepwebos*	*hepwebos/applications.html*
	10.65.64.206	*hepwebri*	*hepwebri/applications.html*
	10.129.64.116	*hepwebst*	*hepwebst/applications.html*
	10.1.200.206	*hepwebzg*	*hepwebzg/applications.html*

Exceptions and redirection to remaining sites in failover (or overload) scenarios are handled by the second level of redirection performed by server site scripts installed at all nodes of each NLB cluster. NLB clusters exchange their statuses among themselves. Each NLB cluster advertises its current user load. Based on this info the second level redirection can make smart redirecting decisions when the NLB cluster at some location is overloaded. Please note that NLB in described solutions is limited to a particular location and not used across all locations, this is the role of the geotargeting redirection.

B. Two Site Solution

In this solution servers with virtualization platforms are installed at two regional centers, Fig. 6. Users are directed using the two level geotargeting redirection (DNS and server side script) to the NLB cluster located at the closest regional center. This is a basic, two site, geographically dispersed cluster with both locations serving users simultaneously. It is HA solution where, when one location fails, remaining location immediately

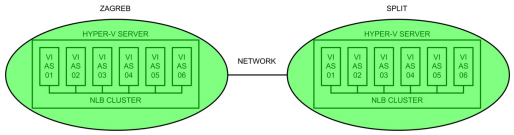

Figure 6 iAS cluster on two Hyper-V platforms on two locations, both location in normal operation, user is directed to the nearest location

takes all load, Fig. 7. If the failure lasts longer, A-record of the failed location can be temporarily revoked from DNS.

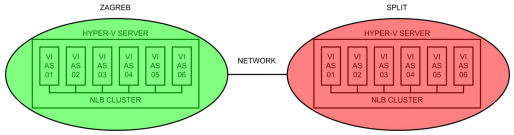

Figure 7 iAS cluster on two Hyper-V platforms on two locations with failure at location Split, all users served in Zagreb

Capacity of the application server cluster at each location must be dimensioned to serve additional users. To avoid too generous overprovisioning at each location for the rare case of accepting load from the failed site, slight degradation in performance and user experience may be acceptable (e.g. greater response time for some reports). There should be a compromise between the overprovisioning and performance in case of the failover.

C. *Four Site Solution*

More redundant solution is to use four geographic locations. Physical servers with virtualization platforms are installed at four regional centers, Fig. 8. All clusters at all locations should be up and running. Users are again directed using the two level geotargeting redirection (DNS and server side script) to the NLB cluster located at the closest regional center. In case of a failure at a particular location, all remaining sites accept users from region with failed cluster, Fig. 9. A-record belonging to the failed location can be temporarily revoked from the DNS.

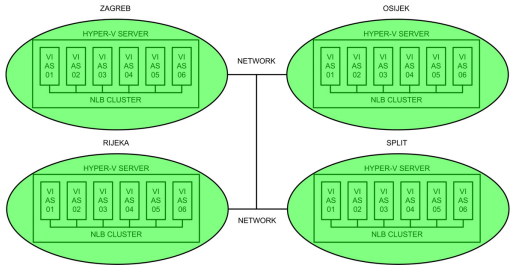

Figure 8 iAS cluster on four Hyper-V platforms and four locations, all four locations are active, user is directed to the nearest location

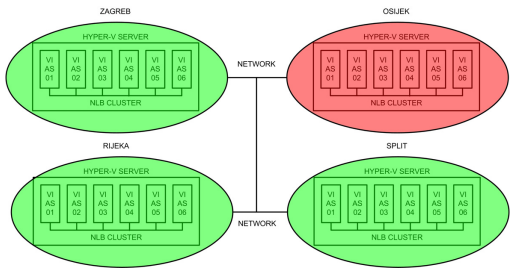

Figure 9 iAS cluster on four Hyper-V platforms and four locations, one location failed, users form Osijek region directed to remaining locations

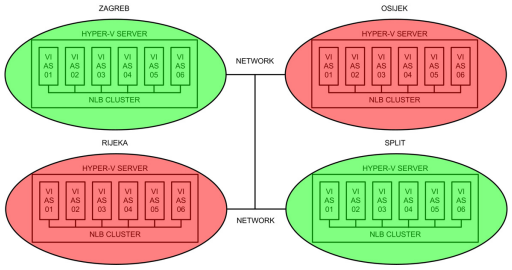

Figure 10 iAS cluster on four Hyper-V platforms and four locations, two locations failed (Rijeka and Osijek), users form regions Rijeka and Osijek directed to remaining locations

In case of failover load at remaining sites will typically increase for about 33% and this doesn't require too much overprovisioning. With failure of a second site, Fig. 10, some degradation in user performance and experience should be tolerated. If there are failures at three sites, Fig. 11, the remaining site should accept only fraction of all users doing most important tasks.

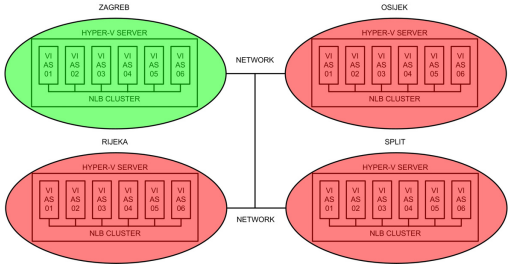

Figure 11 iAS cluster on four Hyper-V platforms and four locations, three locations failed (Rijeka, Osijek and Split), all users directed to the remaining location

Because it uses four locations with four physical servers this solution is expensive, particularly from the point of software licensing (physical servers for providing this solutions are generally far less expensive).

D. *Two Sites Up of Four Site Solution*

Servers with virtualization platforms are installed at four locations. However, only two NLB clusters are in service at any given moment, Fig. 12. This is chosen for licensing reason. Licenses (based on the number of CPUs on physical servers) are charged only for two active servers. Users are directed using the two level geotargeting redirection (DNS and server side script) to the closest NLB cluster. Two A-records are used for cluster address. In case of failure of a NLB cluster at a particular location additional NLB cluster is activated from remaining sites. Failover is almost immediate while failback is performed outside normal working hours. After failover A-record of the failed NLB cluster is replaced in the DNS with the A-record of activated NLB cluster. Choices for two initially active locations are the best equipped datacenters with remaining two acting as spares. Spare locations can be in two states, either with servers turned off or with servers turned on but with VMs turned off. In either case application servers on virtual machines should be brought into operation. In case of turned off servers remote power on command may be issued from remaining operating cluster. This should be followed by a short period (about a

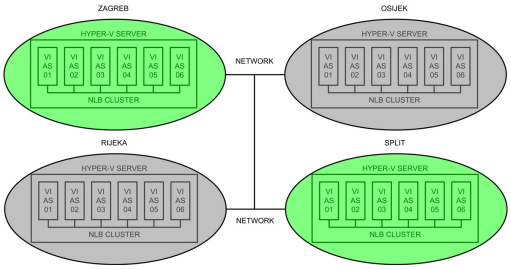

Figure 12 iAS cluster on four Hyper-V platforms and four locations with only two locations active (Zagreb and Split)

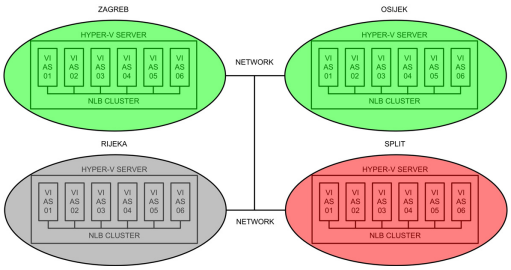

Figure 13 iAS cluster on four Hyper-V platforms and four locations with only two locations active (Zagreb and Osijek) after reconfiguration (failure at location Split)

minute) during which started site update its applications code and application sever configuration files. If licensing conditions are more relaxed, potential failover sites may have its servers powered on all the time and only virtual machines are raised when necessary. Normal operation of cluster is illustrated in Fig. 12, and failover in Fig. 13.

V. OVERPROVISIONING FOR FAILOVERS

NLB clusters must be dimensioned for failovers. They should be able to serve additional users in case of failure of one or more locations or restart of node within a cluster.

A. Levels of Overprovisioning

Overprovisioning of resources can be done at two levels: at the level of individual application server and at the level of virtualization platform.

1) Level of Internet Application Server

Internet application server on each node may be dimensioned to handle more users than needed in normal operation of cluster, Fig. 14. This may increase RAM memory requirements but also requires some changes of software settings on the application server and OS. Number of active application servers on virtualization platform remains the same during failover.

2) Level of Virtualization Platform

Necessary disk (in RAID) and RAM memory space is reserved for import of VMs from other locations, Fig. 15. Once imported VMs should be shut down and kept ready

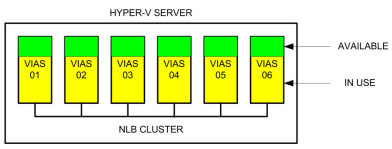

Figure 14 Available resources provided on each application server

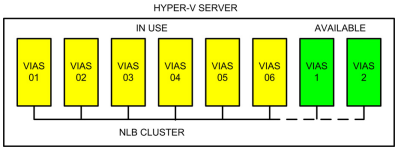

Figure 15 Additional resources for import of VMs

for failover situations. Number of active application servers (and hence virtual machines) on a virtualization platform is increased during the failover.

B. Failovers

Most difficult situation is encountered when the cluster has only two locations with two virtualization platforms. In normal situations each location serves approximate 50% of users (assuming similar loads across regions). If one location fails all user should be served by the remaining location. It would theoretically require 100% overprovisioning reserved at each location. This may be wasting of resources because real life situations often don't require such generous overprovisioning. In most cases a failed site would recover quickly (within several minutes). Many users connected to a failed site are idle users and in these several minutes they will not reestablish their sessions and hence will not overload the remaining site, as illustrate in Fig. 16 and 17.

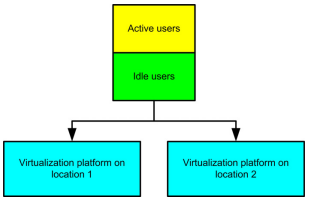

Figure 16 Normal operation on two virtualization platforms

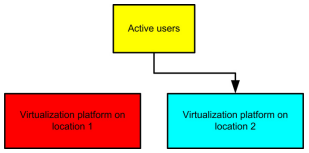

Figure 17 Failover of active users (idle users not reconnecting)

In reality lower numbers like 70-80% overprovisioning may suffice. Also some limited degradation of service (in terms of longer response times) may be acceptable for relatively short period until failed location recovers. Longer outages of location would require full overprovisioning, Fig. 18. When there are four locations, any single failure of location is far less

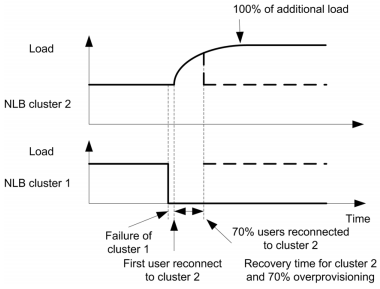

Figure 18 Users reconnect to another NLB cluster

TABLE IV. FULL OVERPROVISIONING REQUIREMENTS FOR VARIOUS NUMBERS OF FAILED LOCATIONS

Solution	Failed locations		
	1	2	3
Two site	100*	-	-
Four site	33*	100*	400**
Four site - two sites up	0	0	100*

*If failed location is quickly recovered (order of minutes) lower numbers (not full overprovisioning) may suffice, **Not feasible

serious. Overprovisioning of 33% will fully cover such situations (again in reality less then this is necessary). Additional location failures would theoretically require 100% overprovisioning, and again lower values should be adequate in real life. Full overprovisioning requirements (assuming equal number of users coming from each region) for each solution and the number of failed locations are listed in Table IV.

C. *Migrations, Replicas and Export/Import*

Migration of failed VMs to a new location is typically not possible once the original location failed. Copies must be made in advance before failure of any location occurs.

Replica of VMs can be easily used among two or more virtualization platforms at the same location and for disaster recovery. All VMs (including replicas) at the same location can be included in the same NLB. Replicas are not so suitable for NLB clusters at different locations due to assigned different address ranges and alternate IP address option must be used. However alternate IP address option doesn't solve problem of NLB settings when replicas are at different locations.

Simple export/import of virtual machines may be used instead of replicas, Fig. 19. This must be done before failures occur. Configuration of each iAS depends on numerous configuration files and these should be updated in when the imported virtual machine at different location is powered up. Imported virtual machines can be easily configured in NLB at new location and after configuration turned off till necessary. Main usage of resources for additional VMs is necessary disk space for each imported VM. Memory usage is nil till the VM is turned on.

Question remains, isn't it simpler to have few more VMs connected in NLB at each location and initially provide 33% overprovisioning instead of complicating with export/import of VMs from all locations. Reliability likes simplicity.

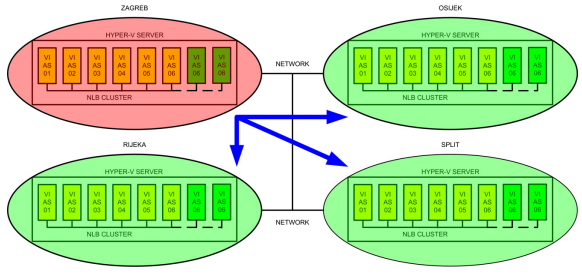

Figure 19 Export/Import of VM among locations, this must be done before failure of the location occurs

VI. COMPARISON

Comparison of described solutions regarding the availability, user capacity, hardware and software licensing cost is shown in Table V. All solutions provide redundancy through geographic dispersion to more locations. Two site solution has advantage of lower cost, but disadvantage of lower availability (still high enough for many applications) and lower user capacity. Four site solution has advantages of very high availability and user capacity, but disadvantage of high hardware and software licensing costs. Four site, two site up, is a compromise.

TABLE V. COMPARIONS OF PRESENTED SOLUTIONS

Solution	Availability	User capacity	Hardware costs	Software costs
Two site	**	**	**	**
Four site	****	****	****	****
Four site - two sites up	***	**	****	**

VII. CONCLUSION

For highly available business critical applications it may be necessary to use geographically dispersed clusters. Virtualization platforms enable use of several application servers installed on separate virtual machines and connected in a NLB cluster, all on the same physical server. This provides better hardware utilization and lower hardware cost, but what is more important, use of per CPU licensing model assures significantly lowered software licensing costs. Availability is further increased by integration of NLB clusters into geographically dispersed cluster using two level geotargeting redirection (DNS based and server site script) and eliminating physical servers as a single points of failure. Three solutions for geographically dispersed cluster that use just one physical server at each location have been presented and analyzed. Each approach is suitable for different requirements on availability and user capacity but also different budgets for hardware and particularly software. The sparing concept of geographically dispersed cluster with some locations powered down till required that combines HA and low software licensing costs may be a good compromise.

Geolocation and data type impact on SQL query execution time using different database approaches

K. Šimenić, I. Lukić and M. Köhler
Faculty of Electrical Engineering, Department of Computer and Software Engineering
Kneza Trpimira 2b, 31000 Osijek, Croatia
ksimenic@etfos.hr, lukic@etfos.hr, mkohler@etfos.hr

Abstract - Picking right database approach or connection – Application Programming Interface in PHP used to achieve connection to database server, together with database and table definition affects query execution time. Servers are located in different geographical positions affecting round-trip time (RTT). Four different database connections are used together with queries consisted of same data trying to point time difference using PHP and MySQL database server. Most common data structures are tested both for time difference and needed storage space. Combining data types and choosing a good database connection in terms of simplicity, security and time needed for execution, lead towards saving space and time. Time and storage problems often occurs when operating with large amount of data which will be case in this paper. Also, providing facts and results, best database connection and table optimization in default database configuration are given. Later optimization can be achieved in terms of choosing different database engines for specific needs.

I. INTRODUCTION

Millions of database queries using different database connections are being run every second on web browsers. There are many types of database servers and their configurations. By configuration we assume: type of MySQL Server, number of concurrent connections, default character set and others explained in database configuration documentation [1]. Nowadays, the collection of data from tables and the providing of results based on it should not only be correct; it must be as quick as possible too. Choosing the best way to access data, by using one of the four ways to connect to MySQL database in PHP are tested in this paper, in terms of query execution time, code simplicity and data safety is discussed. Similar work with Java Query Language is presented in [2] and query optimization in [3]. The geographical location of a database server has a great impact on both the execution time and the database connection which is also presented.

Operating with large amount of data necessitates large storage capacity. The optimization of fields with different data structures affects both execution time and needed storage space. How to choose the most appropriate field data structure is based on the type of data stored for later usage. In this paper, the focus is on character-based structures such as character (CHAR), variable-length character (VARCHAR) and TEXT. The same principle can be transferred to numeric based structures.

Good database server configuration results in almost no difference between database connections. One example of good table definition, or choosing proper cell structures, engine and character set, results is presented in terms of inserting specific data. Finest optimization is achieved by defining good table cell data structure which is strictly defined by the type of data needed to be stored. Basic examples of choosing proper cell structures are discussed and all methods of inserting and collecting data between the user and the database are shown.

II. CONNECTION TYPES OVERVIEW

Four database connections (PHP API – Application Programming Interface [4]) are tested, two of which are object-oriented (OO): PDO or PHP Data Objects and MySQL improved (MySQLi) OO ; and two procedural: MySQLi procedural and MySQL all of them described in literature [4 and 5]. Using PDO or MySQLi over MySQL provides the solution for basic security vulnerabilities such as SQL injection [6] using escape strings and binding parameters. PDO already has a built-in function to quote strings, while in MySQLi this should be done in code. An improvement of MySQLi over MySQL is mostly in the field of security, but it also has an OO version which is more and more used nowadays because of code simplicity. MySQL and MySQLi only support the MySQL database driver, while the PDO supports up to 12 different database drivers including MySQL. Another advantage of PDO is "named parameters". It is much easier to bind specific values to a character based parameter name rather than to numerically based names which follow a specific order of placement in a code. All security and code advantages and disadvantages result in different database insertion query time presented in section III.

TABLE I. SERVERS' GEOGRAPHICAL LOCATION AND RTT

Name	Geographical position	RTT [ms]
gimli.velv.hr	Croatia, Varazdin	22
core-design.info	France, Roubaix	42
directorycentral.com	USA, Newark	115

The list of servers used for testing of database insertion time differences (section III) and presentation of good database configuration (section V) is shown in table 1. The first two servers have a basic database server configuration, while the third one, located in the USA, is well-configured owing to its specific usage for commercial purposes. The goal is to show how good database configuration can minimize the differences between database connection methods. Time invested in such a configuration should be proportional to the usage of the specific web place or more of them located on the same server.

Aside from database connection methods and good database server configuration, good column structure definition also affects not only query execution time while selecting or updating data, but required storage capacity as well. In section IV, average execution time is tested using all four connections with SELECT statement on tables pre-populated with data. Four different tables are used, each one for specific character structure populated with the same data earlier. All methods are implemented and tested in PHP (HTML web page) on XAMPP localhost server on a laptop with an Intel(R) Core(TM) i5-3230M CPU@2.60GHz, 6GB of main memory and Thomson(R) TWG850 router on a 6 Mbit/s downstream and 0.5 Mbit/s upstream connection.

III. QUERY TIME DIFFERENCES BETWEEN CONNECTIONS

One of the four SQL fundamental data manipulation language (DML) statements is INSERT statement. INSERT statement is used for inserting rows of data into a specific table in a database. Sometimes, there is a need for inserting large amounts of data inside a specific table or more of them. The tests were conducted by inserting 50000 rows of data using four different connections two times on two different servers in order to get a uniform execution time. In addition, total execution time diagram is presented as well as a table showing the average time difference from RTT.

A. *Insertion*

In Figure 1, the results shown represent the total execution time for every 12500 rows of data on Croatia server. It is obvious that PDO is the slowest among all four connections, while both MySQLi connections are almost equal in best execution time. In Figure 2, the same results are shown for France server. Differences in the execution time are smaller because the time for code execution stays the same and has a smaller impact when compared to RTT. France server definitely shows the most expected values where MySQL, because of its simplicity and lack of security (which needs time), shows the best results while both OO connections are basically the same. Results presented in Table 2 show the average time for all connections on both servers.

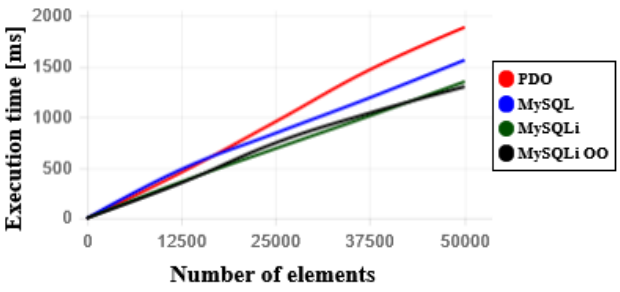

Figure 1. Total execution time on Croatia server

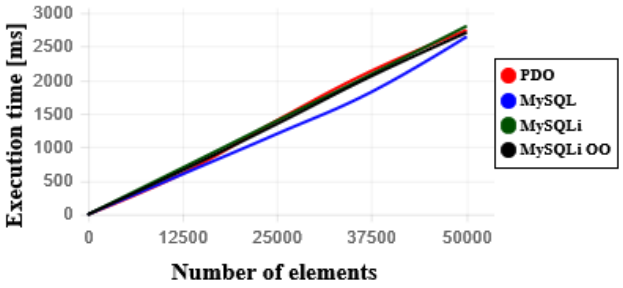

Figure 2. Total execution time on France server

TABLE II. AVERAGE TIME OF EXECUTION

Method	Average time [ms] CRO	Average time [ms] FRA
PDO	37.68	54.90
MySQL	31.20	52.94
MySQLi	26.92	56.11
MySQLiOO	24.28	54.18

B. *Difference*

Average time difference from RTT with percentage difference from RTT is presented in Table 3. The data show the time needed for data processing on the local machine (web page server or localhost server machine power) and on the database server, which depends on database configuration, machine power and response time. Machine power is defined with processor power, RAM type and capacity and type of disk units used for data storage. The variations in collected data on both servers are caused by physical differences between the machines combined with other requests that were currently processed.

TABLE III. AVERAGE TIME DIFFERENCE

Method	Average difference [ms] CRO	%	Average difference [ms] FRA	%
PDO	15.68	71.27	15.95	39.87
MySQL	9.97	45.35	20.39	8.16
MySQLi	8.91	40.49	10	25
MySQLi OO	1.89	8.63	21.16	25.90

IV. PROPER CELL DEFINITON

Storing character-based data, such as first and last names is present in almost every database. Optimizing table cells for specific usage affects execution time. Sometimes, indexing and searching by primary and unique keys is impossible. Time needed for data retrieval (SELECT statement) by using WHERE condition on non-indexed character-based cells varies, which depends on the cell definition as well as the conditions outlined in section IIIB. The same principle for insertion can be applied to SELECT and every other DML statement. As mentioned earlier, the primary focus is on character-based structures. MySQL servers used in tests support CHAR(X), VARCHAR(X) and TEXT fields and those structures were tested. X represents the maximum number of characters that can be stored. The difference between CHAR(X) and VARCHAR(X) is that CHAR always stores X number of characters (if provided with less, it fills the string with blank spaces until X characters is reached) while VARCHAR(X) can hold up to X characters but stores provided characters only. For example, storing "ABC" in CHAR(5) would look like 'ABC--' (where '-' represents a blank space) and in VARCHAR(5) the result would be 'ABC'. CHAR(X) is good for storing a fixed number of characters, e.g., md5 hashed passwords or data that differs in one or two characters from X, while VARCHAR(X) is good for storing data that can differ in many characters e.g. first or last names, but should be of reasonable length (20-30 characters). In comparison to VARCHAR(X), which is limited to 8000 characters, TEXT can store up to 2GB of data with no significant difference in the way data is being stored. VARCHAR and CHAR supports only ASCII values while TEXT can store Unicode characters too.

Four different tables, one for each data structure including two for CHAR, are populated with the same data. The first CHAR table has CHAR(10) structure and another has CHAR(15). There are 5 columns (name1-name5) which specify one row of data; and all have the same structure. One million names were randomly generated and inserted into table (first five names – first row, second five – second row), creating a total of 20000 rows. The SELECT statement used for testing is:

```
SELECT * FROM table_name WHERE name1 = "Robert"
```

The results presented in Table 4 show the average time of 1000 identical query executions with all four connections on Croatia server. All four results are rather close, but CHAR(X) results worsen as X grows. On the other hand, TEXT and VARCHAR(X), no matter how large X is, and because of the identical way of storing data are practically the same and change only when data with more or less characters is inserted.

Not only does the execution time worsen, but also larger capacity is needed to store CHAR because it fills strings with blank space characters. In Table 5, storage capacity after populating of tables is presented. The problem is that the small differences (sub-1 MB) in size are rounded to specific values by the table information schema. Still, it is obvious that CHAR takes up more space for the same amount of data; contrary to VARCHAR and TEXT.

TABLE IV. SELECT STATEMENT TIME OF EXECUTION

Type	Average time [ms]
CHAR(10)	33.28
CHAR(15)	34.67
VARCHAR(X)	36.02
TEXT	34.35

TABLE V. STORAGE CAPACITY

Type	Capacity [MB]
CHAR(10)	2.51
CHAR(15)	2.51
CHAR(20)	3.51
VARCHAR(X)	1.51
TEXT	1.51

V. SERVER CONFIGURATION ADVANTAGES

The prospects of good database server configuration are multiple. When the differences between the database connections are small, it allows the owner to provide a more flexible and complete service. The users could adapt their code to their liking worrying about performance issues. In Figure 3, the total inserting time for all four methods is presented. In table 6, the average time for execution is presented and it is visible that there is almost no difference in query execution time among all methods.

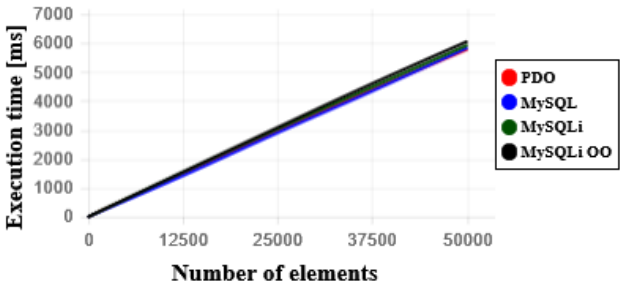

Figure 3. Total execution time on American server

TABLE VI. AVERAGE EXECUTION TIME

Method	Average time [ms]
PDO	115.73
MySQL	116.74
MySQLi	118.52
MySQLi OO	121.16

The average time difference for all methods, presented in table 7, is almost under 5%. One of the reasons is the connection via "level3" network, which reduces the number of points in network from source to destination.

Strong and high-quality connection altogether with a powerful machine and a good table definition will result in the smallest possible execution time. Having the database on the same machine as the web page, or minimizing the number of hops through the network decreases both the RTT and the total execution time.

TABLE VII. AVERAGE TIME DIFFERENCE

Method	Average difference [ms]	%
PDO	0.73	0.63
MySQL	1.74	1.51
MySQLi	3.51	3.06
MySQLi OO	6.16	5.36

Choosing a proper database engine and defining a good table will, as presented, affect storage capacity and time for query execution in a positive way. This is not particularly relevant when speaking of web places connected to databases with small amount of data e.g. few users, blog posts or similar. Extracting large amounts of data, e.g., an administrator's page for user administration on a web page with a large amount of users will be significantly faster in data retrieval and updating if the necessary table is properly defined.

VI. DISCUSSION AND CONCLUSION

In this paper, a basic overview of how database connection and RTT affects total execution time for inserting statements and how SELECT statement execution time and needed storage capacity depends on character data structures is provided. There are many factors that affect query execution time. The most fundamental ones are the physical attributes of the machine and RTT. From a coding point of view, a good database server configuration, the most appropriate database storage engine and a good table definition affects not only execution time but storage capacity needed as well. Most of the conclusion can also be applied to DML statements and data type. Complex statements with given conditions will be executed faster if the columns are indexed either by primary or unique keys.

The connections are largely similar in execution time. PDO improves as RTT rises, while MySQL is almost always the fastest type of connection because of its simplicity. Both MySQLi connections are acting similar regardless to RTT.

Using PDO allows for an easy switch if/when database driver is changed and the same security level as MySQLi makes it the most reasonable type of connection to use. However, MySQLi provides all the neccessary actions for MySQL database driver; and with similar OO interface it is still a good option.

Depending on the amount of data stored, the frequency of usage and the number of users, the right connection type, table definition and server configuration should be implemented. Optimization is a slow and painful process of learning and tracking what is best for use. Purchasing and installing the right equipment for its intended use will positively affect query execution time and this must be considered when creating a database environment.

ACKNOWLEDGMENT

We thank Filip Stojić for providing us with the servers to conduct our tests on.

Abstract – This paper presents an overview of contemporary architectures for Internet of Things and then introduces a simple novel architecture. The main goal of proposed architecture is to remain simple but still applicable to any Internet of Things environment. Specific applications of IoT should be implemented in application layer, using proposed architecture as backbone. Proposed architecture isn't yet fully defined, but ideas on which is based are well defined and should provide straightforward design and implementation.

I. INTRODUCTION

Internet of Things (IoT) is a relatively new paradigm of connecting anyone, anything, anywhere and anytime. Despite being relatively fresh, the idea is much older. Even though the term IoT is first mentioned by Kevin Ashton in 1999, similar networks were discussed through the 90s. Also, IoT does not necessarily include new technologies, but often only a new use of the old or current technologies, like Radio Frequency Identification (RFID) and Wireless Sensor Networks (WSN).

However, only recently, in the current decade or so, IoT has been studied more intensively, as the technology has been rapidly evolving to enable the IoT. IoT has gone beyond Ashton's original idea of connecting *things* in supply chains to the *Internet* and grew to occupy almost every part of human lives. It has been successfully applied to, for example, climate monitoring, transport and road safety, home automation and building monitoring, health care, supply chain, agriculture and rural development, border security and military application, etc.

IoT is commonly defined as a network of many resource-constrained nodes connected to local networks and then, through the higher layers of IoT platform, connected to everyone and everything. A typical IoT architecture looks as illustrated by Fig. 1. IoT is commonly divided into three layers, possibly with two sub-layers each, as seen in the picture.

The lowest layer, encompassing sensors and the physical world, is called the perception layer. The most prominent technologies in the perception layer are RFID for identifying and sensing things, WSN for sensor communication, and lightweight wireless communication protocols for WSNs and other types of networks. ZigBee seems to be the current state of the art protocol for such cases. Bluetooth is another protocol, but not as adapted for resource-constrained devices. Recently, there has been a lot of effort put into Internet Protocol version 6 Low-Power Personal Area Networks (6LoWPAN) and Constrained Application Protocol (CoAP) for communicating on higher layers. For things less constrained by power or performance, sometimes even their full counterparts Internet Protocol version 6 (IPv6) and Hypertext Transfer Protocol (HTTP) are used.

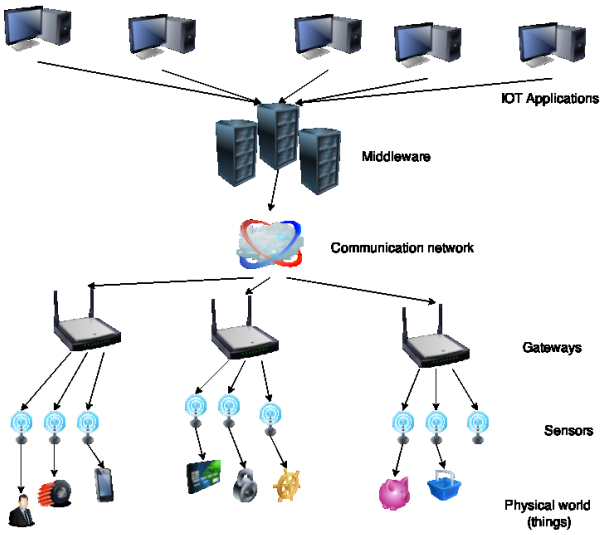

Figure 1. A typical IoT architecture

On the network layers, consisting of gateways communicating through the broadband network, there have been suggestions to use mobile networks, the Internet or even completely new networks. However, recently the use of the current Internet has been taken for granted.

On the application layer, here consisting out of IoT middleware and user applications, the research is extremely diverse. There are many unique or less unique approaches proposed by researchers in order to connect presumably at least billions of things in a working network.

Still, a significant amount of research that has been put into IoT neither means the field has been sufficiently explored nor that satisfying global solutions have been found. A common person still does not know what IoT is, and the deployment of IoT is only in nascent stages, with the little that has been deployed varying in technology and coverage. Also, the researchers have mostly been

concentrated on building IoT for specific cases, effectively building small isolated networks of things, not Internet of Things but rather Intranets of Things. We didn't find adequate architecture proposals in rest of the research, architecture that could be used as base for all IoT applications. Therefore we designed one architecture that could be used as base for implementing IoT.

The rest of the article is organized as follows. In Section II the state of the art is presented and similar conclusions drawn. In Section III our new architecture for IoT is proposed. In Section IV the conclusions and future work are laid out.

II. Related Work

We will now try to summarize main research directions in IoT architectures. Usually, first ones referenced are architectures backed up by global groups. Some of these architectures will be presented here, but it should be noted that there is not much scientific research based on those architectures and we do not think that they have necessary features for a global IoT. Two ongoing Seventh Framework Programme (FP7) projects will also be presented, IoT-A and OpenIoT, as they are European Union (EU) projects relevant to the local scientific community, but also very large projects with important investors.

First architecture is the EPCglobal project [1]. It is promulgated by the EPCglobal organization, successor of the Automatic Identification (Auto-ID) Labs where the term IoT was coined. The GS1 architecture offers three sets of standards. Those are standards for creating a variety of codes for things, standards for representing these codes by graphics and RFIDs, and standards for manipulating the data captured by reading these codes. It is more concerned with creating business models like supply chains than creating a global network.

The second architecture is the Machine Type Communication (MTC) [2] by Third Generation Partnership Project (3GPP). MTC is a set of standards for communication between different things and the core network. It is focused on implementing the communication through Long Term Evolution (LTE) networks and mobile phones. No upper architecture seems to be emerging. Paper [3] presents a potential one, putting servers and applications over it. Communication is rather complex, requiring a lot of telecommunication knowledge in order to push messages from one side to another.

The third architecture is the Machine to Machine (M2M) [4] done by European Telecommunication Standards (ETSI). M2M aims to create applications, built upon service capabilities, in both the upper layer and the gateways, but also the things, which do not need a gateway in that case. It does so by defining three sets of interfaces. These are M2M application interface, device application interface, and M2M to device interface. There does not seem to be concrete technologies defined.

The fourth chosen commonly referenced architecture is the Near Field Communication (NFC) [5] put forward by the NFC Forum, mainly Nokia. This system is used only for identifying and capturing things. It is already built into many smartphones. It does not seem to aspire to building higher layers, but only uses RFID to communicate with sensors and let them interpret the data.

The most successful of these global groups seem to be the Internet Engineering Task Force (IETF). They have constructed two protocols, the more successful of which is the Constrained Application Protocol (CoAP). Recently, it has generated many research papers and its architectures will be presented a bit later. CoAP alone is not complete architecture. It is a counterpart for the Hypertext Transfer Protocol (HTTP) for resource-constrained devices.

The second protocol is the Extensible Messaging and Presence Protocol (XMPP), an even higher-layer protocol family for near real-time communication. An example system in [6] builds a basic platform for bidirectional communication based on publish-subscribe and request-response.

Currently, various visions of IoT seem to converge in implementing IoT using the current Internet. There are architectures like MobilityFirst [7], which envision a complete overhaul of the current network. The researcher developed a new vision or the internet, with the main goal being extreme mobility of the members, which they see as the ideal environment for the IoT. In the paper they specify exactly how IoT is combined with the network. Still, visions of replacing the current internet seem more and more far-fetched.

Searching for more implementable global architectures, the first thing visible is the huge work targeted on creating small, isolated IoTs, here dubbed "Intranets of Things". After a brief search on, for example, Institute of Electrical and Electronics Engineers (IEEE) Explore, many narrow niches like electronic commerce, smart supermarkets, rural patient tracking smart gas tanks, smart scenic sites, smart food, electronic identities and much more pop out. A good architecture needs to be flexible, meaning it can be used for many use cases, unlike those. Only architectures intended for a global IoT will be further analyzed. Also, there has been much work in order to completely fixate the IoT to the current Internet. Host Identity Protocol [8] has been used for IPv4 and IPv6 Low-Power Personal Area Networks (6LoWPAN) for IPv6. The paper referenced deals with address translations.

Some common architecture proposals will now be presented. The first is Service Oriented Architecture (SOA). An example in [9] outlines a network of service entities. These are connected with services, actually general data, being sent through channels or links. It is just a sketch of a potential model and its behavior.

SOA is borrowed from the Semantic Web, and so is Representational State Transfer (REST). Actinium [10] is an example of a RESTful runtime container for scriptable IoT applications. It uses CoAP for communicating in a real network. The user needs to implement applications in a RESTful fashion to communicate via CoAP, and still seems to only get an Intranet of Things. As already said, CoAP is a HTTP counterpart. But even if HTTP is great, binding to four layers of protocols does not have to be.

Another Semantic Web technology is the Simple Object Access Protocol (SOAP). Paper [11] defines a

things management protocol based on it. It relies on Web Services Description Language (WSDL) to define three types of operations, getting information, getting next information and setting information. It does not provide a higher layer.

The use of the ontologies is presented in [12] in order to refine the crude data received from things. Having defined a data model ontology in Web Ontology Language (OWL) and described data sources, data providers, and the data, and also defining concrete ontologies, an algorithm is provided in order to integrate them.

Another CoAP proposal is [13]. It is focused on the EPC and creates a network using ZigBee on the lower layer and CoAP on the higher, also utilizing Universal Plug and Play (UPnP) for discovery mechanisms.

Paper [14] implements SOA through CoAP with the help of peer-to-peer (P2P). A new P2P protocol is put forward in order to create such networks, used for their Distributed Hash Tables (DHT). All in all it seems rather complex, and we believe that if the Internet of the 80's started with a complex architecture, there would be no Internet of today.

There is also a notion of message-oriented architectures. Paper [15] discusses a message-oriented middleware as a set of devices, which can receive, send, store and forward messages between devices, acting as a temporary database with different channels acting like dynamically created pipes.

Having mentioned P2P, reference [16] presents a system built especially upon it. It uses the DHT for identifying and locating things, and also uses other nodes for publishing services. It is still rather abstract, since it is just a helper network.

P2P is just another way of dealing with scalability. Special systems with a focus just on the scalability have emerged.

Some work is focused on treating IoT as a database. This system [17] creates three storage layers as an IoT abstraction and uses database indexes to navigate it. The idea is expanded with more indexing types and supporting infrastructure.

A common buzzword in the scalability is the self-organization. For example, architecture [18] is based on the nature-inspired algorithm of endocrine systems. It uses so-called hormones to, not interfering with each other, communicate between things and slightly modify their behavior. It does not consider that the things will be joined in local networks.

Another architecture is [19], which presents a middleware platform built upon immobile WSNs, which and then successfully spatially grouped and included to the global network.

Sometimes, there is talk about autonomic architectures, which is not connected with self-organization, but seems to emphasize things cannot work with IP. Paper [20] outlines an architecture based on multiple planes with their agents and protocols to abstract the IP in the communication.

Supposed to complex networks, there are systems for only helping existing networks. For example, Virtual Sensor Editor [21] integrates nodes from different networks using graphical component programming.

There are also security architectures built that way, on top of the networks, which seems to introduce more overhead and effort that just including security.

For example, [22] presents a security system based on the HIP Diet Exchange (DEX), extending the key management protocol by a number of ideas like giving the attacker increasingly difficult puzzles. It is also expanded to other key management protocols, but nothing else.

We believe that, conversely, security should be one of the basic features of the IoT.

Also, simplicity is another requirement. Only when our homes and offices get IoT people will care more about it, and that will not be possible with a complicated network.

Finally, some complete architecture proposals will be presented. Paper [23] shows a system with extremely thin client nodes, where the servers are used for presenting their data. It also presents compressed TCP and compressed HTTP, which are used for communication. No security seems to be emphasized, even though things need to implement four layers.

Paper [24] seems to be a large project for a complete architecture with proprietary physical protocols and IPv6, but it is still a work in progress. Gateway servers are envisioned to be used to connect things to the Internet.

Paper [25] sees IoT as a network of gateways without intermediate servers. Not too much is detailed, but it appears to be intended for Intranets of Things. Still, it is modeled to be modular and scalable.

Paper [26] shows a system based on a SOA spin-off called Event-Condition-Action (ECA). Even though envisioning a complete architecture, only the platform intended for making triggers upon the ECA rule and communication with neighboring layers are detailed.

Reference [27] utilizes a similar system like ours, based on M2M and using HTTP with REST on upper layers. It also enables discovery, connections with non-smart things, associating metadata and actuator control.

OpenIoT project [28] develops an open source middleware for getting information from sensor clouds, without having to worry about what exact sensors are used. The OpenIoT architecture is comprised by seven main elements that belong to three different logical planes. In the Utility-App Plane – the application layer, there are three modules: Request Definition – for users to define requests to the IoT, Config & Monitor – for administrators to configure and monitor the middleware and things, and Request Presentation – for presenting responses from the IoT. In the Virtualized Plane – the service layer, there are three modules too: Scheduler – for handling requests to the IoT, Cloud Data Storage – for a cloud database of the IoT, and Service Delivery & Utility Manager – for

delivering responses from the cloud and tracking metrics of the data. In the Physical Plane – the physical layer, there is only one module: Sensor Middleware – for communicating with the things.

IoT-A [29] creates an architectural reference model for the IoT. Four things are identified as building blocks of the model. The vision summarizes the rationale for providing an architectural reference model for the IoT. Business scenarios & stakeholders are the drivers of the architecture work. The IoT Reference model provides the highest abstraction level for the definition of the IoT-A Architectural Reference Model. The IoT Reference Architecture is the reference for building compliant IoT architectures. The Reference Model mainly defines five things as abstractions. The entity model defines Physical Entities (roughly Devices), Virtual Entities (roughly Services), and Users. The data model defines information types. The functional model defines layers, lower to higher, as Device, Communication, IoT Service, Virtual Entity, IoT Business Process Management, and Application. The communication model defines communication layers, higher to lower, as Data, End to End, ID, Network, Link, and Physical. The security model defines security features and their layering. The Reference Architecture mainly defines functionalities each mentioned actor has to implement. An extensive list of desired functionalities is given. Also, there are UML Use Case Diagrams, UML Sequence Diagrams, and interfaces, defined.

III. OVERVIEW OD PROPOSED ARCHITECTURE

Proposed architecture could be roughly divided into four layers:

1. Things layer
2. Communication layer
3. Data storage and control layer
4. Application layer.

Similar division is presented on most IoT architectures. However, operations on those layers and communication between them differentiates architectures. Fig. 2 presents an overview of presented architecture. Short description of concepts for each layer follows.

Things in things layer have their own operation mode we don't model. We assume they need to communicate with layer 3 to fulfill their purpose. Since things could be various, from very simple battery operated devices to powerful computers, we don't define multi-layer communication stack – communication mechanism is broadcast on physical layer. Other things might catch that broadcast message and broadcast it further. We don't propose special communication protocol on physical layer, any current or future will work. We just need them to carry a message with IoT data (described later).

Communication layer provide connectivity between things and data storage and control layer (layer 3). We assume that gateways could be used in this layer to catch message that things broadcast and forward it (using TCP/IP or some application protocol) to layer 3. Gateways will also forward messages in other direction: from layer 3 to devices.

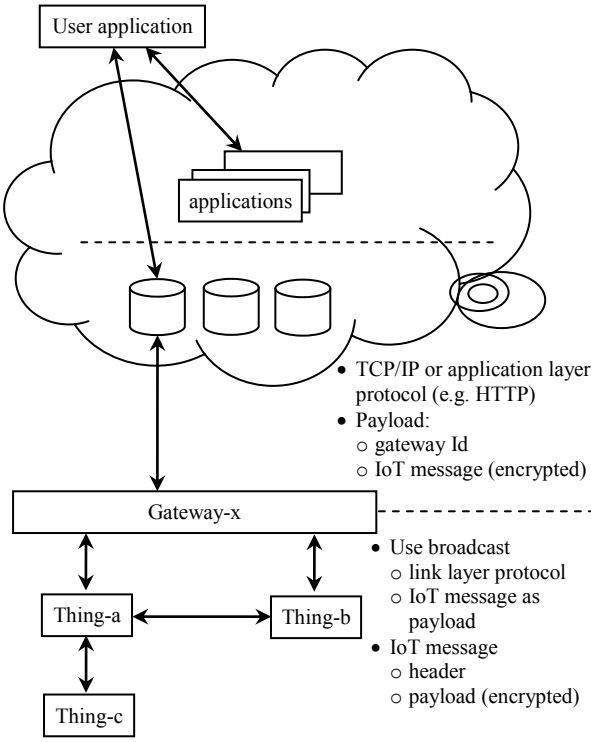

Figure 2. Overview of proposed architecture

Data storage and control layer contains databases with information about devices (and how to reach them - through which gateways), users owning devices, past exchanged information with devices (both received from devices and send to devices), and triggers for control. Triggers could be used to start some action when an event occurs. Events could be simply related with sending and receiving data from one thing or a complex trigger that involves evaluation of received data, combination of data in databases, periodic events (periodically request update from things) and similar. Action on triggers could vary, from simple data retrieval request from things to a start of complex operation implemented in application layer.

Application layer is where things with their data and operations are used for creating some benefit for a end user, such as sensor readings, command dispatch to remote devices and similar. We don't design this layer, we perceive that most required operations in this level can be created using described lower layers we define.

Things with Internet connectivity could act as gateways (directly communicate with layer 3) or connect with gateway using TCP/IP. There is no need to use broadcast if a thing is smarter and can detect internet connectivity, or connectivity with gateway. For connection to gateway it doesn't have to use full TCP/P stack – physical layer protocol could be used, just without broadcast.

Using broadcast in layer 1 looks terribly ineffective, choking the network with packets. However, there are a number of facts helping here. Firstly, the packets are supposed to be short and rare. Secondly, constant ping-pong of the packets must be mitigated using a Time to Live (TTL) mechanism, analogous to the one used by the Internet Protocol (IP). Thirdly, each packet has a local-network identifier. A packet that ends up in a different

local network could simply be dropped. Fourthly, if a thing receives a packet meant for it, it will naturally not forward the packet. Fifthly, as every packet has its identifier so that already forwarded packet can also be dropped.

Some gateways can have a subset of layer 3 functionality, enabling operating with things from local network only, in which applications could use local gateway instead of layer 3 from cloud. Such gateways could still communicate with full layer 3 implementation in cloud (and forward a copy of messages to them).

IV. IoT MESSAGE FORMAT AND SECURITY ISSUES

IoT messages must contain relevant information - payload (per thing specific) but must also contain communication data - header. Header should contain:

a) protocol identifier

b) time-to-live (TTL)

c) thing's identifier (e.g. physical layer address)

d) packet identifier

e) network identifier

f) payload length.

Identifiers could be used to manage messages. A thing can process messages sent to it, broadcast all others or just ones that belong to same network. Packet identifier could be use to manage packet flow (e.g. discard duplicate packets).

Payload could be in various formats but for maximal extensibility we propose simple string, carrying a message (that could be in e.g. Java Simple Object Notation - JSON) with values.

Payload must be encrypted with thing's password (known to thing and layer 3 only). Advanced Encryption System (AES) or similar algorithm could be used to provide sufficient security on this layer.

Gateways could communicate with things on layer 1 with previously described principles. For communication with layer 3 in cloud, standard TCP/IP or some application layer could be used (like HTTP). In a simple implementation, the UDP protocol could be used, where an UDP packet will contain IoT message forwarded from layer 1 or for layer 1. This message could be encrypted with gateway's password (known to layer 3 and gateway only) which could solve security issues on this level.

Security of communication protocols between applications (layer 4) and layer 3 is out of scope of this proposal. For example, some application layer protocol could be used (e.g. SSL).

Management in layer 3 must ensure that only authenticated users (their applications) could manipulate with data and devices that belong to them or they are given appropriate privileges by owners or administrators.

V. COMPARISON WITH IoT-A AND OPENIOT

In this section we compare presented architecture with architectures from projects IoT-a and OpenIoT, as most recent and probably most refined architectures for IoT today.

Comparing proposed architecture with the OpenIoT, the biggest difference is that proposed architecture is incomparably simpler. Proposed architectures is concerned about protocols for communicating with things, protocols for communicating with servers in cloud, definitions of gateways and definitions of a cloud. Also, the Sensor Middleware in the OpenIoT relies heavily on running their web server X-GSN written in Java. In proposed architecture the local network with arbitrary link protocols are used, inside of which is encapsulated our own simple protocol, while gateways speak with the cloud over an arbitrary network layer.

Comparing the architecture with the IoT-A, it is seen that IoT-A defines no physical architecture. Gateways, for example, are only briefly mentioned saying they can possibly be put in the middle to help with the communication. We, on the other hand, put forward actual physical architecture and actual communication. IoT-A only describes what needs to exist, but not how it has to be implemented. Same goes for describing IoT-A communication. Our system is also much simpler (even though ontologically are similar). There are still things, services, and users, here, but the vast amount of requirements listed as functionalities is not considered appropriate for a nascent system. We have only considered basic things needed for a simple IoT.

VI. CONCLUSION

After screening the literature, we didn't found architecture that accomplishes ours requirements of simplicity and generality. We therefore conceptually designed simple, secure and general architecture.

On the lowest level (level 1) contemporary link layer protocols should be used with broadcasting mode for transmission of an IoT packet between things and gateway, which has a communication role in our model (level 2). The IoT packet consists of IoT header and IoT payload which should be encrypted with a contemporary symmetric algorithm using thing's password. Gateways should be used for forwarding messages to and from databases and services located in the cloud (layer 3). Users should observe and control their things with their applications (agents) directly or via the services in the cloud (level 4).

We think that proposed architecture looks promising as a foundation for implementation of tomorrow's IoT. There is a lot of work ahead to prove its feasibility and usefulness with an example implementation.

Abstract - This paper presents design and development process of software solution for the control, acquisition and analysis of the dynamic resistance measurement results for high voltage circuit breaker analyzer devices. Five years' experience in algorithms and software development for the circuit breaker analyzer control and data acquisition and circuit breaker analyzer itself has been summarized in this paper.

I. INTRODUCTION

The design of modern high-voltage puffer type SF6 gas circuit breakers (HVCB) is based on the switching of two parallel contact sets. The first one are the low-resistance contacts – main contacts which are specifically designed to carry the load current without any excessive temperature rise. The second set, tungsten-copper arcing contacts, operate at breaker opening following the main contact part. The electrical arc starts after the separation of the arcing contacts. The tungsten-copper material is designed to carry the arc until it is cleared at the next current zero-crossing value. [1][2]

Measurement of the dynamic resistance of the contact system (DRM) can be used as a tool to diagnose the condition of the arcing contacts. The method consists of applying high DC current through the contact system, measuring voltage drop on the contacts and calculating the resistance waveform during open or close sequence of the HVCB. [3] Relevant information related to contact anomalies, wear and/or misalignment can be obtained by analyzing resistance waveform together with the waveform of the motion of the contact system.

Instruments used to perform measurement of the dynamic resistance of the HVCB are known under the name of Circuit Breaker Analyzer and Timers (CAT). Usually, those are portable field devices with the possibility of generating high current up to 500A and performing measurement with very high sampling rate. [3] DRM Test instrument is used to inject a very high DC current through the contact system, measure voltage drop and current as well as motion of the contact system and calculate the resistance samples. All measurements are obtained with sampling rate of 0.05ms (or higher) and forwarded to the software application system for presentation, interpretation and analysis. [4]

Design and implementation of the software solution has to meet strict requirements for control and data acquisition, follow hardware implementation rules and provide a user with a rich set of features such as report creating, results comparison, appearance adjustment etc.

II. REQUIREMENTS

Design and implementation of this software suite was guided by following these requirements:

- Software Specification Requirements (SRS) defined prior to the development
- Hardware design & implementation specification and features that must be incorporated and supported by software
- Customers feedback

Following those requirements and guidance, the core features of this software are:

- Communication with the instruments - send, handshake and receive using defined communication protocol and firmware command set
- Presentation of obtained results in a graphical and numerical form
- Saving the results in the file format or into the internal database
- Tools for analysis (cursor, results comparison, graphical tools for zoom, pan, adjust operations etc.)
- Report creating, saving and exporting with the customization feature
- Test plan creation prior to going on the field testing and pass/fail tests of the obtained or saved numerical results

III. APPLICATION ARCHITECTURE

Application vertical architecture is structured in the 4 layers:

- Application layer (APP)
- Business Level Logic (BLL)
- Data Access Layer (DAL)
- Communication Layer (COM)

The APP layer contains implementation of the user interface and events. BLL layer is responsible for linking APP layer with DAL and COM layer and creating methods that respond to the events from the APP layer. It also uses DAL and COM layers to perform requested operation.

The DAL layer implements methods related to any kind of work with database and/or storing or exporting results or test plan templates to a file. It is horizontally divided in two groups: database methods and file methods.

The COM layer implements methods for sending and receiving data from the device. It is organized in the logical groups according to the communication protocol selected to work with the certain CAT device being used in a specific test environment

IV. USER INTERFACE ARCHITECTURE

There are three user interface groups: test settings frontend, results viewer frontend and test plan frontend. The test settings frontend must include the following parameter adjustments:

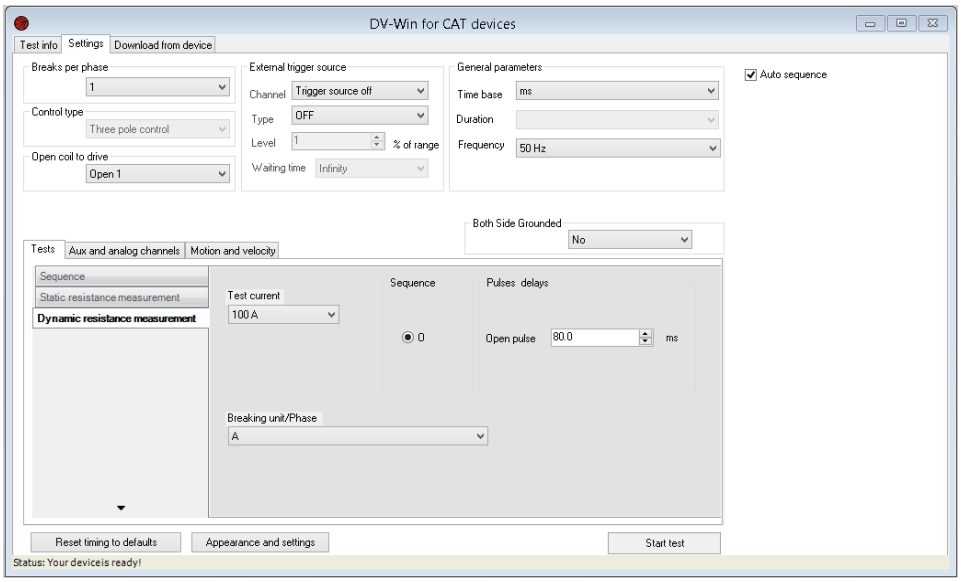

Figure 1. - DRM settings adjustment frontend

APP layer horizontal architecture is organized in the following groups:

- Test settings group
- Results viewer
- Results comparison
- Report generator
- Test plan interface

BLL level contains implementation of the functions and groups of functions such as algorithms, appropriate response to the events triggered at the APP level etc. It is organized in the form of abstraction layers going from the device, device family and specific circuit breaker analyzer within one device family.

- Time base / frequency / resolution
- Open coil to drive
- Test current value
- Sequence selection (C or O)
- Sequence pulse timing (close or open pulse)
- Motion transducer channel
- Motion transducer type (linear or digital)
- Motion transducer unit (mm, inch, degree)
- Motion transducer transfer function type and parameters (linear or nonlinear)

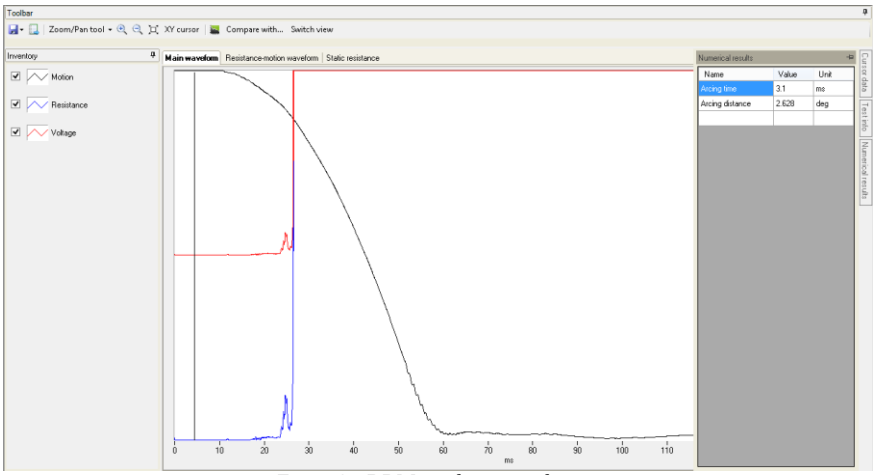

Figure 2 - DRM results viewer layout

Final layout of the frontend is shown in the Figure 1. It is organized in two sections that are related to the DRM testing: "Tests" and "Motion and Velocity". Tab "Tests" contains parameters such as sequence selection, sequence timing etc. Tab "Motion and Velocity" contains parameters related to the motion transducer.

Results viewer contains the following segments:

- Voltage, motion and resistance graphs
- Resistance-motion graph
- Numerical results (static resistance, overlapping time and distance)
- Tools for analysis (vertical cursors, XY cursor, pan and zoom option , comparison with another DRM result)
- Tools for storing results (save to a file or database, save as image or copy graph to a clipboard, create a report)

Layout of the result viewer is shown in the Figure 2.

V. GRAPHICAL PRESENTATION OF THE RESULTS

Main guideline is to provide users with "different flavors" of the graphical results presentation with a high customization ability. For that reason the graphical presentation is provided in two different forms:

- Default view
- Compact view

Default view is the one where voltage, motion and resistance waveforms are presented on one waveform area with invisible Y axis. This view is used to look for intersection in time of certain waveforms since waveforms are auto scaled to the full screen and overlaid.

Compact view is more appropriate if a user would like to read values of certain points in time since in the compact view the waveforms are divided in its individual waveform areas and Y axis is visible.

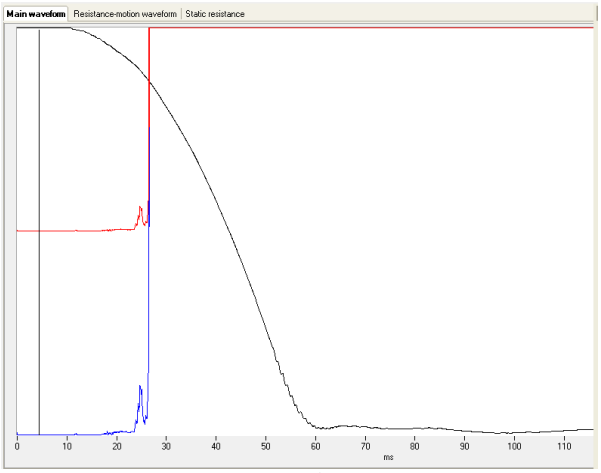

Figure 3 - Default view

It is easy to switch between these two views "on the fly". All tools including all type of cursors are active in both view modes. Customizations such as changing waveform plot color, width, waveform area color, background grid etc. are applicable to both view modes.

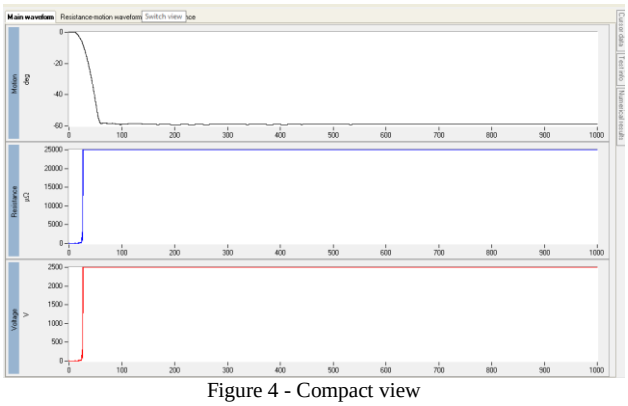

Figure 4 - Compact view

VI. RESULTS COMPARISON INTERFACE

DRM results comparison consists of main graph comparison, resistance-motion graph comparison as well as the static resistance measurement comparison

All waveform plots are overlaid with the possibility of panning and zooming. Main interface is shown in the Figure 5.

Cursor data panel is created according to the presentation in the single result viewer and it is populated with signals from both of the results.

In the inventory panel the user is able to select the results to work on, modify its appearance, show or hide it or pan it along X or Y axis. For improved comfort of the user, there are built in tools such as manual zoom or pan, XY cursor which provide X and Y value for each sample using a mouse pointer, fine X axis zoom in and out as well as an appearance adjustment for each result.

In the appearance adjustment, parameters such as title, line width, line color and style for a single channel in each of the results can be adjusted. However, general parameters such as waveform background color, grid appearance, color and cursors color can be adjusted as well.

Table 1 – HVCB data sheet

Type	SFE 11/ 18 – G
Manufacturer	Energoinvest
Number of breaks per phase	1
Rated voltage	123 kV
Rated short circuit current	31.5 kA
Rated short circuit duration	1 s
Operating mechanism	Hydraulic
Control type	Three pole control
Medium	SF6

As can be seen in the Figure 6, the moment when main contacts separate is the moment when the resistance changes (increases) suddenly for the first time (23. 6 ms). The moment when the arcing contacts separate finally is the moment when the resistance goes to infinity (26.6). The time difference (3 ms) between these two moments is the arcing contact overlapping time.

Based on these two moments and motion curve the arcing contact wipe is calculated (2.53 deg). Since motion is measured with rotary transducer, it is expressed in degrees. When this is converted into contact motion, it

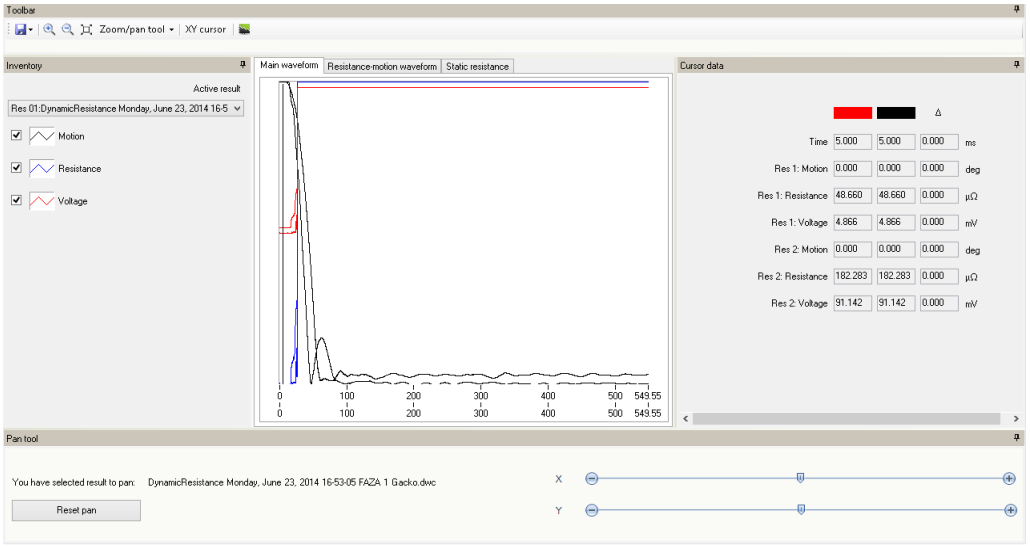

Figure 5 - DRM results comparison

VII. EXAMPLE

For the purpose of the demonstration, a DRM test has been performed on an Energoinvest SFE 11/ 18 – G 123 kV HVCB.

As a measurement tools it has been used circuit breaker analyzer and timer test instrument with the software solution described in this paper. For the analysis purpose, graphical and numerical results have been considered. The dynamic resistance measurement has been performed during trip operation.

Obtained result is shown in the Figure 6.

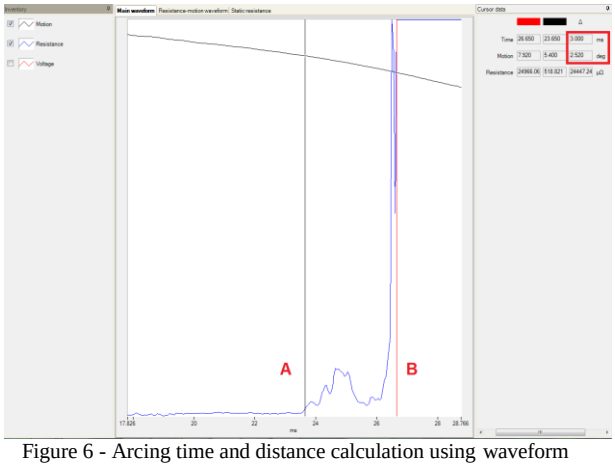

Figure 6 - Arcing time and distance calculation using waveform and cursors

corresponds about 7 mm.

Also, from the waveform of the resistance it can be concluded that there are no abnormalities in the term of outliers or sudden peaks during the arcing contact engagement (A-B in the Figure 6). Furthermore, in the period prior to the A point in time where the contact are still, there is no increase in the voltage and resistance waveform what indicates that the contact force and contact surface in the closed position of the HVCB is good.

These parameters indicate there is no serious damage or wear at the arcing contacts.

VIII. CONCLUSION

During the project development, each iteration has been evaluated according to the customer response and wishes. However, initial project pillars: “make it reliable, accurate, international and enormously ease to use” has been guidance in each iteration and release.

Since high voltage circuit breakers are tested mostly in the field under various weather conditions, testing procedure has to be quick and simple. That is the main reason why software solution user interface simplicity and frontend components arrangement is highly important

Abstract - Nowadays embedded systems are one of the most important application areas in information technology. Embedded systems are often used in life critical situations, where reliability and safety are more important criteria than performance. This paper presents a data collector service that has been developed based on embedded Linux, which operates as a key element in a larger intelligent alarm system. The target of this study was to test out how well a cost-efficient single-board computer could be used to gather sensory data, and how this data can be provided for the client over the public Internet. The paper describes the data collector service currently in use and its functionality and also gives a concrete example of how to utilize a microcontroller with an embedded Linux distribution. The paper presents one solution on how to utilize embedded systems for managing and controlling conditions in buildings and also environmental conditions in a smart and cost-effective way.

I. INTRODUCTION

Sensors are commonly utilized components including various kinds of warning and alarm systems. With the huge development of sensor technology, it has been possible to create minuscule, reasonably priced components, sensors and controllers with ultra-low power consumption. These kind of components are enabled for the rapidly improvement of the sensor networks and therefore it can be seen how sensor network implementations have been applied in numerous different fields of operation. A sensor network consists of single sensors, with the purpose of sensing the surroundings and to forward the collected data. There is a great variety of sensors available and their classification is based mainly on the features of the information collected. These kinds of physical features include temperature, humidity, brightness or air pressure.

In this research, one particular subject was to sense the condition changes in indoor spaces and data collection and entry related to their authentication as well as transmitting them forward. The objective of the research was to construct an automatic service – i.e. a data collector service – for collecting condition data that would, in turn, enable the collection and transmission of condition data for a backup system that exploits and analyzes measurement data as flexibly as possible in real-time. The starting point was the development of a system optimally attending to an independent, selected backup system for collecting, recording and transmitting condition data. The aim was to study and develop a solution that was as simple, reliable, cost-effective and easy to maintain as possible for the defined purpose. In this case, it was decided to implement the solution by adapting a microcontroller with embedded Linux for data collection and distribution. Embedded systems usually adopt embedded Linux as the operating system because of the numerous economic and technical benefits – the Linux kernel sources are well structured so that CPU-specific code is easy to find and is minimized. A prototype for realizing the service in question, which will be presented in detail in this paper, was created during the KiiauData research project in 2014.

The study presented here is part of the intensive collaboration between the Tampere University of Technology (TUT) in Finland and Keio University in Japan. The Global Environmental System Leaders (GESL) Program, ongoing in Keio University's Shonan Fujisawa Campus (SFC), and the Alert system for detecting anomalous situations developed as one of its outcomes serve as the background of the research. One main part of the alert system under development is the *data collector service* which was developed in collaboration by the university partners in TUT Pori, enabled by the ongoing KiiauData (Smart analysis of property systems data) project. One of the main aims of this two-year (2013-2014) project, funded by TEKES [1], was to study potential new technologies for managing and controlling conditions in buildings in a smart way. The expected results of the project will enable providers of products and services in the built environment to form wider and more automated solutions both for new breakthroughs and recognized problems in the smart built environment. The data collector service presented here is one concrete example of the studied and piloted solutions produced during the joint project.

Related research in this specific area – i.e. utilization of a microcontroller with embedded systems – has been conducted by Rakesh et al. [2], for example, who have introduced a system which implements an embedded system for monitoring wireless sensor nodes and a camera installed inside a building for security surveillance. Toshniwal and Conrad [3] have studied how to make a cost-effective network-based sensor monitoring system which is portable for various applications. They have developed Linux-based systems based on desktop architecture with a sensor package, and also another system which used an embedded Single Board Computer

(SBC) together with sensors. In addition, Cheng and Shen [4] have introduced a wireless sensor network communication terminal based on embedded Linux. Voinescu et al. [5] describe a device which can work as a network connection to a single board computer (BeagleBone or similar), where the target was to make an easy-to-use wireless networking device. Sawant et al. [6] studied a device that is capable of making file manager operations with two USB flash drives. Their study gives basic knowledge of using of an ARM-based embedded Linux and touch screen. Banerjee et al. [7] proposed and implemented the design of a secure sensor node prototype. They built the prototype using a single board computer (Raspberry Pi in this case), accelerometer, and Bluetooth dongle. The above-mentioned studies deal with the same research area and have a very close connection to the specific research topic presented in this paper.

The following section (Section 2) briefly describes the background system and Section 3 gives a detailed explanation of how its first part – the data collector service – has been carried out. Section 4 includes a discussion and suggestions for future research on the topic and finally section 5 summarizes the study.

II. BACKGROUND – THE INTELLIGENT ALERT SYSTEM

The basis of the study is the alert system under development in Keio SFC. With this planned system it is possible to collect environmental data for different purposes. The system will make environmental sensing easier in various places by using small sensors, and there are many ways to utilize this collected data. One of the intended applications for using the system is for detecting anomalous situations. The aim of such a system is to handle environmental sensor data collected from multiple locations. In practice, it is not easy to understand the problems inherent in a given place just by looking over a graph of sensor data. Therefore, an alert system is need for interpreting the environmental changes in the space in question and associated problems.

This intelligent alert system consists of three (3) main parts shown in Fig. 1: *the first part* is the collection of environmental sensor data via the new *data collector service. The second part* is the detection of anomalous situations by utilizing the sensor data. *The third part* is sending the alert to where the situations were detected.

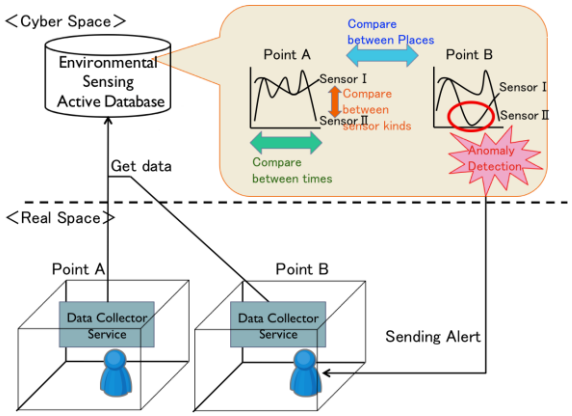

Figure 1. Overview of the Alert system

This particular system targets indoor spaces utilized by the public such as offices, meeting rooms, stations, trains, etc. In this case, the variables being sensed include temperature, light, and humidity. The system automatically collects the sensor data from sensors placed in various places, and analyzes changes over time. As environmental sensor data is collected for a given place over a long time-span, the results become more useful, not only by evaluating the results at one location but also by comparing the results from the sensor data from many locations. Each type of sensor data has four (4) feature values: location information, time, data type, and sensing value. The alert system registers the collected sensing data with an *active database* system in real time. The active database (upper left corner in Fig. 1) automatically reacts in response to detected state change rules that have been pre-defined by the users of the alert system. If an anomalous situation is detected as specified in the active database's rule set, the database system *sends alerts* to the anomalous location. In this case, the role of the active database is to support rule definition, compare data between sensors, compare similar data at different time-points, and compare between different sensor types.

This paper deals with the first part of the alert system, i.e. the *data collector service* (lower left corner in Fig. 1), and does not describe the Intelligent Alert System as a whole. The paper presents the features and architecture, hardware and software components of the developed service, and also the physical connections between the components. The structure of the developed software used for data collection is also described.

III. DATA COLLECTOR SERVICE – IMPLEMENTATION

The architecture of the *Data Collector Service* is shown in Fig. 2. The purpose of the service is to measure light, temperature, and humidity. The sensors used are shown in Fig. 2 (right side). The data can be collected continuously, up to six times a minute. The collected data is then provided as a service for clients, who access the service using the Internet (left side of Fig. 2). In our use case the clients can also be other service providers.

The physical device itself is placed in a public space – TUT's laboratory in this case – to collect data. Attention had to be paid to the physical size of the device as a device smaller than an ordinary PC is easier to install in a public area. In this implementation, the device must also have Ethernet or Wi-Fi capabilities in order to be remotely accessible. These two requirements lead to the use of a device with embedded Linux. The embedded Linux in this context means Linux that can run on ARM-based processors. The embedded Linux devices often have database and web server capabilities, or they can be easily added afterwards. The size of the device's internal mass memory is not critical as long as the device has peripheral ports for external flash memory or Secure Digital (SD) cards.

The integral component of the Data Collector Service, the BeagleBone Black [8], is a low-cost, high-expansion focused SBC using an ARM Cortex-A8 based processor. It can host a Linux operating system and has a 10/100 Ethernet connection and a microSD connector, with 512

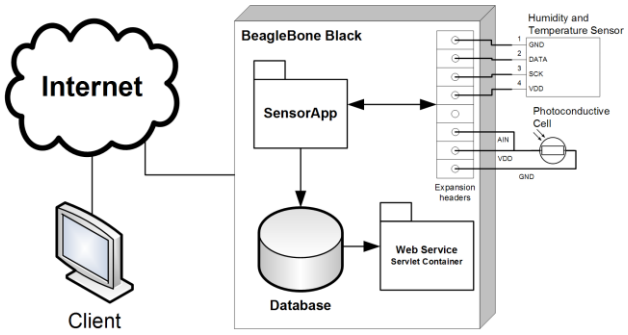

Figure 2. System Architecture of Data Collector Service

MB system memory and 2 GB of embedded MultiMediaCard (eMMC) memory.

The BeagleBone Black has two expansion headers, labeled P8 and P9, which allows the integration of BeagleBone electronics projects [8, 9], and in this research the features of these expansion headers were used. The sub system developed utilizes GND (Ground), 3.3V and 1.8V power, two GPIO (General Purpose Input/Output), and AIN (analog input) pins to drive light, humidity, and temperature sensors.

A. BeagleBone Black with Embedded Linux

The BeagleBone board comes with a pre-installed operating system called Ångström Linux**,** which is a stable and user-friendly distribution for embedded devices and is categorized in the Embedded Linux category. [10] Despite being designed for embedded devices, the Ångström Linux has many of the capabilities that can be found in other full-fledged Linux distributions, such as the X11 windowing system and a substantial amount of software packages in its package repositories.

Some basic Linux server hardening configurations were made to the Ångström Linux for more secure network operation. For example, the system time management was changed to use ntpdate [11], the X11 service was disabled, direct root user access was removed and a new basic user was created which could be used for remote Secure Shell (SSH) access. Python programming language was used together with an Adafruit-BeagleBone-IO-Python library, to utilize the I/O operations of the sensors [12].

The Data Collector Service itself does not utilize the data it collects, as this was to be done by a remote computer with more computing capacity. Thus the Data Collector Service only collects the data and serves it over the Internet for use or as input to the next part of the alert system. We chose to store the data to persistent memory so it could be later accessed by one or more clients. In this case there were no special requirements on how, when and how often the data should be delivered to the remote computer, so the decision was to implement relatively simple server software utilizing the client-server architecture. This way the consumer of the sensor data can decide the most convenient update cycle.

The Data Collector Service provides the data to the clients over a representational state transfer (REST) HTTP/GET [13] interface. Clients may access the interface for historical data from a chosen time interval, or if they choose to, poll periodically for the newest data. By using a short enough polling interval, it would be possible to get near real-time data from the service within the limitations of the computing performance of the BeagleBone platform. The number of new data points per minute would be limited by how often the sensors are read on the Data Collector Service.

The server software was deployed on an Apache Tomcat web server [14] and the sensor readings stored in a MySQL database [15]. In Fig. 2, these two components are called *Web Service* and *Database*, respectively. A third major software component called *SensorApp* also runs on the *BeagleBone Black* platform. The task of the *SensorApp* is to communicate with the *Expansion headers* which are used to drive the physical sensors attached to the BeagleBone Black.

The *SensorApp* and the *Web Service* running on top of the servlet container were written by the project team. The *Database* and *Servlet Container* were written by a third party. Ångström's own package manager provided MySQL, while Apache Tomcat and Java Virtual Machine (Oracle's Java in this case) were installed using their latest available installation packages for Linux operating systems.

Fig. 2 also illustrates the directions of data flow which happen between the components. The *Web Service* can only read data from the *Database*, while the *SensorApp* has read and write access to the device's GPIO headers in order to operate the sensors, and it also directly writes the collected data into the *Database*. For the completeness of the REST interface, the full CRUD (Create, read, update and delete) operations could have been implemented through the interface, but that would have increased the total code complexity of the system. In addition, it would have raised security issues, such as the malicious removal or modification of the collected data. Unauthorized access could be mitigated by the use of access control such as passwords or certificates. In the end, the prime interest was on collecting the data, so keeping outside access as "read only" was the most effective method in terms of computational capacity and code complexity.

Fig. 3 shows the architecture of the physical device with the sensors attached. BeagleBone expansion header

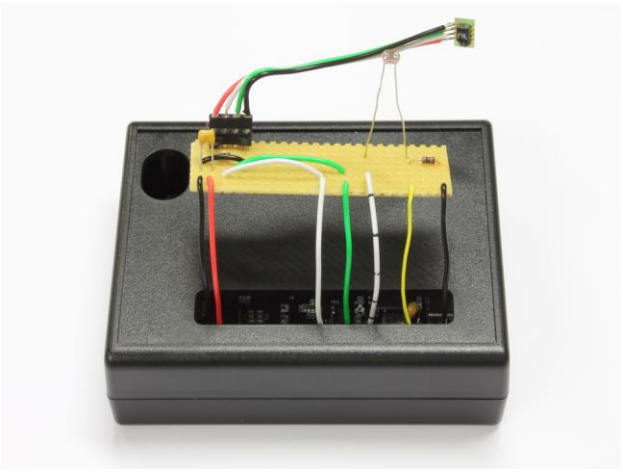

Figure 3. Sensor device used for Data Collector Service

P9 was used to connect the sensors – a photoconductive cell (NSL-19M51 [16]) and humidity and temperature sensor (SHT11 [17]). The photoconductive cell is connected by using a typical application circuit [18]. The humidity and temperature sensor is connected to the BeagleBone by using a datasheet application circuit [17].

B. System Functionality

The web service provides the collected data through one read-only interface. The interface can be accessed by using a simple HTTP GET request. The default query without any parameters returns the ten latest data points. By using different parameters (such as begin_date, end_date, limit and paging) one can request a desired data set from the service. Fig. 4 shows the sequence of accessing the data from the web service. The *Client* connects to the device's *Web Service* interface, which in turn retrieves the requested data from the *Database*. The data is then marshaled into XML format by utilizing JAXB (Java Architecture for XML Binding) annotations and sent back to the client.

As the data is stored to the device's persistent memory, the data can be requested when needed and as often as needed. However, due to the limited computing resources of the platform, a request for a large data set may take a long time or even fail. The code for the web service was not specially written nor optimized for this use case, but merely as a generic proof-of-concept implementation. The marshaling of the XML output at least could have been done in a more memory-efficient way, or a different approach such as JSON serializing could have been used instead. An often-used paradigm is to limit the maximum measurement count to a known safe figure, and use the paging parameter to retrieve the rest of the results. The current implementation appears to cap at around 40000 measurements (or about five days of collected data) on the device, while a desktop machine was able to double that amount (both are with the default Java VM settings). Requesting any more than the aforementioned number of measurements either causes serious degradation of performance, or results in an out-of-memory situation because of the limited memory capabilities of the BeagleBone platform.

The sensor data is collected in a separate process to the web service. Fig. 5 is an illustration of one loop of the sensor reading process. Each loop corresponds to a single measurement point. The humidity and temperature sensor used has its own built-in circuit, and the measurements can take up to 80 or 320 milliseconds at the default accuracy (12 bits for humidity and 14 bits for

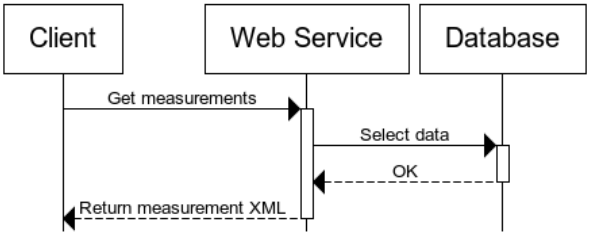

Figure 4. Sequence diagram for accessing the data from the web service

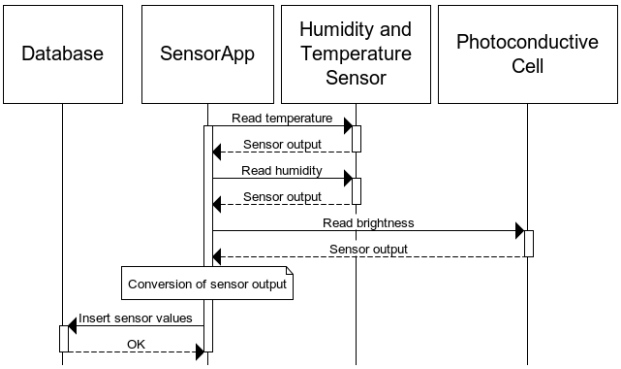

Figure 5. Sensor device used for Data Collector Service

temperature). Also, in order to avoid excess self-heating of the sensor, a maximum of one measurement per second at 12 bit accuracy should be made. [17] These limitations set a theoretical maximum of 15 measurements per minute at default accuracy (when the communication with the sensor is not taken into account). When a lower accuracy (20ms/8bit and 80ms/12bit) is used, a maximum of 60 measurements per minute can be achieved. For this application, it was decided to use the default accuracy and an interval of six measurements per minute.

As can be seen in Fig. 5, first the application reads the raw temperature value for the combined *humidity and temperature sensor*, and then pauses for a while to let the sensor cool down, after which the raw humidity value is read from the same sensor. Then the raw value from the *photoconductive cell* is read. The raw signal values have to be converted before they can be stored to the *database* by using the conversion formulas provided by the manufacturer. After the database has been updated, the application enters sleep mode to attain the desired measurement interval.

IV. DISCUSSION & FUTURE RESEARCH

This paper presents a *data collector service*, which utilizes BeagleBone Black development board with an embedded Linux distribution. The goal was to experiment how well a cost-efficient SBC can be used to gather sensory data, and how this data can be provided to the client over the public Internet. This goal was reached successfully, and the designed system was tested and found to work as planned. Nevertheless, the development process raised several improvement ideas, which could be realized in the future.

One of the issues is the packaging of the sensor system. The current version was a prototype version, and consequently the focus was on making the system functional, both by testing the sensor connections and readings, as well as benchmarking the functionality of the REST API and the software components. This limited the practical usability of the system, for example, making it unfit for use outdoors. In addition, the current software consists of various libraries, programming languages and components, and is as such slightly tricky to install. The software components could be packaged into a single application for easier installation. There is also the possibility to release the source code as an open source release.

The chosen sensor components could also be improved. The serial interface of SHT11 offers good power efficiency, but it cannot be addressed by standard I2C (Inter-Integrated Circuit) protocol, which would make programming tasks easier. In this use case the system is always provided with a continuous power supply and thus better programmability would be a major asset in future studies. In our case, the limited amount of sensor devices to be deployed makes the cost of the single board computer largely irrelevant, though it should be noted that there are other SBCs that are slightly cheaper, but still offer reasonable computing performance. One popular choice is the RaspberryPi (e.g. [19]), which would work – specification-wise – equally well in this use case. Both of these boards offer excellent extension capabilities and can be expanded with additional sensors. The addition of multiple sensors raises another issue, which has not been studied in this research. It is unclear how well the board and the developed system would cope with a very large number of sensors. Also, in this system, all sensors are located very close to the actual board, and thus, the signal degradation can be thought negligible, but this is not necessarily true in large-scale monitoring systems. One example of this kind of system would be the monitoring of an entire apartment complex, where sensors are physically located very far apart and connected to the board by long wires or cables. In this case, it would be possible to deploy a multiple sensor system, but simply using multiple sensors with a single board is a more cost-efficient solution.

In addition to the aforementioned improvement ideas, our future research will focus on topics only briefly discussed in this paper, such as the utilization of the collected data using the designed REST API in various end-user applications.

As can be seen, there are many ways to continue and improve this study. However, the current service produces real-time data regularly and reliably for the benefit of the main system. The prototype developed has proven to be stable and reliable in practice. Work on building the final alarm system is currently ongoing at Keio University.

V. SUMMARY

The paper introduced a prototype system created for sensor data collection and transmission. The presented data collector service is part of a larger alarm system and provides sensor data for the main system. The aim of the study was to test how a single board computer can be used to gather sensory data and how this data can be provided to clients over the public Internet. The paper presented the features and architecture of the developed service, the used hardware and software components, the physical connections between the components, and also the structure of the software. The paper gives a concrete example of how to utilize a microcontroller with an embedded Linux distribution.

***Abstract*—Several ICT technologies are used in the SMILE project for StiMulating IntelLEctual activity with adaptive environment.**

In this paper we give an overview of state of the art of these technologies and discuss possibilities of their integration for realization of a SMILE prototype.

***Index Terms*—Stimulating intellectual activity, Adaptive environment, Social Networks, Tablets, Self-health Care, Avatars.**

I. Introduction

Having in mind that by 2025 more than 20% of Europe's population will be over 65, including a rapid increase in the number of citizens over 80 years old, dealing with the process of aging through facing all challenges and obstacles it imposes, has become one of the greatest social and economic issues of European societies. Normal, optimal and pathological aging are all acknowledged as types of aging in literature, and equally demand further development of different services provided to senior citizens.

Online social networking services, along with IPTV, smart TVs and Internet TVs have been become the most popular and fastest growing services in the recent years.

SMILE concept stands for realization of the project StiMulating IntelLEctual activity with adaptive environment. In this project we plan a promising approach to develop an innovative solution delivered as software as a service that will act as Self-Care Social interactive TV. It includes the integration of social and networking services with interactive TV functionality into one consolidated user profiled service. Such an integration presents difficulties in that their utilisation is based on the fact that the older users are trained to use a TV as passive experience. However, in order to benefit from social TV, users will have to actively interact with the content as well as to communicate and collaborate with others, including self-care systems with physicians or subordinate care givers.

Hence, the selection of integrated services and applications is non-obvious, since it needs to gauge between the comfort of passive content consumption and active contribution. SMILE project promotes the concept of how to integrate interactive multimedia technologies, link interactive TV with a set of sensing units on one side and on the other, how to convenience the user to accept Self-care social services.

The main goal of the SMILE project is to build a prototype solution that integrates several technologies into an interoperable solution using open standards. The activities will include analysis, design, interoperability specification, development of software components, their integration in a software as a service solution, development of application interfaces and adapters to existing popular personalised medical devices, personalised hardware user devices, health related services, social media and third party mind stimulating services.

The innovative character of the prototype solution is in the integration of existing technologies with the goal to support independent living. Besides deploying several components into an integrated and scalable cloud-based solution, the project will also include activities for testing its functional and non-functional performances and product evaluation, including validation, usability and user satisfaction.

The final outcome is the realisation of a commercialisation strategy with a business plan and model; sustainability and market research with awareness raising campaigns, dissemination of results and early product marketing. All planned project activities are aimed at intellectual cognitive stimulation, social inclusion and personalised health-care system increasing independence and quality of life.

In this paper we give an overview of current technologies used for the SMILE project.

The paper is organized as follows. Background information is given in Section II. Section III describes the newest social networking services as tools. The new self helath-care management systems are presented in Section IV. The concept of Avatars and several projects are elaborated in Section V, while Section VI describes the tablets. Section VII discusses the SMILE project. The conclusions and directions for future work are presented in Section VIII.

II. Background

Fig. 1 presents the overall architecture of the Smile concept. The system integrates smart TVs or IPTV with personal computers into everyday life of the elderly with goal to establish better environment for independent living. Integration of technologies such as social networks, adapted for elderly, use of tablets as new human interface specially adapted for elderly, and avatars for presentation of a human assistant in self health care is crucial for the concept.

A typical scenario of use of this system is based on limited capabilities of elderly to communicate via small smartphones

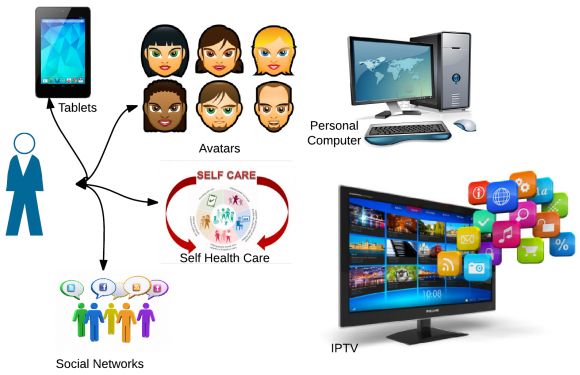

Fig. 1: Architecture of the SMILE concept

and smart TVs, so the idea is to adapt the technology to us of tablets and big TVs as a new adapted human computer interface. The built in camera of the smart TV enables monitoring if the person is in the room. The system offers a welcome message, and list of recommendations supported by the self-care system. In addition any other person (from a list of friends) who is also in the system will be presented in the TV and the person can establish a communication by voice activation or using a tablet with appropriate use of big icons and relevant touchpad.

IPTV can present content which is required to support mental activities of the elderly and keep them in good mental heath. Increased interaction is in the essence of using tablets and Smart TV systems. Besides the self health care recommendations and social network interactions, the system offers interactive content that keeps the elderly mentally active. Most of these stimuli activate corresponding centres and ensure a good mental shape of elderly avoiding content, which they just stare at, without any mental activities at all.

III. Social Networks

Put simply, social networking is a way for one person to meet up with other people on the Internet. A social networking service is a platform to build social networks or social relations among people who, for example, share interests, activities, backgrounds or real-life connections. People use social networking for meeting new friends, finding old friends, or locating people who have the same problems or interests they have, called niche networking [1].

Most social network services are web-based and provide means for users to interact over the Internet, such as e-mail and instant messaging and they incorporate new information and communication tools such as, mobile connectivity, photo/video/sharing and blogging [2]. Online community services are sometimes considered as a social network service, though in a broader sense, social network service usually means an individual-centered service whereas online community services are group-centered. Social networking sites allow users to share ideas, pictures, posts, activities, events, and interests with people in their network [1].

The main types of social networking services are those that contain category places (such as former school year or classmates), means to connect with friends (usually with self-description pages), and a recommendation system linked to trust. Popular methods now combine many of these, with American-based services such as *Facebook*, *Google+*, *YouTube*, *LinkedIn*, *Instagram*, *Pinterest*, *Tumblr*, and *Twitter* widely used worldwide; *Nexopia* in Canada; *Badoo*, *Bebo*, *VKontakte* (Russia), *Delphi* (also called Delphi Forums), *Draugiem.lv* (mostly in Latvia), *Hi5* (Europe), *Hyves* (mostly in The Netherlands), *iWiW* (mostly in Hungary), *Nasza-Klasa*, *Soup* (mostly in Poland), *Glocals* in Switzerland, *Skyrock*, *The Sphere*, *StudiVZ* (mostly in Germany), *Tagged*, *Tuenti* (mostly in Spain), and *XING* in parts of Europe; *Hi5* and *Orkut* in South America and Central America; *Mxit* in Africa; and *Cyworld*, *Mixi*, *Orkut*, *renren*, *weibo*, and *Wretch* in Asia and the Pacific Islands [1].

Social networking tools are increasingly the object of scholarly research. Scholars in many fields have begun to investigate the impact of social-networking sites, investigating how such sites may play into issues of identity, privacy [3], social capital, youth culture, and education [4].

While the popularity of social networking consistently rises, new uses for the technology are frequently being observed. At the forefront of emerging trends in social networking sites is the concept of ”real-time web” and ”location-based.” Real-time allows users to contribute contents, which is then broadcast as it is being uploaded - the concept is analogous to live radio and television broadcasts. *Twitter* set the trend for ”real-time” services, wherein users can broadcast to the world what they are doing, or what is on their minds within a 140-character limit. *Facebook* followed suit with their ”Live Feed” where users’ activities are streamed as soon as it happens. While Twitter focuses on words, *Clixtr*, another real-time service, focuses on group photo sharing wherein users can update their photo streams with photos while at an event. *Foursquare* gained popularity as it allowed for users to ”check-in” to places that they are frequenting at that moment. *Gowalla* is another such service that functions in much the same way that Foursquare does, leveraging the GPS in phones to create a location-based user experience [1].

IV. Self Health-Care Measurement Systems

The research in the information and communication technologies area has helped the development of automated concepts to be used in personalized healthcare. This implies that we are entering the e-Health era. Newly developed self healthcare systems are characterised by new ways of healthcare delivery through a broad range of teleservices. However, providing ubiquitous access to high-level healthcare for everyone, anytime, anywhere requires the real integration of the various technological platforms [5]. One of today’s most promising essential new technologies in ICT is most certainly IPTV (Internet Protocol Television) which changes the perspective

of the way end users consume TV services, but also serves as a platform for new ideas and concepts in other areas, such as medicine, science and industry. It is considered as a technology that brings significant contribution in different scientific areas, as well as technology assisted living, mainly personalized self health-care systems based on e-Health diagnosis and monitoring. Such personalized system is defined by Mlakar et al. [6] which present UMB-SmartTV, a novel platform that combines traditional IPTV services with multimodal-based non-IPTV services (automatic speech synthesis, speech recognition ambience control). It is important to note that any service within IPTV in this platform can be operated by using speech. The core of this platform is IMS, which is combined with a distributed DATA architecture in order to merge IPTV services and other non-IPTV services. This systems consists of four main blocks, described as follows. The first block, named Content core, represents an application server for content production and presentation. The second block is named IMS core. In the context of IPTV system, IMS represents multimedia service platform architecture. The third block is named Multimodal services. It actually represents the novel contribution of this platform- a distributed system intended for providing non-web speech-based multimodal services (automatic speech recognition, automatic text-to-speech synthesis, virtual assistants, home automation, personalization, etc.). Finally, the fourth block is named Environment controller, which controls several devices in the household (either by using TV remote, keyboard, mobile device, or speech)[6]. Another example of contributing to the designing of personalized health care systems is given by Pustivsek et al. [7]. Their research focuses on the development of a personal health telemonitoring application integrated into the IPTV home communication environment. The application enables monitoring of blood pressure and body weight, with rather common sensors and weight scales that have built-in communication interfaces, thus taking medicine to a whole new level. The application also supports on-line medical interviews. The user interface is manageable by a simple TV remote-control. Furthermore, enhancing advancement in the field of medicine is the goal of the FP7 EU-funded Vital Mind project [8], [9]. Here, instead of improving the diagnostics (remote measurement of blood pressure and weight), the goal is increasing the lifespan of the elderly by enabling them to actively participate in mind fitness exercises while watching TV by using a combination of cognitive psychology, the TV medium and advanced interactive ICT. This is done by new methods for users control, production of Authoring and Production tools for IDTV STB and the development of usage of USB Flash-Device-UFD as an alternative to a broadcast delivery system [9].

Komninos et al. [10] have introduced HealthPal, which is an intelligent, powerful and adaptive health monitoring dialogue-based system, which aims at assisting the elderly people control and manage their health condition on a regular basis, without relying exclusively on their doctors or caretakers. The implementation of the HealthPal system is based on a combination of advanced of-the-shell medical engineering, PDA, WLAN, mobile computing and natural language text and speech processing technologies integrated into a common, open and intelligent medical suite, in order to guarantee that the user's communication with the system is efficient, convenient, and interactive and that it does not pre- requisite any technology skills on behalf of the user.

V. Avatars

Avatars have been defined in [11] as online manifestations of self in a virtual world, and are designed to enhance interaction in a virtual space. This definition is extended by adding that avatars allow the user to take on a visible persona within a virtual world, providing them the opportunity to engage in surreal and imaginary experiences that transcend the actual world in which they live. Hemp et al [12] define avatars as the most conspicuous online manifestation of people's desire to try out alternative identities or project some private aspect of themselves. The word 'Avatar' originally described the incarnation of the Hindu god Vishnu and was popularized in its cybersense by Neal Stephenson in his 1992 cult novel Snow Crash. Not only does this term describe complex beings belonging to a shared virtual reality, but also any visual representation of a user in an online community. For example, more than seven million people have created Yahoo avatars, simple but personalized cartoon-like characters used as pictorial signatures in activities ranging from instant messaging to fantasy sports. [12]. Gusev et al. [13] explores the design technology of avatars in order to increase the lifespan of the elderly by providing the active aging of the newly developed personalized self health-care system.

Besides for entertainment purposes, avatar concepts can also make a huge difference in the area of social networking, education, as well as personalized self-care.

Researchers in their discussion of online object-oriented environments, claim that virtual environments have the potential to enhance social interaction. They comment that the anonymity of interacting in the virtual world via a programmable avatar often enables individuals to communicate and express themselves in ways they may have been incapable of doing otherwise. Katz and Rice [14] found evidence that cyber-relationships facilitated by the use of virtual environments generally proved to be robust and long lasting. Similar claims have been promoted by Antonacci et al. [15] in their discussion paper on the use of avatar virtual worlds in education. They state that virtual worlds hold considerable potential as powerful mediums for learning. Consistent with previously conducted research, they define the existence of benefits in three key areas:

1) Virtual worlds give users the ability to carry out tasks that could be difficult for them in the 'real world' due to constraints, including cost, scheduling or location;
2) Virtual worlds' persistence provides continuing and growing social interactions, which can serve as a basis for collaborative education;
3) Virtual worlds adapt and grow to meet user needs [15].

Also, engagement in virtual environments enables students to experience learning opportunities that would not normally have been easily accessible, including role playing, operating simulated equipment, designing and building things, or creating simulations of physical or procedural processes.

Furthermore, Oestreicher et al. [16] introduce iBot2000, which is a "virtual interactive robot that can display different characters, so that it can look like a robot or a human being; designed differently to attract various audiences, whether for corporate use, children or academia". Some of it's advantages include attractive presentation of learning content, inviting to repeatedly studying content for intensified learning of details, learning at any place with web access, customisation of teaching to specific groups of ages, overcoming certain language barriers, etc. Nevertheless, this robot has its disadvantages, such as its complexity that may present a number of adoption problems to interested universities. Also, different learning styles in respecting to different students' individualities suggests an additional problem for instance, such virtual environment may be for some students too distracting and could cause a negative effect on their pursuit of a good degree. This is expected to be overcome in the the future [16].

Morie et al. [17] state that one of the main benefits of virtual worlds is their persistent nature. Because of the activeness of the virtual space, scientists are enabled to place virtual sensors where needed to record various forms of data. This data can be used to enhance VW forms of telehealth therapy. These system can be further customized to benefit patient-therapist needs. According to Morie et al. [18] Virtual Worlds (VWs) are not the same as Virtual Reality, because of the fact that they provide much easier accessibility, as all a user needs is a computer and an Internet connection. VWs are connected social spaces, so that many hundreds or thousands of users can be concurrently online. VWs also allow for highly focused forms of environments that can be specially built and targeted to assist in any healthcare process that is delivered by them. Finally, almost all VWs provide the means for a participant to create and customize their avatar with which they will navigate the world and interact with others. These characteristics of VWs allow them to make inroads to the healthcare field as an emerging type of "telehealth care." Traditional telehealth care provides several proven advantages that complement traditional, face-to-face health care, including accessibility from rural locations, remote patient monitoring, reduction in need for travel, fostering a positive client-patient relationship, providing enhanced continuity of care, reduction of hospitalization, as well as overall savings in cost of care, even with increased contact [18].

One example of personalized healthcare avatars is defined by Morie et al. [17]. They introduce "a novel method for engaging an amputee in rehabilitation activities delivered through an advanced telehealth mechanism using virtual worlds". This system places the avatar, being the graphical, embodied representation of the user, as the basic, most essential element through which each user accomplishes all socialization in the newly developed Virtual World (VW). Any avatar can be customized or personalized to a range of appearances, from cartoony to fairly realistic. Avatars can even be made to look like animals, fantastic creatures, or robots. By each particular user having their own avatar, all VW participants interact avatar to avatar. The VW allows hundreds of users to be logged on at the same time. This system functions in the following way: the data containing the newly developed virtual world is stored on server-side computers. A user downloads a software client that runs locally on his computer, synchronizing to the data server in a continuous real time process [17].

Finally, elderly people can benefit from the integration of avatar concepts in telemedicine. An example of this is presented in [19] where it is stated that "older adults benefit from information and communication technology solutions and services in the Ambient Assisted Living (AAL) domain". The aim of the AALuis project is to offer a practical solution for adapting user interfaces and services to changing needs and wishes of older adults in a flexible way by providing various devices and I/O modalities. This research describes the approach for the integration of an avatar into the generated user interfaces. The user interfaces aim to provide consistent look and feel for different services to interact using the user's preferred modality [19].

VI. Tablets

Conceptualized in the mid-20th century and prototyped and developed in the last two decades of that century, tablets became popular in 2010. A tablet computer, or simply tablet, is a mobile computer with display, circuitry and battery in a single unit. Tablets are equipped with sensors, including cameras, microphone, accelerometer and touchscreen, with finger or stylus gestures replacing computer mouse and keyboard. Tablets may include physical buttons, e.g., to control basic features such as speaker volume and power and ports for network communications and to charge the battery. An on-screen, pop-up virtual keyboard is usually used for typing [20].

A. Features

Tablet features include [20]:

- Hardware
  - High-definition, anti-glare display
  - Wireless internet connectivity (usually with Wi-Fi standard and optional mobile broadband)
  - GPS satellite location
  - Front- and/or back- facing camera(s) for photographs and video
  - Lower weight and longer battery life than a comparably-sized laptop
  - Bluetooth for connecting peripherals and communicating with local devices
  - Docking station: Keyboard and USB port(s)
- Software
  - Mobile web browser
  - Reader for digital books, periodicals and other content

  - Downloadable apps such as games, education and utilities
  - Portable media player function including video playback
  - E-mail and social media
  - Mobile phone functions (messaging, speakerphone, address book)
  - Video-teleconferencing
- Data Storage
  - On-board flash memory
  - Ports for removable storage
  - Cloud storage options for backup and syncing data across devices

Besides a touchscreen and keyboard, some tablets can also use these input methods:

- Accelerometer: Detects the physical movement and orientation of the tablet. This allows the touchscreen display to shift to either portrait or landscape mode. In addition, tilting the tablet may be used as an input (for instance to steer in a driving game).
- Ambient light and proximity sensors, which help distinguish between intentional and unintentional touches.
- Speech recognition
- Gesture recognition

Tablets, like conventional PCs, run multiple operating systems (though dual-booting on tablets is relatively rare). These operating systems come in two classes, desktop-based and mobile-based (”phone-like”) operating system. Desktop-based tablets usually are thicker and heavier, require more storage, more cooling and give less battery life, but can run desktop applications such as Photoshop in addition to mobile apps and have more ports, while mobile-based tablets are the reverse, only run mobile apps.

B. Use

Sony Mobile revealed its Xperia Z2, proudly describing it as ”the world’s slimmest and lightest waterproof tablet”. ”It is perfect if you want to take it into the bathtub, to the beach, to the pool”, Sony Mobile official Almos Szabo said at the Japanese manufacturer’s stand in the world’s largest mobile industry fair.

Yet, according to Informa, only 20% of tablets are connected to the mobile network, the rest relying on wifi. During the last iPad launch, Apple showed a promotional video with thousands of different ways that people can use their iPad including mountain bikers, surfers, and doctors. I think that is how they would like to show the iPad is being used, but it is mainly in the home, streaming media, streaming movies said Julian Jest, analyst at the technology research house Informa. The classic profile of a tablet user, is actually a person lounging on the sofa watching videos or playing electronic games. In 2012, a poll by Google showed that only 21% of users took their tablets out of the home.

VII. Discussion

To the best of our knowledge so far, there are no integrated commercial solutions, which can bring social network on IPTV, along with health self-care. The SMILE concept could make the European ICT industry more competitive in the forthcoming years. Modularity and interoperability of the SMILE components, as well as, wide exploitation of each of the deployed technologies, guarantee the scalability and a long-term influence of the integrated SMILE solution for the European market. The technologies to be integrated into the new system are widely available across Europe, and will be accessible in a gender-neutral and accessible way, without ethical implications.

The SMILE project aims at design and development of the following measurable outputs:

- Demonstration multimedia box with specially developed remote control that integrates the pro-posed hardware and software solutions into an intuitive, user friendly and highly sophisticated interactive system;
- An interoperable platform with wireless communication to the medical sensors that will measure relevant health parameters, process the results and store in a cloud-based environment, and interact with physicians, which provide medical advises;
- An avatar environment for increased interactivity between users and the prototype system;
- A notification system with reminder capabilities, interchanging information with social media, calendars, contacts;
- A solution as a service that integrates newly designed interactive user interfaces and self-care system with social media, including contacts, comments, blogs, photos, communication,
- Hardware and software specification for cross-platform interoperability, including mobile phones, tablets, external medical devices, and third party services;
- Application Programming Interface (API) for remote control integration both in hardware and software;
- Demonstration and evaluation of the prototype;
- Dissemination of results, raising awareness, and commercialisation strategy including sustainability.

These outputs promote independence, prevent or delay the deterioration of wellbeing resulting from ageing, illness or disability and delay the need for more costly and intensive services.

Our approach is therefore to prevent older people, which are particularly vulnerable to social isolation or are alone due to loss of friends and family, mobility or income. Social isolation and loneliness impact upon individuals’ quality of life and wellbeing, which effects health and increase dependence on health and social care services. The interventions to tackle social isolation or loneliness include befriending, mentoring, Community Navigators, social group schemes. People using befriending or Community Navigator services are less lonely and less socially isolated.

Some studies recorded that older people who were part of a social group intervention had a greater chance of survival than those who had not such service. Therefore the aim of the project is to develop interoperable ICT solutions with services to reduce social isolation or loneliness, strong partnership arrangements also to ensure the self-care services. In order to achieve a given objective the research needs should be carried out on actions that include different genders, populations and localities. There also exists an urgent need for controlled trials that incorporate all standardized services for life quality with minimised costs.

The overall project readiness level is positioned as TRL 7 (system prototype demonstration in operational environment), since it realises all intermediate stages of observing basic principles, specifying technology concepts and designs, experimental proof of concept, validated technology in lab environment, followed by validation and demonstration in relevant and operational environments. It follows the whole life cycle of product development: from idea, concept analysis and research, design, development, verification and validation, performance and security evaluation, application demonstration, market analysis, business modelling and commercialisation strategy, sustainability analysis, product marketing and dissemination of results, determining a path from lab to market, analysing possibilities for third parties involvement in an open standard product realisation.

VIII. Conclusion

So far there are no published articles or projects that are targeted at the same goal to develop a self-care social interactive TV system as a Service, which is the aim of the SMILE project. There are a lot of projects and papers about the relevant technologies, however not the integrated approach, which is the key innovation in this project.

We conclude that using the newest information communication technologies could be customised to be used by the older people in order to improve their life, without being isolated by the environment, loneliness, as well as to ensure the self-care services. This paper analyzes and presents several technologies in this direction.

Android-Powered Web Server for Volunteer-Based Environment Sensing

D. Skvorc, M. Orsic and S. Gros
University of Zagreb, Faculty of Electrical Engineering and Computing, Zagreb, Croatia
dejan.skvorc@fer.hr, marin.orsic@fer.hr, stjepan.gros@fer.hr

Abstract - Many people today are using smartphones and similar forms of mobile computers in every aspect of their lives as a standard and undetachable personal outfit. Besides the significant amount of computing power, storage capacity, and communication capabilities, these devices are equipped with a set of embedded sensors. This makes them not only sufficient for being a reliable on-site assistants, but also powerful enough to deliver sensory information collected from the environment to the remote users through the Internet. Having an open community of smartphone users involved as data sources into the environment sensing program reduces the need for a dedicated sensory infrastructure preinstalled throughout the environment, yet providing a satisfactory level of territory coverage. The necessary prerequisite is, however, that users can contribute effortlessly, with minimum or no overhead compared to a normal smartphone usage.

In this paper, we present a prototype implementation of an Android-powered web server for autonomous capture and delivery of sensory information from a mobile device to the remote users. A modular software framework is described for seamless extension of the server with support for new types of sensors as new models of devices appear on the market, while still providing basic level of interoperability with these sensors until the server gets upgraded.

I. INTRODUCTION

Since around 2005, when user-generated content entered the mainstream usage on the Internet [1], many popular web services owe their success to the people's addiction to share their work with others. *Wikipedia*, *Youtube*, *TripAdvisor*, different social networking sites, discussion groups, and blogs are all examples of web services where the content delivered to the users is not created by the service providers themselves, but by the open user community [2]. Even before, the *BOINC* infrastructure [3] that was originally developed to manage the *SETI@home* project [4], has based its operation on the Internet users willingness to share the idle time of their desktop computers for mass-scale data processing used to cure diseases, study global warming, discover pulsars, and do many other types of scientific research. All of these systems and services are examples of volunteer-based distributed computing where individual users contributes to the community either with their computing resources, intellectual work, or creativity in content creation.

While the benefit derived from user-generated content and volunteer-based computing for the service providers and users is clear, the benefit to the contributor is less obvious. The motivation for contributing with user-generated content or other types of computational and intellectual resources ranges from altruistic, to social, to materialistic [1]. Due to the strong dependence on and high value of volunteer-based activity, many sites use various models to encourage users to participate in their ecosystems as contributors [5, 6]. Models based on implicit incentives do not reward users with material goods, but allow them to build social status within the community. These models target people who feel good as active members of the community. Examples of social popularity metrics are number of likes someone gains on his/her *Facebook* post, number of *Twitter* followers, or number of pageviews of uploaded *Youtube* video. On the other hand, models based on explicit incentives refer to tangible rewards. These can either be expressed in direct financial payment, but also through vouchers, coupons, frequent traveler miles, etc. Example is the crowdsourcing-powered Internet marketplace *Amazon Mechanical Turk*, where individuals and businesses publish human intelligence tasks that computers are currently unable to do and pay monetary payment to users for their completion [7].

In our research, we apply the concepts of volunteer-based computing to build an infrastructure for environment sensing. Traditionally, environment sensing systems required dedicated sensory equipment preinstalled throughout the environment. Except being costly for initial installation and maintenance during the operation, such an approach also suffers from territory coverage, which is limited to locations where service operator has installed the equipment. There is, however, a lot of underutilized sensory equipment available in existing and emerging wearable devices, smartphones being one of the most representative ones. Many people today are using smartphones and similar forms of mobile computers in every aspect of their life as a standard and undetachable personal outfit. Besides the significant amount of computing power, storage capacity, and communication capabilities, these devices are equipped with a set of embedded sensors, such as GPS receivers, cameras, microphones, accelerometers, compasses, thermometers, barometers, etc. This makes them not only sufficient for being a reliable on-site assistants to their owners, but also powerful enough to deliver sensory information collected from the environment to the remote users through the Internet.

The idea behind the volunteer-based environment sensing program is to utilize sensory, computational, and

communication resources of ordinary smartphones to collect sensory information from the device's physical surrounding and to deliver them to the interested end users or applications through the Internet. Although the expected reliability and accuracy of such information is inferior to those provided by professional dedicated equipment, their availability, low cost of system installation and maintenance, and extensive territory coverage due to the widespread use of smartphones makes the concept interesting for non-mission-critical applications. However, since the concept is highly dependent on the voluntary contribution of open community of smartphone users, the necessary prerequisite is that users can contribute with as little additional effort as possible, compared to a normal smartphone usage.

In this paper, we present a prototype implementation of an Android-powered web server for capture and delivery of sensory information from a mobile device to the remote users. Once started, the web server autonomously reads the information from device sensors and delivers them to the connected clients. Since it does not require any user intervention during the operation, even passive or lazy users are able to contribute as much as most eager ones.

Since different types of client applications require different rates of delivery of sensory information, the web server supports two modes of operation. Using the standard HTTP protocol [8, 9], the information from device sensors is available to a client application on request. The application receives a snapshot of the sensor readings at the time of placing a request. This enables the application to have the information delivery rate under control. On the other hand, the web server also supports the communication using the emerging *Websocket* protocol [10, 11, 12]. This enables the application to establish a permanent communication channel with a remote device and to receive updates as soon as sensor readings change on the device.

Smartphone-powered web servers are terminal components of a more comprehensive distributed computing infrastructure for volunteer-based environment sensing. This infrastructure also includes core components for volunteer location tracking, search, discovery, etc. However, these components are out of scope of this paper.

The rest of the paper is organized as follows. In Section 2, we briefly describe existing projects whose goal is to transform an ordinary smartphone into a web server. Section 3 describes the device-agnostic sensor server architecture that enables the design of a single version of web server transparent to the variations in devices' hardware equipment. In Section 4, we present a web-server self-configuration procedure used to autonomously generate the URI scheme and the REST interface based on the available set of sensors on a given device. Section 5 describes the development model used to upgrade the web server with support for new types of sensors. Section 6 concludes the paper.

II. Related Work

Having a web server running on a smartphone is not a new idea. There are several general-purpose web server implementations available for Android and other operating systems for mobile devices.

NanoHttpd [13] is a lightweight HTTP server designed for embedding in Java applications. It fully implements the features of HTTP 1.1 protocol version and supports the *Websocket* protocol with low memory overhead. Since *NanoHttpd* is written in Java and is available as open source software, the integration with Android applications is seamless. The project shares similarities with our implementation regarding the support for both HTTP and *Websocket* protocols. However, *NanoHttpd* is a skeleton web server implementation that enables application developers to add content and functionalities to the server as necessary for specific application. The web server we present in this paper is integrated with Android sensor framework with strong focus on a modular architecture that enables easy extension of the server with support for new types of sensors.

Jetty [14] is a Java-based web server and servlet container intended to run on standalone server machines. It supports HTTP, *Websocket*, and SPDY protocols. *I-Jetty* [15] is a port of *Jetty* to the Android platform. It is implemented as an Android service [16, 17]. Once started and configured, it continues to run in the background, listening on a specified port. Application-specific functionalities are exposed to remote clients through Java servlet technology [18]. *I-Jetty* is similar to our implementation in terms of function and smartphone user experience. They both run as an Android service in the background, thus enabling the smartphone owners to perform other tasks on their devices without interruption.

DroidPHP [19] provides a lightweight Android web server which runs PHP and MySql based applications. It enables developers to create fully functional PHP applications based on dynamic web pages and run them on an Android-powered device. With PHP being the most frequently used server side language, *DroidPHP* provides a powerful Android server platform for creating web applications. The project demonstrates the capability of mobile Android-powered devices to execute tasks normally expected from a larger and more powerful standalone server computers. This underpins our hypothesis that contemporary smartphones and similar wearable devices are powerful enough and useful to act as mobile web servers.

III. Device-Agnostic Sensor Server Architecture

Android-powered smartphones and tablets are equipped with various built-in sensors for retrieving data about device motion, orientation, and environmental conditions. While the diversity of underlying hardware produced by different vendors is satisfactory hidden from the application layer by the Android operating system and corresponding API, the number and types of sensors still vary significantly from device to device. Moreover, new types of sensors emerge as new models of devices appear on the market. Since this type of diversity is inherently

present and cannot be hidden from the application layer, we designed a device-agnostic sensor server architecture independent of the number and types of hardware sensors available on a specific device. This architecture enables web server to operate with all available sensors from any existing and future device, without the need to customize the internal server organization to any specific device. The main objective of the proposed architecture is to provide:

- minimal set of functionalities for any type of sensor, even for those that do not exist yet, but will emerge with new types of devices
- full set of functionalities for the selected types of sensors

A. *Integration of Android Sensor Framework and the Web Server*

In Android operating system, data collected from sensors are made available to the applications through Android sensor API [20]. Android sensor API is designed to enable the inspection of available sensors on a particular device and access to all of the device sensors in a uniform way. In addition, it allows for customization of data handling logic for particular sensors to specific needs of an application. Main classes and interfaces exposed to applications through Android sensor API are: *SensorManager*, *Sensor*, and *SensorEventListener*.

SensorManager is used to retrieve the list of sensors available on a specific device. It is also used to register listeners to sensors, which are then triggered once a sensor's state changes.

Sensor represents a default class that is used to access a single sensor, regardless of its type. It contains the information about the sensor type, name, vendor, power usage etc. *Sensor* class enables uniform access to any type of sensor and is thus independent of any hardware- or device-specific configuration.

SensorEventListener is an interface used for receiving notifications from the *SensorManager* when the state of a particular sensor has changed. To get notifications from sensor in an application, application developer implements custom event listener that implements the *SensorEventListener* interface. Custom listeners receive raw sensor data from the hardware sensors represented as a list of floating point values. Customization of these data into an appropriate application-specific format is up to the application developer.

Fig. 1 shows a common pattern of integration of Android sensor framework into an application and emphasizes how we use this pattern to design a device-agnostic sensor server architecture. Using the *SensorManager* class, application developer registers a sensor-specific listener with a selected type of sensor. Sensor-specific listener acts as a bridge between hardware sensor and the application. On one hand, sensor-specific listener implements the *SensorEventListener* interface to be able to receive notifications when sensor state changes. On the other hand, it allows application developer to implement the internal logic for customized handling of the data received from the sensor. Sensor listeners are registered with sensors during the application run-time, usually during the application startup.

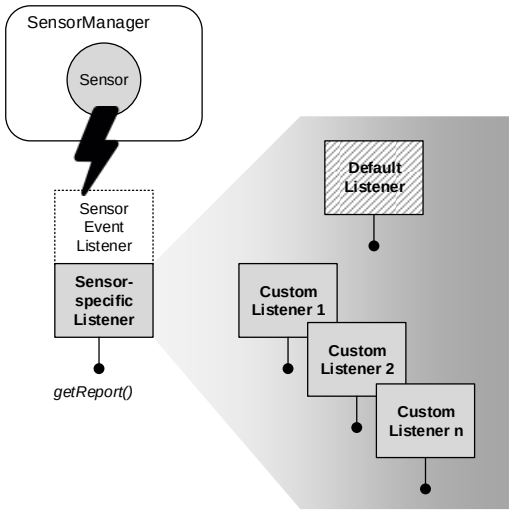

Figure 1. Implementation of the device-agnostic sensor server architecture using a common Android sensor framework design pattern

Using this common pattern of accessing Android sensor framework, we designed an architecture that supports both existing and emerging types of sensors that will appear in the future. For each type of sensor that is common in already released devices, we provide a specific implementation of custom sensor listener. Each of these listeners receives the raw data from the hardware sensor and reformats them according to the semantics of a specific sensor. The web server then uses the *getReport()* method to read the latest sensor readings and sends the data to the remote client. To support new types of sensors that will appear in the future, we provide a default sensor listener. It is registered with all sensors of unknown type. Default sensor listener is a generic type of listener that receives the raw data from the hardware sensor, but does not do any sensor-specific data formatting. Data are delivered to the client in raw format and is up to the client to interpret the semantics of the sensor data.

IV. Self-Configurable Web Server for Android Sensor Framework

Device-agnostic sensor server architecture described in Section 3 enables the development of a single version of the web server that is ready to run on any type of Android-powered device, regardless of the available sensory equipment. In addition, such architecture enables the web server to configure its interface to the remote clients according to a specific capabilities of the target device. The procedure of a web server self-configuration is shown in Fig. 2.

A. *Sensor Discovery and Listener Setup*

Initialization of the web server begins with sensor discovery. The Android operating system keeps tracks of the state of each sensor, as well as their types, power consumption, etc. This information is available to applications via *SensorManager* class. At the startup, the web server uses the *SensorManager* to retrieve the list of available sensors on a device it is running on.

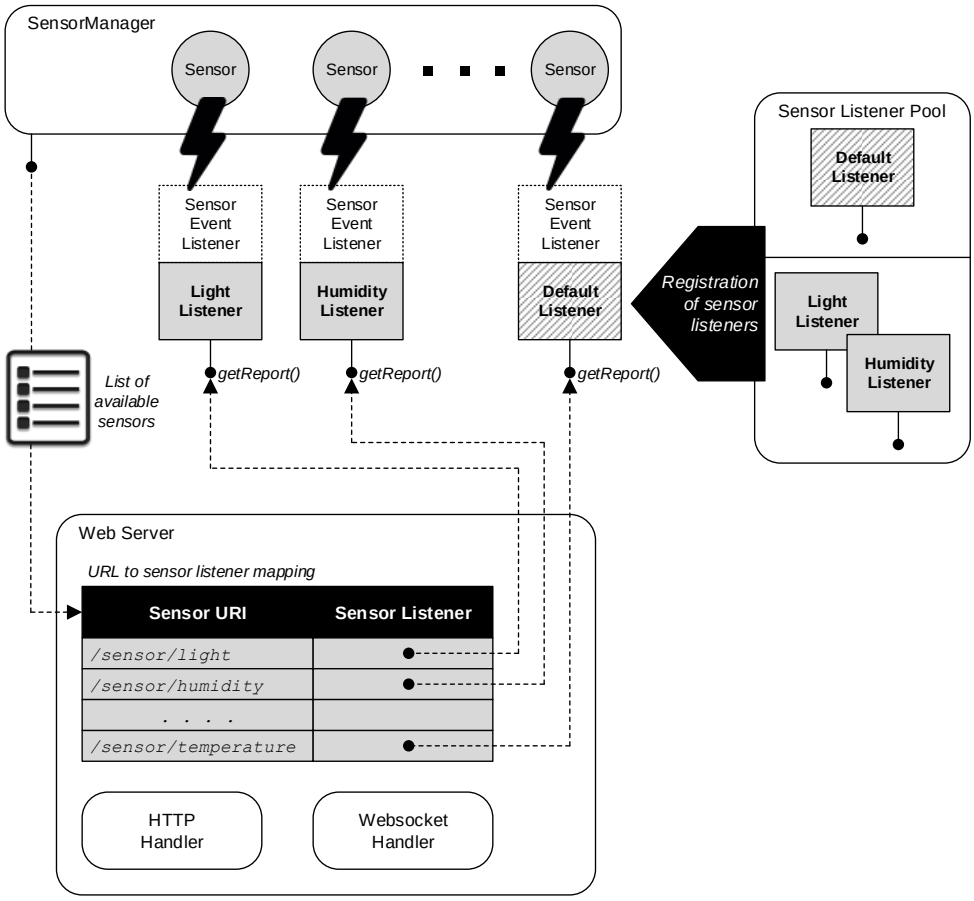

Figure 2. Self-configured web server for Android sensor framework based on the device-agnostic sensor sever architecture

SensorManager delivers a list of *Sensor* objects, each of which represents a particular hardware sensor.

The next step is to register a listener with each sensor in order to be able to access sensor data. Web server iterates through sensor list retrieved from *SensorManager* and inspects the type of each sensor. Then it searches through the pool of sensor listeners to check if there is any sensor-specific listener assigned to the given type of sensor. If so, it registers an instance of the listener with the sensor. If no sensor-specific listener is found in the pool, the web server registers an instance of the *DefaultListener* with the sensor. The role of the *DefaultListener* is to provide a minimum functionalities necessary to expose raw sensor data of unknown sensors to the web server. At the end of this procedure, each hardware sensor has associated listener with public *getReport()* method exposed through which the web server retrieves the sensor data when clients ask for them.

The example shown in Fig. 2 illustrates the scenario in which the web server is aware of the existence of light and humidity sensor, but does not yet have support for top-notch device that comes equipped with a temperature sensor. Therefore, it instantiates specialized listeners to handle light and humidity sensors, but uses the default listener for temperature sensor. The light- and humidity-related data sent out to the clients will be formatted according to their semantics, while the data read from the temperature sensor will be sent out in a form of raw floating point values. Until the web server gets upgraded with full support for handling temperature-related data, this mode of operation provides a minimal necessary support for remote clients to retrieve these data.

B. *URI Scheme Construction*

Final step in web server initialization is to build a URI scheme for exposing sensory data to remote clients through a REST interface. Each sensor needs to be associated with a URI through which remote clients can access sensor data. Since the number and types of sensors vary from device to device, the URI scheme is also different on different devices.

For particular device, the URI scheme is generated dynamically during the web server startup based on the list of available sensors retrieved from *SensorManager*. Based on the type of a particular sensor in sensor list, the web server constructs a URI for each sensor and maps the URI to the instance of the sensor listener registered with that type of sensor during the sensor discovery phase.

C. *Dual Protocol Support*

Sensory readings are formatted into HTML snippets and delivered to the remote clients using standard HTTP protocol. Responses are generated using HTML templates, which get filled with requested sensory data. Although the sensory data representation format may be adapted to the specific needs of particular applications, HTML is chosen as a default format in order to be easily displayed in clients' web browsers.

Using HTTP protocol to read sensory data is satisfactory for sensors whose state stays stable for a relatively long period of time, or for applications that do not require frequent updates of sensor state. However, there are situations where a constant feed of data is crucial for correct operation of an application. For example, if a client is interested in getting info on temperature or atmospheric pressure, a single HTTP request followed by the server's response may be enough for a period of few hours because temperature and pressure are changing slowly. This, however, does not hold true if client is interested in using device's motion sensors for gathering GPS coordinates to calculate speed or routes. Frequent delivery of updated sensory data using HTTP protocol makes communication inefficient due to the fact that each update requires new HTTP request-response cycle.

To make the communication more network-efficient, the proposed implementation of the web server also supports the *Websocket* protocol. Using the *Websocket* protocol, a permanent network connection is established between the client and the server, so a stream of data can flow through the network continuously. To get updated sensor reading, the client does not need to send new HTTP request to the server for each update. Instead, the server pushes the data to the client when they changes on the mobile device. *Websocket*-based communication enables near real-time updates of sensory data in client applications. Besides being network-efficient, *Websocket*-based communication also saves device's battery life because no need for repeating client's HTTP requests significantly reduces the amount of network traffic received through a device's wireless network interface.

V. Web Server Upgrades to Support New Types of Sensors

Proposed architecture enables seamless introduction of new modules if the web server needs to be upgraded to provide full support for new types of sensors that appear with new models of Android devices (e.g. radiation sensor). To support a new type of sensor, we need to develop new sensor-specific listener that replaces the default listener.

Fig. 3 shows the object-oriented design pattern used to develop new sensor-specific listener. The listener is developed by subclassing the *DefaultListener* class. Since the *DefaultListener* already implements the *SensorEventListener* interface defined in Android sensor API, each new subclass is compatible with Android sensor framework to receive notifications about sensor state changes. This is achieved by exposing the *onSensorChanged()* method, which is invoked by the Android sensor framework. Subclassing the *DefaultListener* allows the developer to redefine the raw sensor data handling and formatting by overriding the *getReport()* method. Once the object instantiated from new developed listener class gets registered with device's *SensorManager*, the web server will use this object instead of the *DefaultListener* to retrieve sensor data. This, in turn, enables the web server to get the sensor data in their sensor-specific, rather than raw form, and to deliver them to the clients preformatted.

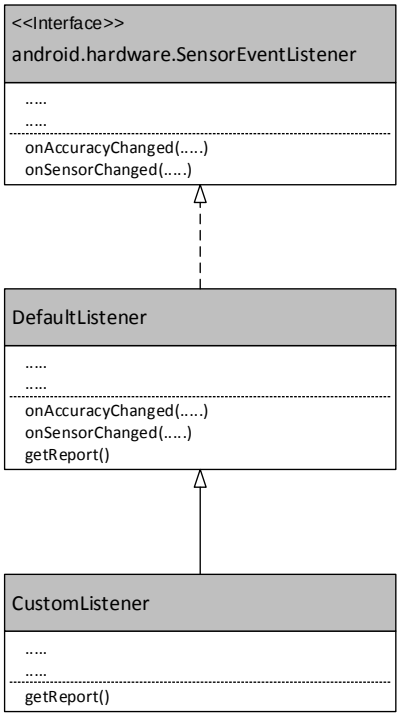

Figure 3. An excerpt of the class diagram that enables the extension of the web server with custom sensor listeners

VI. Conlusion

In this paper, we present the concept of exposing a smartphone's sensor framework to the remote users or applications through the Internet. To make sensor data available for remote access, we present an implementation of a web server for execution on Android-powered mobile devices. The purpose of the web server is to operate as a component of a volunteer-based environment sensing infrastructure where smartphones are used as terminal devices to collect and deliver sensory data from their surroundings to the remote clients.

Each individual sensor is exposed to clients through REST API via HTTP and *Websocket* protocol. The web server is implemented as an Android service, which is a special type of Android application component that can perform long-running operations in the background. This enables that smartphone owners can contribute to the environment sensing program, while at the same time regularly and unobtrusively using other applications on their devices. Since the number and types of available sensors vary from device to device, special attention is paid to the modular web server architecture that enables dynamic creation of URI scheme based on the available set of sensors, as well as default data handling for unknown types of sensors. However, the architecture is modular and enables seamless integration of sensor-specific data handling modules as new types of sensors are introduced with new models of devices.

***Abstract*—Diving is a dangerous activity during which diver's safety is significantly compromised, both due to unpredictable environment and dependence on technical systems for life support. Introducing the concept of a cognitive autonomous underwater vehicle (AUV), that is capable of guiding, observing and assisting the diver at all times, requires precise positioning of the AUV relative to the diver. While diver orientation can be measured locally on the diver and transmitted to the underwater vehicle using acoustic communication channels, the problems of limited bandwidth and communication delay can influence the quality of AUV positioning. Another approach, which is considered in this paper, is to use remote sensing techniques, i.e. mono or stereo camera on board the AUV, to determine orientation of the diver based on markers placed on the divers shoulders. As an initial step, laboratory experiments were conducted where orientation of two physically coupled spherical markers is determined by using mono and stereo camera, and compared to the ground truth orientation obtained from an inertial measurement unit. The obtained results prove the concept in laboratory conditions, with the limitations imposed on the distance of markers relative to the camera.**

I. Introduction

Diving is an extremely dangerous activity not only because of the hazardous and unpredictable underwater environment in which divers operate, but also because of the fact that divers lives depend on technical equipment such as breathing regulators. One of the main objectives of CADDY project is to introduce an autonomous underwater vehicle that will act as cognitive robotic diving buddy, thus significantly reducing risks inherent to diving activities (see Fig. 1). This autonomous vehicle will act at the same time as a buddy "guide", leading the way for the diver; buddy "observer", looking out for the diver; and buddy "slave", helping the diver execute specific tasks. In order to achieve these functionalities, the vehicle has to perceive the diver (determine diver's position and orientation) in order to be able to position itself around the diver while at the same time keeping the diver within its field of view.

This work is supported by the European Commission under the FP7-ICT project "CADDY - Cognitive Autonomous Diving Buddy" Grant Agreement No. 611373.

Fig. 1. A diver and a remotely operated underwater vehicle working together.

Underwater environment imposes many constraints on technical systems. Estimating orientation of a person, which can easily be done on dry land with inertial measurement sensors, becomes a non-trivial task. Sensor has to be placed in a waterproof casing and the data transfer at distances longer than a few meters has to be done either by acoustic communication or by wired link. Given the very high price of an acoustic communication system and many constraints caused by having a wire connected to a diver, it is reasonable to explore other remote sensing options.
In this paper we address the problem of estimating orientation and distance of a diver for the purpose of positioning an autonomous underwater vehicle (AUV) which serves as a cognitive diving buddy. As an alternative to having a sensor mounted on the diver and needing to transmit the data to our vehicle we are using video cameras to record the diver. Our vehicle is equipped with a stereo and a mono camera, both of which were used for the task.
To cope with often poor visibility issues, caused by water turbidity or low lighting, we are using highly visible body markers to mark predefined body parts of a diver. Altho-

ugh diver detection and distance estimation can be done in various conditions even without the markers, estimating the orientation is much more tricky if a distinct marker (e.g. mask or air tank) is not visible in the image. As a starting point in diver orientation estimation, this paper focuses on laboratory experiments on dry land. Even though this setup significantly simplifies the situation which is expected in the underwater environment, this step is crucial for determining the proof of concept. Separate approaches by both mono and stereo camera are taken to calculate the orientation and distance based on the detected spatial positions of the markers.

The paper is organized as follows. Sections II and IIi describe the principles of using mono and stereo camera for determining positions of visual markers, while Section IV describes how orientation is determined from the obtained data. Section V focuses on the experimental setup and reports results from laboratory experiments, while the paper is concluded with Section VI.

II. Mono Camera

The first approach that was used in estimating the orientation was by tracking the spatial position of two distinct visual markers with an ordinary mono camera.

It is clear that mono cameras have a major limitation in tasks that include estimating distances from objects. It is impossible to give a good estimate of depth from a single image and without any prior knowledge. In [1] authors use supervised learning to train a model for depth estimation in a single still image. Other approaches include estimating depth from video of a moving camera based on optical flow [2], [3].

For the problem of determining diver orientation, we are using a much simpler solution of estimating depth from the perceived size of a familiar object. Given a reference size of an object in pixels at a known distance, we are estimating the change of distance from the changes in size.

If an object is recorded at two different distances z_1 and $z_2 = sz_1$, the ratio of object areas in pixels in the two recordings P_{1pix}/P_{2pix} is equal to the ratio of areas A_2 and A_1 captured by the camera.

$$\begin{aligned} P_{1pix}/P_{2pix} &= \frac{P/A_1}{P/A_2} = \frac{A_2}{A_1} = \frac{a_2 b_2}{a_1 b_1} \\ &= \frac{k(2z_2 \operatorname{tg}(\alpha/2))^2}{k(2z_1 \operatorname{tg}(\alpha/2))^2} \\ &= \frac{z_2^2}{z_1^2} = \left(\frac{sz_1}{z_1}\right)^2 = s^2 \end{aligned}$$

In the formula above, P_{1pix} and P_{2pix} are the sizes of the recorded object in pixels when the object is recorded at distances z_1 and z_2 from the camera. A_1 and A_2 are areas of the field captured by the camera at distances z_1 and z_2. s is the ratio of distances z_2/z_1, α is the horizontal field of view angle and k is the height-to-width aspect ratio of the image $k = b/a$. All values are depicted on Fig. 2. Given that the ratio of object area sizes is inversely proportional to the square of the ratio of distances, square roots of object area sizes or any linear measure of objects (such as height, width or radius) are linearly inversely proportional to the ratio of distances. This enables us to estimate the unknown distance to the object by measuring it's size and knowing size at a reference distance.

$$z_{curr} = z_{ref}\sqrt{\frac{P_{ref,pix}}{P_{curr,pix}}}$$

Also, several measurements, such as area, width and height, can be combined to give a better estimate.

For the lateral movement from the camera two approaches are considered. Firstly, pixel size at a given distance can also be estimated from a pixel size at a reference distance and estimated depth of an object. However, it is reasonably to assume that the markers mounted on a human body (e.g. on the shoulders) maintain constant mutual distance l. This enables the calculation of relative positions of the markers, given the previously calculated depths z_1 and z_2.

$$\begin{aligned} t &= \sqrt{\frac{b_{pix}}{b}} \\ t &= \sqrt{\frac{(x_{2,pix} - x_{1,pix})^2 + (y_{2,pix} - y_{1,pix})^2}{l^2 - (z_2 - z_1)^2}} \\ x_2 &= (x_{2,pix} - x_{1,pix})/t \\ y_2 &= (y_{2,pix} - y_{1,pix})/t \end{aligned}$$

In the equations above, t is the ratio of distance measured in pixels and actual distance. It is calculated as a ratios of distance b, marked in 3. The numerator, b_{pix}, is the distance in pixels, and the denominator, actual distance b, is calculated from the previously calculated depth difference between the two markers. Based on the ratio t marker locations can be transformed from pixels to millimeters.

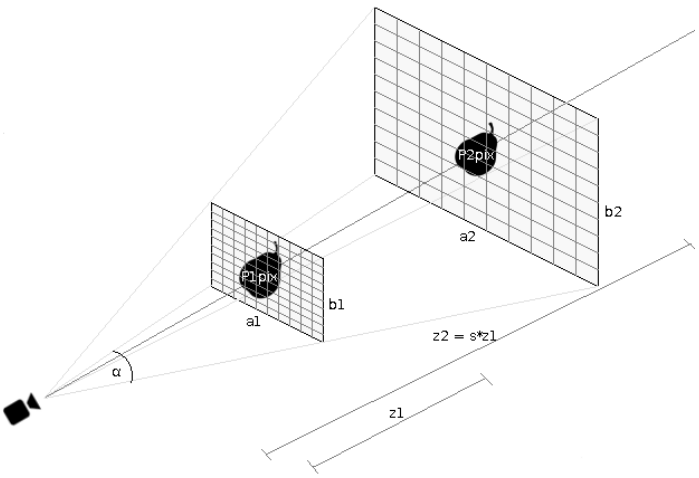

Fig. 2. Visualization of object recording at different distances.

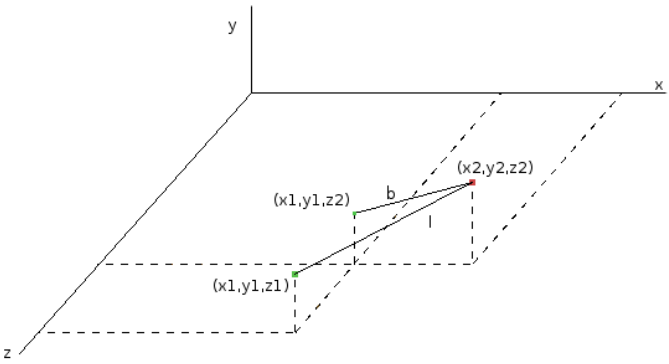

Fig. 3. Visualization of object recording at different distances.

III. Stereo Camera

In the second approach, orientation was estimated by using stereo camera. Stereo vision system is used to determine depth from two or more images taken at the same time from horizontally shifted cameras.
The calculation of depth includes the following steps of processing pairs of stereo images:

1) Calibration of a stereo camera system
2) Stereo image rectification
3) Search for correspondence points in stereo pair
4) Calculating distance from disparity

The process of calibration is to determine the estimation of the intrinsic parameters for each camera and estimation of the translation and rotation of the second camera relative to the first one. This is accomplished using a calibration plane with an asymmetric checkerboard. Multiple pairs of images of a calibration pattern is needed to calibrate the system. Detailed explanation of calibration process are omitted but can be found in in [4].
Estimated parameters are used to rectify a stereo pair of images. Rectification is a transformation process used to project two or more images onto a common image plane, which reduces the 2D stereo correspondence problem to a 1D problem (see e.g. [5]).
Now corresponding point in left image can be found in the same row in the right image. Points chosen are centers of the markers. Disparity is calculated as distance between corresponding pixels in the left and right image as

$$d = |x_{1pix} - x_{2pix}|$$

where x_{1pix} is x coordinate of the corresponding pixel in the left image and x_{2pix} is x coordinate of the corresponding pixel in the right image. Now we can tell that the geometry of the stereo camera system is known, meaning that x, y and z coordinates of the markers can be calculated as

$$z_p = T * \frac{f}{d}$$
$$x_p = x_{lpix} * \frac{f}{d}$$
$$y_p = y_{lpix} * \frac{f}{d}$$

where T is the distance between two cameras, f is the focal length, x_{lpix} and y_{lpix} are the coordinates of the coordinate system from the left camera.

IV. Orientation From Spatial Coordinates

After obtaining the spatial coordinates of both markers by either of the methods described in previous sections, orientation of the diver (e.g. assuming the markers are mounted on his shoulders) can be calculated by simple trigonometry. For representation of the orientation Euler angles yaw and roll are used.

$$\psi = \text{arc tg}(\frac{z_2 - z_1}{x_2 - x_1})$$
$$\phi = \text{arc tg}(\frac{y_2 - y_1}{\sqrt{(z_2 - z_1)^2 + (x_2 - x_1)^2}})$$

Here ψ is the yaw angle around the z-axis and ϕ is the roll angle around the x-axis. The position of the markers on a diver is shown in Fig. 4, along with the rotation axes. Calculation of all three angles cannot be done from only two markers and would require a third one.

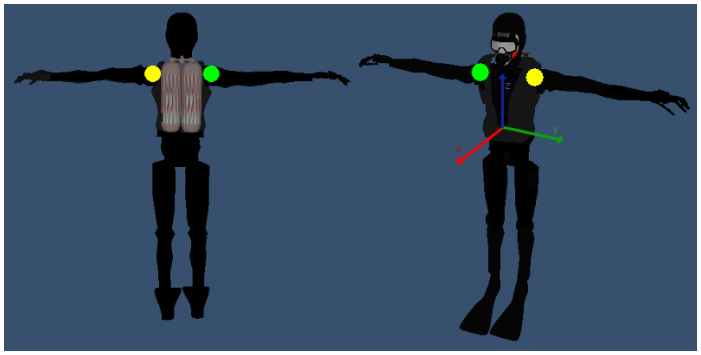

Fig. 4. Position of the markers on a diver and coordinate system of the diver for calculating orientation.

V. Experimental Setup and Results

To test the accuracy of the proposed systems an experimental setup consisting of two items (visual markers) mounted on opposite ends of a pole was used. An IMU sensor was used to provide reference orientation during the recording with a mono and a stereo camera. The setup is shown in Fig. 5.

Fig. 5. Experimental setup for visual orientation estimation.

A. IMU Reference Orientation

A Pololu MinIMU-9 was used to obtain reference orientation. It includes three 3-axis sensors, measuring acceleration, angular velocity and magnetic field. All sensors were sampled at 50Hz and time-stamped. The independently measured nine degrees of freedom enables the calculation of absolute orientation in space. Data from the three sensors is processed by a complementary filter described in [6] in order to get a precise estimate.

B. Visual Marker Detection

1) Mono Camera: Video acquisition was performed with an ordinary computer web camera in VGA resolution (640x480) for the mono orientation estimation experiment. Frames were captured at average of 15Hz and time-stamped to allow direct comparison to the IMU reference orientation.
Template- and color-based detection were used to obtain the positions (in pixels) of the x and y coordinates of the markers, and to give an estimate of the marker size in pixels.
Color-based detectors were used to simply distinguish pixels matching the marker colors in the image and find the areas that are most likely corresponding to the markers. This method allows for simple size estimation by counting the pixels that are matched to each marker.
For the template-based detection, OpenCV template matching library was used on a multiple scales of the marker image and the results were used to estimate the position and depth of the markers.

2) Stereo Camera: For the stereo video acquisition a monochromatic Point Grey Bumblebee XB3 was used. The camera has three sensors distanced at 12cm apart, allowing three separate stereo pairs to be formed for a single shot. Frames were taken at 5Hz and also time-stamped for comparison to the IMU.
The markers used in stereo vision test were spherical, so the detector used Hough Circle Transform [7].

Table I
Standard deviations of differences between orientations obtained by IMU and visual sensing.

	$< 1m$	$3m$
mono camera roll	$\sigma = 3.58°$	$\sigma = 10.54°$
mono camera yaw	$\sigma = 8.16°$	$\sigma = 24.14°$
stereo camera roll	$\sigma = 2.53°$	$\sigma = 7.67°$
stereo camera yaw	$\sigma = 4.01°$	$\sigma = 12.23°$

C. Results

In this section we present the results of the visual orientation estimation.

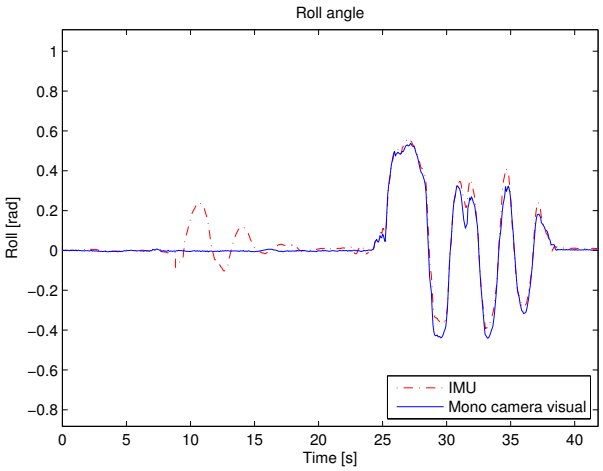
1) Mono Camera: Tests with the mono camera were conducted by tracking two almost-spherical markers whose diameter is approximately $10cm$. As expected, the depth estimation based on size change is heavily influenced by the distance to the object. The tests were conducted at two distances.
First, the setup was moved at distances between 0.5 and 1.0 meter from the camera. Results from those tests are visible in Fig. 6. The orientation obtained from the visual tracking is very accurate and closely follow the one obtained with the IMU. Then, the same markers were used at a larger distance from the camera. This impairs the ability of the marker detector to give a good estimate of the size, as well as limits the resolution of the detected marker size in pixels. The results shown in Fig. 7 show the orientation calculated when the setup was at slightly over 3.0 meters from the camera.
Standard deviation from the reference orientation obtained with IMU is shown in Table I.

2) Stereo Camera: Unlike the mono-based orientation estimation described above, the stereo based one does not suffer as much on longer distances from the accuracy of object size and position detection.
Tests were conducted with the same spherical markers as for mono camera. The distance between the markers and the camera was $1m$ in the first trial and $3m$ in the second one. Results of two trials are shown in Fig.8 and Fig.9.
Standard deviation from the reference IMU orientation is given in Table I.

VI. Conclusions and future work

This paper presented the results of laboratory experiments that were designed to determine two angles of orientation (yaw and roll) of physically coupled spherical markers by using mono and stereo camera. These markers will at a later stage be mounted on the divers shoulders, and will be used to determine diver's orientation relative to the autonomous underwater vehicle equipped with the cameras.

The initial results have shown that, at least in controlled laboratory conditions, both mono and stereo camera can be used to determine orientation. Since calculation of yaw and roll angle requires distance of the object to the camera, the experiments were carried out at two distances.



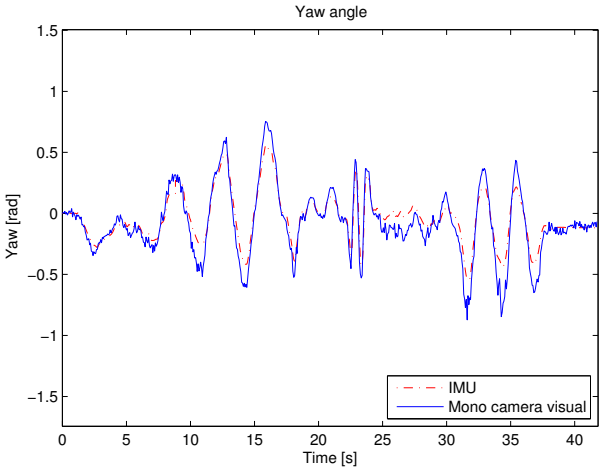


Fig. 6. First trial with mono camera, movement induces changes in both yaw and roll angles. Distance from the camera $< 1m$

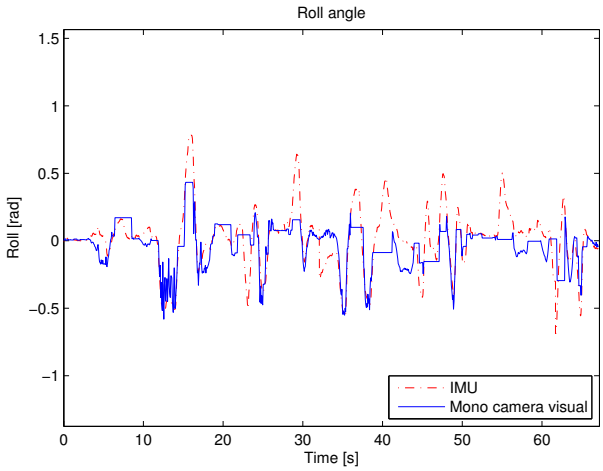

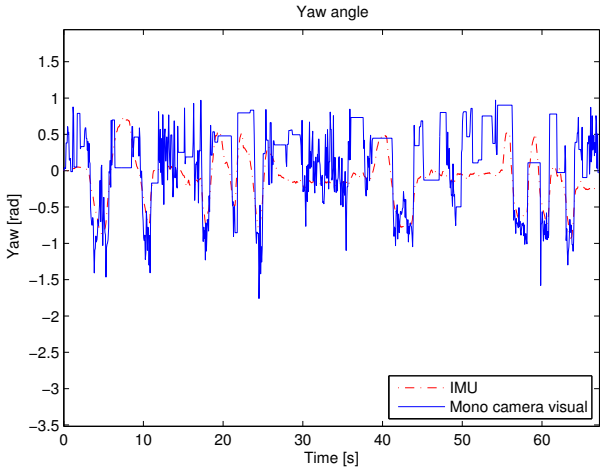

Fig. 7. Second trial with mono camera, movement induces changes in both yaw and roll angles. Distance from the camera $\approx 3m$

Ground–truth was set with measurements from an inertial measurement unit.

We have shown that results obtained by mono camera are very good at small distances, but are heavily deteriorated with increasing distance. On the other hand, measurements from the stereo–camera are less influenced by distance, mostly due to more precise distance measurements, keeping the standard deviation of measurements below 10°.

Future work will include using the experimental setup underwater, in laboratory conditions. After that, the markers will be mounted on the diver and full field experiments will be conducted, in order to test the robustness of image processing in real conditions, with low visibility.

miroslav.segvic@computer2cockpit.com, karolina.krajcek@fpz.hr, edouard.ivanjko@fpz.hr

Abstract - This paper reviews the state of the art (SOTA) in distributed flight control technologies using publicly available, scientific and technical publications. Technological developments, such as embedded computing and microelectromechanical systems are enabling advanced aerospace-oriented distributed systems. Distributed systems are comprised of a large number of simple elements, each with its own sensing, actuation and control, in order to obtain the desired behaviour. These systems have the potential to be more economic than a centralized system due to the simplicity of individual components, and possibility of using the same production unit for a different role within the system. The challenge with these systems is the coordination amongst nodes comprising a distributed control network. Benefits of distributed architecture are increased robustness trough redundancy and inherent fault tolerance. The SOTA summary comprises a description of challenges in the design of flight control systems with a distributed structure, technologies currently used in flight control systems and also technologies not specifically related to distributed flight control but applicable for the design of future flight control strategies. Described systems and technologies are represented with examples of real systems including swarms of small Unmanned Aerial Vehicles and distributed networks for Fault Detection and Isolation.

I. INTRODUCTION

Recent advancement in aviation requires more and more sophisticated control systems. New control systems are needed for both, air traffic control and aircraft flight control systems. One of the new approaches are distributed control systems which are examined in this paper. The aim of this paper is to provide a survey of technologies developed and deployed for distributed flight control. The need for distributed control systems arises from the demands of today's modern aircraft which contain many subsystems. All subsystems have to work in an optimal way to ensure that all security and economic constraints are fulfilled. To ensure that, new smart sensors and actuators are used. Such smart elements contain a local embedded computer (controller) with data processing and communication abilities comprising a distributed control system. In such a system a significant amount of data processing is done in local embedded controllers and the master control unit has a global overview of the whole system.

There are three possible types of system architectures for a control system in general: (i) Central architecture; (ii) Distributed architecture; and (iii) Federated architecture. A central architecture uses a centralized hardware and a centralized software framework. One computer is used for several subsystems. As all control hardware is centralized, the environment can be controlled very well [1]. Also the maintenance of these systems is easy. All calculations are also centralized. The distributed architecture uses a distributed hardware and distributed software framework. All calculations are finding place in the sensors and the results are transmitted. A central control unit does not exist and all subsystems have to communicate with each other [1]. The federated architecture is a compromise between the central and distributed architecture. It uses a distributed hardware and centralized software. There are more subsystems than in the case of centralized hardware, but fewer than in the case of distributed hardware [1].

A centralized control approach for Flight Control System (FCS) requires a large amount of electrical cables originating at the flight control computer and ending at actuators and control surfaces as shown in the Fig. 1. The issue of larger mass and complexity of centralized FCS, along with the susceptibility of servo control signals and sensory wiring to noise originating from surrounding electrical systems, are the main technical reasons for the development of distributed FCS.

Recent effort in the field of FCS design is directed towards the improvement of safety, efficiency and overall cost [2]. Airbus patented a robust control system that does not need a large amount of cabling and is based on transmitting calculated signals over the data bus in the form of command messages [3]. The idea of the Airbus invention is to use a distributed FCS, organized around a communication bus in which the control function and some monitoring functions are performed remotely at the actuators.

This paper is organized as follows. In the second section, the problem of flight control is described. The third section describes distributed FCS, and proposed methods for system decentralisation and design. The fourth section reviews emerging technologies related to FCS, such as MEMS (microelectromechanical systems) based systems, unmanned aerial vehicle (UAV) swarm control, distributed fault detection and isolation (FDI) and optimisation. Paper ends with a conclusion.

II. THE PROBLEM OF FLIGHT CONTROL

The problem of aircraft flight control is in creating appropriate control inputs to the aerodynamic control surfaces. An aircraft can have primary, secondary and

auxiliary control surfaces. Primary flight control surfaces are required to safely control an aircraft during flight and include ailerons, elevators and a rudder (Fig. 1). Secondary control surfaces are intended to relieve excessive control load and include trim and spring tabs. Auxiliary control surfaces improve the aircraft performance characteristics and include flaps, spoilers, speed brakes and slats. These control surfaces can be controlled by a pilot or by an autopilot as given in Fig. 1.

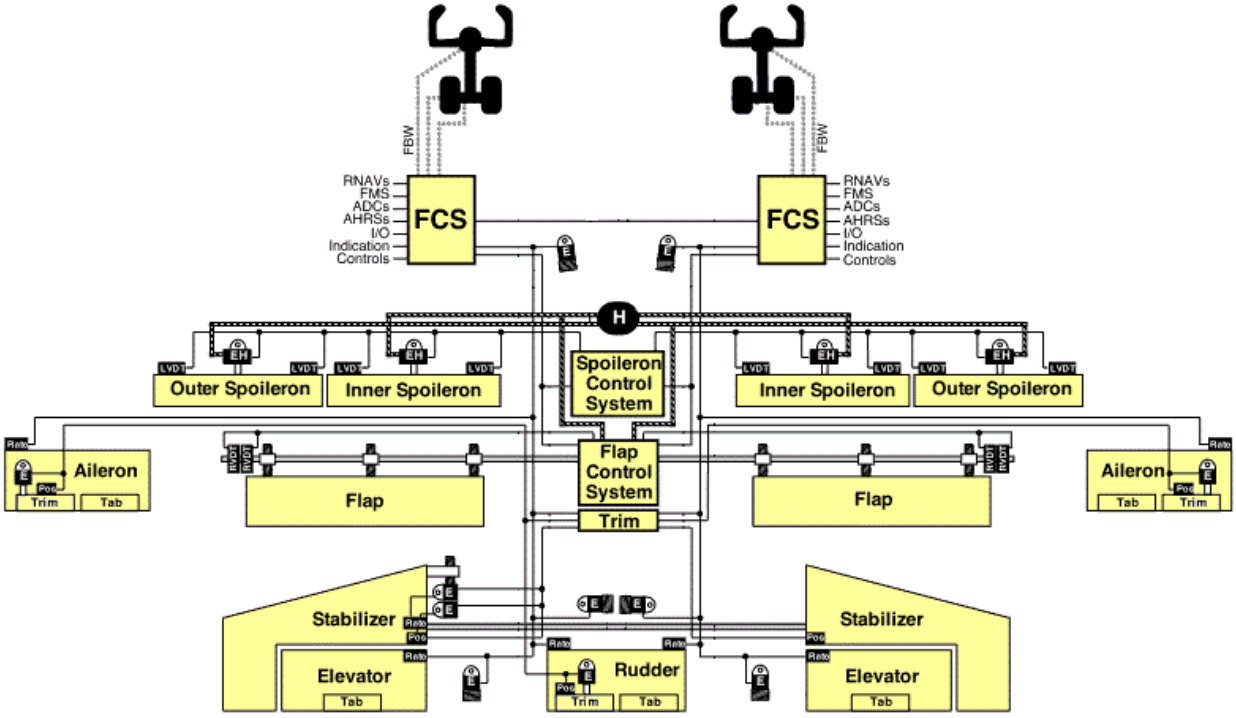

Fig. 1. Aircraft flight control surfaces and architecture [26]

The aim of all mentioned control surfaces is to control the airplane height, speed (V), roll (p), pitch (q) and yaw (r) rates, and moments (L, M and N) as presented in Fig. 2.

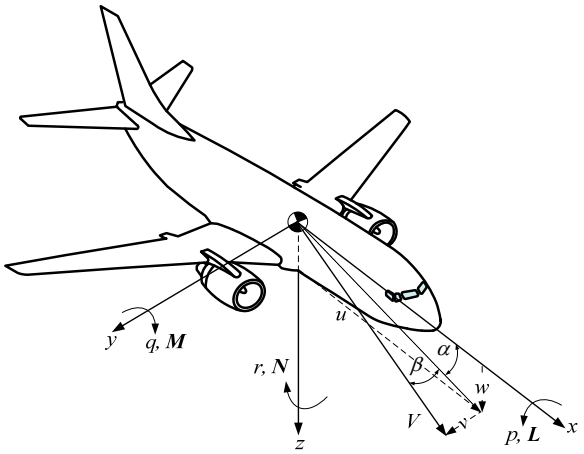

Fig. 2. Body fixed frame with aerodynamic angles, pitch rates and moments

On a modern high speed aircraft, the pilot's control joystick and pedals are not directly linked with the control surfaces. Appropriate systems are in between and augment the pilot control commands applied on the joystick and pedals. Large aircrafts have systems that convert pilot control commands into electrical signals. They are sent via electrical or optical cables to various actuators which can be electromechanical, pneumatical, electrical or hydraulic devices. Actuators then move the appropriate control surfaces to the desired direction. Today's sensors, actuators and the pilot are part of an electronically controlled system or fly-by-wire (FBW) system that enables full-time surface control utilizing advanced control laws. Control commands from the pilot or autopilot are adjusted to improve the stability characteristics of the airplane.

When the time scale of aircraft dynamics is too small that the airplane can be manually managed or when the pilot workload is demanding, it is necessary to have automatic flight control implemented. The automatic flight control system (AFCS) has two separate control subsystems. One subsystem is required for guiding the vehicle's center of mass along a specific trajectory and the other for controlling the aircraft attitude by rotating it around its center of mass. The first control subsystem type is known as the autopilot. The second control subsystem type is known as the stability augmentation system (SAS) and control augmentation system (CAS).

Autopilots are usually segregated into a lateral and a vertical mode. Typical autopilots in lateral mode are: roll angle hold, turn coordination and heading hold/ VOR hold and in vertical mode: pitch attitude hold, altitude hold, speed/Mach hold and automatic landing. Typical CAS functions are: roll rate, pitch rate, normal acceleration and lateral/directional control. SAS serves as a roll, pitch and yaw damper.

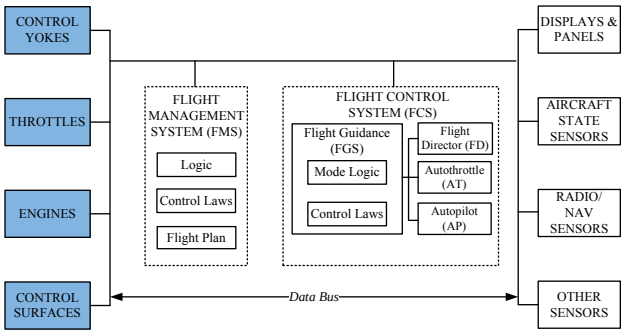

Fig. 3. High level avionics architecture in modern airliners and business jet airplanes [25]

Modern avionics architecture is comprised of many individual systems. Two key functions are the Flight Management System (FMS) and FCS. The FCS is composed of a Flight Guidance System (FGS), Flight Director (FD), Autothrottle (AT) and Auto-Pilot (AP). The FGS is a software function that generates roll and pitch values, and also speed commands used to control the aircraft.

III. AIRCRAFT DISTRIBUTED CONTROL SYSTEMS

Decentralized/distributed control has been a control approach of choice for designing large scale systems for decades. Decentralization assumes splitting the unmanageable complex problems into manageable smaller sub problems, so that the resulting solutions solve the original overall problem.

A. State of the Art in current aircraft distributed control systems

Continuously increasing requirements for aircraft and air transport safety along with operational demands for reliability, performance, efficiency and costs, are shifting the focus of recent development to distributed systems. The massive voting architecture proposed by Airbus [4] suggests to allocate the task of control laws and logic between flight control computers and control surface actuator nodes as shown in Fig. 5. Flight control computers and actuator nodes are connected via an advanced data communication network developed by Airbus. Flight control computers calculate the control laws and proprietary commands for control surface actuator nodes, which are then broadcast as messages over the communication bus. Actuator nodes are equipped with flight control remote modules, and perform massive voting upon receiving the messages from many flight control computers. The massive voting architecture resides upon digital communication technologies. New smart actuator technologies are explored for particular system application. Fault handling in the system proposed from Airbus is resolved within the actuator nodes. A high degree of fault detection as well as a fault location is demonstrated, both due to the large number of nodes [5].

A distributed FCS architecture is presented also for accessing fault handling and redundancy managing on the JAS39 Gripen [6]. The proposed system included 16 nodes. Various simulations showed that distributed sensor nodes meet fault detection coverage of 99% for both transient and permanent faults. The proposed system used a triggered multi master broadcast bus with Time division multiple access communication. As a result, the failure on any node cannot jeopardize communication by sending data outside the dedicated time slot, resulting in a fail silent system.

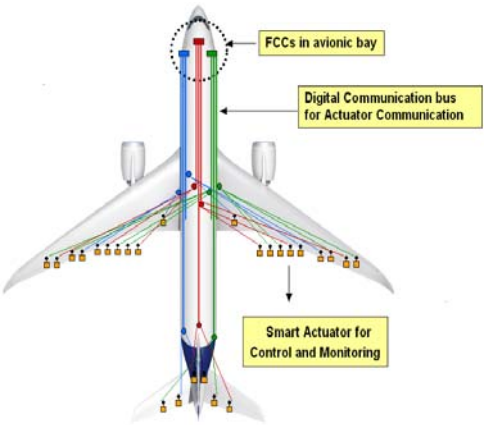

Fig. 4. Fully distributed FCS architecture [5]

Power line communications (PLC) have been proposed for distributed aircraft control systems in [7]. The PLC communications approach eliminates the need for digital data bus wiring by modulating the data on power cables that are installed between the flight control computer and control surface actuators.

Although technology is promising and widely used in other applications, vehicular control systems are not usually installed with PLC systems. For aircraft's FCS, there are many requirements that make implementation of PLC difficult, such as using negative return wires on the power bus instead of chassis return as usual. The problem arises from selective frequency fading or multipath fading. Furthermore, as a general system design safety rule requires, primary and secondary flight surfaces must remain independent. More than one network must be used to reduce wiring, and also for tail surface reliability. Communication speed requirements for various standards must be met, and also to ensure reliability with a given number of remote units. From many other aspects, PLC has to be further developed for aircraft use and its usability is yet to be explored.

Decentralisation is entering other aircraft subsystems, with the development of larger and more complex aircraft. Smart components are proposed for a decentralised fuel management system [8] and microcontrollers are embedded in the pumps, valves and sensors (Fig. 5).

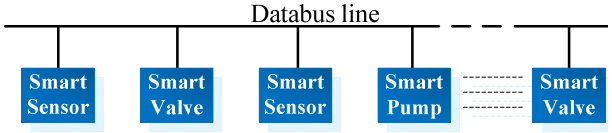

Fig. 5. Architecture of the distributed fuel control system

Proposed system components make its own decisions during various fuel operations, depending on the performed action. They share a time-triggered bus for communication. When a smart component reaches a decision, it transmits it over the bus. For safety, all system components retain a copy of the state vector that describes

the system state. Laboratory and real scale testing have been performed proving such a distribution is possible and that the new system can be adaptable to faults.

B. Challenges of distributed system design

In order to create a control system, the control system designer first has to establish the structure of the whole system, its subsystems and their interconnections. Then control inputs and measured outputs are determined. Local controllers are designed using available input and outputs to satisfy the overall system stability and performance. Described procedure is known as decentralized control design.

Properties characterizing complex dynamical systems are: a large scale of system equations, different types of uncertainties of system models, information structure limitations, and communication delays [9]. The problem of high dimensionality can be solved by decomposing the system into subsystems with their respective interconnections. A complex system can be decomposed in two ways. One way is to physically decompose the system according to its physical properties. That can be challenging as there are many systems where it is difficult to identify weak couplings. The other approach is a numerical decomposition of the system. It effectively addresses the problem of high dimensionality [9].

Control of large scale complex systems requires efficient design methods and algorithms whose implementation needs minimal information exchange among local systems [9]. Recent growth of communication networks intensifies the move of traditional system theory to communication networks. This is particularly suitable for complex real world systems such as transportation and large manufacturing systems, the internet or embedded control systems. Wireless networks offer significant advantages but also introduce some drawbacks compared with wired networks. The advantages include low cost of operation, ease of installation and reconfiguration, natural reliability, robustness, and adaptability enabling in avionics a flight-by-wireless system [10]. Drawbacks are time delays, packet loss, finite capacity, and data flow problems.

Digital networked dynamic system design can be analysed from the position of:

- Control over a network covers the design of feedback strategies adapted to existing control systems where control is performed via unreliable communication links;
- Control of networks that is concerned with providing a defined level of performance to network data flow;
- Multi agent systems study how network architecture and interactions between different network components affects global control goals.

Interconnected systems have been classified according to different principles and system structures into disjoint, overlapping and hierarchical decompositions, as well as decompositions for time scale, singular symmetric systems [9]. A basic modern theory problem in interconnected systems is the approach to timing. The timing problem is in finding the communication frequency of the networked-based feedback loops for which system stability and performance is satisfied. Typical phenomena concerning network performance are: random delays, packet dropouts, quantization and data rate limits.

We can separate time driven and event driven feedback schemes, regarding to the data transmission approach. The periodic sampling of the continuous time system characterizes the time driven approach. This approach generates redundant communication within the feedback loop. That results in an effort to reduce the communication traffic only to necessary data. The event driven system communication is triggered by the occurrence of an event to engage a sample realization. As a result, the event triggered control relieves the communication network and also saves energy.

IV. Emerging technologies related to flight control systems

A. MEMS based FCS

The MEMS is a "batch-fabricated integrated microscale system that; converts physical stimuli, events, and parameters to electrical, mechanical and optical signals and vice versa; performs actuation, sensing and other functions; comprises control, diagnostics, signal processing and data acquisition features" [11] .

MEMS sensors are very promising in aerospace technology because of their small size (the overall dimensions are a few millimetres), low power consumption (fractions of a watt), high reliability (operation life up to 120000 h) and extremely low cost [12]. Although MEMS sensors lack the accuracy of conventional sensors, it is being improved continuously. For example, the drift of the first MEMS gyros put into mass production in 1995 was greater than 500 deg/h according to [12]. Currently, it is reduced to below 1.0 deg/h [13], and it is predicted to go down to 0.1 deg/h [12].

Large manufacturers are developing MEMS based gyros for production to replace a low and medium accuracy laser and fiber optic gyros. For example, the company Northrop Grumman LITEF GmbH is producing a small sized inertial reference system LCR110 with MEMS accelerometers for civil aviation purposes. Current development lies in bringing the performance of mass produced MEMS sensors to a level required for use in aircraft navigation systems, and in designing MEMS based devices for a wide range of aircraft. MEMS sensors are known to feature zero bias and scale factor depending on temperature, gyro output depending on linear overloads, high noise components, and sensor output parameters practically linearly related to power supply instability. Performance improvements are based on a number of circuit, software, and design modifications.

MEMS sensors are particularly important for the development of UAV flight control systems. The flight control system enables an UAV to fly autonomously based on a series of preplanned waypoints while transferring real-time data of mission targets to ground control stations. Commercial UAV flight control systems

are available by companies like MicroPilot and UAV Flight Systems.

UAV flight control systems must provide at least altitude hold control and global positioning system navigation, in order to perform UAV missions. Using several UAV agents to perform a mission quickly and more efficiently as a team is a problem of distributed control of UAV swarms.

B. UAV swarms

UAV are a rapidly evolving technology with a variety of military applications such as reconnaissance, target and decoy combat missions [14]. A variety of civil and commercial applications can be performed also. Certain surveillance applications such search and rescue can be accomplished most effectively by teams of cooperating autonomous agents, i.e. swarms of UAVs.

Development of reliable autonomous navigation algorithms for individual UAVs was a technological prerequisite for development of cooperative team technologies and frameworks. Recently explored approaches that deal with multi-agent collaboration significantly rely on agent-to-agent communication. Ad-hoc wireless technologies are explored for line of sight communications, primarily due to the availability of low cost of the shelf technologies/parts [15]. Using the communication infrastructure, a team of UAVs receives a list of mission tasks and collaborates to autonomously and efficiently assign the tasks among themselves.

Multi-level control systems are designed for centralized mission command centres. Levels for mission control, agents monitoring and task execution monitoring comprise mission command center control. Such an approach reduces the amount of training for the mission operator, relieving him of monitoring and task organizing duties.

Completely decentralized and autonomous system enables the fleet of UAVs to accomplish missions beyond the range of any centralized command station [16]. Agents within such a system are performing all of the collaboration and control processing on the aircraft. Also they perform decentralized task allocation for a dynamic mission via on-board computation and ad-hoc aircraft-to-aircraft communication.

Determining the stability properties of multi-agent teams is rather challenging, but can be verified in restricted scenarios. This problem is addressed using methods such as model predictive control [17] and receding horizon control [18]. Future work includes development of platforms with described properties within larger airframe UAVs, all in an effort to increase flight time and support more complicated missions [19].

C. Fault Detection and Isolation

According to [20], a fault is „an unpermitted deviation of at least one characteristic property (feature) of the system from the acceptable, usual, standard condition“ and a failure is “a permanent interruption of a system’s ability to perform a required function under specified operating conditions”. Large distributed systems like automotive systems, jet engine control, and teams of unmanned vehicles are comprised of many individual components and sensors. It is very difficult to diagnose faults in interconnected distributed systems using a centralized FDI architecture, mostly due to constraints imposed by computational abilities and communication limitations. Therefore, a distributed FDI architecture is developed extensively in recent years by [21] and [22].

Operations of distributed systems rely significantly on sensory health. A sensor fault may lead to poor control performance and compromise stability of the control system. Sensor information error can propagate to other subsystems trough interconnections, affecting their performance, and also causing difficulties pinpointing and isolating the faulty unit. Therefore, sensor fault diagnosis is a critical issue in distributed interconnected control systems. “A fault-tolerant control system is capable of controlling the system with satisfactory performance even if one or several faults, or more critically, one or several failures occur in this system” [23].

Distributed FDI architecture is proposed by [21]. For each subsystem a local FDI component is designed. The FDI component uses local measurements and communicated information from neighbouring FDI components associated by interconnection. Each local FDI component consists of a fault detector estimator and adaptive fault isolation estimator. Fault detector estimator monitors the local subsystem under normal operating conditions. If a sensor fault is detected, fault isolation estimator isolates subsystem where the fault has occurred. There is an inherent trade-off between robustness and fault detectability. The importance of adaptive thresholds for distributed sensor FDI is demonstrated, as they ensure robustness with respect to interactions among interconnected subsystems and modelling uncertainty.

D. Distributed optimisation

Aerospace systems control can be described as a complex problem. Approaches from computer science are introduced to aerospace systems in order to cope with the large complexity of such systems. One of such approaches is reinforcement learning which is based on selecting actions, receiving rewards, and updating settings for future actions.

Another promising approach for distributed aerospace systems is the Collective Intelligence (COIN) framework [24]. Collective in this case is “a system of adaptive computational agents with a specified system level performance criterion” [24]. COIN techniques have already been applied to a many of distributed optimization problems such as network routing and data collection by autonomous vehicles. Collective systems address the optimization task as tasks distributed among agents which represent system variables. The variables can represent a specific control surface position on an aircraft. The collective’s solution is generated when agents select actions and receive rewards depending on the system objective. The actions can be commands relayed to a control system. Equilibrium for the multi agent system is reached when the agents can no longer improve their rewards by selecting a different choice of actions. The COIN research puts a focus on local reward

functions which are also referred to as private utilities, as the connection to the increase of the convergence rate is clearly proven [24]. Probability Collectives (PC) theory extends the COIN framework and handles constraints more explicitly as it is necessary for aerospace systems. PC theory concentrates on how the system agents update the probability distributions on range of their possible actions instead of focusing on the joint action created by sampling those distributions.

The collectives approach is specifically designed for systems that are distributed. The use of probabilities removes any issues associated with discrete actuation. Because noise and disturbance are often characterized using probabilities, the collectives approach is naturally suited. Collectives can use locally available information, or alternatively include information from other agents and can use a data broadcast from a centralized source. Formulating the problem of control as a distributed optimization problem makes these systems benefit from the application of machine learning algorithms, statistics, gradient-based methods for optimization, and game theory strategies [24].

V. CONCLUSION

Distributed FCSs present a significant leap in the evolution of aircraft FCS architectures. Novel technological advances in areas of embedded computing and communication, machine learning, and multi agent systems control continue to push FCS design towards distributed systems. Although there are some demonstrations of distributed systems for aircrafts, they are mostly analysed from the aspect of fault detectability and identification. However, distributed control systems should be further explored to find the final optimal way how the control law calculation can be decentralised at the same time fulfilling all safety criteria. For example, some systems offer voting mechanisms for identical flight control computers and nodes, to achieve redundancy.

Authors of this review conclude that other ways of decentralisation, possibly across hardware architecture boundaries between different control surfaces should be investigated, and that the possibility of decentralised decision making needs to be further examined.

The Computer Architecture and Hardware Description Language

A.S. Burlakov, A.E. Khmelnov
Institute for System Dynamics and Control Theory of Siberian Branch of Russian Academy of Sciences,
Irkutsk, Russian Federation
alex_burlakov@bk.ru

The paper introduces CAHDL, the Computer Architecture and Hardware Description Language. CAHDL is aimed to specify processor instructions and computer hardware formally. Although CAHDL supports RTL modeling to some extent, it is does not describe digital circuits. CAHDL is designed first to specify CPU and hardware behavior, rather than their structure. CAHDL can be applied in simulators, compilers, disassemblers, testers and other programs requiring specification of computer architecture. In the end of the paper we observe how CAHDL is applied in computer simulation. The paper brings some CAHDL syntactic constructions as examples and explains their semantics. Parsing methods are also briefly reviewed.

I. INTRODUCTION

There are many hardware description languages like Verilog HDL [1] or VHDL [2] aimed to specify integrated circuits. These languages work on three levels of abstraction: on structural level, on RTL level and on behavioral level. Although CAHDL supports RTL modeling to some extent, it works on behavioral level. The main purpose of the language is to provide a high level specification of a computer architecture which could be used in software.

The CAHDL is an object oriented imperative language with declarative constructions. It operates the high level constructions like processor, memory, keyboard, etc. The syntax of CAHDL bases on C++ ISO/IEC programming language. There are also some syntax constructions taken from Verilog and from technical literature [3-6]. The source [7] was used in the development of the syntax of description of arguments of processor instructions.

The CAHDL was successfully applied in the DCU32INT program (Delphi Compiled Units Disassembler) [8] alongside with FlexT specification language [9]. In the end of the paper we observe the application of CAHDL in a computer simulator. This simulator was used in testing of the CAHDL itself and in debugging specifications written in CAHDL.

II. SYNTAX

Computer Architecture and Hardware Description Language is an object-oriented programming language designed for describing computer architecture. The syntax was influenced by C++ and Verilog and reminds C++ to some extent. However, there are special syntactical constructions, which cannot be easily realized in any existing programming language, even by C macros.

The language supports data types of objects, integers and strings. They may be used in scalar variables, arrays, constants and references. There are special mechanisms of *nesting* and *concatenation* of integer variables (see below) which are implemented by the use of references.

Besides the standard assignment operators (=, +=, -=, *=, /=, &=, |=, %=) and program flow control operators (*if, for, while*), the language provides operators working with different bits. These operators considerably facilitate the process of describing of computer architecture [10].

The most interesting of the operators are extract, concatenation and branching operators. Extract operators can extract a separate bit <*bit_number*> or a sequence of bits <*higher_bit..lower_bit*>. We don't use the Verilog form of bits extraction with square brackets, because they are reserved for arrays. An operator of concatenation (colon character) concatenates two or more operands. A branching operator *case* works similar to the visual basic *case* operator.

In order to adjust an environment, the specialist has to operate with objects of corresponding types. Memory, processor, monitor are all some types and they are represented in a description as some device classes. The language supports an encapsulation mechanism. A class may encapsulate fields and methods. The language also supports an inheritance mechanism. It allows to access public fields and methods of a parent class. Class fields and methods could be hidden if they are located in a *private* section. Like in C++, if a field is located in *protected* section, it is only available in derived classes. Listing 1 represents a fragment of the description of the most complicated computer device – CPU (Central Processor Unit).

```
class CCpuIx86 : public CCpu
{
private:
  CMemoryIx86 m_memory;
  // general purpose registers
  bits<32> EAX, EBX, ECX, EDX;
  bits<32> ESI, EDI;     // index
  bits<32> ESP, EBP;     // stack
  bits<32> EIP;          // program
  bits<32> EFLAGS;       // flag
  bits<16> CS,SS,DS,ES,FS,GS;
  bits<16>& AX = EAX<15..0>;
  bits<8>& AH = AX<15..8>;
```

```
  bits<8>& AL = AX<7..0>;
  bits<8>& BH = EBX<15..8>;
  bits<8>& BL = EBX<7..0>;
  bits<16>& BX = BH:BL;
  // SP length would be set automatically
  bits& SP = ESP<15..0>;
  bits<1>& CF = EFLAGS<0>;
  bits<1>& ZF = EFLAGS<6>;
public:
  bits& RNs(bits<3> N, bits<1> W){
    if(W)    case(N){
      maskb 0:0:0 then return EAX;
      maskb 0:0:1 then return ECX;
      maskb 0:1:0 then return EDX;
      ...
    }
  }
  void Process(){
    bits<3> Ns, Nd;
    bits<1> W;   // ? dword : word
    unsigned short opcode = m_memory.ReadByte(EIP);
    case(opcode){
      maskb 1:0:0:0:1:0:1:W:1:1:Nd:Ns
        then MOV(R(Ns,W),R(Nd,W));
      maskb 0:1:0:0:Nd:0          then INC(R(Nd));
      maskb 1:e                   then PUSH(DS);
      maskb 1:f                   then POP(DS);
      ...
    }
  }
  ...
};
```

LISTING 1. EXAMPLE OF IA-32 PROCESSOR ARCHITECTURE DESCRIPTION

The listing 1 is an incomplete description of IA-32 processor architecture. This description is represented as a *CCpuIx86* class. In the body of the class are registers and a memory type object (see Listing 5). General purpose registers, index registers and stack pointer registers are represented as integer variables 32 bits length. Segment registers are 16 bits integers.

The reference type realizes mechanisms of nesting and concatenation. These mechanisms make it possible to declare AX register as a nested variable of EAX register. AH and AL registers are nested in AX register. At the same time, a variable containing other variables may be declared as a concatenation (colon character) of these variables. Thus, in the example, BX is declared as a concatenation of AH and AL registers.

It is notable, that if the size of the variable is not defined, then it would be set automatically, as it is done for SP register. In that case, the length of SP register would be 16 bits pointing to the first 16 bits (from 0 to 15) of ESP register.

The carry and zero flags are defined as a single bit variables pointing to zero and sixth bits of EFLAGS respectively.

It is worthy to discuss the *case* brunching operator. The keyword *case* was chosen to designate for branching operator because of its similarity to the Visual Basic *case* operator. It works not only with constants as C++ *switch* operator does, but also with expressions and bitmasks. An example of the *case* operator could be found in listing 1, in the *Process* and *RNs* functions. In the row

```
maskb 1:0:0:0:1:0:1:W:1:1:Nd:Ns
```

within the *Process* function, the *case* statement works as a predicate of arity 3, where 3 is a number of entries of variables in the concatenation sequence. This feature of *case* operator is used for representation of tabular information, such as processor instruction specification. The syntax of *case* operator is as following:

```
CASE '(' expr ')' '{'
  case_body_list
'}' ';'

case_body_list: case_body_row
| case_body_list case_body_row
;

case_body_row:
  WHEN expr1 THEN stmt_list1
  | MASKB binary_mask_conc      THEN stmt_list2
  | MASKO octal_mask_conc       THEN stmt_list3
  | MASKH hexadecimal_mask_conc THEN stmt_list4
;
```

LISTING 2. CASE SYNTAX

The keyword *when* is followed by an *expr1*, the result of which will be compared to the result of *expr*. In case of matching, the *stmt_list1* will be executed. After the keywords *maskb*, *masko*, *maskh* follows a concatenation of numbers written in binary, octal or hexadecimal format, but without prefixes '0' or '0x' for octal and hexadecimal numbers respectively. If there is a variable in a concatenation sequence, it would be interpreted as a number, rather than a variable. For instance, in a row

```
maskb 1:0:0:0:1:0:1:W:1:1:Nd:Ns
    then MOV(R(Ns,W),R(Nd,W));
```

LISTING 3. IA-32 MOV COMMAND IN CAHDL

after the keyword *maskb* follows a sequence of binary formatted bits and variables, joined by the concatenation operator. When this concatenation is compared to a number, these variables may be interpreted as any value, which does not exceed the length of a corresponding variable. The length of *Ns* and *Nd* is 3 bits. It is known from their declarations (see listing 1).

A concatenation may be considered as a bitmask. If a mask matches some required number, then the variables in a concatenation sequence would be assigned with values so that the result of concatenation would be equal to the value required. Instead of using of C++ statements like in example below

```
// expr – is a case argument
// look listing 2
Ns = expr & 7;
Nd = (expr >> 3) & 7;
if((expr >> 6) & 3!= 3)
  return;
W = (expr >> 8) & 1;
if((expr >> 9) & 127!= 69)
  return;
MOV(R(Ns,W), R(Nd,W));
```

LISTING 4. FRAGMENT OF IA-32 MOV COMMAND IN C

we write this instruction in two lines of code (see listing 3).

It is notable, that different formats of a digit representation cannot be mixed in a single row, i.e. *maskb* cannot be followed by digits in a hexadecimal format. Moreover, if we write some digits after *maskh* keyword, these digits would be interpreted as hexadecimal ones. For example, an instruction of concatenation *maskh 1:1* would be interpreted as number 17 rather than number 3.

Abstract classes are used as an interface of basic devices. Like in other programming languages, in CAHDL we cannot create objects of abstract classes. In order to create a device we need to define its behavior in a class inherited from the base abstract class. In the example above (see listing 1) the class *CCpuIx86* inherits fields and methods of a virtual abstract *CCpu* class, hence it must implement all *CCpu* abstract methods, one of which is the *Process* method.

Other computer devices like random access memory or hard disk drive may be described in a similar way. There we need to define an inherited class, which will implement all the abstract methods. Let's see how it would look like for a memory class.

```
class CMemoryIx86 : public CMemory
{
private:
  // the size of memory in bytes
  const RAM_SIZE = 0x80000000;//2Gb

public:
  CMemoryIx86(){…};
  unsigned char ReadByte(unsigned long address){…};
  void WriteByte(unsigned long address
                , unsigned char value) {…};
  …
}
```

LISTING 5. MEMORY CLASS IN CAHDL

The code in listing 5 is self-explanatory. There we define memory class as one derived from *CMemory* class. In order to set a memory size, we just change the value of *RAM_SIZE* constant.

If we need to track memory changes, we would have to edit code for *WriteByte* method. It is also possible to change CPU class methods in order to track register values. (Tracking values changes method is widely used in debugging technics.) Besides memory tracking we may even change the logic of some methods, accordingly to our demands.

III. PARSING

The description of a computer's architecture is stored in a simple text file. When the simulator is started, the function *yyparse* begins to parse the description text. The body of *yyparse* function is generated automatically by Bison and Yacc programs, according to the language grammar description[11]. The CAHDL has some syntactical constructions, which could not be reduced by a single lookahead symbol, thus the GLR algorithm was preferred to LALR(1). The main difference between LALR(1) and GLR is that GLR can backtrack more than one parsing node if the production is not matched [11,12]. In the body of *yyparse* function we build a parsing tree. In the nodes of the tree are objects of different classes. However, all these classes have the same base class.

The grammar of the language developed is context-sensitive. The aim of context-sensitivity is to simplify code understanding. Context-sensitivity deals only with the representation of numbers. In general, hexadecimal numbers must follow '0x' prefix. If we use a hexadecimal number in the *case* construction within *maskh* section, then the prefix must be omitted. In case of ambiguity, when an identifier may be interpreted as both a number and a variable of the same name, the number would be preferred due to the fact that it is easier to rename the variable rather than represent a number in another form.

For example (see listing 1), *PUSH* operation in *Process* method would be executed, if only the *opcode* variable matches mask 0x1e. In this case, the symbol *e* would be interpreted as a number 14, rather than an "e" named variable. This means that *opcode* must be equal to 0x1e.

The language supports modality at a level of files. This modality is similar to one used in C++. In order to include another file of description, we have to place it in quotation marks following an *#include* keyword.

Bison and Yacc generate a parser. This parser is not an executive file, but a bunch of source files. This source code is included into the simulator's project. When the embedded parser founds a grammar mistake in a description file, it alerts an error outputting some debug information and then it terminates the program's execution. Now, the debugging information is quite simple and reveals only position of a mistake, but does not tells, what kind of mistake there was. It is supposed to improve this description debugging technics in the later releases of CAHDL.

IV. APPLICATION

The CAHDL was used in Delphi Compiled Units Disassembler [8]. (This tool is aimed to parse *.dcu files and represent their structure in terms of Delphi statements and functionality in terms of assembler code.) The CAHDL was also applied in computer simulator to specify computer architectures. This simulator is observed below.

V. THE SIMULATOR'S STRUCTURE

The simulator has the user interface, framework, virtual machine and parser. The text of architecture specification is located in an outer plaintext file. The emulator works as follows: when user starts the application and selects the hardware to create, the specifications of the hardware are parsed into internal representation then the specified memory image is loaded into memory and the emulation starts.

The structure of the simulator can be represented as follows:

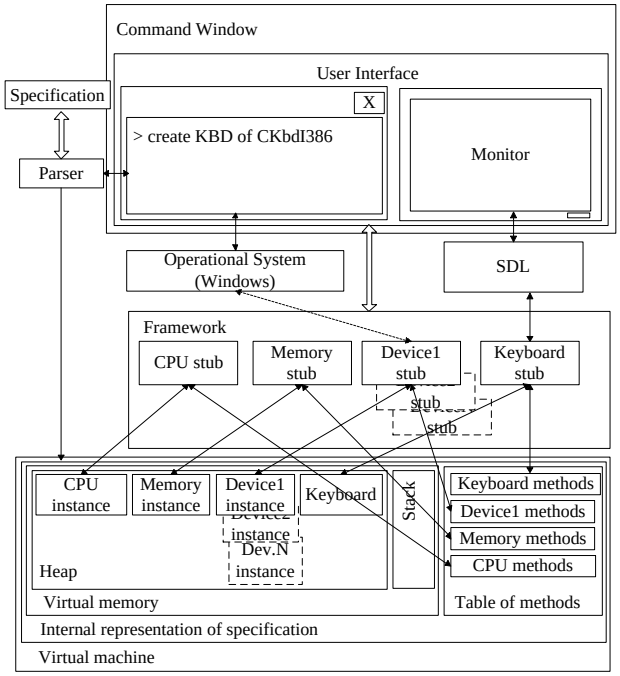

FIGURE 1. SIMULATOR'S CLASS HIERARCHY

The emulator framework is a set of stub computer devices. It complies with the von Neumann architecture. There are processor, memory, I/O devices, etc. Since all the devices are stubs, they must be overridden by child classes in the text of specification. The interaction between the stub objects and their child class instances is based upon the event driven programming. The stub objects call their overridden methods. If a method is absent, then the corresponding stub method is called.

The simulator consists of two windows. The main window is console another is graphical.

A. Console window

Console window is used to adjust the environment. There the user inputs a path to an image file to upload, a path to a file with specification of architecture and a command that starts simulation.

B. Graphical window

Graphical window is created by SDL library [13][13] only when the simulator starts, because the resolution of the screen and other settings are set only when the architecture description is already parsed and interpreted. This window is aimed to simulate the computer's screen. Graphical window may also work in a textual mode. In this mode, all the symbols are represented as small bitmaps. Graphical window handles keyboard buttons messages, mouse movements and mouse button clicks. In order to synchronize two windows an infinite cycle is used rather than a threading mechanism, because it makes the debugging of simulator more convenient.

C. Periphery devices

Simulated periphery devices interact with a user by the standard Windows API functions. For example, when a mouse button is clicked within bounds of SDL simulated window i.e. the simulated screen, a message loop handles the message and dispatches it to a mouse device object. Mouse object interrupts processing of the simulated operational system. When the interruption is handled, the processor goes on processing the operational system, where the cursor's position is already shifted.

VI. INITIALIZATION

The simulator's environment is being initialized only when a text of a computer's architecture description is parsed into a set of objects of different classes. Every syntax construction has its own class. For example, there are classes storing objects of type of class, function, variable, integer, operation, etc. All the objects of these classes are stored hierarchically. For instance, a variable may belong whether to a function or to a class. A function may only belong to a class. A class of an upper level contains all the lexical classes.

The initialization proceeds in two steps. Firstly, the class and function headers are parsed. Secondly function bodies are traversed. Two traversals are needed to be able to refer to a method which is declared in the text below.

VII. SIMULATION

When the simulator's environment is properly configures, there may start the application to do simulation of the required architecture. In order to start simulation, the specialist is provided with the console interface where he has to input a path to an image-file, which would be loaded into the simulator's memory.

When the simulation stars, the program creates a screen object by the use of SDL library (see Simulators structure). Then the main loop is started to handle device messages (mouse movements and clicks, keyboard buttons pressed, etc.).

VIII. CONLUSION

The paper describes the Computer Architecture and Hardware Description Language. The syntax of the language is based upon the C++ and Verilog syntax. Some examples of usage of the language were given. The CAHDL can be used for development of the programs, which require information about computer's architecture, such as compilers, decompilers, emulators, etc.

The CAHDL was tested on two computer architectures I8080 and PDP11. They were specified by 600 and 2000 lines of code respectively. At this time a specification of the real mode of I386 architecture is being developed. The estimated number of lines of the specification code is 5000. Considering that the language is still being improved, the number of lines of code may decrease significantly.

Heterogeneity Impact on MPSoC Platforms Performance

Nikolina Frid, Danko Ivošević and Vlado Sruk
University of Zagreb, Faculty of Electrical Engineering and Computing, Zagreb, Croatia
nikolina.frid@fer.hr, danko.ivosevic@fer.hr, vlado.sruk@fer.hr

Abstract – Embedded systems have become an integral part of High Performance Computing (HPC) due to their appealing energy and resource consumption characteristics. Required performance goals can be achieved only by deploying the application on a heterogeneous platform. The established approach of designing a custom made FPGA architecture platform targeting particular application is challenged by novel multiprocessor heterogeneous platforms built using existing of-the-shelf embedded CPUs. The challenge is to exploit all the available parallelism and heterogeneity to design a time and cost efficient, but also a reusable solution which will meet the performance goals.
In this paper the heterogeneity of parallel SoC system is evaluated through different processor cores and memory configurations usage examination. The design space exploration undertaken relies on several hypotheses concerning design concepts relations. Since system operating frequency is crucial, but not the only design performance success parameter, the importance of operating processor data path is emphasized as it conducts the application mapping approach. We show that, depending on the different heterogeneous elements configurations used within some multicore SoC solution, the suitability of particular processor cores usage varies on application type, but with achieved performance comparable to application-specific custom generated hardware.

Keywords: Embedded Computer Systems, Heterogeneous Computing, FPGA, High Level Synthesis, Design Space Exploration, Software partitioning and mapping,

I. INTRODUCTION

Broad and versatile application of embedded computer systems has marked the last decade of their usage. Due to the wide variety of applications these systems are used for, their design can pose many challenges. The design requirements for embedded systems involve meeting desired performance goals while observing numerous other constraints ranging from development cost and time, energy efficiency, final product cost to reliability concerns and more [1][2].
Choosing the optimal architecture platform for a particular application often proves to be the biggest design issue. In order to satisfy the above enlisted design requirements, often a heterogeneous multiprocessor platform must be used. Still the design will not benefit from the platform heterogeneity unless the software application is properly tuned to exploit available hardware potential. Common approach is to choose a certain platform based on one or more of the following criteria: price, availability, earlier experience or legacy status, and then manually optimize the application software for the target platform.
The alternative is the Design Space Exploration (DSE), a process to find out near-optimal system architectures for a given application, considering the design constraints and objectives. It involves task partitioning and mapping, architecture and processing element selection, and performance estimation before a hardware prototype is built [3]. The process starts with application specified using a model of computation, description of architecture instance and a set of constraints for the overall system. Those inputs are fed to mapping engine which performs partitioning and mapping of software to hardware. Finally, a performance analysis is conducted to determine whether the output design meets given constraints.
During DSE process, the platform can be built either entirely out of-the shelf components (embedded CPUs, RAM memories etc.) or custom made FPGA components can be used to build the part or even an entire architecture platform targeting particular application. High level synthesis (HLS) [4] denotes a set of methodologies that generate custom hardware units from high level specification in automated manner. The idea is to help designers to build and verify custom piece of hardware in short time by writing algorithmic specification. Usually, the specification language is C or some of its derivate such as C++ or SystemC, and the output is synthesizable RTL level (VHDL, Verilog) circuit description. FPGA is the target implementation device as the most popular prototyping platform with good software support for logic synthesis process. It is suitable for generating dedicated high performance components that will be used as coprocessors for design functionalities selected for acceleration, and during last decade a number of academic and commercial tools appeared in design community and on the market.

II. RELATED WORK

Lately, many research groups have tried to optimize and automate parts or the entire DSE process. The main two points of focus have been: (1) code analysis and partitioning and (2) task to processor mapping.
Early work in this area embraced the approach to take the application, divide it into tasks on a very high level and try to come to best near-optimal (NP-hard problems) task-to-processor mapping scheme in a reasonable

amount of time [5][6]. The scheduling algorithms used were modified versions of integer linear programming.
More recent work has focused on optimizing both the application and the mapping scheme, while automating the most part of this process. The most successful at the time were the Daedalus tool [8], developed at University of Amsterdam and MAPS tool [7] developed at the research group at RWTH Aachen University. While MAPS features a more advanced compiler and focuses on adapting the application to the given platform, Daedalus provides better support for platform customization and is able to produce custom cores in FPGA, which MAPS is not. However, both tools rely on virtual platforms for performance estimation, which are not cycle-accurate by definition and do not reflect the implicit processor data path features. They are also not able to work with a loosely defined platform definition i.e. choose a certain number from a pool of components.

III. Problem Definition & Hypothesis

As stated above, DSE application-to-processor mapping process currently relies on virtual platform simulations for performance estimation or manual intervention of the system designer based on professional experience. However, virtual platform simulations do not take inherent features of a certain platform, like inner data path architecture, into account and thus do not correctly estimate the time for a certain task to execute on an element of a platform. Consequently, any approach relying on this type of performance estimation can potentially fail to exploit the full potential of heterogeneous platforms.
The goal of this research is to explore the extent of impact of platform heterogeneity on mapping efficiency regarding performance goals. The rest of this paper will try to give an answer to whether it is possible to partition the application and map it to heterogeneous platform to achieve performance results comparable to a custom hardware platform built using fully automated HLS approach. The custom hardware platform has been chosen as a reference point because currently it is the most common architecture platform type used for critical tasks that require significant speedup.
At the beginning of this research three hypothesis have been established.
Hypothesis 1: Inherent features of a certain platform architecture significantly affect the performance of execution of specific types of operations. The time needed for a processor to execute a certain operation does not only depend on the operating frequency, but also on the inner data path architecture, which can indeed have a major impact on the execution duration. Consequently, the suitability of two processors with a somewhat similar architecture (e.g. RISC type) can be proved between different types of operations, assuming the same external memory environment.
Hypothesis 2: In order to be able to determine which processor is more suitable for a certain task (in broader sense then operation) it is enough to examine the performance of "basic tests" i.e. execution of operations typical for a certain task (e.g multiplication and trigonometry vs. bitwise operations) in a given memory environment.
Hypothesis 3: By examining the results of processor performance for "basic tests" in a given memory environment and applying efficient task-level parallelization of the application, it is possible to achieve an overall performance comparable to custom built hardware platform using HLS method. It is assumed that basic tests were chosen to accurately represent the prevailing types of operations in each task in the application of interest.
In the rest of this paper the experiments conducted in order to prove these three hypothesis are described.

IV. Experimental Setup & Results

In first part of this section the evaluation platform and test bench are described in detail. Later the results of conducted experiments are presented and discussed.

A. Evaluation platform

All experiments were conducted on the ZC706 evaluation board which provides a hardware environment for developing and evaluating designs targeting the Zynq®-7000 XC7Z045-2FFG900C AP SoC. The ZC706 evaluation board provides features common to many embedded processing systems, including DDR3 SODIMM and component memory (1GB), a four-lane PCI Express® interface, an Ethernet PHY, general purpose I/O, and two UART interfaces.
Two types of RISC processors were used:

1. The ARM Cortex-A9 processor, a popular general purpose choice for low-power or thermally constrained, cost-sensitive devices. The processor is a mature option having been introduced in 2008, and remains a very popular choice in smartphones, digital TV, and both consumer and enterprise applications enabling the Internet of Things. Zynq system integrates two ARM cores.
2. MicroBlaze™, a 32-bit RISC Harvard architecture soft processor core with highly flexible architecture, plus a rich instruction set optimized for embedded applications, delivers the exact processing system needed at the lowest system cost possible. This industry-leader in FPGA-based soft processors features advanced architecture options like AXI or PLB interface, Memory Management Unit (MMU), instruction and data-side cache, configurable pipeline depth, Floating-Point unit (FPU), and much more.

B. *Test bench*

According to the previously stated hypothesis three different test cases have been prepared.

Two test cases were adopted from MiBench [9] and represent "basic" test cases which aim to determine the behaviour of each type of processor in performing different types of computation.

1. CubicTB test solves the third-degree polynomial equation, and serves to measure performance in performing typical mathematical operations (addition, multiplication, basic trigonometry).
2. SqrtTB finds the square root of an integer with all the calculations being the base-two analogue of the square root algorithm learned in grammar school. Bit-wise operations are the prevailing type in this test case with absolutely no multiplications or divisions.

The above two test cases have been executed on twelve different architecture configurations. A single core of the ARM processor was used in the following configuration: operating frequency @ 667MHZ, 32 KB L1 cache and 512 KB L2 cache with two different memory mapping schemes:

- both instructions and data stored in local DDR3 SDRAM memory operating at 533 MHz (*local*),
- instructions stored in local memory and data was stored in shared DDR3 SDRAM operating at 200 MHz (*mixed*).

MicroBlaze processor was used in three different architecture configurations: (1) 3-stage pipeline @ 100 MHz, (2) 5-stage pipeline with hardware multiplier and barrel shifter @ 100 MHz, and (3) 5-stage pipeline with hardware multiplier and barrel shifter @ 200 MHz. The 200 MHz clock frequency is the maximum achievable frequency on PL side of Zynq system and thus is the reason why both shared DDR and MicroBlaze are not able to operate at higher speed. As was the case for the ARM processor, all three configurations of MicroBlaze have been tested with three different memory mapping schemes:

- both the instructions and data stored in local BRAM memory (*local*),
- instructions stored in local BRAM memory, and data in shared DDR memory operating at 200 MHz (*mixed*),
- both instructions and data stored in shared DDR memory operating at 200 MHz (*shared*).

The performance results are reported in TABLE I. and visually compared in Figure 1 and 2.

The results clearly show that the ARM processor greatly outperforms MicroBlaze for CubicTB in all memory settings. On the other hand, SqrtTB results show that

TABLE I. CUBICTB AND SQRTTB EXECUTION TIMES

Target processor	Memory configuration	Execution time [s]	
		CubicTB	***SqrtTB***
ARM [1]	Local*	4,74E-06	1,69E-06
	Mixed**	6,15E-05	2,58E-04

	Shared***	1,06E-02	2,31E-04

[1] ARM® Cortex™-A9 CPU at 667 MHz
[2] XILINX® MicroBlaze™ CPU at 100 MHz
[3] XILINX® MicroBlaze™ CPU at 100 MHz with HW multiplier and barrel shifter
[4] XILINX® MicroBlaze™ CPU at 200 MHz with HW multiplier and barrel shifter
* Both instructions and data are stored in local memory
** Instructions are stored in local memory but data is stored in shared memory
*** Both instructions and data are stored in shared memory

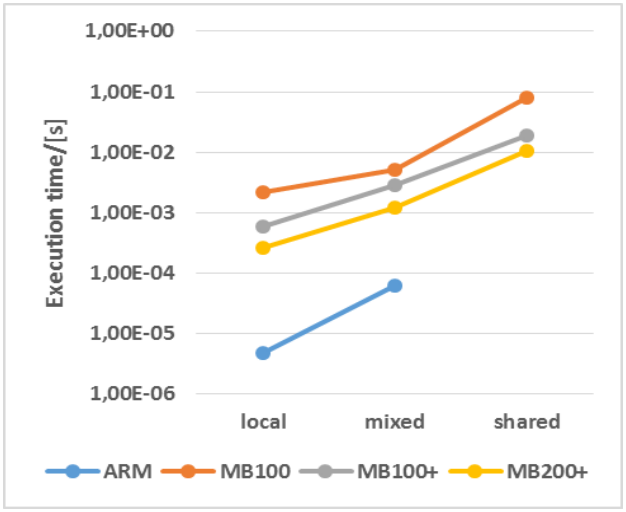

Figure 1. CubicTB performance comparison

Figure 2. SqrtTB performance comparison

MicroBlaze delivers much better performance than ARM for bitwise operations when accessing shared memory is required. Additionally, modifying MicroBlaze by adding two more stages in pipeline, hardware multiplier and a barrel shifter delivers up to four time better performance at the same clock speed.

As for the memory configuration, it can be clearly stated that the best performance is always achieved when everything is stored locally. However, this is often not feasible, especially in multicore systems when processor need to exchange data and thus the mixed memory configuration results should be considered in further discussion.

At this point it can be deduced that ARM would be a better choice for tasks consisting of mathematically more complex operations, while MicroBlaze would be a much better choice for simple and bitwise operations.

For the third test case JPEG [10] compression algorithm was chosen since it consists of several tasks with different prevailing types of operation which should be a good test of previously deduced assumption about processor affinity.

The JPEG compression algorithm has 6 consequential steps with YUV 3-component image model given as input. After the initial extraction of 8x8 pixel block from the original image, every pixel is shifted by -128 so that the whole range of DCT is used. The shift is followed by a DCT transformation which broadens the pixel data range to 12 bits, and scales back to 8 bits per pixel when quantization is performed. Next, data is arranged in a zig-zag manner so that the coefficients with higher value come first which is important for the efficiency of the following step – the Huffman entropy coding. Finally, coded data is formatted and written to a .jpeg file according to Standard. The JPEG compression flow is shown in Figure3.

In the original standard DCT requires 64x64 passes through the pixel block and its core includes 3 multiplications per each step thus taking up more time than all other parts of the JPEG compression together. Through exploration of the specific properties of DCT, special algorithms were devised that help achieve significant speedup. In this paper the AAN algorithm [11] for scaled 1D DCT (8 points) was chosen for implementation and testing. Single pass of this algorithm requires 5 multiplication, 29 additions and 16 2nd complements. Two passes are needed for transformation of one block of pixels. Since it is completely obvious that

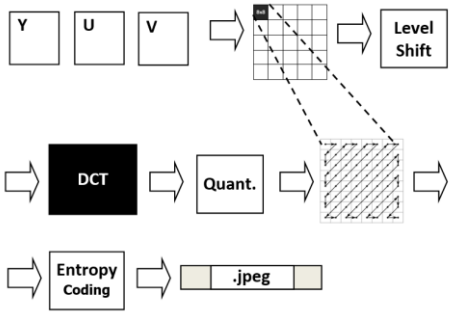

Figure 3. JPEG algorithm flow

MB is no match for ARM for original DCT, this algorithm was chosen as a more interesting alternative which could prove to be suitable enough for MicroBlaze to be able to compete in performance with ARM.

From the previous twelve architecture configurations only three that have previously shown best performance results were chosen:

1. ARM with local memory access,
2. ARM with mixed memory configuration,
3. MicroBlaze at 200 MHz with 5-stage pipeline, hardware multiplier and barrel shifter and mixed memory configuration.

It must be noted that, as previously stated, the first configuration where ARM communicates only with local memory is not a viable solution for any multicore system but it has been put here for comparison purposes.

The obtained performance results for a picture size of 40 blocks are presented in TABLE II. . As expected from the previous test cases, MicroBlaze outperformed the ARM processor in mixed memory mode in *shift*, *Huffman coding* and *create_image* tasks in which simple and bitwise operations prevailed. These results give strong evidence in favour of the first and the second hypothesis.

C. Case Study – JPEG performance optimization

Each of the previous test cases was executed on a single processor in order to obtain performance results for each task and determine the affinity of each type of processor to a certain type of tasks. The ultimate goal of these research is to show how to most efficiently use available platform resources based on processor affinity to certain tasks in order to achieve performance comparable to

TABLE II. JPEG EXECUTION TIMES

Target configuration	**Execution time [s]**						
	Create_blocks	***Shift***	***DCT***	***Zig-zag***	***Huffamn coding***	***Create _image***	***Total***
ARM local	3.42E-04	2.72E-04	1.85E-03	2.13E-04	4.31E-03	1.28E-04	7.11E-03
ARM mixed	2.12E-02	1.90E-02	9.28E-02	1.91E-02	7.55E-01	3.26E-02	9.40E-01
MB200+ mixed	2.02E-02	1.85E-02	9.41E-02	1.85E-02	6.70E-02	3.25E-03	2.22E-01

TABLE III. JPEG ON CUSTOM HARDWARE - EXECUTION TIMES

Target configuration	Execution time [s]						
	Create_blocks*	***Shift***	***DCT***	***Zig-zag***	***Huffamn coding***	***Create_image****	***Total***
solution1	2.12E-02	5.08E-05	1.73E-03	2.16E-05	2.17E-04	3.26E-02	5.59E-02
solution2	2.12E-02	5.08E-05	1.62E-03	2.16E-05	2.17E-04	3.26E-02	5.57E-02
solution3	2.12E-02	5.08E-05	2.32E-05	2.16E-05	2.17E-04	3.26E-02	5.41E-02

*These tasks were executed on ARM

custom made FPGA architecture platform targeting this particular application - JPEG.

For this purpose, a custom made architecture, which would serve as a reference point, has been designed on Zynq platform. It consists of a single core ARM processor and custom made hardware designed using HLS method with the source code previously used and implemented in FPGA. The ARM processor performs the first and the last task in JPEG flow (receiving/sending data from/to memory and pipelining it to FPGA) while the other tasks are completely executed in hardware. In order to ensure equal testing environment, mixed mode memory was used. Three levels of optimization of DCT function were applied and resulted in three solutions:

- solution 1 – no optimization
- solution 2 – first level of DCT pipelined
- solution 3 – DCT transform loop pipelined.

The results are presented in TABLE III. and, as expected, the third solution achieves best performance results.

After obtaining performance results from a custom made architecture, the next step was to devise an application partitioning and mapping scheme on the same Zynq platform, which would deliver results comparable to the previous ones. Zynq platform provides two ARM A9 cores with the surrounding programmable logic which can be used to instantiate a number of soft-core MicroBlaze processors. In this research the maximum possible number of soft processors was targeted. Due to routing and timing limitations the maximum possible number of MicroBlaze instances was ten. By observing the timings obtained for each type of processors in previous experiments for a mixed memory environment, using a combination of LPP[13] and LPT[12] mapping and scheduling heuristics for the same picture size as in the previous cases the following average execution time has been achieved: 9.18E-02. It is important to point out that it is only 1.7 time slower than the best time achieved on custom hardware platform and provides strong arguments in favour of the third hypothesis.

TABLE IV. RESOURCE UTILIZATION

Target configuration	Resource utilization [%]				
	LUT	***FF***	***MUX***	***BRAM***	***DSP***
config1*	16	7	13	70	4
config2**	20	7	1	13	58

* multicore platform
** custom hardware platform

Resource utilization for multicore system is compared with resource utilization in custom hardware system in TABLE IV. The percentage of utilized resources is rather similar, and while custom hardware platform uses more DSP resources, the multicore platform uses more BRAM resources. However, it is important to mention that while custom hardware platform can be used only for the application for which it was designed, while a multicore platform is much more versatile and same configuration (with a different mapping scheme) can be used for a various set of applications thus improving the reusability of the solution.

V. DISCUSSION & FUTURE WORK

The results presented in the previous chapter provide strong evidence in favour of all three hypothesis established at the beginning of this research. The key concept of this approach is the possibility to gain insight into platform architecture specifics by using a basic set of tests and use that knowledge to develop an efficient mapping scheme for a more complex application. What is more, this approach, unlike expert knowledge, can be more easily automatized and integrated into a mapping tool targeting heterogeneous embedded multiprocessor platforms. It is important to note that the custom made hardware cores are often irreplaceable for accelerating parts of the application, especially in hard real-time systems, and in the future research devising a heuristic which will determine when a part of the application must be "moved" to hardware should be considered. Certainly, many more types of architectures and applications need to be studied in order to develop a viable mapping heuristic. Finally, much more emphasis needs to be put on reliability end energy consumption parameters to be able to provide solutions which will fully keep the pace with current demands for embedded computer systems.

In this paper the clustering, classification, regression, and associative search are viewed as formal tasks Data Mining. Objects presented in the form of multi-dimensional numerical vectors of informative features are initial data. For each of the tasks exist many known algorithms of solving, but they have fundamental differences. For example, the first group is based on calculation of the distance between the images in a specific metric, the second group is based on approximation of regression or discriminant function, and others are based on analysis and processing of math graphs. These differences are a cause for very narrow application of known neuro-computers and associative processors. At the same time, the universal parallel processors (multi-core CPU and GPU) have objective limitations in accordance with the Amdahl's and Gustafson's Laws, and aren't optimal for solving Data Mining. We propose an approach that unifies hardware and software implementation of the tasks of regression, classification, clustering and associative search through the unification of different algorithms in a unified mathematical model. This opens the way to create of hardware universal core of computation for all tasks Data Mining and Knowledge Discovery, and hence to the creation of a new type of cognitive or intelligent computers.

INTRODUCTION

Modern intelligent data analysis presents a wide spectrum of mathematical methods and algorithms for classification, clustering, associative search and other kinds of problems including evaluating efficiency of such systems. Some works are even reveal main constraints of these methods applications and introduce possible ways to overcome it [1]. But still practical accomplishments in the field of intelligent systems are quite small: actually implemented systems only scarcely can be called "intelligent" while cost and efforts required are often unacceptable.

Most of applications are not bound to a single formal task of classification, clustering or some other. Instead there is a problem of presenting target task as a composition of formal intelligent data analysis subtasks. This resulting solutions are often represent a straightforward application of one particular method known to developer or weakly predictable mix of different algorithms and heuristics. And very rarely there is a scientifically and technically well-founded composition of methods and algorithms that will allow to achieve balanced and efficient solution for the problem.

This disbalance between theory and practice becomes even more noticeable in development of high performance hardware for intelligent data processing. It is only natural since specialized hardware design preceded by algorithmic preparations and thus requires much more efforts. Typical example of this is fate of neurocomputers and neurochips which were expected to have bright future. But in reality it became apparent that in addition to technical constraints (such as number of connections and simultaneously active neurons) neural model doesn't cover all methods and algorithms needed to solve actual tasks. As a result it looks like neurocomputers do exist but there are no customers ready to use them in practice. The only exception for this is when some electronics manufacturers provide simple DSPs under the name of neurochips since in both cases weighted sum is used as the massively parallel operation.

From the other side there are technological tendencies like evolving multicore CPU, GPU, supercomputers, clusters and distributed processing systems which are in fact unified parallel computational architectures. They create additional rivalry for specialized intelligent processing hardware.

It rises a natural question: what can be presented as an alternative to "hard" neuron, associative, semantic processors from one side and to universal parallel computers from the other? Maybe problem-oriented "intelligent" or "cognitive" computers designed for a wide spectrum of intelligent data analysis problems?

UPPER LEVEL FUNCTIONS AND ARCHITECTURE

From the very beginning we will limit our research to the level of computing technologies that are accessible in our country (and also Russian Federation) and to reasonable price category. This means that we will avoid self-organizing synergetic structures, 3D-chips, nano-,

quantum- and other highly technological types of computers.

The main target of this work is to propose practical approach which will lead to the creation of an effective integrated hardware/software solutions as a base for creating intelligent systems. Ideas presented in this work are developed from authors' previous results (mathematical models of fuzzy classification, semantic processing and their implementation) [2-4] in direction of further unification.

This work proposes original architecture of a problem-oriented machine which lies on top of a usual parallel or specialized computer. Architecture includes next parts: central processor (supervisor), parallel co-processor (hardware acceleration unit) and library of intelligent data processing programs (Fig. 1).

Complex of CPU and co-processor presents well-known and widely used approach, while key feature is library of algorithms. Note: particular details of computing system implementation may differ and in this work are not considered.

Proposed conceptual approach implements principle of upper-level program control. It is understood that actual intelligent data processing task may be presented as a composition of clustering, classification, regression, associative search, semantic processing and other kinds of mathematical problems including statistical ones. For each problem there is a known set of algorithms and most of them are actually enumeration methods. Which means that computational complexity grows in a non-linear way with amount of input data. Each of these algorithms is implemented in form of program optimized for specific hardware implementation of parallel processor. In addition to it library includes methods of evaluating these algorithms' efficiency.

Main intelligent processing host-program runs on CPU and operates through subprograms which present data analysis and auxiliary algorithms from library plus set of commands not included in the library. Fig. 1 shows

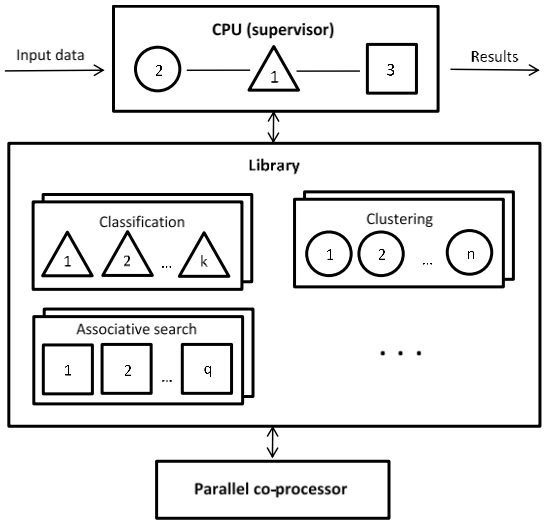

Figure 1. Problem-oriented machine architecture.

simplified example of such program. It consists of clustering algorithm №2, classification algorithm №1 and associative search algorithm №3. This program also implements input data receiving, acceleration on parallel co-processor and delivering computation results.

From functional point of view presented computing system reminds software complexes like Weka [5]. The main difference is in use of parallel co-processor (for example GPU cluster) and algorithms adaptation for specific architecture.

In case of an original co-processor implementation higher degree of architecture-algorithm coherency can be expected. And thus efficiency of whole system is expected to be higher.

MASS CO-PROCESSOR OPERATIONS AND COMPUTATIONAL MODEL

There are three linked problems that should be addressed during design of new parallel co-processor architecture:

- Choosing mass operations functions which will be appropriate for specified set of Data Mining problems;
- Designing processing element (PE) structure and schematics (hardware basis);
- Developing protocol and implementing hardware/software communication between processing units and host processor.

Naturally, the main criteria is unification of library algorithms implementation within framework of some computation model.

Experience in design of several DSP and neurocomputer architectures shows that there is sense in taking weighted sum as the mass operation. This arithmetical operation is used by many Data Mining algorithms [6, 7] and often implemented in hardware. But current level of development in electronic technologies allows to reach mass operations of higher complexity.

For instance distance function can be used in such operation. There are works in this field related to similarity measures for text classification [8] and common metrics in real-valued spaces [6, 9]. They have some differences which should be considered in computation model.

Most often used distance metric is Euclidean distance since it possesses homogeneity in all directions. But from computational point of view this function is really heavy and difficult to implement in hardware. Manhattan and Chebyshev distances are examples of easier and faster metrics. They use only sum and max operations correspondingly. But the same time they are less homogenous than Euclidian metrics. Also there are other operations that may be useful for some fuzzy classification and clustering solutions such as membership function and informative features of critical importance. Some of mentioned features were already tested on generalized identification model [2] and were

implemented in one of the specialized co-processor variants [3].

HARDWARE PLATFORMS EFFECTIVENESS COMPARISON

It is common to understand efficiency as a ration of quality to cost (or other type of resources). In relation to computing it is usually ration of performance to cost of hardware. From the experience in neural computers efficiency evaluation we know, that measurement of the productivity in flops will not be quite correct. Because of it different approaches were suggested, like counting number of modelled synapses (multiplication plus summing), or neurons (same plus threshold function) in time. A number of works in the field by default assume fully parallel functioning of neural networks. They, however, usually overlook one important question in this case: How many neurons can really work simultaneously at each moment of time? Experimental modelling of neural networks using parallel computers shows that Amdahl-Gustafson's law is still effective for parallel implementation of neural networks. I.e. increasing number of PE does not lead to linear growth of computational performance as a whole. It is only natural since parallelization during modeling touches not only parallel architecture but also implemented model.

What kind of efficiency can we expect from problem-oriented cognitive computer? To answer this question let us first point out and comment on parameters which influence efficiency. This includes single task processing time, amount of input data, processing precision and number of processing elements. Naturally, total cost is integral parameter which characterizes machine efficiency but in this work we will not discuss this aspect. Instead we will think of number of processing elements as resources spent on achieving specific computation performance.

Size of input (processed) data is a value defined by a number of informative features, patterns, classes and/or clusters. For simplicity's sake we will discard influence of data representation on amount of calculations.

Computation precision (in our case it is decision making reliability) is a value which is defined through a method and algorithm by dataset representativity, decision making criteria etc. For simplicity's sake we will discard influence of data representation on computation precision.

Number of PE directly characterizes parallelization potential of computation process and indirectly, as was stated above, cost of the whole system.

Computation time of specified task (clustering, classification, associative search or their composition) is defined as interval from the moment of passing input data until result retrieving. This parameter can be measured both in absolute and conventional (model tick) units. In the first case efficiency evaluation will be affected by hardware platform technical characteristics. In the second case – by model time definition. Naturally, performance will be measured not in Giga-, Tera- flops and not in Kilo- or Mega- neurons, but in tasks of clustering/classification per time. The total computation time will consist of parallel co-processor computation time and overhead time costs related to: loading/retrieving data, operations preparation and other code that can't be effectively paralleled.

Mutual influence of mentioned parameters characterizes intelligent computation efficiency. Fig. 2 shows curves of such dependencies for different hardware platforms.

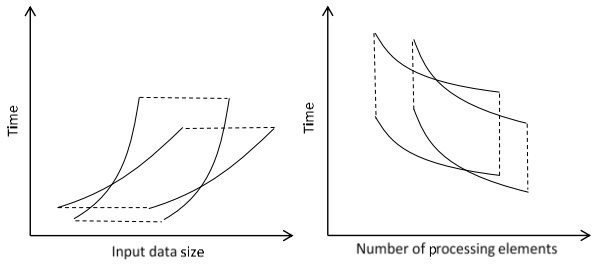

Figure 2. Dependency of task execution time from (a) input data size; (b) number of processing elements

Fig. 2a illustrates expected form of exponential dependency caused by enumerative character of data analysis problems. Actual curve slope may significantly vary depending on quality of algorithms implementation with respect to specific hardware platform. Graph on Fig. 2b demonstrates Amdahl-Gustafson's law according to which performance of parallel machine cannot grow linearly with increasing number of processing elements. But using proposed approach in cognitive computers design, slope of this curve can be significantly lowered. Both graphs consider other parameters (precision, data size and number of processing elements) to be constant.

On both graphs similar curves form range in space where may lay some third curve. Its actual position will be defined by technical characteristics of hardware platform. It is important to mention that curves which describe efficiency of different alternative platforms may intersect and this intersection coordinates can be very useful during computing system design stage.

CONLUSION

This work considers such Data Mining problems as classification, regression, clustering, associative search and others. Input data presented by multidimensional real-valued vectors of informative features. Each problem has a wide set of algorithms with their differences. For instance some are related to calculating distances in defined metrics, others – to approximating discriminant or regression function. All these differences cause narrow application field for known neurocomputers and associative processors.

This work proposes approach for hardware/software solutions unification with regard to Data Mining techniques through bringing different algorithms to single hardware platform. Here platform can be presented by both universal parallel machine (multicore CPU, GPU, supercomputers) and specialized one. This opens path to designing hardware processing core common for a set of Data Mining and Knowledge Discovery problems, and

thus to creating new type of computers. Proposed computation model shows more versatility in comparison to neuron, associative, semantical and some other models since it is oriented on higher level of mathematical tasks representation. Because of it term "cognitive" or "intelligent" is used for defining this type of machine.

Suggested approach allows to perform comparative evaluation of alternative hardware platforms used in actual intelligent systems. For this purpose functional unit should be presented by known Data Mining problem (classification, clustering, associative search and others).

A Model of Speed Profiles for Urban Road Networks Using G-means Clustering

Tomislav Erdelić [1], Silvija Vrbančić [1], Lovro Rožić [1]

tomislav.erdelic@fpz.hr

Abstract - In this paper, we present a method for computing speed profiles by processing GPS data collected by vehicles in an urban area. The vehicles were tracked during a five year period on the road network of the capital city of Croatia (Zagreb). Traffic congestions in Croatia appear almost exclusively in urban areas, therefore Zagreb was chosen for this study as it is by far the largest city. The profiles for the roads were computed for each day of the week, where each day was segmented into five minute intervals. As there are no congestions during the night, the free flow speed for the roads was determined by averaging vehicle speeds which were recorded during that time. The speed profiles were clustered using G-means, a variant of the k-means clustering algorithm, to reduce storage space and to categorize roads observed in future research based on their profile. By applying this algorithm we reduced the number of total speed profiles by more than 90%. The profiles were developed as part of the SORDITO project, with the goal of developing algorithms for vehicle route optimizations.

I. INTRODUCTION

With the advent of large scale data gathering and handling, prediction of travel time in urban areas has become an important tool in business as much as in personal life. GPS receivers typically produce a log that contains a time stamp when data were recorded; measured speed, longitude, latitude and heading. Such data have been used to observe various regularities regarding traffic, such as traffic congestions, and has been used in route planning applications. Today, GPS data are widely used as a source of information regarding traffic regularities [1,2] and general mobility patterns [3,4], because of the ubiquitous presence of GPS technology in various mobile devices, including mobile phones. This makes GPS data relatively easy to gather when compared to alternate means [5]. However, data gathered from GPS devices do have drawbacks: there are instances where the signal is weak (e.g. when driving in tunnels or between buildings) and there are inaccuracies which add a certain error to the data [6]. In order to minimize such errors a constant stream of data is needed to correct possible measurement errors. Real time analysis of such data, however, requires a significant and complex infrastructure as the traffic data can come from a number of different vehicle types such as personal, delivery or public transportation vehicles, and many heterogeneous GPS devices which might record data differently.

Coupled with the amount of data needed to get an accurate description of traffic in real time, this presents a serious challenge. On the other hand, historical data are much easier to analyze as they are static, and can be easily preprocessed. In this work, we have developed speed profiles using historical data gathered by taxis and delivery vehicles over a course of five years on the road network of the capital city of Croatia (Zagreb). There are many factors which determine travel time besides just geographical locations, such as road quality, weather conditions, road accidents and roadwork etc. However, although linked to certain predictable parameters, accidents and closures are not predictable on a smaller timescale and are therefore not usable as historical data. In contrast, congestions in urban areas are mostly regular as they are the result of daily migrations of commuters, either going to or returning from their workplace. It is therefore reasonable to assume that speed profiles for the roads with the most traffic during the day are highly dependent not only on the time of day, but also on the day of the week, as most people work only on weekdays and not on weekends. This has prompted us to develop a model taking these differences into account. It was determined that the profile differences were indeed significant when comparing not only workdays to weekends, but all days of the week to each other.

In order for the resulting profiles to be used in practice, one has to consider the space requirements. One possible usage of the resulting profiles is solving the Time Dependent Shortest Path Problem (TDSPP) [7], which requires frequent lookup and calculation of travel times. With that in mind, it is unfeasible to store every single profile for a whole city. Moreover, the TDSPP needs to be solved in real time, possibly on a machine with limited resources available, such as a mobile phone with navigation software. Using the G-means algorithm described in [8], we have developed categories which represent sets of profiles and have reduced the number of needed profiles by over 90%.

II. DATASET PROCESSING

Our main goal was to compute speed profiles for roads on a digital map. A brief overview of the data set and a method of calculating average speed for roads, based on the time of day, is given. At the end of the section, the coverage of roads with computed speed profiles is presented.

A. Dataset

The GPS data (approx. 373 million records) were recorded during a five year period between August 2009 and October 2014 by 1937 tracked vehicles which passed

This work is part of the SORDITO project, which is funded in part by the European Regional Development Fund.

Figure 1. GPS records matched to a part of the city; faster roads are shown in green, slower roads in red

through the road network of Zagreb, which measures approximately 2900 kilometers. GPS receivers were installed by the partner company Mireo Inc. on taxis and delivery vehicles in Zagreb. A small portion of the recorded data is shown in Fig. 1, where each record is depicted by a single dot. Data collection and preprocessing was done by the partner company as well, so along with the common data every record had the following information: a note whether the vehicle was driving or not, corrected longitude and latitude matched to the road on which the vehicle was driving, matched course, speed and distance covered by the vehicle since the previous GPS signal. The recorded data were stored by month and the unique number of the receiver installed on the vehicle. This way, a chronological route of a tracked vehicle could easily be obtained.

The traffic map of Croatia is represented by a network of road-links. A road-link (from this point link) is, in most cases, a segment of road between two intersections or between traffic lights. Every link on the map has a unique ID, longitude and latitude of the first and last point on link and length in meters. For some larger roads such as highways, each direction is represented by a separate link. Longitude and latitude of all historical data were matched to an appropriate link.

Before the profiles could be calculated, some additional processing was needed. Records that were recorded when the vehicle was turned off (approx. 5 % of total stored records), as well as records that did not have longitude and latitude matched to a road (approx. 4 % of total stored records) were discarded. Speeds that were higher than 200 km/h were considered as outliers and were also discarded.

B. Computing speed profiles

The developed method for calculating speed profiles takes into account the time that passes until the vehicle exits the link, or more precisely, the time needed for the vehicle to appear on the next link in its route. The main idea of this approach is the fact that most of the speed drops occur towards the end of the link, on intersections and traffic lights. Taking into account data which appear only on a single link would disregard the time needed to traverse the intersection.

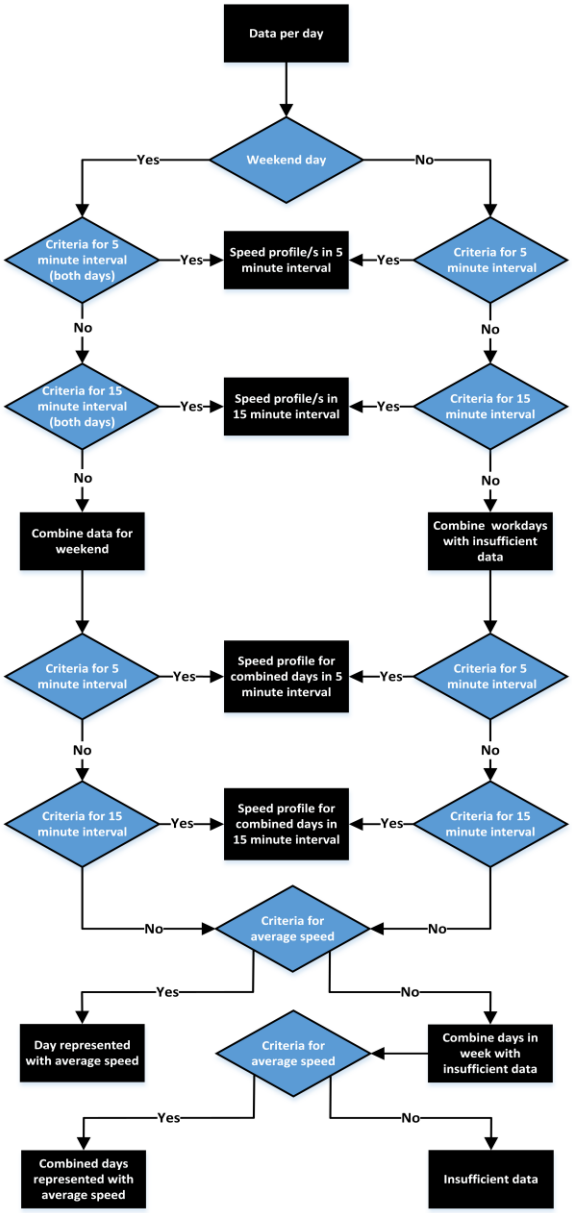

Figure 2. Flow chart depicting steps of data analysis

Free-flow speed is "practically determined as the average speed of passenger cars in conditions of low traffic flow rates" [9]. As there were no explicit data available on free-flow speeds of roads in Zagreb, free-flow speeds were estimated using available nighttime speeds. Nighttime speeds were used as there are no congestions during the night and traffic moves freely. As we do not expect there to be any difference in nighttime speeds for various days of the week, in order to use as much data as possible and maximize precision, the free-flow speeds were calculated using combined nighttime data from every day of the week. In our case, nighttime is the time interval between 22 h and 5:30 h.

Each day of the week was divided into five minute intervals, resulting in a total of 288 intervals per day. For a given link, speeds in nighttime intervals (intervals 0 to 66, and 264 to 287) were all set to the free-flow speed. The speeds for the rest of the intervals were computed based on vehicle trajectories through the link. For a given vehicle,

an entry point on the link was determined and the first signal which appeared outside of the given link (i.e. the next link on the vehicle route) was designated as the exit point. Although matched speed from the GPS record is very precise when the time differences between consecutive data are small, this was not the case with the used historical data as the time gap could vary from a couple of seconds when a vehicle was moving, up to five minutes when the vehicle was stationary. However, using the distances recorded by the GPS receiver between the entry and exit points, and the recorded time difference, it was possible to calculate the speed. The speeds were then included in all intervals between the starting and exiting time, inclusively. At the end of the process speeds in all intervals were averaged.

Although our goal was to calculate speed profiles in five minute intervals, for some links there were insufficient data for each of the 288 intervals to be calculated precisely. The procedure for each workday (as described in Fig. 2) is as follows: an attempt is made to calculate the profiles, trying respectively to generate five or fifteen minute intervals. If these attempts fail some predetermined criteria, the data for each workday which failed are combined and the procedure is again applied to the combined data. Finally, if the procedure fails again, only an average speed is calculated. The same procedure is then repeated for the weekend. If both workday and weekend profiles fail to meet the criteria, the data are combined and average speed is designated as the profile for every day of the week. The criteria used to determine whether there were enough data to calculate a profile was the following: the average number of data per time interval had to be larger than 4, and the percentage of intervals which did not contain at least one datum had to be less than 30%. In order to use the average speed as a profile, the number of data on a given link had to be larger than 7.

The problem with the computed data is the possibility of sudden changes between two adjacent time intervals, which could result in a significant change of predicted travel time. With that in mind, the profiles were smoothed using a cubic smoothing spline [10]. A cubic smoothing spline is a function f which minimizes the following expression:

$$p\sum_{j=1}^{n} w(j)\left|y(j)-f(x(j))\right|^2+(1-p)\int_{x_1}^{x_n}\left|\frac{\partial^2 f(t)}{\partial t^2}\right|^2 dt \quad (1)$$

where x is a vector of the given discrete time sequence and y is a vector of speed profile values. A cubic smoothing spline f at the time interval $x(j)$ is an approximation of the value $y(j)$ for j ranging from 1 to n, where n is the number of discrete time intervals. The expression $|y(j)-f(x(j))|$ represents the error between the speed profile y and smoothed speed profile f. The integral ranges over the smallest interval containing all the entries of x. The value p is the smoothing parameter which varies from 0 to 1, as the smoothing spline changes from the regression line to a natural cubic spline. For uniformly spaced data, the smoothing factor p is chosen as:

$$p=\frac{1}{1+\frac{h^3}{0.6}} \quad (2)$$

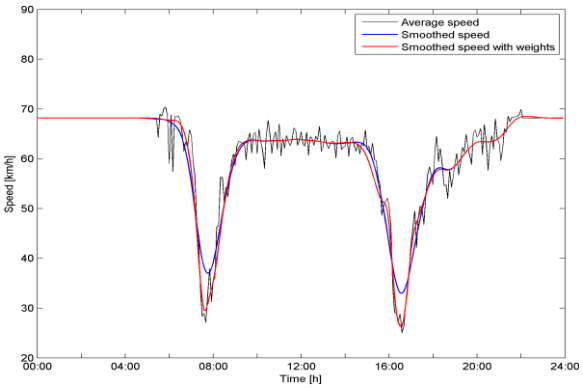

Figure 3. Example of simple and weighted profiles

where h denotes spacing of data sites. The value w denotes weights in the error measure, as a vector of nonnegative entries of the same size as x, with the default value of 1.

In order to apply the smoothing spline to fifteen minute intervals, each interval was interpreted as three separate five minute intervals.

We noticed that the times in which congestion appears are the two hour intervals in the morning (approx. 7:00-9:00 h) and in the afternoon (approx. 15:30-17:30 h). In those cases the described smoothed representation was not a good congestion indicator (Fig. 3). For that reason, additional weights were given to points in intervals between the mentioned times. This process ameliorates the effect of the smoothing spline which tends to average values across the whole domain, and does not affect data which are close to the free-flow values and indicate low congestion traffic.

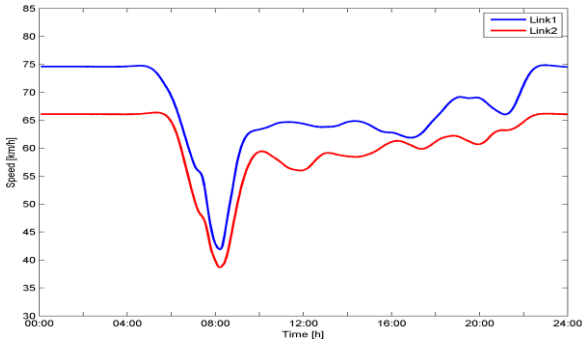

Figure 4. Absolute speed comparison

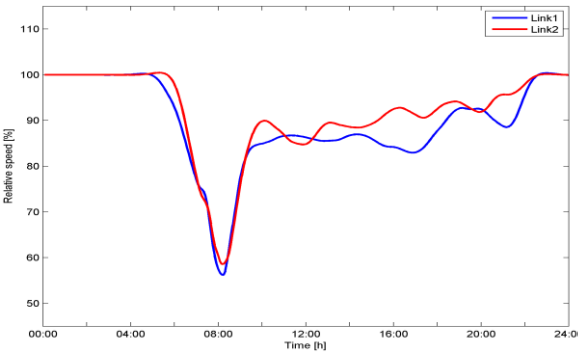

Figure 5. Relative speed (slowdown) comparison

TABLE I. PERCENTAGE OF COVERED URBAN ROADS

	Type of road	Type 1	Type 2	Type 3
1.	Highway	100.00	97.68	86.54
2.	Avenue	97.66	96.03	87.77
3.	Fast road	100.00	96.81	75.15
4.	Main road	99.99	96.34	76.82
5.	Main streets	98.51	74.15	30.70
6.	Local street	98.77	33.79	5.98
7.	Small streets	86.00	3.52	0.80

Finally, in order to compare traffic behavior on links which have different free-flow speeds but show a similar congestion pattern, speed profiles were normalized using free-flow speed. This allowed us to group links based on the displayed traffic pattern and not on absolute speed, as speed varies significantly between links and could therefore impact clustering precision. Fig. 4 and Fig. 5 depict the difference between profiles using absolute and relative speed values, respectively.

C. Profile coverage of Zagreb

Links in Zagreb are organized in seven categories by type of road, e.g. highway, state roads, country roads, local roads, streets and etc. This categorization was provided by Mireo Inc. However, those categories are insufficient for speed profile analysis as it was noticed that there are a lot of different types of speed profiles within each category. Link types can be used for comparison and analysis of behavior between different types of roads after speed profile clustering.

In the road network of Zagreb, GPS signals were matched to total number of 28496 links out of a total of 34111 links present in the area of Zagreb (84% of links). For those links a total number of 40821 speed profiles and 105731 free-flow speeds were computed. For 25818 speed profiles there were insufficient data and no profiles were computed. Table I shows the percentage of covered distance by type of road for three types of comparison. The percentage is calculated as a sum of lengths of found links relative to the total length of links in the corresponding category. Type 1 represents links found in Zagreb represented with free-flow and speed profiles. Type 2 represents links where every workday is represented by a speed profile, and type 3 links that have every day of the week represented by a speed profile.

III. G-MEANS

As it was mentioned in the introduction, the number of profiles of a city network is too large to be used effectively for various calculations. Furthermore, storing profiles which are similar or close to identical is redundant. One would also want to know what kind of traffic congestion could be expected in different times of day considering different locations in the city.

Many algorithms for data size reduction were developed over the years. Since 1967 the k-means algorithm [11] has been used in clustering methods on a daily basis. In general, k-means attempts to generate k clusters by trying to keep the distance between clusters as big as possible while minimizing the distance of points inside clusters from their respective cluster centroids. Although it is widely used, the k-means algorithm requires defining the number of clusters in advance, which could lead to problems such as overfitting and generating empty clusters. For speed profile clustering, the number of centers is not intuitively obvious, and an a priori determination of parameter k could cause results not complying with the actual data.

Hamerly and Elkan [8] suggested the G-means (Gaussian-means) algorithm which is based on k-means, but with the added improvement of not requiring the number of clusters as a parameter. G-means computes a number of clusters based on the normal distribution of data within clusters. More precisely, the algorithm starts with one center and checks whether data around that center follow the normal distribution. If the answer is positive, the data are clustered around one center, otherwise, two new centers are initialized and the procedure continues recursively until the data around all clusters are normally distributed.

For normality testing the Anderson-Darling normality test was used [12]. The Anderson-Darling (A-D) test statistic A^2 is defined as:

$$A^2 = -N - S, \tag{3}$$

where N is the sample size and

$$S = \sum_i^N \frac{2i-1}{N} \left[\ln\left(F(x_i)\right) + \ln\left(1 - F(x_{N+1-i})\right)\right]. \tag{4}$$

The vector $\left(x_{i_i}\right)_{i=1}^{N}$ represents sorted data in ascending order with zero mean and standard deviation equal to 1, and F is the normal cumulative distribution function (CDF). According to [12], the modification A_*^2 is computed as follows:

$$A_*^2 = A^2\left(1 + \frac{0.75}{N} + \frac{2.25}{N^2}\right). \tag{5}$$

The P-value is then estimated based on critical values given in [12].

A. Determining the Number of Clusters

In this subsection the G-means algorithm will be described. The first step in G-means is defining the initial cluster center C and applying the k-means algorithm starting with the computed center C. Two new child centers are then defined as it was described in [8]:

- The main principle component s and eigenvalue λ of the data are computed.
- A new variable m is defined as $m = s\sqrt{2\,\lambda/\pi}$.
- Child centers $c_{1,2}$ are then initialized as

$$c_{1,2} = C \pm m. \tag{6}$$

After initializing two new centers, the k-means algorithm clusters data around center C with parametars $k = 2$ and initial centers $c_{1,2}$. For simplicity, two centers chosen by k-means are also named $c_{1,2}$.

In the next step the hypothesis that the data around C follows the normal distribution is checked by the Anderson-Darling normality test. The data around the center C are labeled as Y. To make the normality test simpler to apply, Y is reduced to one dimension:

- A new variable v is defined, $v = c_1 - c_2$,
- Y is then projected onto v:

$$Y^*: =< Y, v > /||v||^2 \tag{7}$$

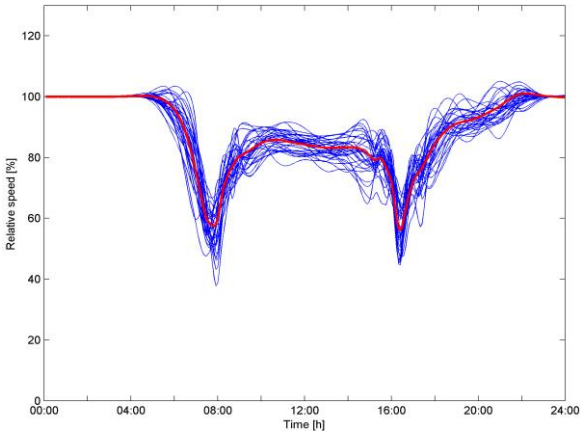

Figure 6. Example of one cluster created with G-means

A couple of transformations on the data are done before the Anderson-Darling test statistic is computed:

- The mean $\hat{\mu}$ and standard deviation $\hat{\sigma}$ of Y^* are estimated and Y^* is standardized.

$$Y^+ = \frac{Y^* - \hat{\mu}}{\hat{\sigma}}. \quad (8)$$

- Elements in Y^+ are sorted in ascending order as it is required in A-D test.

After A_*^2 is calculated and p-value p is estimated, the conclusion is as follows:

- If $p \geq 0.0001$, the hypothesis is not rejected and the original center C is a true cluster center,
- If $p < 0.0001$, the hypothesis is rejected, C is discarded and elements in Y are clustered in two groups with centers c_1 and c_2.

The described procedure is repeated recursively until elements of each cluster are normally distributed. It should be noticed that multiple normality A-D tests will be preformed, so for m performed independent tests and significance level α there will be $m \times \alpha$ significant results only by chance [13]. Therefore, the significance level α must be preserved. For this reason, a correction of significance level α was done. As it was used in [8], the Bonferroni adjustment [13] on Type I error was applied, and corrected significance level was $\alpha = 0.0001$.

Our goal in this work was efficient and quick speed profile clustering, therefore the performance of the G-means algorithm was not compared to other clustering algorithms that were described as less efficient in the literature. For example, authors in [8] compared k-means which uses Bayesian Information Criterion (BIC) significance level as cluster criterion and they showed that the G-means is considerably better in all aspects.

IV. RESULTS

Using G-means on 40821 calculated speed profiles 770 clusters were created, which is a reduction of 98.11 %. An example of a cluster is shown in Fig. 6. Table II shows cluster size distribution of speed profiles per determined clusters. The coefficient l denotes the number of speed profiles in one cluster, while the number of clusters with respect to l is denoted by *NC*.

TABLE III. CLUSTER SIZE DISTRIBUTION

l	≤ 5	$5 < l \leq 20$	$20 < l \leq 50$	> 50
NC	13	122	299	336

TABLE III. ANALYSIS OF CLUSTERS BY THE TYPE OF URBAN ROADS

CAT	N	N_{90}
1.	201	82
2.	377	204
3.	683	421
4.	666	399

In order to calculate variation inside clusters, an average correlation coefficient between each cluster element and corresponding cluster center was computed. Distribution of average correlation coefficients between cluster elements and corresponding cluster centers is shown in Fig. 7. The averaged correlation coefficient is 0.82.

To compare clusters, Euclidean distances were computed. Average Euclidean distances between cluster elements and corresponding centers are 146.89, which means that average distances between daily intervals inside one cluster is about 0.74. The average Euclidean distance between cluster centers is 379.78.

Table III shows the analysis of the top four types of urban roads presented in Table I. The first column represents the observed type (CAT) of urban road for

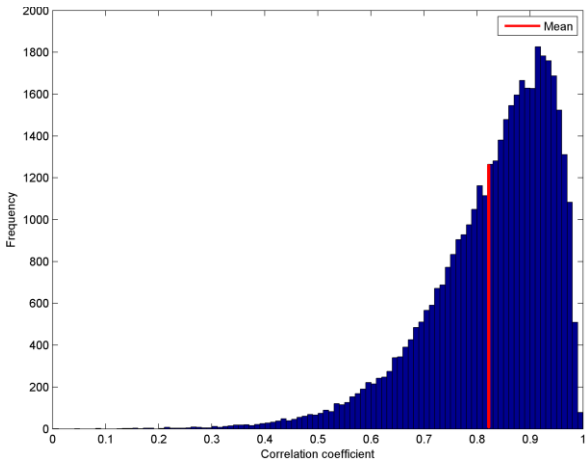

Figure 7. Distribution of correlation coefficients

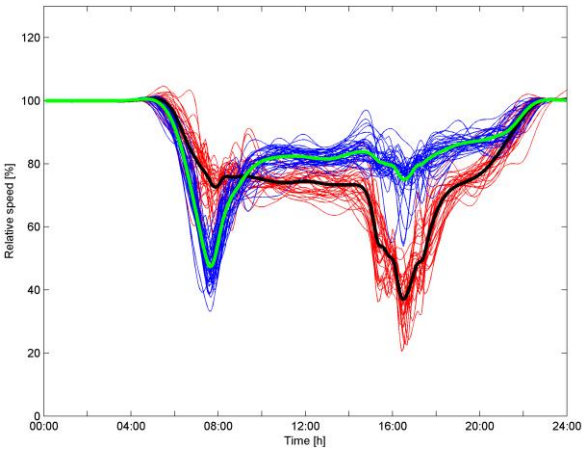

Figure 8. Two clusters representing morning and afternoon speed drops

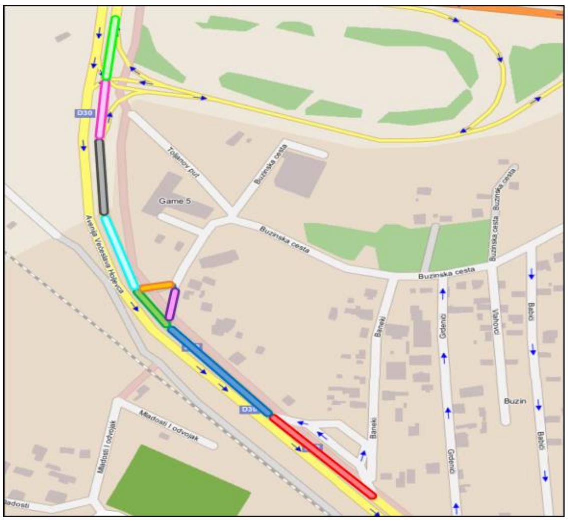

Figure 9. Links found in cluster on Fig. 6

which the speed profile was calculated. The second column represents the number of clusters which contain all profiles from the respective category. For example, all highway profiles are contained in 201 clusters.

The third column represents the number of clusters covering 90% of the profiles of the respective category.

Fig. 6 shows 36 profiles contained in a cluster, where 3 speed profiles correspond to urban roads of type 2 (avenue), 24 for roads of type 3 (main roads), and 11 for roads of type 7 (local streets). This shows that links with different category of urban road can have similar speed profiles. A group of links which are represented by that cluster are shown in Fig. 9. Each link is represented with a different color.

In Fig 8. two clusters are displayed. The differences between those clusters are notable: in one cluster (green line), the morning speed drop is more pronounced while the same is true for the second cluster (black line) for the afternoon period. We can say that those two clusters represent links which have regular daily migrations of commuters.

V. Conclusion

In this work, we have presented a method to compute speed profiles for the road network of a whole city by using GPS data as the source of information. The proposed method of calculating speeds on links takes into account the time loss on intersections. The processed data were used to compute speed profiles for most of the major roads of a large city network. The resulting 40821 profiles were smoothed with weighted cubic smoothing splines in order to better approximate traffic during congestions. The G-means algorithm was used to reduce the size of the dataset in order to make its usage in various applications feasible.

As a possible goal for future research, other factors which influence traffic behavior can be studied, for example, weather conditions, holidays, school break and tourist season.

Acknowledgment

The authors would like to thank our colleague Juraj Fosin for great mentoring and numerous advices regarding the research.

Abstract - In this paper we tackle the problem of factory floor layout optimisation in a furniture factory. The goal of optimisation was the reduction of manufacturing costs, specifically reduction of the costs of product transport between machines by reducing the product travel distance and consequently the amount of labour. Limiting factors are the costs of relocating the machines to the optimal positions. We have analysed the current state of the manufacturing system by developing a detailed discrete event simulation (DES) model. The DES model was then used to develop optimisation methods and verify optimisation scenarios. Finally, from output results of the simulation we developed a novel heuristic method, based on force-directed graph drawing algorithms which has produced significantly improved floor layouts.

I. INTRODUCTION

Analysis and optimisation of complex manufacturing systems can be a demanding and time-consuming work since the processes are interwoven and impossible to analyse separately. Processes are usually also too complex to be modelled and optimised with exact mathematical methods. Methods more suited for modelling complex manufacturing systems include discrete event simulation (DES) modelling, which despite its ease of use can provide enough details to understand and analyse the logistic processes in a manufacturing system.

Construction of a DES simulation model requires that the data that describe the manufacturing processes are obtained, extracted and analysed in structured form. Integration of simulation software, auxiliary applications and databases with the model is necessary in order to have one coherent system that operates accurately despite changes in manufacturing processes or variations of scenarios in work orders.

System or process optimisation can be performed in two ways: by changing model parameters, or by changing the model structure. Changing the parameters is often implemented by built-in optimisation methods within the simulation tools, while modifications of model structure are not. In our case the optimisation involved changing the factory layout, which was modelled by a network model, which is part of structure of the model.

Optimisation through modification of model structure can be performed by constructing several versions of the model and input data (i.e. scenarios) and comparing simulation results. To accelerate the development of model versions and scenarios one can construct algorithms that build or modify simulation models according to model input data. This is especially useful in cases of large simulation models and if the model versions are prepared by an optimisation algorithm. Automated model building and modification however requires that the model structure can be modified with an algorithm, without manual interventions. To this end we have developed an automated model construction algorithm, which will be extensively described in our further publications. The focus of this paper is on the novel heuristic optimisation method.

In the paper we present the novel factory layout optimisation method, based on force-directed graph drawing. The method was developed in the course of manufacturing process optimisation project in a furniture company. Our goal was to investigate how the layout of machines on the factory floor affects the efficiency and costs of manufacturing processes. Furthermore, the objective was to develop an optimised layout that would be implemented in real life. In [1] we focused on optimising the total distance the manufactured products need to travel on the floor. In this paper we extend the problem by minimising two dependant criteria. The considered criteria are the total costs of one-time machine relocation and the labour costs in transport of products between the machines as a result of changes in machine relocation.

A. Problem situation

The factory floor contains approximately 140 machines of different types – from simple carpeting workstations to expensive multi-purpose CNC machines. Company catalogue contains more than 30,000 different products and semi-finished products. Every item is manufactured according to the prescribed bill of materials (BOM) and its technical procedure. In BOM, required semi-finished products and materials to manufacture the given product are listed. The technical procedure data describe the sequence of operations in the manufacturing of the given product. The number of operations per finished product ranges from 3 to 20 with the average of 8 operations. The technical procedure data include a group of equivalent machines (GEM) for each operation and standard machine setup and machine operation duration times. The times are listed as single numbers, not as distributions. Compound products are manufactured by joining smaller semi-finished products also produced in the factory.

Work supported by Creative Core FISNM-3330-13-500033 'Simulations' project funded by the European Union, The European Regional Development Fund. The operation is carried out within the framework of the Operational Programme for Strengthening Regional Development Potentials for the period 2007-2013, Development Priority 1: Competitiveness and research excellence, Priority Guideline 1.1: Improving the competitive skills and research excellence.

Production scheduling is based on customer orders and their priorities and performed using the Preactor scheduling system. Our simulation model uses schedule generated by Preactor or prepared by factory planners, without modification. Typically, there are several open customer orders in active production schedule. Products are manufactured in series ranging from approximately ten to several hundred pieces with a typical series containing approximately 30 pieces. For every operation, unfinished products are stored at input pallets or carts next to the machine. Machined products are stored on the output palette or carts until the entire series of products has completed the current operation. The series is then moved to the next location (machine) manually. Therefore the total number of required transport workers depends on the number of simultaneous carts in transition between machines. The assumption in the optimisation process was that shorter transport routes will result in shorter transport worker tasks, increasing the worker availability and potentially reducing the required number of transport workers.

The Preactor database defines GEM for each operation from the technical procedures. Most operations can be performed on several machines, either because there are several identical machines available, or because the operation can be performed on different multi-purpose machines. During the manufacture, a machine is dynamically selected from the GEM for the entire series of a product, according to machine preference and machine availability. Typically a machine that is currently least loaded within the GEM is selected. Hence the manufacturing process can be referred to as "flexible manufacturing". The simulation model has to reflect this flexibility and model the machine groups, group selection and machine selection process for each technical procedure (i.e. each product).

The manufacturing process involves a large set of different products and monthly variations of open orders. Therefore, developing a static simulation model that would cover all available (i.e. 30,000) products and their technical procedures is not realistic. Instead, the simulation model is built automatically from a model template by an algorithm that uses the database of technical procedures and the database of currently open orders to place only the necessary machines in the model. The model reads the technical procedures and BOMs dynamically during the simulation to adjust machine model parameters and assembly of products.

B. Optimisation goal

The costs of manufacturing can be reduced by decreasing the need for labour in the transport of products between machines through better machine placement, i.e. factory layout. However, relocation of a machine is a difficult and costly measure and disrupts the manufacturing process. Therefore it makes economic sense to move a machine only if the relocation will considerably reduce product travel distance and consequently the need for labour. Namely, relocating the machines is associated with additional expenses: moving the machine m_i costs g_i amount of currency. Presumably, good candidates for relocation are machines with high product flows.

Various model statistics are measured during the simulation runs. Most important in this part of the project is the flow of products $\tilde{f}_{ij}$ between a pair of machines m_i, m_j, $i = 1,2, \dots, N$. Flow $\tilde{f}_{ij}$ represents the total amount of volume of products that was directly transported between these two machines. From the product flow $\tilde{f}_{ij}$ we straightforwardly compute cost flow f_{ij}, i.e., cost to move all products between the two machines for distance of 1 m. The distances between the machines are yet not known and are obtained from the optimisation of the factory floor layout. To reduce the overall costs we need to solve the following optimisation problem

$$\min_{\{p_1,p_2,\dots,p_N\}} \left(\sum_{\substack{i,j=1 \\ i \neq j}}^{N} f_{ij} \cdot d(p_i, p_j) + \sum_{i=1}^{N} g_i \right), \qquad (1)$$

where p_i represents position of machine m_i and d is a distance functional. If we neglect the costs g_i and restrict the positions p_i to a predefined grid, the problem simplifies to well-known quadratic assignment problem (QAP). The latter is NP-hard optimisation problem and exact optimisation methods are successful only for smaller number of machines, usually around $N < 30$. In our case, where $N = 140$, the exact methods are not feasible and we need to apply heuristic methods instead, which in practice return a near optimal solution.

C. Previous research (review of literature)

Simulation is commonly used for the evaluation of scenarios [2], [3], [4]. However, the models developed with the visual interactive modelling method (VIM) are usually manually constructed through careful analysis of the real-life system and communication with process owners. Automated model development is more common with methods that allow easier and more standardized formal description of models, e.g. Petri nets [5], [6]. Automation of model construction and adaptation can importantly facilitate the development of models of complex systems [7], [8] and generation of simulation scenarios.

Several papers deal with factory layout optimisation, with paper [9] stating that multiproduct enterprises requires a new generation of factory layouts that are flexible, modular, and easy to reconfigure. Evolutionary optimisation methods are often proposed due to problem complexity [10]. Layout optimisation problem is identified as hard combinatorial optimisation problem and the simulated annealing meta-heuristic resolution approach is proposed to solve to problem [11]. A novel particle swarm optimization method is proposed by [12] for intelligent design of an unconstrained layout in flexible manufacturing systems.

Factory layout design optimisation is further discussed in [13], [14], [15]. Authors [13] propose a new facility layout design model to optimise material handling costs. Sources [14] and [15] propose genetic algorithm based solutions to respond to the changes in product design, mix and volume in a continuously evolving work environment.

The layout optimisation problem is similar to well-known quadratic assignment problem (QAP) [16], [17]. But the problem in its original form does not consider including fixed expenses to move the facilities (machines)

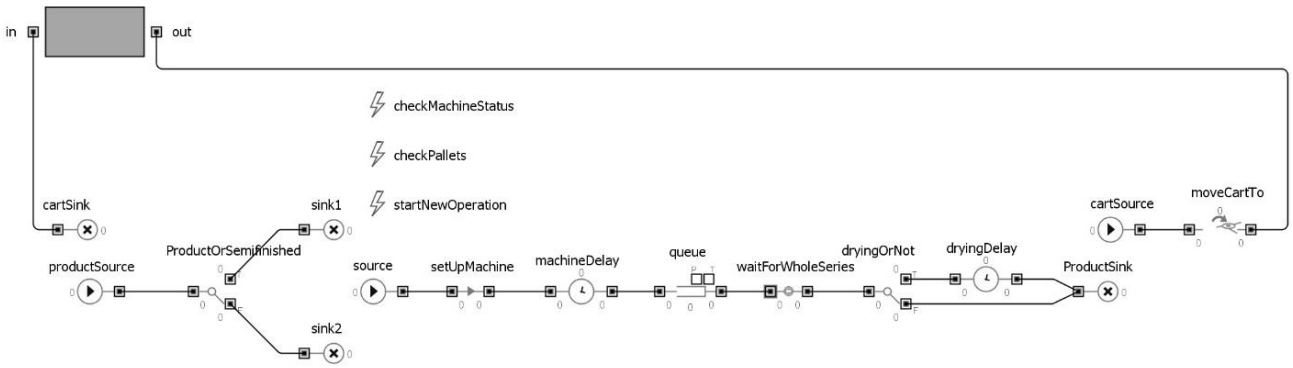

Figure 1. Schematic of a single machine in DES model.

to new locations as it is in our case. Hence QAP algorithms in the original form cannot be used to solve our optimisation problem.

There are numerous methods for graph drawing and class of force-directed methods are one of the most commonly used in practice due to their simplicity and visually appealing representation of the graphs (see [18], [19], [20] and references therein). One of the earliest and still commonly used method is from the authors Fruchterman and Reingold [20].

II. METHODOLOGY

We have used Discrete Event Simulation methodology to develop a simulation model that captures all of the important features of manufacturing processes. The purpose of the model is verification of new manually or algorithmically generated floor layouts. Optimisation of floor layout is conducted in cooperation with experienced manufacturing planners, managers and other experts within the company, and is greatly facilitated by our novel heuristic optimisation method that is employed to generate new layout scenarios, i.e. to search for the optimal layout within a large set of possible layouts.

A. Machine model

Every machine is modelled as a machine block in Anylogic as shown in Fig. 1. On the input of the block, carts filled with products enter the system. Products are sorted according to their type at *productOrSemifinished*. The corresponding sinks, *sink1* and *sink2*, monitor products on input pallets. Once the product is chosen for operation, it is injected at *source*. Blocks *setUpMachine* and *machineDelay* are standard service blocks. Block *waitForWholeSeries* plays a role of output pallet. Products wait there until complete series of products is finished. Some products need to wait at *dryingDelay* according to the technical procedure (paint, varnish drying, etc.). Filled carts are injected at *cartSource* and moved to the next location at *moveCartTo*. Output of the main machine block sends a cart to the input of the next machine.

B. Optimisation problem

In this section we describe the problem of finding the factory floor that minimises the overall costs of machine relocations and costs of workers that move carts between the machines. The problem is to find the optimal mathematical network, in which nodes of the network represent the machines on the factory floor. Weighted edges between the nodes represent transactions between the machines. Additional edges connect the sought network with the fixed old machine positions. Real routes on the floor between the machines are neglected in this case, since it considerably complicates the optimisation problem. The optimisation method should only propose a basic outline of the layout, since the final layout needs to be further tuned by the company experts to meet other less precise criteria.

Factory floor is described as a region Ω in the plane $\mathbb{R}^2$. We will simplify the problem by restricting Ω to the rectangular shape,

$$\Omega = \{(x,y) \in \mathbb{R}^2; x_{min} \le x \le x_{max}, \; y_{min} \le y \le y_{max}\}, \tag{2}$$

where $x_{min}, x_{max}, y_{min}, y_{max}$ represent boundaries of the rectangular factory floor.

Let us denote machines by $m_i,\ i = 1,2,\dots,N$. Position of the machine m_i is described by

$$p_i = \{(x_i, y_i) \in \mathbb{R}^2\}. \tag{3}$$

Each machine takes certain amount of space which can be conveniently described by a metric rectangular-like ball $B_{r_i}(p_i)$ with radius r_i and centre p_i in ∞-norm L_∞,

$$B_{r_i}(p_i) = \{(x,y) \in \mathbb{R}^2; d_\infty((x,y), p_i)\} = \max\{|x - x_i|, |y - y_i|\} < r_i\}. \tag{4}$$

Let p_i' be old position (before relocating) of machine p_i. For every pair of machines m_i and m_j, $i,j = 1,2,\dots,N$, we obtain overall costs $f_{ij} \ge 0$ to move the products between the machines for 1 m. The quantity is obtained as a result of the simulation of the manufacturing processes. The cost is proportional to the amount of products that is transferred between the machines. The cost is also proportional to the considered observed time interval. In practice due to high costs of relocating the machine, the observed time interval for workers' costs should be at least a year.

Manhattan distance d_M between two points p_i, p_j is defined as

$$d_M(p_i, p_j) := |x_i - x_j| + |y_i - y_j|. \quad (5)$$

Manhattan distance is a good approximation of actual route distance between the machines on the factory floor.

Relocation costs for machine m_i from position p_i' to p_i is defined as a value $g_i > 0$ if $d_M(p_i, p_i') \neq 0$ and zero cost otherwise. Costs g_i were obtained from company planners who consider several criteria such as switching on and off the machine, construction work, resupplying costs, cleaning, etc.

The optimisation problem of minimising the total cost is described as

$$\min_{\{p_1, p_2, \ldots, p_N\}} \left(\sum_{\substack{i,j=1 \\ i \neq j}}^{N} f_{ij} \cdot d_M(p_i, p_j) + \sum_{i=1}^{N} g_i(p_i, p_i') \right), \quad (6)$$

where positions p_i must satisfy the conditions

$$B_{r_i}(p_i) \cap B_{r_j}(p_j) = \emptyset \quad (7)$$

for every $i \neq j$ and

$$B_{r_i}(p_i) \subset \Omega \quad (8)$$

for every $i = 1,2, \ldots, N$.

The first conditions states that the regions of machines must not intersect between each other and the second that every machines must lie entirely on the factory floor.

III. RESULTS

The main result of our project described in this paper is the novel force-directed graph drawing optimisation heuristic method that generates new factory floor layouts by minimising overall costs of repositioning the machines and costs of workers that move the carts between the machines. Costs for machine relocation were estimated by the company planners. Workers' costs depend on three parameters: manufacturing process, observed time interval and distances between the machines. The first two parameters are fixed in our optimisation method. The distances are uniquely determined from machine positions. For predefined manufacturing processes we obtain flows of products between the machines. From this data we can directly obtain workers' costs f_{ij} to move the products for 1 m. Taking into account f_{ij}, distances between the machines $d_M(p_i, p_j)$ and relocation costs g_i we obtain the overall transport costs of the manufacturing processes.

1) Force-directed graph drawing algorithm

The heuristic optimisation algorithm for assigning positions p_i to machines m_i is based on force-directed graph drawing methods. Initial position of the machines is chosen randomly but machines with greater product traffic are added to the system earlier. The machines are positioned according to the applied forces in the system and converge to configuration with a local minimum of the overall energy. After the systems converges or the maximum number of iterations is reached, the simulation is finished.

The optimisation was implemented in the system dynamics (SD) methodology in Anylogic software. The method is an extension of the original method that was used recently in QAP of minimising the total distance of machines [1].

Every machine is presented as a node on a plane. To every node n_i we prescribe the corresponding repelling force F_{ij} to all other nodes n_j,

$$F_{ij} = H_{ij}(||p_j - p_i||_\infty) \cdot \frac{p_j - p_i}{||p_j - p_i||_\infty}, \quad (9)$$

where H_{ij} is a positive monotonically decreasing function. For our algorithm we used

$$H_{ij}(r) = \begin{cases} c_i \cdot (r_i - r)^2, & r \leq r_i \\ 0, & r > r_i \end{cases}, \quad (10)$$

where c_i and r_i are distance influence parameters. Repulsive forces keep the nodes away from each other since we want sufficient space between the machines.

For every pair of nodes n_i, n_j we define a weighted edge e_{ij} with weight f_{ij}, i.e., cost to move all products between m_i and m_j for 1 m. Attractive forces between the nodes are defined as

$$G_{ij} = -f_{ij} \cdot I_{ij}(||p_j - p_i||_1) \cdot \frac{p_j - p_i}{||p_j - p_i||_1} \quad (11)$$

where I_{ij} is a positive monotonically increasing function. In our case, I_{ij} is defined as $I_{ij}(r) = d_M(p_i, p_j)$. Attractive forces move the nodes with large edge weights closer to each other.

Attractive force representing machine m_i relocation cost is defined as

$$J_i = \begin{cases} g_i \cdot d_M(p_i, p_i'), & d_M(p_i, p_i') < 5 \\ g_i, & d_M(p_i, p_i') \geq 5 \end{cases}. \quad (12)$$

Note that J_i needs to be a continuous function of the distance, otherwise the optimisation method would not converge to a stable node configuration. Distance of 5 m is a threshold at which moving the machine is still considered.

To keep the nodes inside the prescribed location Ω, we also need to define forces that pull the nodes back to the interior if they are outside the prescribed region Ω,

$$K_i = \begin{cases} 0, & p_i \in \Omega \\ dist(p_i, \Omega), & p_i \notin \Omega \end{cases}, \quad (13)$$

and $dist(\cdot, \cdot)$ is a function measuring the distance between objects.

Screenshot of the running algorithm implemented in Anylogic is shown in Fig. Machines (nodes) are presented as circles on the rectangular factory floor.

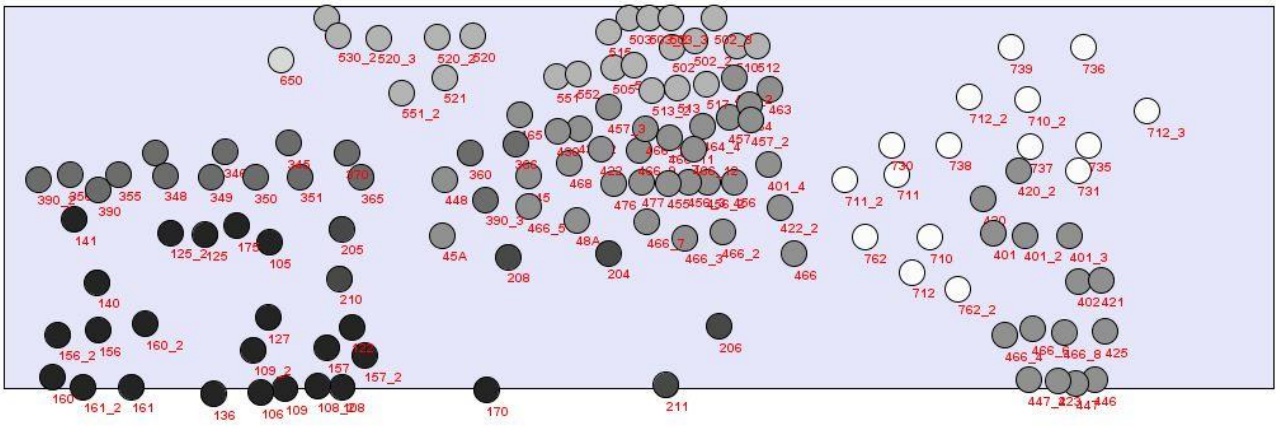

Figure 2. Screenshot of the optimisation algorithm in Anylogic.

For our furniture factory floor layout we tested the algorithm for two observed time intervals: one year and three years. The distances between the machines were optimised by the algorithm to obtain the lowest overall costs. The results of optimisation are presented in Table 1. For both observed time intervals we reduced overall costs of around 7 %.

TABLE I. OVERALL COSTS AND NUMBER OF MOVED MACHINES FOR DIFFERENT FACTORY FLOOR LAYOUTS

Time interval	Layout	Cost	Number of moved machines
1 year	current	50,800 €	0
1 year	optimal	47,400 €	12
3 years	current	149,400 €	0
3 years	optimal	139,700 €	32

Further important results of the project are the automated model construction algorithm and the discrete event simulation model in Anylogic. The model is integrated with a manufacturing scheduling system database and is used for in-depth analysis of the manufacturing process and verification of optimisation scenarios.

IV. CONCLUSION

In this phase of the project the deliverables include the novel force-directed graph drawing optimisation heuristic method, the automated model construction algorithm and the integrated detailed simulation model in Anylogic that communicates with external database files. The model captures all important features of the manufacturing process and servers as an indispensable tool for in-depth analysis and extracting additional data for further optimisation.

The described force-directed graph drawing optimisation heuristic method has been used to generate several new factory layouts which have been validated by the factory planners. The new layouts were significantly better than the current layout and manually produced layouts prepared by the factory planners. The optimisation method allows the company to significantly reduce the product transport costs by decreasing the number of workers performing in-factory transport of products. The reduction considers the costs of machine relocation, i.e. only the most relevant machines are moved.

The factory layouts will be further refined and implemented in the course of ongoing micro-logistic optimisation project. During this project we will further develop the factory model by modelling scenarios, including automatisation of machine servicing using robots and new automated transport system that uses automated guided vehicles (AGVs).

Abstract – Wind power has already become an important renewable energy resource in many regions of the world. Because of its variability and uncertainty, integration of wind power presents a challenge that, if not adequately addressed, can jeopardize the operational reliability of a power system. Generally, generation unit commitment decisions are made once a day, i.e., the commitment decisions are made 24 or more hours ahead of the actual operation. Taking into account the uncertainty of wind power prediction, these decisions need to provide sufficient flexibility at a minimum price. This paper describes the current practice and analyzes unit commitment formulations available in literature highlighting their advantages and shortcomings.

I. INTRODUCTION

The primary concern in operating an electrical power system is to meet the demand for electricity at all times and under different conditions depending on the season, the climate, and the weather.

Modern power systems are supposed to accommodate large total capacity of distributed, volatile generation, as well as large-scale price responsive demand and electric vehicles which dramatically increases both supply and demand uncertainty [1]-[3]. Because of its variability and uncertainty, wind generation impacts power system operation and can potentially jeopardize its reliability. To deal with the larger uncertainty on the net load (the difference between electricity demand and the output of non-dispatchable generation), power system operators are increasing the reserve margins, thus increasing the regulation cost [4].

In order to minimize the operating cost of non-dispatchable resources, it is essential to derive a computationally effective approach to optimally select the units and their output level to preserve the operational reliability of the system. Unit commitment (UC), one of the most critical decision processes, is an optimization problem that generates the outputs of all the generators in a way that minimizes the system-wide fuel cost. Features included in most modern unit commitment models include generator minimum and maximum generation limits, ramping limits, minimum up and down time constraints, time-dependant start up costs and transmission capacity limits [5]-[8].

The work of the authors is a part of the FENISG – Flexible Energy Nodes in Low Carbon Smart Grid funded by Croatian Science Foundation under project grant No. 7766

During the normal operation, system operator dispatches the committed generation resources to satisfy the actual demand and reliability requirements. In the event of a significant deviation between the actual and the expected system condition, system operator needs to take corrective actions, such as committing expensive fast-start generators, voltage regulation or load shedding, to maintain system security. The main causes of the unexpected events come from the uncertainties associated with the load forecast error, changes of system interchange schedule, and unexpected transmission and generation outages. [9]

Deterministic UC formulation is a traditional solution in which the net load is modeled using a single forecast for each wind farm output and the associated uncertainty is handled using ad-hoc rules, i.e., the generating units are committed to meet the deterministic forecast and the uncertainty is handled by imposing reserve requirements [10]-[13]. Such an approach is easy to implement in practice, but the ad-hoc rules do not necessarily adequately account for this uncertainty. Namely, committing extra generation resources for reserve is economically inefficient, while the power system may still suffer from capacity inadequacy in case of a significant deviation between real-time and expected net load. There is a lot of research on optimizing the reserve requirements based on deterministic criteria [14]-[17]. In [14] a new technique to determine the SR requirements at each period of the optimization horizon is proposed using a cost/benefit analysis. Similarly, in [15] the cost of interruptions is considered when optimizing the scheduling of spinning reserve. In [16] a probabilistic analysis of the reserve requirements is taken into account. The authors of [17] show that reserve requirements cannot be specified a priori without sacrificing the optimality.

A more rigorous approach is incorporating uncertainty in the unit commitment model itself, which is the focus of this review paper. Section II describes stochastic unit UC, Section III robust UC formulation, while Section IV describes interval UC formulation. Section V describes some recent advancement in hybrid UC models that combine the aforementioned formulations. Conclusions are duly drawn in Section VI.

II. STOCHASTIC UNIT COMMITMENT

Stochastic UC is based on probabilistic scenarios. A finite set of scenarios is generated and assigned weight in proportion to their likelihood. Stochastic UC is

formulated as a two-stage problem that determines the generation schedule that minimizes the expected cost over all of the scenarios respecting their probabilities. The commitment decisions are unique over all the scenarios, while dispatch decisions are scenario dependent. Including a large number of scenarios in the model requires computationally demanding simulations. Computational burden of the stochastic UC is dramatically increased with the time horizon as well, which is visualized in Figure 1. Thus, scenario reduction techniques that eliminate scenarios with very low probabilities and aggregate close scenarios are developed [18]. Similar scenarios get aggregated based on a particular metrics, such as their probability, hourly magnitude, or the resulting cost [19]. In [19] the authors did a comparison of scenario reduction techniques for the stochastic unit commitment. A clustering method, k-means is used to partition a given set of scenarios into a given number of clusters. The cluster features similar scenarios and is represented by a scenario with the lowest probability distance from the centroid. The centroid is an average pattern of all the scenarios from the cluster [19] [28]. The forward scenario selection and backward scenario reduction approaches are based on minimizing the Kantorovich distance between the scenarios in the original and in the reduced set [19] [29]. The forward scenario selection approach is used to construct a reduced set containing a desired number of scenarios by iteratively adding a scenario from the original set. Similarly, the backward reduction approach gives a reduced set by iteratively eliminating one scenario from the original set until the desired number of scenarios remains. Importance-sampling scenario reduction technique is used to select the scenarios that best represent the monetary impact of uncertainty on the operating cost [19] [30]. However, insufficient number of scenarios reduces accuracy of the solution and increases its cost. The eliminated scenarios may have great impact on the system, so stochastic UC formulations provide only probabilistic guarantees to the system reliability. It is important to note that the stochastic UC solution contains a certain amount of unhedged uncertainty, i.e. load shedding or wind curtailment in the most extreme scenarios might be cheaper than modifying the schedule to serve the net load over all the scenarios. Due to increased uncertainty in later hours of the time horizon, the amount of unhedged uncertainty increases over time [20]. In order to secure the robustness of the solution, a large set of scenarios is required, which is computationally demanding. Problems to be considered:

- Possible loss of information
- Disregarding the scenarios with comparatively low probability but great impact on the power system
- Availability of data
- Difficulties to identify accurate probability distribution of the uncertainty

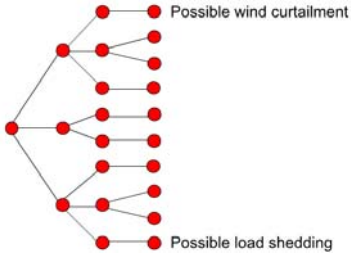

Figure 1. Scenario tree

In [21] the authors consider a set of possible scenarios rather than solving the UC problem for one expected and the worst-case demand scenario. Each of the scenarios is assigned a weight that reflects the possibility of its occurrence in the future. The solution must satisfy the constraint that if two different scenarios *s* and *s*' are indistinguishable at time period *t* based on the available information at time period *t*, the decision made for scenario *s* must be the same as that for scenario *s*'. The constraint is modeled by partitioning the scenario set at each time period into disjoint subsets called scenario bundles. Mathematically, a bundle at time period *t* is represented as a constraint on the decision variables of its scenarios. The objective function is to minimize weighted sum of the objective functions of the smaller problems, i.e. to minimize the expected cost over all of the scenarios. The problem can then be solved using a Lagrangian relaxation type of technique.

In [18] authors present a security-constrained unit commitment algorithm considering the volatility of wind power generation. To capture volatility it is assumed that the wind power is subject to a normal distribution N (μ, σ^2) with forecasted wind power as expected value μ and a percentage of μ as its volatility (σ). The Monte Carlo simulation is used to generate a large number of scenarios subject to the normal distribution. The probability assigned to each scenario is one divided by the number of generated scenarios. To decrease the computational requirement for large number of scenarios, a scenario reduction technique is used. The algorithm is formulated as an optimization problem with the objective function composed of fuel costs and startup and shutdown costs of generating units over the scheduling horizon. The problem is a large-scale mixed-integer non-linear program. The Benders' decomposition is applied to decompose the problem into master problem, feasibility check subproblems, and network security check subproblems. The master problem provides a commitment and dispatch solution that minimizes the operating cost of dispatchable units. The feasibility check subproblems whether the commitment and dispatch solution of the master problem can accommodate the volatility of the wind power in individual scenarios. The paper shows that the physical limitations of units, such as ramping, are crucial for accommodating the volatility of the wind power generation.

In [22] the authors present a stochastic model for the long-term solution of security-constrained UC. Forced outages of generating units and transmission lines are modeled as independent Markov processes, and load

forecasting uncertainties as uniform random variables. Optimization problem is decomposed into deterministic long-term subproblems. A scenario reduction method is used to obtain a tractable solution. A 6-bus system, the IEEE 118-bus system, and an 1168-bus system are used to test the algorithm. The stochastic solution provides more reliable decisions on energy allocation, fuel consumption, emission allowance, and long-term utilization of generating units in comparison to the deterministic UC solution.

III. Robust Unit Commitment

Robust unit commitment formulations require a deterministic set of uncertainty, rather than a probability distribution on the uncertain data. Robust UC model described in [9] is a two-stage model: the first stage finds the optimal commitment decision, while the second stage generates the worst case dispatch cost under a fixed commitment solution from the first stage. The range of uncertainty is defined by the upper and lower bounds on the net load at each time period.

The robust model generates the optimal solution feasible for all realizations of the uncertain data within the given bounds. By minimizing the highest cost over all realizations, the model tends to provide conservative solutions, thus more expensive, which can be adjusted using the budget of uncertainty. The budget of uncertainty is defined as the number of buses that are allowed to deviate from a given central wind forecast in the worst case scenario [9]. The higher the budget of uncertainty the more robust the solution. The value for the budget of uncertainty is not known in advance but depends on the system and the experience. ISO New England (NE) enlisted Lawrence Livermore National Laboratory (LLNL)'s help in determining whether a robust UC would improve system reliability while keeping the operation cost relatively low in the presence of renewable variability [31]. In the study, a comprehensive evaluation of robust UC was conducted. The objectives were to identify the optimal conservatism level to balance the economic efficiency and operational reliability of robust UC solutions, as well as to compare the robust and deterministic approaches.

In [23] authors present a two-stage network constrained robust UC problem introducing a two-dimensional uncertainty set to describe the uncertain problem parameter, allowing the uncertainty correlations among different buses and among different time periods. A bilinear separation approach generates tight lower and upper bounds for the optimal objective value and it is tested for computational efficiency on a 118-bus system. The authors use the Benders' decomposition that includes feasibility and optimality cuts. A case in which the demand at each bus in each operating hour may be uncertain is addressed, and the uncertainties are described by a given polyhedral uncertainty set rather than by the probability distribution.

In [24] a two-stage robust UC model is developed to obtain day-ahead generator schedules where wind uncertainty is captured by a polytopic uncertainty set. The uncertainty set modeling method captures the random nature of wind without any explicit description of the distribution function. The model is also extended to include the demand response strategy. The authors performed a computational study on an IEEE 18-bus system to show that the robust UC model can utilize wind generation and lower overall generation cost.

A robust UC model that takes into account the worst-case scenario of wind power output with deterministic loads during all periods is presented in [25]. This approach distributes the random problem parameters in a predetermined uncertainty set containing the worst-case scenario. Uncertain wind power output in each time period is within an interval defined by its lower and upper bounds which are obtained based on historical data or estimated with a confidence interval. The problem is formulated as a two-stage min-max problem with the objective to minimize the total cost under the worst wind power output scenario. The degree of conservatism is adjusted using the budget of uncertainty, an integer that takes a value between 0 and the number of hours in the time horizon T, to restrict the number of time periods that allow the actual wind power output to deviate from its forecasted value. By adjusting the value of the budget of uncertainty, system operators can control the robustness of the solution. The higher the budget of uncertainty, the more robust the solution. The UC decisions are made at the first stage, while the second stage results in economic dispatch. Wind power generation values are subject to uncertainty, and they are presented by random variables described by the uncertainty set. The authors describe their solution methodology and test the algorithm on a 6-bus and a modified 118-bus system. The wind power uncertainty is additionally hedged using pumped storage hydro units.

IV. Interval Unit Commitment

Interval UC formulations produce a schedule that minimizes the cost of serving the most probable net load forecast while guaranteeing feasibility in the entire uncertainty range that is delimited with upper and lower bounds as in robust unit commitment formulations. Figure 2. shows the central forecast, i.e. the most probable realization to be minimized in the objective function, along with the upper and lower bounds and the transitions between them. The solution is optimal along central forecast while remaining feasible along upper and lower bound. The solutions tend to be conservative because of the steep ramp requirements that need to be satisfied in between all consecutive time periods, as shown in Figure 2. The formulation is computationally more efficient than the stochastic unit commitment formulation because the model can be formulated using three scenarios, i.e. the central forecast and the upper and lower bounds, while the transition constraints are modeled as constraints. The interval UC can also be formulated as a two-stage problem where the optimal solution is found in the first stage and then tested for feasibility in the second stage.

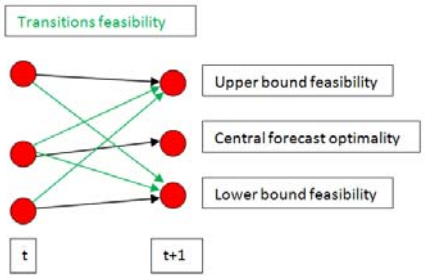

Figure 2. Interval unit commitment

A method for daily UC and dispatch incorporating wind power based on the interval number theory is introduced in [26]. Uncertain wind power generation is represented by a functional interval. The optimal model is first divided into two deterministic mix-integer programming subproblems with the parameters expressed as constants. The interval solutions of the model can be constructed using the solutions of two subproblems. The model is tested on a 30-bus system showing that the proposed method can be used for the unit commitment. The forecasting accuracy has a great impact on the optimal interval of UC.

V. HYBRID UNIT COMMITMENT MODELS

Recently, some authors have developed hybrid models that exploit the advantages and eliminate disadvantages of the models presented in the previous Sections. Such models are unified stochastic and robust unit commitment formulation proposed in [27] and hybrid stochastic/interval unit commitment model proposed in [20].

A. Unified stochastic and robust unit commitment

Stochastic UC formulations face computational challenges due to the large scenario size necessary to secure system robustness, while the robust UC formulations tend to result in conservative, thus expensive solutions. To take advantage of both of the approaches the authors of [27] propose a unified stochastic and robust UC model able to achieve low expected total cost while ensuring the system robustness. The objective function contains stochastic and robust parts that are weighed with scaling factors which can be adjusted by system power operators. The model generates a less conservative solution as compared to the two-stage robust optimization approach and a more robust solution as compared to the two-stage stochastic optimization approach. As in previous two-stage models, at the first stage the day-ahead unit commitment decisions are made. The second stage decides on the dispatch for each scenario for the stochastic optimization part and the worst-case scenario for the robust optimization part. A new parameter is introduced ranging between 0 and 1 to represent the weight of the worst case generation cost. The authors tested their approach on a modified IEEE 118-bus system.

The downside is that this approach employs heuristics to balance the stochastic and robust unit commitment solutions, which may result in suboptimal solution.

B. Hybrid stochastic/interval unit commitment

The authors of [20] propose a model that applies the stochastic formulation to the initial operating hours of the optimization horizon and then switches to the interval formulation for the remaining hours. The switching time is optimized to achieve optimal trade-off between the cost of unhedged uncertainty from the stochastic UC and the security premium of the interval UC. The two formulations are applied sequentially, instead of simultaneously according to their heuristically chosen weights in [27]. The stochastic UC, which is more cost effective but for a computationally tractable numbers of scenario less robust, is applied to the first part of the time horizon during which the wind power output predictions are more accurate. The model then switches to interval UC offering more robust solution for the remaining time period when the uncertainty is also greater.

The authors introduce a day-ahead cost (DAC) which represents the expected operating cost at the day-ahead stage. The DAC of a stochastic UC formulation is a minimum expected operating cost over the set of scenarios, while DAC of the interval UC formulation represents the cost of the schedule that minimizes the cost of meeting the central net load forecast while ensuring the feasibility of the predefined worst-case scenarios. A more conservative uncertainty model results in greater DAC because of a more conservative schedule. The actual operating cost (AOC) is the cost that includes the corrective actions which include redispatch of committed generators and starting up or shutting down other generators to account for deviations between actual and predicted output. This hybrid UC formulation aims to minimize AOC by finding the optimal balance between the day-ahead security cost and the expected cost of uncertainty associated with the day-ahead schedule. The authors present a method to optimally select the switching time and they test their approach on a modified version of the 24-bus system

VI. CONCLUSION

The common goal of UC formulations is to minimize the operating cost, while ensuring sufficient reserve to accommodate real-time realization of uncertainty. The main difference between models is the representation of this uncertainty. The stochastic UC formulation tends to give the most cost effective solution. However, in order to secure the robustness of solution, a large number of scenarios is required which renders this formulation computationally intensive. The robust and interval UC formulations secure a robust solution, but tend to give conservative, thus more expensive solutions. The hybrid models are developed to exploit the best traits of stochastic formulation (being the most cost effective) and robust or interval formulation (securing the robustness).

A research direction in unit commitment under uncertainty will include a combination of the existing methods that will try to exploit their respective

advantages. However, an important issue is the scenario generation and reduction techniques, which is a field of the ongoing research.

Also, in the scientific community it is still not clear how to validate the solutions obtained using different techniques. Although Monte Carlo simulations are the most common technique for classification of the solutions, it is sensitive to its input parameters (historical errors). This method should also be re-examined and improved.

Describing function analysis of systems with fuzzy compensated odd symmetric nonlinear actuators

O. Kuljača, and K. Horvat
Brodarski Institute, Zagreb, Croatia
ognjen.kuljaca@hrbi.hr, krunoslav.horvat@hrbi.hr

Abstract - Paper deals with fuzzy compensated odd symmetric nonlinear actuators. Most actuators are nonlinear sporting odd symmetric nonlinearities such as deadzone and saturation. One of ways of dealing with such actuators is to try to compensate for nonlinearities by fuzzy systems. Compensated actuators can improve behaviour of the system, but then arises the problem of stability analysis because compensated nonlinearity is now complex nonlinearity not described in common literature. One way of dealing with such problem is to perform stability analysis via describing function method. Paper will describe the method for compensating nonlinearities, recording describing function and performing stability analysis.

I. INTRODUCTION

Every control system contains at least one actuator. Virtually all actuators have nonlinearities. Depending on the control system these nonlinearities can be neglected or one has to deal with them in some way. Nonlinear control theory is rich with different methods of compensation or stability analysis of systems with nonlinear actuators ([9],[11],[12],[13],[14],[15] and many others.).

Many actuators have odd nonlinearity followed by linear filter type element. Examples are some electrical motors, hydraulic cylinders and solenoid actuators. There are different methods for dealing with such systems (introduction of ditter signal, different anti wind-up schemes etc,). This paper deals with fuzzy compensated odd symmetric nonlinear actuators. Such systems will be analyzed via describing function method.

II. DESCRIBING FUNCTION

Many actuators with odd nonlinearity can be represented by structure shown in Figure 1.

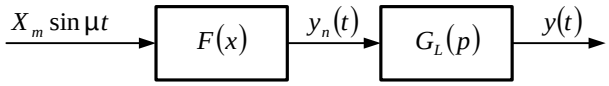

Figure 1. Actuator represented with decoupled nonlinear F(x) and linear parts $G_L(p)$, p=d/dt

Describing function is an equivalent gain of nonlinear element, defined by the harmonic linearization method of nonlinear static characteristic ([2], [9], [10], [11], [12] and many others). It is a known method of analysis and synthesis when nonlinear system can be decoupled into linear and nonlinear parts. If the linear part of the system has the characteristics of low-pass filter and if we apply periodical signal to the system, output signal will have the same base frequency as input signal with damped higher frequencies.

If the amplitudes of higher harmonics are relatively small when compared to the amplitude of the first harmonic, i.e. if filter hypothesis holds, output signal can be approximated by it's first harmonic. Mathematically, first harmonic of the output signal, for the sinusoidal input signal $X_m \sin \mu t$, can be expressed by Fourier expressions:

$$y_N(t) \approx Y_{P1} \sin \mu t + Y_{Q1} \cos \mu t \tag{1}$$

$$Y_{P1} = \frac{1}{\pi} \int_0^{2\pi} F(X_m \sin \mu t) \sin \mu t \, d(\mu t) \tag{2}$$

$$Y_{Q1} = \frac{1}{\pi} \int_0^{2\pi} F(X_m \sin \mu t) \cos \mu t \, d(\mu t) \tag{3}$$

where Y_{P1} and Y_{Q1} are first Fourier coefficients. Describing function is the ratio between first harmonic of the output signal and input signal in complex form:

$$G_N(X_m) = P(X_m) + jQ(X_m) = \frac{Y_{P1}}{X_m} + j\frac{Y_{Q1}}{X_m} \tag{4}$$

where $P(X_m)$ and $Q(X_m)$ are coefficients of the harmonic linearization ([2], [9], [10], [11], [12] and many others).

Determination of describing function boils down to the determination of integral expressions for the known static characteristic of the nonlinear part of the system.

There are many conventional nonlinearities for which static characteristics and describing functions are theoretically derived and given in analytical form.

The problem arises when the static characteristic of nonlinear system cannot be analytically expressed or integral expressions cannot be solved. In that case describing function can be determined by experiment or simulation ([3], [4], [5], [6], [7], [8]) or some method of numerical integration [10].

In this work we will use numerical integration in Simulink as given in [10]. The approach is very simple, yet effective. In essence, equations (2) and (3) are directly

applied in Simulink on nonlinear element outputs. More details on this approach to obtaining describing function are also given in [13] and [14].

III. FUZZY COMPENSATED ODD SYMMETRIC NONLINEAR ACTUATOR

In this section we describe simple compensation of nonlinearities via neural network. We deal with actuator with architecture shown in Figure 1. It is important that in practice $y_n(t)$ is measurable. This is often the case because many motor drives and hydraulic drives have nonlinearity in part of their electronic driver and this value can be measured. We then connect an in input with changeable amplitude and measure and save inputs and outputs. Once this is done we will use recorded data to train fuzzy system in such way that we try to achieve fuzzy system that will have opposite action to nonlinearity.

Let us illustrate the procedure on dead zone nonlinearity with Matlab simulation.

Schematic of data generation and recording is shown in Figure 2.

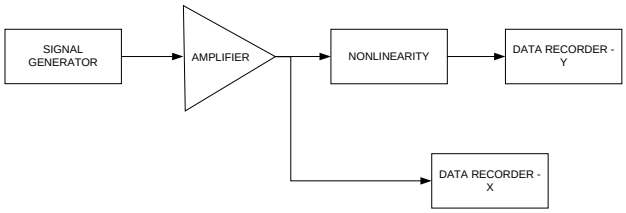

Figure 2. Data generation and recording

Datasets X and Y were generated using chirp signal generator with starting frequency 0.1 Hz, final frequency 20 Hz and simulation end time 1000s with fixed step size 0.001. Dead zone is static nonlinearity so frequency really does not have effect on it but we used chirp signal in order to generate a number of different data points. Deadzone had start of deadzone at -1 and end of deadzone at 1. Amplifier had gain 5.

Deadzone is shown in Figure 3.

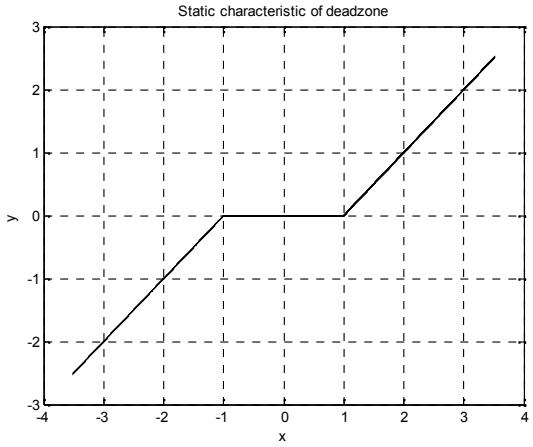

Figure 3. Deadzone

In principle any fuzzy single input single output system could be used. In this example, for compensation we used Takagi-Sugeno type fuzzy system and trained it using anfis procedure Matlab. We used max-prod inference with weights average deffuzification.

Training was performed for 20 epochs. Results are shown in Figure 4.

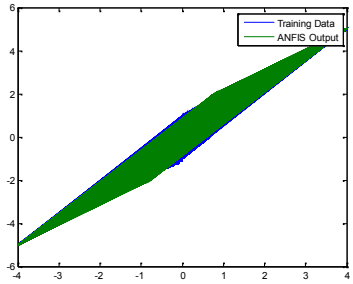

Figure 4. Training results

Input membership functions are shown in Figure 5. Output membership functions ar of type linear. The rule list is given as:

- 1. If (input1 is in1mf1) then (output is out1mf1) (1)
- 2. If (input1 is in1mf2) then (output is out1mf2) (1)
- 3. If (input1 is in1mf3) then (output is out1mf3) (1)
- 4. If (input1 is in1mf4) then (output is out1mf4) (1)
- 5. If (input1 is in1mf5) then (output is out1mf5) (1)

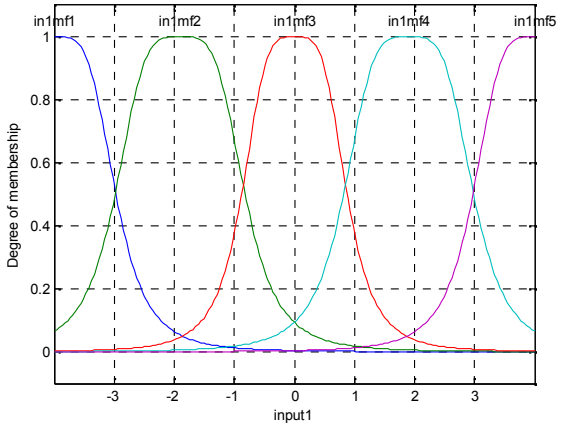

Figure 5. Input membership functions

Fuzzy system input-output (static) characteristic is shown in Figure 6.

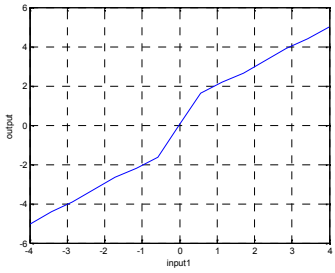

Figure 6. Fuzzy system static characteristic

Then, we can use fuzzy system to compensate for nonlinearity as shown in Figure 7 ([13], [14]),

Figure 7. Fuzzy nonlinearity compensation

where fuzzy stands for neural network, F(p) is nonlinearity and G_L(p) is linear part of the system.

The idea is that fuzzy system compensates for some effects of nonlinearity since fuzzy system is trained to act as inversion of nonlinear function.

This procedure can be applied on any system with odd symmetric nonlinearity.

IV. DEADZONE EXAMPLE – SIMULATION RESULTS

Let us now see some simulation results for deadzone case. Simulink simulation scheme is shown in Figure 8.

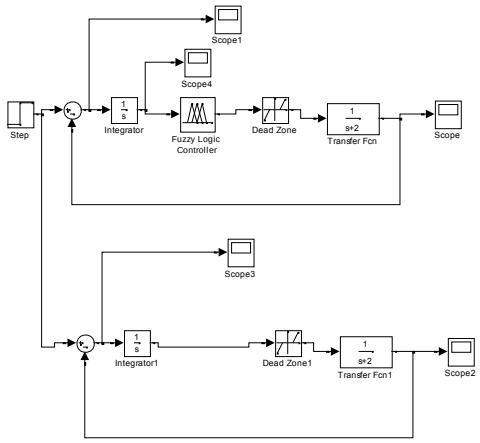

Figure 8. Simulink simulation scheme for dead zone case

Deadzone and fuzzy system are given in Section III. Responses for step input 1.7 are given in Figure 9.

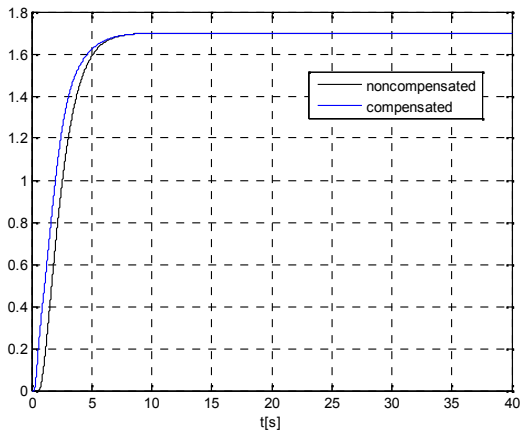

Figure 9. Responses for step input 1.7

Response of noncompensated system is depicted in black and response of compensated system is depicted in blue. It can be seen that compensated system reaches required value faster.

Let us now see what happens for smaller reference values, let's say with reference input of 0.1. Responses are shown in Figure 10.

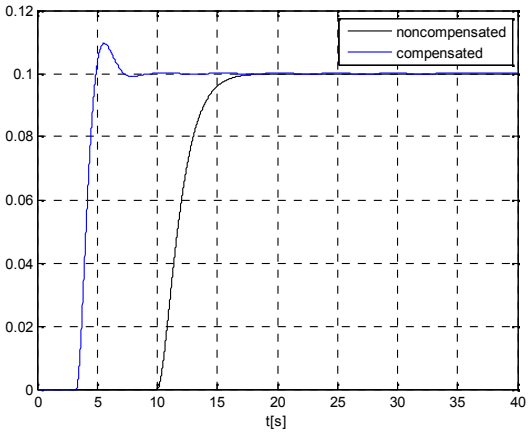

Figure 10. Responses for step input 0.1

Response of noncompensated system is depicted in black and response of compensated system is depicted in blue. It can be seen that compensated system reaches required value faster, although with some overshoot.

Let us also look at tracking case with sinusoidal input reference value. Simulink simulation scheme is shown in Figure 11.

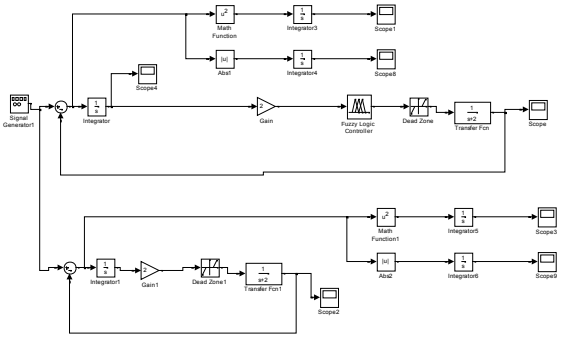

Figure 11. Simulink simulation scheme for dead zone case - sinusoidal input reference value

As it can be seen from Figure 11, in this case we used as a measure of quality performance indicators for each simulation, i.e Integral of Absolute Error (IAE)

$$J_{IAE} = \int_0^\infty |e(t)|dt. \quad (5)$$

and Integral of Squared Error (ISE)

$$J_{ISE} = \int_0^\infty e^2(t)dt. \quad (6)$$

Reference input was sinusoidal signal with amplitude of 1.7 and frequency of 0.01 Hz. Responses are shown in Figure 12.

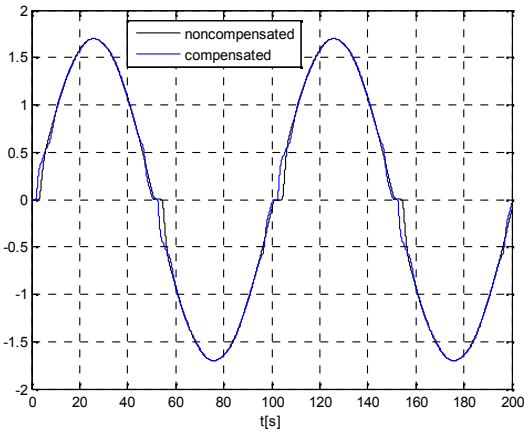

Figure 12. Responses for sinusoidal input with amplitude 1.7 and frequency 0.1 Hz

Response of noncompensated system is depicted in black and response of compensated system is depicted in blue. It appears that compensated system reaches required value faster. Let us check IAE and ISE (Table 1).

Table 1 Mean values of IAE and ISE with original parameters for sinusoidal input with amplitude 1.7 and frequency 0.1 Hz

	IAE	ISE
noncompensated	17.0532	2.6987
compensated	13.552	1.3281

Both integral parameters show smaller values for compensated case, thus it can be concluded that compensation indeed yields better performance.

Let us now see what happens for smaller reference values, with reference input of 0.1. Responses are shown in Figure 13.

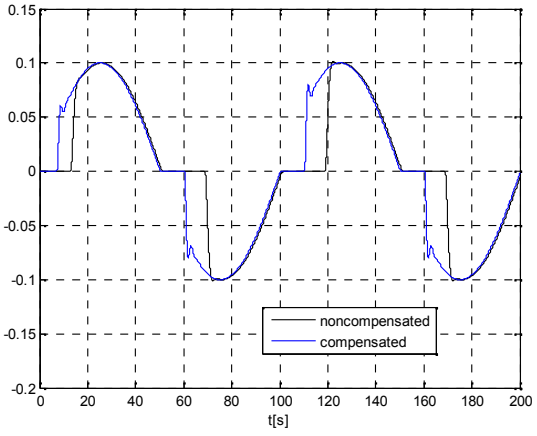

Figure 13. Responses for sinusoidal input with amplitude 0.1 and frequency 0.1 Hz

Response of noncompensated system is depicted in black and response of compensated system is depicted in blue. Again, t appears that compensated system reaches required value faster. Let us check IAE and ISE (Table 2).

Table 2 Mean values of IAE and ISE with original parameters for sinusoidal input with amplitude 0.1 and frequency 0.1 Hz

	IAE	ISE
noncompensated	4.3169	0.2531
compensated	1.4937	0.0511

Again, both integral parameters show smaller values for compensated case, thus it can be concluded that compensation indeed yields better performance.

It can be seen that responses are better in case of bigger input amplitude. This is expected situation since we deal with dead zone. If deadzone accounts for bigger percentage of input signal the response will be worse.

V. Stability Analysis of Fuzzy Compensated Odd Symmetric Nonlinear Actuator

It is clear that when we make compensation of nonlinearity with fuzzy system, in essence we have a new nonlinearity as shown in Figure 14.

Figure 14. Compensated nonlinearity

With compensated nonlinearity we can record describing function of compensated nonlinearity as described in [10], [13], [14] and [15]. In this example we recorded describing function of deadzone compensated with fuzzy system for parameters already given in this paper. Describing function is shown in Figure 15.

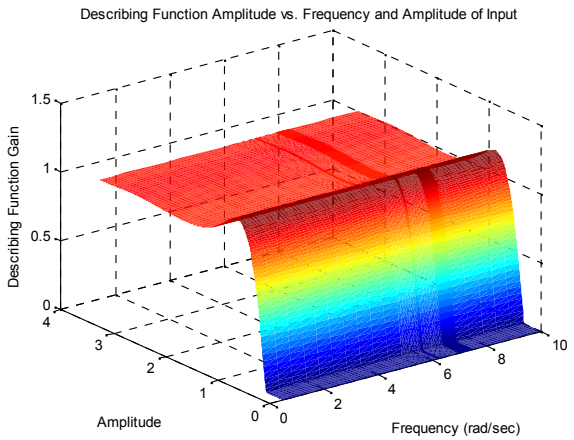

Figure 15. Describing function of compensated deadzone – $P(X_m)$

Because deadzone is symmetric nonlinearity there is no imaginary term in describing function. This is so for all symmetric nonlinearities. Thus, the same stability analysis procedure as given below can be used.

Characteristic equation of closed loop system with compensated nonlinearity as shown in Figure 8 can be written as

$$s^2 + Ks + G = 0 \tag{7}$$

where G is describing function of compensated nonlinearity and K is linear parameter system of actuator transfer function represented by

$$\frac{1}{s+K} \tag{8}$$

Once we have describing function we can use any stability criterion we use for linear systems. By Hurwitz criterion the system will be stable if

$$KG > 0 \tag{9}$$

Since K is always positive, system will be stable if G>0. In case of our system with dead zone that is always the case, thus the system is stable. The same analysis can be conducted with other types of odd symmetric nonlinearities. Also, actuator transfer function (8) can be of higher order and, as long as it is Hurwitz, this will not affect above described analysis.

VI. CONCLUSION

Paper gives the procedure for training fuzzy system to act as compensator for odd symmetric nonlinearities. It is shown how to record the describing function of such fuzzy system. Simulation examples are performed on case of dead zone and it was shown that compensation is effective. More analysis will be performed in future research for other nonlinearity types.

Finally, a simple procedure for analyzing stability of such systems is given.

***Abstract*—In this paper we present a heuristic distributed algorithm for day-ahead bidding between collection of microgrids that sell their surplus energy to a power grid controller – distributor, who can use that energy with its consumers. Each microgrid is modeled as a node with consumers, energy generator (from renewable sources) and energy storage capabilities. For each time period, distributor negotiate amounts and prices with each microgrid separately, in rounds. Although both sides are modeled, we focus our research on the microgrid's bidding algorithm for monetary gain from sold surplus energy. Presented algorithm is simple and produces good results from microgrid perspective. Due to model simplicity, produced results aren't always optimal, and convergence had to be additionally helped. In comparison to similar distributed bidding algorithms for systems with storage capacity presented algorithm is simplest and can be used for day-ahead but with presented adaptations also for more complex microgrids and distributor, real-time adjustments and asynchronous negotiations.**

I. Introduction

Using renewable energy sources is the only long term strategy that will ensure energy stability. Therefore, today we put a lot of effort to identify renewable energy sources and use them. Such researches are being promoted and widely supported by governments and organizations, as in [1]. In electric power systems, on global scale, power plants that use fossil fuels should be complemented or replaced with ones that use renewable energy. On a smaller scale, renewable energy could be collected with small power plants (e.g. wind turbines, solar panels) and used locally, in areas called microgrids, for its own consumers.

However, renewable energy production might be very variable even over single day. In some periods (hours) produced energy might be sufficient or insufficient for local consumers. Therefore, additional energy sources might be required. Such sources may include battery or other type of energy storage, diesel generator (or similar), or/and connection to a global power grid. Those sources can be used when renewable sources don't produce sufficient amount of energy for local microgrid. On the other side, when renewable sources produce more energy than its locally needed, surplus can be used to charge local storage or/and it can be sold through global power grid.

This work is supported by the research project MICROGRID, Grant no. I-4463-2011, Croatian Science Foundation.

Microgrids will not significantly influence global power grid (or smart grid), at least not in near future since their surplus energy is not significant when comparing with power grid needs. However, since they use renewable energy, microgrids might be supported by governments. In this paper we assume a model (Fig. 1) where a power grid controller – distributor (in rest of the paper), possibly under influence of government, should offer to buy some of microgrids' surplus energy (up to predefined amount for each period of day). That's where a trade market could be created – between a distributor and connected microgrids. To optimize usage of energy bought from microgrids, distributor defines different price ranges for different periods of day ahead (e.g. highest prices for peak demand periods) giving incentive to microgrids to adjust their selling strategy, to provide more energy in high-price periods. In this paper we focus on microgrid's control method that will maximize profit from sold surplus energy. Storage management influence microgrid's offers to distributor, and distributor's prices influence microgrid's storage management. This is where 'the game' is defined.

Similar problems were being addressed in literature. In [2] and [3] smart grid is simulated consisting of users (consumers) and suppliers (generators). Generator models include thermal and hydro generators. Thermal generators are modeled with: maximal power, minimum stable load, ramps and variable, no-load and startup costs. Hydro generators are modeled with maximal and minimal power outputs and daily energy reserves. Demand side was modeled as static, inelastic – does not changes with price. In [2] biding is performing iteratively, decrementing price in each iteration, while in [3] price was chosen at intersection of supply and demand curves. Convergence problems in [3] was addressed with heuristic approaches.

In [4] a system is modeled with (a simple) supply-side (distribution network) connected to central unit, which is connected to users (consumers). Users may be passive (just consumers) or active, that besides consumers also have energy generators and storage. Their demand side management consists of day-ahead bidding and real-time adjustments for variations of user needs and production. Their algorithm is distributed and iterative.

Methods from cited papers, and similar ones, with some effort might be adjusted even for our system model. However,

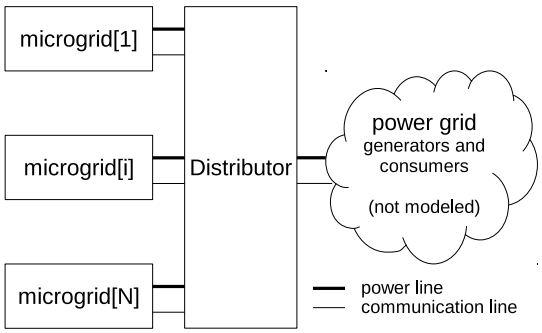

Fig. 1. The system model

we wanted to define and test a simpler models and highlight storage management in microgrids. Furthermore, our system model has some subtle difference. Price adjustment ("bidding process") is performed differently. Distributor proposes prices (one per each period) and sends offers to microgrids – each microgrid receive its own offers, one for each period. Microgrids evaluate offers individually, and send back replies to distributor. Each reply, from single microgrid and for single period, consists of accept or reject decision of appropriate offer, with units and prices distributor should use in next iteration of bidding process. For each period of day ahead distributor tries to buy up to previously calculated required amount of energy (which is fixed for whole bidding process). In bidding process, when microgrids (cumulatively) don't provide required amount, distributor might raise price for that period, if price isn't already on predefined limit. Similarly, when distributor detects that offered amount for particular period exceeds distributor demands, distributor might lower price for that period (if not already on predefined lower limit).

One of our main requirement for model was simplicity. We are trying to find a simple algorithm for a microgrid in previously described setup. Therefore, in our initial work on the subject, we present a simple heuristic algorithm that is ready to be 'copy-pasted' in control program. Simplicity enable usage of this algorithm even in automatically controlled small scale system consisting of small microgrids managed by micro-controllers (e.g. a house with solar panels, battery and consumers) connected together with one controlling node that acts as distributor and can sell energy to third party. We think that most difference from real systems (generators, storages, consumers) and presented model can be accounted locally on particular microgrid, adjusting only amounts, prices and capacity.

As we didn't yet put enough focus on distributor's side, our simulation system have problems with convergence and optimality. Convergence problem is for now (in used models) mitigated by slowing price changes. However, further work is required on distributor's side of algorithm if we want guarantee of convergence. Results from all experiments we used produced good results, but not always optimal from global perspective. However, global optimum is hard to reach in distributed algorithms. Furthermore, global optimum definition in described system is problematic – if we optimize for microgrids' gain, distributor will probably have to pay more than if optimization was toward distributor's gain.

Rest of the paper is structured as follows. In sections II and III a system model and negotiation algorithm are presented. Experimental results are presented in section IV, possible adaptation in section V and conclusion is given in section VI.

II. The system model

The system model consists of collection of microgrids and a distributor, as shown on Fig. 1. We do not model power grid with its generators and consumers. However, we assume they influence initial settings for distributor (demanded energy per periods, with price ranges).

A. Microgrid model

Every microgrid is defined with energy generators, local consumers and storage. Since we model renewable sources, energy production is based on weather conditions (e.g. wind or solar intensity) and can be (accurately) predicted for day ahead for each period (e.g. hour). Energy that can be produced in single period could be used for local microgrid consumers, for charging local energy storage (e.g. battery) and for selling it to distributor. First priority is to ensure enough energy for local consumers (cover it completely if possible). For that purpose microgrid can use storage: charge it when surplus is produced and discharge it when produced energy is insufficient. What energy is left can be sold to distributor. Storage can also be used for optimizing sale: store surplus energy when energy is 'cheap' and sell it later when its price is higher. In our model we didn't account storage manipulation costs and loses. Also, price of energy generation is not modeled directly. Instead, minimum selling price is defined for each period that might include those production costs.

Let $M = \{m_1, m_2, \ldots, m_i, \ldots, m_N\}$ represent system with N microgrids. Day (ahead) is divided into P periods (e.g. hours).

Parameters that define single microgrid m_i are:

- ST_i – storage capacity (kWh)
- $SC_{i,0}$ – storage initial charge (kWh)
- for each period of next day j:
  - constant (given as input):
    - $CE_{i,j}$ – local consumers need (kWh)
    - $PE_{i,j}$ – production (generator) capacity (kWh)
    - $MP_{i,j}$ – minimal selling price (kn/kWh)
  - calculated within algorithm in k-th iteration:
    - $SC^k_{i,j}$ – starting storage charge (kWh)
    - $RC^k_{i,j}$ – reserved storage charge (kWh)
    - $RS^k_{i,j}$ – reply status: $ACCEPT$ or $REJECT$
    - $RP^k_{i,j}$ – price for next iteration (kn/kWh)
    - $RU^k_{i,j}$ – units for next iteration (kWh)

Amount $RC^k_{i,j}$ represent storage charge that must be left in storage for next period. If $RC^k_{i,j} > SC^k_{i,j}$ than storage must be additionally charged in j-th period.

B. Distributor model

We assume that distributor has prediction for day-ahead demands from connected consumers and producing capabilities from connected generators, both from power grid side (excluding microgrids). Base on this data distributor can define appropriate demands toward microgrids (given per periods). Those demands with price ranges are inputs into our model. Distributor is defined with parameters:

- constant (given as input) for each period j:
  - RE_j – required energy (kWh)
  - LP_j – minimal (lowest) price (kn)
  - HP_j – maximal (highest) price (kn)
- calculated in k-th iteration for each m_i and period j:
  - $OU_{i,j}^k$ – offered amount (kWh)
  - $OP_{i,j}^k$ – offered price (kn)
  - $OS_{i,j}^k$ – status: $MORE$ or $ENOUGH$

Status is as a signal to microgrids in which periods demands are not met ($OS_{i,j}^k = MORE$) and in which periods offered amount exceeds demand ($OS_{i,j}^k = ENOUGH$).

C. Additional system constraints

For simplification and feasibility of result of each iteration, additional constraints are placed upon system model.

1) Fairness: In our model of distributor we defined that for each period, energy unit prices must be the same for each microgrid, i.e.:

$$OP_{1,j}^k = OP_{i,j}^k, \quad \forall i, j, k \tag{1}$$

Condition (1) doesn't affect microgrid's model. Used microgrid's model can be used in systems when previous condition isn't valid, i.e. where different microgrids gets different prices for same period.

2) Feasibility I: Amounts in offers for next iterations must not exceed units provided in replies, i.e.:

$$OU_{i,j}^{k+1} \leq RU_{i,j}^k, \quad \forall i, j, k \tag{2}$$

Therefore, initial offers in first iteration have:

$$OU_{i,j}^1 = 0, \quad OS_{i,j}^1 = MORE, \quad \forall i, j \tag{3}$$

Initial price must be from interval $[LP_j, HP_j]$. In our implementation we used middle value $(LP_j + HP_j)/2$.

3) Feasibility II: Cumulatively, offers for same period must not exceed required amount for that same period, i.e.;

$$\sum_{i=1}^{N} OU_{i,j}^k \leq RE_j, \quad \forall j, k \tag{4}$$

4) Feasibility III: The microgrid in its reply must not offer more energy that it can sell, i.e.:

$$RU_{i,j}^k \leq SC_{i,j}^k + PE_{i,j} - CE_{i,j} - RS_{i,j}^k, \quad \forall i, j \tag{5}$$

5) Feasibility IV: When status in particular reply is $ACCEPT$, amount in that reply must not be lower that amount in corresponding offer, and price must not be higher than one in same offer:

$$RP_{i,j}^k \leq OP_{i,j}^k, \quad \forall i, j \quad | \quad RS_{i,j}^k = ACCEPT \tag{6}$$

$$RU_{i,j}^k \geq OU_{i,j}^k, \quad \forall i, j \quad | \quad RS_{i,j}^k = ACCEPT \tag{7}$$

No restriction on amount and price is set when offer is rejected.

6) No buying from power grid: If local consumers can't be satisfied with local production and storage management we remodel microgrid with local consumers we can satisfy locally. Additionally energy must be bought, but we do not model this process. Algorithm 1 presents microgrid validation and remodel procedure. We assumed such procedure was performed on microgrids before negotiation process begun.

Algorithm 1 Discard excess consumers' demand in m_i

```
for j = 1 to P do
  if SC_{i,j}^k + PE_{i,j} < CE_{i,j} then {not enough energy?}
    CE_{i,j} = SC_{i,j}^k + PE_{i,j}          {remodel consumers}
  end if
  if j < periods then {calculate storage charge for j+1}
    SC_{i,j+1}^k = SC_{i,j}^k + PE_{i,j} - CE_{i,j}
    if SC_{i,j+1}^k > ST_i then {can't overcharge}
      SC_{i,j+1}^k = ST_i
    end if
  end if
end for
```

III. The Negotiation Algorithm

Negotiations shown on Fig. 2 are initiated by distributor, who creates offers and sends them to microgrids. Each microgrid gets its own offers, one for each period. After evaluating offers, microgrids send back replies, one for each period.

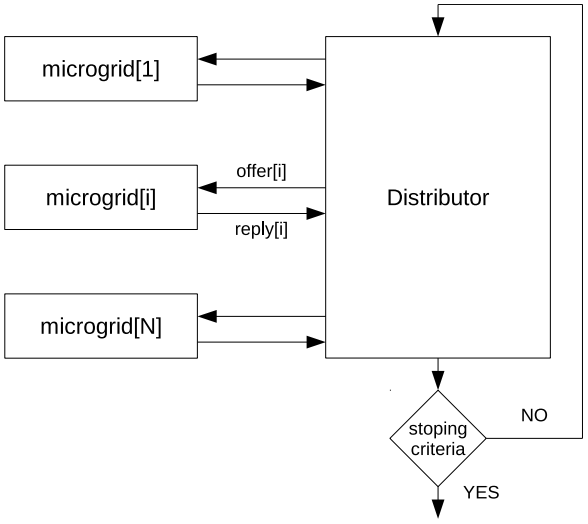

Fig. 2. Price negotiation process

A. The microgrid's algorithm

Microgrids evaluate offers separately, each microgrid looks at offers sent only to him. Main optimization criteria for a microgrid is maximization of profit from energy sold. However, the microgrid must first take into account its own local energy consumptions (per period). Units to sell are calculated iteratively: starting from period with the highest price per unit in offers. All surplus from that period and surplus from periods before that can be saved in storage and not already reserved can be included in offer for that period.

After any change in energy for sale, reservations on storage are first calculated, as presented in Algorithm 2.

Algorithm 2 $Update\_storage\_and\_reservations(i)$

for $j = 2$ **to** $periods$ **do** {calculate $SC^k_{i,j}$}
  $SC^k_{i,j} = SC^k_{i,j-1} + PE_{i,j-1} - CE_{i,j-1} - RU^k_{i,j-1}$
  if $SC^k_{i,j} > ST_i$ **then** {can't overcharge}
    $SC^k_{i,j} = ST_i$
  end if
end for
for $j = periods - 1$ **to** 1 **do** {calculate $RC^k_{i,j}$}
  $RC^k_{i,j} = CE_{i,j+1} + RC^k_{i,j+1} + RU^k_{i,j+1} - PE_{i,j+1}$
  if $RC^k_{i,j} < 0$ **then**
    $RC^k_{i,j} = 0$;
  end if
end for

First loop in Algorithm 2 calculate storage state after each period, accounting: initial storage state, production capability, local consumers and already allocated energy for selling. Second loop calculates amount of energy that must be left in storage for next period. This information is required in offer evaluation algorithm, Algorithm 3.

After optimization process (maximizing cumulative sell price), remaining units in periods are offered as well, because they might be requested in next iteration. Even if they are not requested, the microgrid can't use them (store for later) so its better to offer them anyway – distributor might ask for it in next iteration.

B. The distributor's algorithm

The distributor's behavior is simulated with simple model, presented in Algorithm 4. The main objective of algorithm is to get as much energy as can be obtained per period, up to defined value. Secondary objective is to minimize total cost per period. Used rules to achieve objectives were simple: when offered amount is below required amount – price is raised (for that period), and vice versa, when offered amount is equal or above required amount – price is lowered.

Optimization is stopped when no change is detected in successive iterations or when predefined maximum number of iterations is reached (for situations where algorithm don't converge), as shown in Algorithm 5.

Algorithm 3 Optimization algorithm for m_i

for $j = 1$ **to** P **do** {reset replies}
  $RS^k_{i,j} = REJECT$ {status}
  $RP^k_{i,j} = \max(MP_{i,j}, OP^k_{i,j})$ {price}
  $RU^k_{i,j} = 0$ {units}
  $sort[j] = j$
end for
for $l = 1$ **to** P **do** {optimize for period $sort[l]$}
  for $n = l + 1$ **to** P **do** {search for higher price}
    if $OP^k_{i,sort[l]} < OP^k_{i,sort[n]}$ **then**
      $\text{swap}(sort[l], sort[n])$ {swap values}
    end if
  end for
  $j = sort[l]$
  $Update\_storage\_and\_reservations(i)$
  if $OP^k_{i,j} \geq MP_{i,j}$ **then**
    $available = SC^k_{i,j} + PE_{i,j} - CE_{i,j} - RC^k_{i,j}$
    if $available \geq OU^k_{i,j}$ **then**
      $RS^k_{i,j} = ACCEPT$
      $RU^k_{i,j} = OU^k_{i,j}$
    end if
    if $OS^k_{i,j} = MORE$ **then**
      $RU^k_{i,j} = available$
    end if
  end if
end for
for $j = 1$ **to** P **do** {offer remaining power in periods}
  $Update\_storage\_and\_reservations(i)$
  $RU^k_{i,j} = SC^k_{i,j} + PE_{i,j} - CE_{i,j} - RC^k_{i,j}$
end for

IV. Experimental results

Proposed algorithm is evaluated on many examples. However, since single example requires large data set, only results from single example are presented in this paper. Microgrids and distributor parameters are just example, not chosen from real environment. In presented example ten microgrids are used. Each microgrid has storage capability for storing 50 kWh energy, but various predicted production capabilities during a day. In our simulation price change is limited to five discrete values defined by distributor separately for each period: lowest, low, normal (initial), higher and the highest, linearly distributed between $[LP_j, HP_j]$.

Cumulative input values for all ten microgrids and distributor are shown on Fig. 3 with: required energy from distributor (RE), production potential of microgrids (PE), local microgrid demands (LE) and initial price per period (IP). Initial price is set to roughly follow distributor's demands, but also taking into account microgrids' production capabilities, and to force

Algorithm 4 Optimization algorithm for distributor

for $j = 1$ **to** P **do** {for each period}

    end if
  end for
end for
if $k \geq k_{MAX}$ **or** $change = false$ **then**
  STOP
end if

them to save as much as they can for peak periods.

Presented algorithm produced results shown on Fig. 4 with: energy offered to distributor with acceptable price (RU), storage charge at period beginnings (SC) and final price difference from initial one (OP). We also put required energy (RE) on this figure to easier compare offers with demands.

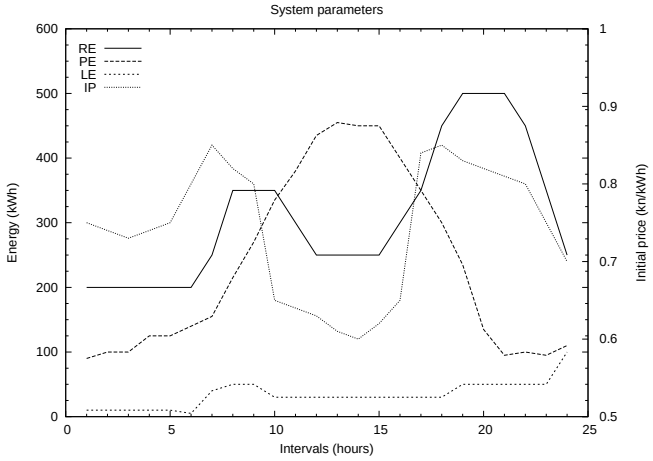

Fig. 3. Cumulative values per period for: required energy (RE), production potential (PE), local microgrid demands (LE) and initial price (IP)

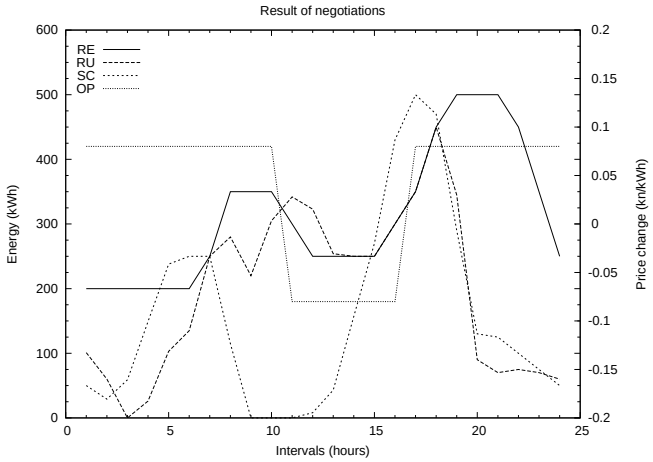

Fig. 4. Cumulative values per period for: required energy (RE), offered energy (RU), storage charge(SC), and price change from initial one (OP)

Analyzing presented results, we can extract several properties of proposed algorithm. Firstly, it behaves as expected: in periods where offered amount (RU) was not sufficient price reached the highest value, while in periods that offers exceed required amount (RE) price was lowered to the lowest possible value (periods 11 to 16). Periods with the highest price (7th and 18th) are covered as much as possible (completely in this example) using storage for difference between required and produced amount. Therefore, periods that precede ones with higher price may not be completely covered because storage was charged.

V. Possible improvements

Major problem with presented algorithm is in its stability. Single price change may trigger significant change in replies since microgrids sort periods by price and optimize periods in that order. We mitigated this problem by slowing price changes – enabling them only once in a few consecutive iterations, and by disabling of price lowering after predefined number of iterations. Those mitigations are not shown in Algorithm 4.

Fairness and cheating scenarios aren't analyzed. However, since single microgrid can't predict when negotiations will be completed, it should offer everything as soon as possible (as in proposed microgrid's algorithm). Otherwise, distributor might buy larger amounts from other microgrids (included behavior in proposed distributor's algorithm).

As already mentioned, optimality is not guaranteed with our algorithm. Within examples we used we found (not presented here) suboptimal solutions. We believe that better results might be achieved if distributor model (algorithm) is upgraded. However, even that might not guarantee optimal results for all cases.

Simple models for microgrids and distributor are used. In real application many parameters might be different and more complex. For example, minimal price per energy unit at which a microgrid is willing to sell energy might be calculated with a complex formula that take into account storage charging and discharging cost. Also, distributor may not offer all microgrids same price – price can be negotiated separately per microgrid. Used simplicity provides easier upgrade of particular model, distributor or microgrid. As long as constraints 2-6 from section II are met in all used algorithms in all nodes, every node might run different algorithm. That means that some microgrids might use one algorithm, other another, and so on. Same goes for distributor.

Presented algorithm is iterative and synchronous: distributor sends offer and collects all replies before evaluating them. However, algorithm could be adapted for asynchronous usage if constraint 1 is not enforced. In that case, communication between distributor and single microgrid could be achieved with three messages: 1) reply from microgrid, 2) offer from distributor and 3) a new reply from microgrid. All messages must conform to constraints 2-6. Microgrids replies, first and second one could be generated with same algorithm as presented. Distributor's algorithm must be adapted since price in offers for same period might not be the same to different microgrids (e.g. new_price could be replaced with $OP_{i,j}^{k+1}$).

What if prediction from any side proved to be incorrect? If we limit real-time adaptation only to energy redistribution from that moment forward, and ignore penalties imposed on node with wrong prediction that reflects on whole system (e.g. penalties could be handled as exception, separately), presented algorithm could be adapted even for real-time corrections. For example, algorithm will use current state of system (storage charge at that moment) as initial state, already negotiated prices as minimal prices (that can only increase), and only future periods in evaluations.

VI. Conclusion

In this paper we presented a simple algorithm for day-ahead negotiation between microgrids and a distributor. Separate algorithm is given for a microgrid and separate for a distributor. Its assumed that all entities in negotiations have accurate prediction on energy requirements and production, given per period.

Presented algorithm produces expected solutions – profit optimization for microgrids' surplus energy. Algorithms are simple, both microgrid's, which was primary objective, and distributor's, that was created for simulation purposed (and thus not fully optimized).

Stability problem was mitigated on distributor's side. When mitigating elements are activated stable solution is obtained within next ten to fifteen iterations. Therefore, at least twenty iterations should be put as upper limit, if one is required at all. In simpler examples, stability was reached within only four iterations.

Negotiation results weren't always optimal, even if Nash equilibrium was reached. Part of that problem lies with distributor's algorithm, which must be improved. However, optimal solution guarantee (as one presented in [4]) is generally hard to provide in distributed algorithms. Therefore, we are satisfied with a occasional 'only good' result which is provided by presented algorithm.

Simplicity of algorithm provides several advantages. Firstly, it enables algorithm implementation even on simplest hardware (microgrid's micro-controller). Secondly, adaptation for specific microgrid or distributor is simpler – not all nodes must run same algorithm, as elaborated in section V.

Abstract - Business systems as well as corresponding websites are constantly growing in their complexity and it is harder and harder to use them and find desired functionality or information. Intelligent assistants can be used as a mean of enabling users to find information they seek and to get the answers they require in a way that is quicker and more suited for wider types of users compared to traditional approach because they are not required to know the system in detail but rather to communicate with appropriate intelligent assistant in a more natural language which is similar to talking with their colleagues. Intelligent assistants should be as easy to develop and maintain as possible because of the need to constantly improve them in order to get the intelligent assistants to provide the latest information. In this paper a multi-purpose intelligent assistant (MIA) is proposed and its architecture as well as the perception of various business systems about the usage of such assistant are presented and discussed.

Keywords **- business systems, information systems, websites, intelligent assistant, multi-purpose**

I. INTRODUCTION

Business systems are becoming more and more complex everyday and the same trend is present in the field of information systems that support these business systems. All kind of software is getting richer in features and thus more demanding from the user's point of view. Because of this exponential growth of software complexity a need for new user interfaces with more advanced technology becomes something that is more and more necessary in order for users to perform their software activities in a satisfactory way that is easy and quick enough to be usable [1]. This is particularly true if everyday activities are involved and that is the area where intelligent assistants are coming into focus.

There are a lot of aspects that intelligent assistants can aid in but the first and the foremost step for users is to get to know the system they want to use. The easiest way to learn about the system is to be able to ask something about the system in a way one would ask a colleague. This implies the usage of natural language to communicate with the system which enables users to have much easier and quicker way of getting information compared to browsing through the system's manual. Since getting the information about the system is one of the most common necessities of new users it would be beneficial to have a system that would enable simple creation of such assistants that would aid users in some particular areas of interest and that would be able to process natural language. In order to provide such concept a MIA (Multi-Purpose Intelligent Assistant) is proposed as an adequate solution. MIA provides its users with a suitable and accessible way of asking a variety of questions, in various forms, about the system of interest and it makes using the system that incorporates MIA as its intelligent assistant easier and more convenient to use. MIA is a multi-purpose intelligent assistant which means that it is not bound to just one particular area of use. MIA enables multiple configurations of its environment and creation of multiple instances that deal with different areas or systems of interest which enables quick creation of specific intelligent assistants.

Intelligent assistants are something that is gaining interest. Research results have shown that 81% of visitors would like to have an intelligent virtual assistant provided that it would improve their online user experience and 72% of visitors stated that they would welcome intelligent virtual assistants as a part of every website and that they would spend more time on a website that would incorporate such assistant [2]. These intelligent assistants are in fact intelligent agents [3] of a specific class and characteristics. Intelligent agents incorporate elements of artificial intelligence (AI) in order to provide users with a greater amount of helpful actions and with a more purposeful and more satisfactory experience. These concepts of AI enable intelligent assistants to aid their users in tasks that are difficult or time consuming for users and that require some form of intelligent behavior and reasoning. AI systems provide support for various tasks that include all from answering questions to helping in coordination or production, information gathering and management, large-scale planning and scheduling of shipments or autonomous robots and robotic assistants [4]. One of more known examples of working AI systems is Deep Blue [5].

In this paper MIA is proposed as a multi-purpose assistant that can be customized with specific rules and applied in various areas of interest as a quick and effective mean of enabling users of various systems to be able to get a quick and concise information about the system which promotes better understanding of the system in a shorter amount of time in a way that is close to new users since processing of natural language is incorporated in order to create an experience that is similar to the one that the users would have when talking with real people and agents of various helping services. In this way the path of learning about the system becomes more convenient and interesting for users which makes them consequently more willing to spend a greater amount of time in dealing with the system.

II. INTELLIGENT ASSISTANTS AND INTELLIGENT AGENTS

Intelligent assistants are based on intelligent agents with a specific set of features and characteristics. Intelligent agent in general is an entity that perceives its environment through sensors and acts upon that environment by using its effectors as can be seen in Fig. 1 [6]. Intelligent agents and intelligent assistants are a result of gradual development that includes five generations of AI systems: expert systems, joint cognitive systems, intelligent systems, intelligent assistant systems and the newest generation that includes context-based intelligent assistant systems [7]. There are many existing classification of intelligent agents. Franklin & Graesser have given a taxonomy of intelligent agents that is shown in Table I [8].

TABLE I. INTELLIGENT AGENTS TAXONOMY (FRANKLIN & GRAESSER)

Property	Other Names	Meaning
reactive	(sensing and acting)	responds in a timely fashion to changes in the environment
autonomous		exercises control over its own actions
goal-oriented	pro-active purposeful	does not simply act in response to the environment
temporally continuous		is a continuously running process
communicative	socially able	communicates with other agents, perhaps including people
learning	adaptive	changes its behavior based on its previous experience
mobile		able to transport itself from one machine to another
flexible		actions are not scripted
character		believable "personality" and emotional state

Nwana gives the following typology [9]:

- Collaborative agents
- Interface agents
- Mobile agents
- Information/Internet agents
- Reactive agents
- Hybrid agents
- Smart Agents

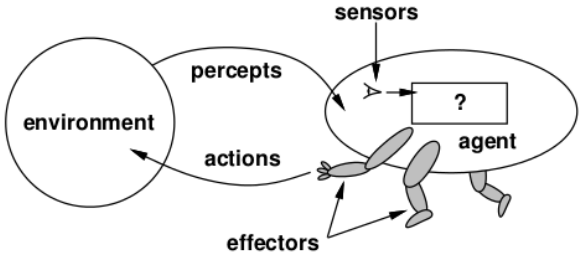

Figure 1. Intelligent agent functionality

Another classification of intelligent agents is given by Müller who distinguishes five categories of intelligent agents [10]:

- Reactive agents
- Deliberative agents
- Interacting agents
- Layered approaches
- Others (believable agents, softbots, Internet software agents)

Müller also proposes an intelligent agents taxonomy based on application areas according to the following two dimensions [10]:

- First dimension
  - Hardware agents
  - Software agents
- Second dimension
  - Autonomous agents
  - Multiagents
  - Assistant agents

Hardware agents are those agents that have some kind of physical form and interaction with physical environment by using sensors as input and effectors as a mean of output. These agents also use some kind of software that provides some form of logical control of these agents. Software agents are on the other hand purely software based and can be viewed as various computer programs that interact with environments which can be either of real or virtual nature. Autonomous agents refer to agents that can control their actions in greater or lesser amount and are focused on not just their own actions but also on their environment. Multiagents are agents that posses knowledge about other agents and have the ability to collaborate with them in order to achieve some goal. Assistant agents are agents that are mainly involved in interaction with another agent which can be and is in many cases a human agent who uses this kind of assistant agent. Based on given dimensions Müller proposes the following taxonomy of intelligent agents [10]: autonomous hardware agents, autonomous software agents, hardware assistant agents, software assistant agents, hardware multiagents and software multiagents.

Autonomous hardware agents are self-controlled agents that are usually involved in planning and implementing various activities as well as in controlling some physical environment by using their physical sensors and effectors. Autonomous software agents are program-based virtual agents that can control their own actions and as such influence their software environment. Hardware assistant agents are physical agents which are designed to help their users in some domain of physical environment. Software assistant agents are agents that are program-based and are designed to help their users in some domain of virtual environment. Hardware multiagents are physical agents that act in collaboration with other agents in physical environment in order to achieve some common

goal. Software multiagents are program-based agents that can communicate with other software agents in some virtual environment in order to achieve a mutual goal.

Intelligent agents can be developed by using a variety of approaches and are used in many different application areas [11]:

- Process Control
- Manufacturing
- Air Traffic Control
- Information Management
- Electronic Commerce
- Business Process Management
- Patient Monitoring
- Health Care
- Games
- Interactive Theater and Cinema

As mentioned before intelligent assistants are in fact a kind of intelligent agents. The term intelligent assistant system can be defined as an intelligent system that mediates interactions and aids its users in using some machine system as is shown in Fig 2. [12]. Intelligent assistants in many cases have some form of avatar that makes these assistants more distinctive and more interesting to use. Intelligent assistants' avatars are designed according to the area and purpose for which some particular intelligent assistant is being used. These avatars can be of either static or dynamic visual nature. This includes various images or animations that are used to represent the avatar. Research has shown that 59% of users have no preference when talking about the usage of dynamic or static avatars while 30% of users prefer dynamic and 11% of users prefer static avatars [2].

There are many examples of intelligent assistants in various areas of use. Some of these assistants are [13] [14] [15] [16] [17] [18] [19] [20]: PexA (an intelligent assistant for aiding in task and time management), WEBSELL (an intelligent assistant for aiding users in web sales), Triton (an intelligent assistant for aiding users in learning and using the air travel planning system), Office Assistant (an intelligent assistant that aids office visitors and helps in management of office's schedule), CAT (Composition Analysis Tool) (an intelligent assistant for aiding users in creation of complete and consistent workflows), TAC (The Architect's Collaborator) (an intelligent assistant for aiding architects in conceptual design), Patient Advocate (an intelligent assistant for patient-centered health care) and CAD (an intelligent assistant for aiding in interaction with computer-aided-design system).

When talking about intelligent assistants there is another important field of their usage and that is the field of education. Intelligent assistants can help students to learn but also the teachers to teach through various features such as: monitoring, error detection, answering questions, alerting teachers or generating feedback [21].

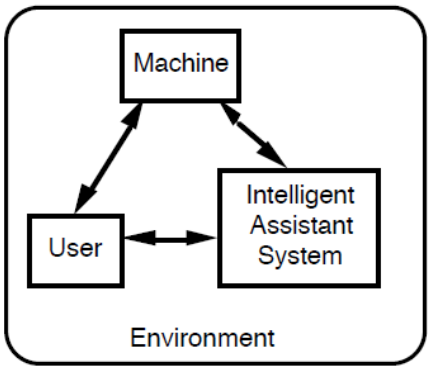

Figure 2. Intelligent assistant system

These kinds of assistants are also called intelligent educational systems and can be classified into three different classes based on the degree of autonomy they provide [21]: (1) Those that are fully autonomous and replace the teacher; (2) Those that assist the teacher, while remaining autonomous in their use: the student can practice without the teacher being present; (3) Those that assist the teacher and are not autonomous: the teacher must remain present during their use.

III. MIA ARCHITECTURE AND APPLICATION

MIA (Multi-Purpose Intelligent Assistant) has been designed as a multi-purpose assistant that can be applied in many different areas. MIA can be classified as an communicative (according to [8]), reactive (according to [9]) and reactive software assistant agent (according to [10]). MIA supports answering on various questions in a robust way that includes support for many different forms of essentially the same question. MIA also enables variations in answers to given questions which results in more natural and real experience. Users communicate with MIA by using a completely natural language just as they would communicate with any human agent. MIA is a multi-purpose assistant which means that it provides a well-defined and easy-to-use way of defining the rules and knowledge that MIA is supposed to have in order to be used in some particular areas of interest. MIA can be generally defined as:

$$\text{MIA: } q \rightarrow a$$

where q is a question and a is an answer. In the case of MIA there are many possible questions and their forms (Q) and also many possible answers and their forms (A). Every question also can have multiple variations of answers (answer can be omitted) and the same answer can be given to various forms of essentially the same question so the following applies:

$$q \in Q;\ a \in A;\ q \rightarrow A'^*;\ Q'^+ \rightarrow a$$

The former definition defines MIA question as $q \in Q$ and MIA answer as $a \in A$. The same question q can have zero or more forms of basically the same answer (A'^*) and one or more forms of basically the same question (Q'^+) can have the same answer a. MIA is developed as a web service which can be used alone or as a part of some existing web page or web application. MIA enables two important aspects that are required in order to customize

MIA for some particular purpose. The first element that needs to be customized is the avatar that represents the assistant. MIA support uploading of customized avatar design that is then shown in the intelligent assistant window as its representation. Since the users communicate with MIA by writing their questions, rules that define these questions and their answers must be produced before MIA can be usable for some particular purpose. To define these rules it is sufficient to use MIA settings where the rules can be written by using a very intuitive and simple interface which consists of a part where the user enters a set of keywords, which can be prioritized and paired with other keywords, and a part where one or more forms of the same answer can be entered. In order for questions to be robust MIA supports defining of various forms of the same question by identifying different keywords. It also enables developers to define which keywords are alternative and which have to be found together. In order to produce more convincing experience there is also a possibility of defining more answers for the same question that are randomly presented. Formal grammar for defining of question rules of MIA in EBNF form [22] is given below:

*rules = rule, (2 * eol, anotherrule) | /* nothing */ ;*

anotherrule = rule, anotherrule | / nothing */ ;*

word = {alphabetchar | digit}- ;

alphabetchar = 'A' | 'B' | 'C' | ... | 'X' | 'Y' | 'Z' | 'a' | 'b' | 'c' | ... | 'x' | 'y' | 'z' ;

digit = '0' | '1' | '2' | '3' | '4' | '5' | '6' | '7' | '8' | '9' ;

eol = ['\r']'\n' ;

divider = ',' ;

ws = {' ' | '\t'}- ;

rule = part, (eol, moreparts) | (nothing *) ;*

part = word, {divider, ws, word} ;

moreparts = part, moreparts | (nothing *) ;*

As can be seen from the given grammar the MIA question rules are simply defined as a set of alternative keywords that are divided with the "," character. Additional keywords that have to be found together are entered as additional lines. MIA is web based and administrated through developed web interface in order to provide more convenient way of developing one's own assistant. MIA question rules enable MIA to be robust and insensitive to various forms of essentially the same question. For example, all following forms of the same question will result in the same answer:

- What is the weather in London?
- I want to know about the weather in London.
- I am interested in weather forecast of London.
- Please give me London's weather forecast.

In this way the user is able to communicate with MIA in a relaxed non-formal way, just as if it was some real person-to-person conversation. This promotes easier and more convenient way of getting the right information.

Figure 3. Customized MIA

The final result of MIA customization is a specialized intelligent assistant that is defined by its own avatar and a customized set of question-answer rules which make MIA applicable to some particular area of use. An example of MIA assistant is shown in Fig. 3. MIA also supports variations in the forms of answers which results in users getting a feeling that MIA is not predictable. This feature creates effect of more intelligent assistant comparing to just one form of answer. Another feature of MIA is that it supports opening of additional web resources in order to clarify given answers even further. An example of this feature is shown in Fig. 4. MIA can be used in many different areas but one of them that is particularly interesting are business systems that can benefit from easier way of getting help and the right information about the business system. In order to find out about the general attitude of business systems towards the usage of intelligent assistants a short research in the form of questionnaire was conducted on 22 business systems. All business systems where of small or medium size and were using various information systems as a part of their everyday business (finance, insurance, trading, web development, etc.). The results of conducted research are given in Table II.

Figure 4. MIA question and answer example with opening of additional web resource

TABLE II. BUSINESS SYSTEMS' ATTITUDE TOWARDS INTELLIGENT ASSISTANTS

Questionnaire item	Mean	Std. dev.
Intelligent assistants seem as an interesting technology.	4,14	0,68
We think that intelligent assistant would help our customers to find information quicker and in easier manner.	3,87	0,92
We think that intelligent assistant would help our employees to learn about new information systems quicker and easier.	3,53	1,19
We would use intelligent assistant as a part of our business system support	3,64	0,83
We would recommend intelligent assistants to our business colleagues.	3,77	1,34

As can be seen in Table II, the conducted research among business system has shown that they perceive intelligent assistants as an interesting technology that they would recommend to others and that they find it useful for both customers and employees. However, research has also shown that although business systems have shown positive attitude towards usage of intelligent assistants their answers weren't as positive as expected and this can be explained with the fact that intelligent assistants represents a new technology that is still rather unknown to their potential users so one step in the right direction would be to make this technology more familiar to its potential users.

IV. CONCLUSION

Business systems and their information systems are getting more and more complex. Increasing complexity of software asks for new technologies and new user interfaces that will make using this kind of software quicker and easier. Intelligent assistants provide their users with many aiding features that can make usage of various systems more convenient. One of possible applications of intelligent assistants is in helping users to learn about the system and to get the desired information about the system. In this paper MIA (Multi-Purpose Intelligent Assistant) is proposed as a generic intelligent assistant that can be applied in many different areas. MIA provides its users with possibilities of customization in both graphical and logical sense. MIA users are able to create their own MIA avatar and customize MIA behavior by defining a set of question-answer rules that will make MIA applicable in the desired area of application. In this way MIA provides an easy and effective way of creating one's own intelligent assistant for some particular purpose. In order to find out about the attitude of business systems towards intelligent assistants a short research has been conducted which has shown that business system find this technology interesting but need additional information in order to understand its full potential. Adding new features to MIA and a more detailed research about its effectiveness will be a part of future research.

Abstract - GUIDL (Graphical User Interface Description Language) system has been proposed as an effective aiding technology that enables inclusion of visually impaired computer users into activities of graphical user interface design. GUIDL system implements many aiding concepts that make creation of graphical user interfaces suitable for visually impaired. In order to make GUIDL system even more accessible to visually impaired a GUIDL IA (Intelligent Assistant) is proposed as a mean of providing a more suitable and simpler way of getting help about various parts of GUIDL system. GUIDL IA enables visually impaired to ask questions in the form of natural language compared to browsing through instruction manual which makes getting the right information easier and quicker. GUIDL IA also enables visually impaired to hear the answer through integrated text-to-speech synthesizer that enables more natural pronunciation of given answers. In this paper GUIDL IA is presented and discussed along with the results about its effectives.

Keywords **- GUIDL, visually impaired, graphical user interfaces, intelligent assistant**

I. INTRODUCTION

Programming is hard and challenging for sighted students to learn because of its abstract nature and a specific way of thinking that it requires [1; 2; 3, 4]. The challenge is much more prominent when it comes to visually impaired students [5]. Visually impaired students experience difficulties in trying to imagine various programming structures and concepts. Nevertheless, visually impaired have shown interest in programming since the very beginning of computer industry [6; 7] and their interest has not disappeared [8]. Along with this interest various means of enabling visually impaired to use computers were developed. Most commonly used aiding tools for visually impaired were based on text-to-speech synthesizers that enabled visually impaired computer users to work with computer programs because all programs' interfaces were based on text. Some of the most known text-to-speech synthesizers are [7]:

- JAWS
- HAL Screen Reader
- COBRA
- Window Eyes
- Easy Web Browsing

These aiding tools also enabled visually impaired to participate in professional programming activities. The adoption of GUIs (Graphical User Interfaces) has brought a huge revolution to the world of computers and made computers much more accessible to a larger number of users. Unfortunately this progress has made things much more difficult for visually impaired. Existing aiding technology that was more than enough to support programming activities of visually impaired has become insufficient to support all new graphical concepts and to describe the graphical screens' context. Along with these problems additional problems have emerged regarding tools for programming and development which have become based on graphical controls and point-and-click actions that have become necessary in order to create graphical user interfaces and to define many other settings. Writing program code still wasn't so problematic since it was still based on text although some concepts and fragmentation of code that came along with new object-oriented programming languages and environments have made programming more complex.

Visually impaired programmers have become unable to participate as equal team members in all activities of software development especially in activities of graphical user interfaces development because textual definition of graphical user interfaces has become practically impossible and although some efforts in the area of aiding visually impaired to learn programming and perceive graphical elements have been made [9; 10; 11; 12; 13] none of them gave any long-term solution for creation of graphical user interfaces.

In order to enable visually impaired programmers to participate as equals in all activities of overall software development, including design of graphical user interfaces a GUIDL (Graphical User Interface Description Language) system with GUIDL language as its core part was developed as an aiding technology that is designed to overcome the obstacle of being unable to create graphical user interfaces in an adequate way for visually impaired [6; 7; 14]. GUIDL system is used as an aiding technology because it does not replace programming development environments. It is only used in a part of development that is dealing with graphical user interfaces creation which is done by using the GUIDL system upon which the rest of the development process is again performed in original development environment. In order to be usable GUIDL system had to meet the following requirements [7]:

- Easiness of usage
- Intuitive, simple and easy to understand syntax
- Independence of descriptive language
- Extensibility of descriptive language

GUIDL system has been designed to make creation of graphical user interfaces possible in a suitable manner for visually impaired programmers and to include them into all activities of programming development as equals. It is as such based on social model of aiding technology [15; 16]. Its GUIDL core language is also designed to be very simple and easy to use since easiness is one of the most important aspects of any aiding technology. In order to make learning about GUIDL system and its usage even easier an intelligent assistant is proposed that enables its users to ask a variety of questions about GUIDL system and to get a quick and clear answer opposed to going through manual page by page. In this way the usage of GUIDL becomes even more efficient and suitable for all visually impaired programmers. In this paper proposed intelligent assistant is described and a research about perception of visually impaired programmers regarding such solution is presented and discussed. This paper also gives some ideas for further research in this area.

II. GUIDL SYSTEM

GUIDL system as an aiding technology has been developed in order to enable visually impaired programmers to work in actual up-to-date technologies rather than having an isolated aiding ecosystem. GUIDL system with its GUIDL language provides easy and understandable way of creating graphical user interfaces that can be translated into desired programming language development environment format by the GUIDL system's mediators which in the end leaves visually impaired programmers with interfaces that can be included into development environments in which some actual projects are being developed. In this way visually impaired are actually included into real projects rather than just having a way to show their ideas in isolated environment without any actual contribution to the real projects. Conceptual model of GUIDL system functioning is shown in Fig. 1 [7; 14].

GUIDL system has been developed to be simple to use with simple syntax of GUIDL language which is designed to be easy and intuitive to use. In order to provide an aiding mean in its full sense GUIDL system includes a number of aiding concepts which are aimed to make creation of graphical user interfaces simple and intuitive for visually impaired. These aiding concepts include [14]:

- Predefined gradual sizes of forms
- Predefined gradual sizes of graphical elements
- Predefined width/height attribute values
- Division of forms into quadrants
- Possibility to position graphical elements into one of form quadrants

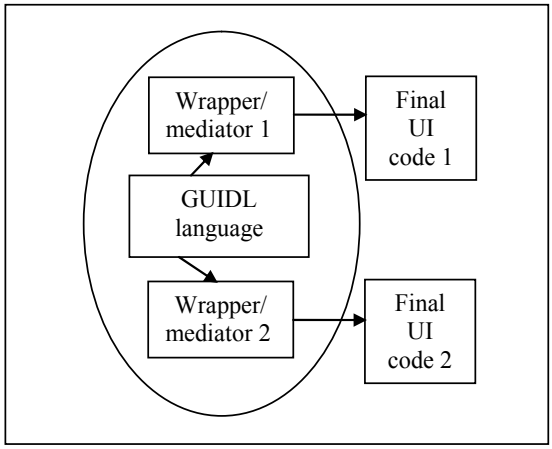

Figure 1. GUIDL system's conceptual model

- Possibility to define the position offset of forms
- Possibility to define the position offset of graphical elements
- Detection of problems with position of graphical elements (graphical element out of form boundaries)
- Automatic correction of problems with form dimension and position (form out of screen boundaries)

The aim of these aiding concepts is to catch those errors that occur on the logical level and are not of syntactical nature. These kind of errors can occur because it is very hard not to make them without seeing the overall screen context. By using these concepts visually impaired are able to create valid graphical user interfaces that do not have overlapping concepts, objects out of screen boundaries, or too small forms. Very important aspect of GUIDL system that is necessary in order for visually impaired to be able to organize objects on the screen is the possibility to divide the form into quadrants in which a certain object can then be placed. This makes organizing of form's elements much easier which in the end results in better and more polished interface. These features combined with simple and accessible GUIDL language make this aiding technology usable and suitable for visually impaired. A part of GUIDL language grammar in EBNF form is shown below [14]:

- project = projectcode, controlname, form;
- projectcode = 'Project ' | 'project ';
- form = formcode, controlname, formattributes, [controldeclarations], formend;
- formcode = 'Frm ' | 'frm ';
- formend = ('End' | 'end'), [eol];
- controlname = qoute, word, qoute, eol;
- word = alphabeticcharacter, {alphabeticcharacter | digit};
- formattributes = frmcommonattributes, windowstateattribute, {colorattribute};

- frmcommonattributes = textattribute, frmrestcommonattributes;
- frmrestcommonattributes = frmsizeattribute, locationattribute;
- frmsizeattribute = sizecode, (frmsize | frmwidth, ws ,frmheight), eol;
- locationattribute = locationcode, xposition, ws, yposition, eol;
- frmsize = 'frmsize1' | 'frmsize2' | 'frmsize3'
- locationcode = 'Location = ' | 'Location=' | 'location = ' | 'location=';
- xposition = 'left' | 'center' | 'right';
- yposition = 'top' | 'middle' | 'bottom';

Although GUIDL system has been designed to be simple to use some effort is needed to learn its rules and concepts. In order to provide visually impaired with something more than just textual or Braille manual an intelligent assistant is proposed as an aiding solution for helping visually impaired to learn and use GUIDL system.

III. GUIDL INTELLIGENT ASSISTANT

GUIDL IA (Intelligent Assistant) is proposed as a suitable aiding mean that is aimed at making GUIDL system easier to learn and use. GUIDL IA is designed to appear in a small part of the screen and to provide an easy way for visually impaired programmers to ask questions about GUIDL system in a form of natural language that they use in everyday conversation. In order to make GUIDL IA simple to use its interface consists of just two fields, one for input of questions and one read-only field for displaying the answers. In this way it is very easy to change focus from one field to another by using the keyboard. The interface of GUIDL IA is shown in Fig. 2. Another feature that is implemented in GUIDL IA is a possibility of opening additional materials in order to clarify or give more details about some aspect of GUIDL system. This feature is shown in Fig. 3. Using GUIDL IA is quite simple. It is sufficient to just enter any GUIDL system related question by typing it and hit the enter key to get the textual answer.

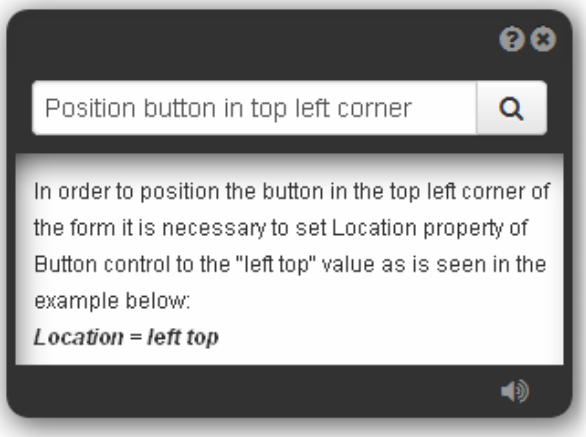

Figure 2. GUIDL IA interface

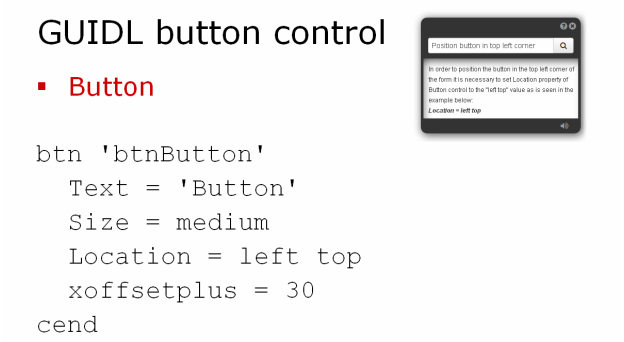

Figure 3. GUIDL IA answer and additional web resource

Since read-only field of GUIDL IA that displays the answers is sometimes not appropriate for a larger amount of information it is sometimes also convenient to open a web page or other web resource with additional information about the asked question and the given answer. In this way visually impaired are presented with more detailed information which can include a larger portion of example GUIDL code and in that way make it easier to understand certain elements of GUIDL system. GUIDL IA incorporates certain aspects of intelligent and expert systems that enable visually impaired programmers to use this assistant in a natural way just as they would communicate with their peers. This includes an extensive tolerance to various forms of questions. For example, all following forms of the same question are accepted and understood by GUIDL IA:

- Tell me how to create buttons?
- What is button and how it is used?
- I am not able to create a button.

Aside from extensive tolerance to different forms of questions GUIDL IA also supports variations of answers so that the same question can have many forms of answer that are randomly displayed which in the end results in somewhat more interesting form for GUIDL IA users. Another aspect that is built into GUIDL IA is a possibility to hear the answer in audio format. Converting text to speech is something that visually impaired computer users have been using for years and although this feature is supported by existing aiding technology which is mostly based on various text-to-speech synthesizers having its own variation of text-to-speech support leaves space for further customization and improvement of this feature and making it even more suitable for GUIDL IA. It is however still possible to use existing text-to-speech tools to convert textual GUIDL IA answers to audio format. Making the usage of GUIDL system even more simple with support of intelligent assistant has a goal to make GUIDL system even more effective and efficient in its main task of enabling visually impaired programmers to create graphical user interfaces.

IV. GUIDL IA EFFECTIVENESS

GUIDL IA has been included into GUIDL system in order to test its level of usefulness in making GUIDL system easier to use. The research was conducted among 24 visually impaired programmers who were given a

GUIDL system with GUIDL IA and were asked to try to do several tasks and report whether GUIDL IA has made using GUIDL system easier compared to using GUIDL system's standard documentation. Research about the experience of participants with GUIDL IA was conducted by using a questionnaire with several questions about their attitude towards provided intelligent assistant and its way of functioning. All answers to given questions were based upon the Likert scale (5 - I strongly agree, 1 - I strongly disagree). Research results are shown in Table I.

TABLE I. RESULTS OF CONDUCTED RESEARCH

Questionnaire item	Mean	Std. dev.
GUIDL IA helps me in using GUIDL system.	4,01	0,84
GUIDL IA makes getting help about GUIDL system quicker.	4,23	0,75
GUIDL IA makes using GUIDL system simpler.	3,89	1,12
GUIDL IA is an interesting aiding tool.	4,38	0,69
I find the feature of being able to ask questions in natural language to be effective way of getting help about GUIDL system.	4,11	0,93
I would recommend this kind of assistant to my peers.	4,04	0,72

The research results have shown that visually impaired programmers find GUIDL IA to be simple and useful tool that helps GUIDL system users in an interesting way that is quick and effective.

V. CONCLUSION

To learn how to program is very challenging for visually impaired who have nevertheless been included in computer and programming activities since the very beginning of computer usage. For years developed aiding technology that was designed to enable visually impaired to use computers was sufficient to support programming activities of visually impaired since all computer programs' interfaces were based on text. With the occurrence of graphical user interfaces in computer industry visually impaired programmers have been left in difficult position because of graphical nature of software development environments, usage of point-and-click actions to set various settings, more complex object-oriented concepts and mostly because of usage of mouse to design graphical interfaces. Visually impaired programmers that were an equal team members found themselves unable to create graphical user interfaces in a suitable manner. In order to include visually impaired into all parts of overall software development a GUIDL system has been developed as an aiding solution which does not replace actual development environments but serves as an aiding technology in a part of software development that includes creation of graphical user interfaces. Although GUIDL system has been made simple it still requires some effort to learn how to use it. To make this process even simpler than it is an intelligent assistant GUIDL IA is proposed that enables its users to ask questions in natural language and to get an instant textual answer with a possibility of opening additional web resources to clarify given answers even further. In order to conclude about the effectiveness of GUIDL IA a research has been conducted in which visually impaired programmers where given GUIDL system with GUIDL IA for use on several tasks and were then asked to report about their experience. Research results have shown that GUIDL IA is simple, interesting and useful aiding solution for making usage of GUIDL system easier and quicker. Further improvements of GUIDL IA and research on a larger scale with additional objective measurements will be a part of future research.

Abstract - Anomalies are integral part of every system's behavior and sometimes cannot be avoided. Therefore it is very important to timely detect such anomalies in real-world running power plant system. Artificial neural networks are one of anomaly detection techniques. This paper gives a type of neural network (probabilistic) to solve the problem of anomaly detection in selected sections of thermal power plant. Selected sections are steam superheaters and steam drum. Inputs for neural networks are some of the most important process variables of these sections. It is noteworthy that all of the inputs are observable in the real system installed in thermal power plant, some of which represent normal behavior and some anomalies. In addition to the implementation of this network for anomaly detection, the effect of key parameter change on anomaly detection results is also shown. Results confirm that probabilistic neural network is excellent solution for anomaly detection problem, especially in real-time industrial applications.

I. INTRODUCTION

With around 40% share in global electricity production, thermal power plants are still significant power generation facilities, although their influence is reduced in favor of the renewable energy plants. Adequate control of thermal power plant units is necessary for the system to function properly, since improper functioning of the system may result in electricity supply interruption and financial losses for electricity producers.

One of the most important systems involved in thermal power plant operation is the plant's boiler. Pulverized coal combustion occurs in this system. Its combustion raises the temperature which helps feedwater conversion into steam with needed parameters. Such steam is driven further to the turbine system propelling it, which is essential for electricity production in thermal power plant. From the above, it is clear that the malfunction of any part in boiler system affects the operation of thermal power plant. Outage of some part or the whole thermal power plant unit can often be avoided with timely anomaly detection.

Many of those techniques are being researched and one of those are neural networks based anomaly detection techniques. If the neural network is created to detect anomalies in the system, reaction time on the anomaly could be significantly reduced. This would provide greater system stability and therefore fewer losses.

This paper presents one of the possible solutions to the anomaly detection problem in boiler system using probabilistic neural network. Given the complexity of the system, because of necessary simplification, only some characteristic sections and some characteristic process variables were selected. All of the input data that are used are coming from the system for monitoring and control present in Thermal Power Plant "Tuzla", Bosnia and Herzegovina.

II. SELECTED SECTIONS OF THERMAL POWER PLANT

A thermal power plant, as a large and complex system, consists of multiple smaller systems that work together and ensure continuous electricity generation. This paper is focused on one of the main systems of every thermal power plant and that is the boiler.

The boiler is one of the most important systems in a thermal power plant because of its role in electricity generation [1, 2]. The boiler represents the entire system that participates in the conversion of water into steam. A single division of the boiler system into individual sections does not exist, because many sections are connected and there is often no clear distinction between them. In this paper, the division is made according to available process images with certain corrections concerning data availability.

A. Water-Steam System

This system is primarily engaged in converting water into steam and consists of multiple subsystems with separate functions. The system consists of multiple pipes and vessels. Heat exchange between different media occurs in this system in order to achieve optimal steam parameters. The steam is driven further to the turbine propelling it, which is essential for electricity generation. Given that the quality and parameters of steam directly affect the electricity generation, anomaly detection in this system is of great importance for the plant. The most important measurements of process variables related to steam are temperature, pressure and steam flow which directly affects the current power output.

B. Feedwater System

One of the important subsystems of the boiler is the system for its feedwater supply, because without the feedwater supply there is no steam generation. After the raw water is treated at the chemical water treatment plant, the water is stored in the feedwater tank. The water is

distributed further from the tank into the feedwater pipe system using feedwater pumps. The pumps maintain the specified feedwater flow which is determined by the required power output. The purpose of this system is distribution of feedwater to the most important subsystem of the water-steam system – the steam drum.

C. Steam Superheaters

The steam generated in the steam drum is distributed through this system. After distribution of steam through this system, it is called the superheated steam. Steam superheaters system consists of pipes mounted in the boiler that distribute the steam to the turbine. This system has a major role in removing moisture from the steam, which improves its quality.

The temperature of steam generated in the drum still does not match the temperature needed in the process. The steam generated in the drum still contains a certain percentage of moisture. Such steam should not be distributed to the turbine due to the possibility of condensation on the blades. In every thermal power plant, there is a tendency to produce 100% quality steam. Because of that, the steam is heated in this system using flue gases. Increasing the steam temperature results in removal of moisture from the steam and that is the primary goal of this system. The steam temperature is increased by around 160 °C compared to steam temperature in the drum. The goal of the system is to maintain the temperature around 535 °C, which is optimal for boiler analyzed in this paper.

D. Steam Drum

The most important subsystem of the water-steam system is the steam drum, which is a large tank with the task of steam extraction from a water-steam mixture stored in the drum. Given the importance of the drum for electricity generation, it is logical that timely anomaly detection is required in this system. The most important process variable in the drum is the water level. In addition to that, steam pressure, conductivity and pH value are also measured. A rough block diagram is shown in "Fig. 1". It shows important boiler sections and selected sections of the boiler for anomaly detection (marked in red) and some connections between the sections.

III. Analysis of Existing Anomaly Detection Techniques

Conventional anomaly detection techniques have been used for a long time, but with the development of computer technology modern anomaly detection techniques can be developed.

Anomaly detection techniques division can be done in multiple ways [3, 4]. Based on the means of acquiring knowledge anomaly detection techniques can operate in one of the following three modes: supervised, semi-supervised and unsupervised. Techniques that operate in unsupervised mode detect anomalies by analyzing an unlabeled data set and making an implicit assumption that majority of the data set represents normal behavior. Anomalous data is the data that least fits the characteristics of the data set. Techniques that operate in semi-supervised mode build a model for the class corresponding to normal behavior. Then the model is used to identify anomalies in the test data. Techniques that operate in supervised mode require two data sets, one labeled as normal behavior and the other labeled as anomaly. Then it is needed to train the classifier that determines if the test data belong to the class labeled as normal behavior.

In addition to this division, there is also another division that is used in this paper, proposed in [3]. It is division based on anomaly type and classifies anomaly detection techniques in one of the following three groups: point anomaly detection techniques, contextual anomaly detection techniques and collective anomaly detection techniques. If an individual data instance from a data set can be considered as anomalous with respect to the rest of data, then such instance can be classified as a point anomaly. The focus of this paper are point anomaly detection techniques.

A. Classification based Anomaly Detection Techniques

Classification is used to learn a model from a set of labeled data instances (training data set). After that, the model is used to classify a test instance into one of the classes. These techniques operate under the assumption that there is enough data in the training data set, so the classifier can learn how to classify test data.

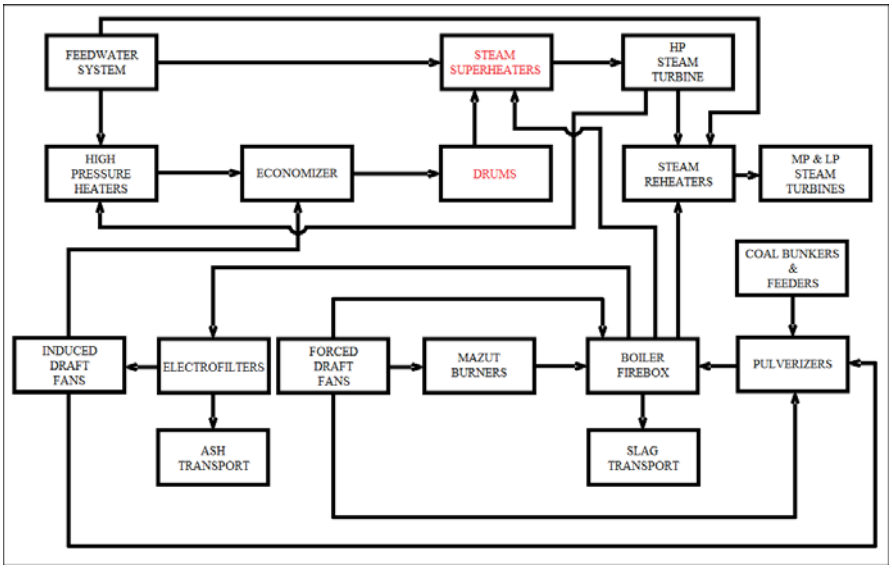

Figure 1. Block diagram of boiler sections (some turbine sections included)

Classification based anomaly detection techniques can be categorized into two following groups: one-class and multi-class anomaly detection techniques. One-class classification based anomaly detection techniques assume that all training instances have only one class label. A test instance different from the labeled ones are declared as anomalous. Multi-class classification based anomaly detection techniques assume that the training data contains labeled instances belonging to multiple normal classes. A test instance is declared as anomalous if it does not belong to any of the normal classes [5].

Commonly used classification based anomaly detection techniques are: rule based techniques, neural networks based techniques and support vector machines (SVM) based techniques.

B. Neural networks based anomaly detection techniques

Neural networks are used for anomaly detection and they represent anomaly detection techniques that use artificial intelligence. They can perform as one-class as well as multi-class classifiers. Neural networks are trained with normal instances and anomalous instances. After that the network should be able to determine anomalous instances in a test data set.

Many of the published papers are dealing with applications of neural networks in various systems. Papers [6] and [7] are dealing with the application of artificial intelligence in anomaly detection. Many techniques that use neural networks are represented in those papers. The application of neural networks in power systems is considered in [8]. In particular, the application of neural networks for anomaly detection in power plants is considered in papers [9] and [10]. Neural networks in combination with fuzzy logic for anomaly detection are considered in [11].

Multiple types of neural networks could be used for anomaly detections: MLP neural networks, recurrent neural networks (RNN), probabilistic neural networks, etc.

IV. PROBABILISTIC ARTIFICIAL NEURAL NETWORK

Probabilistic neural networks (PNN) belong to the stochastic neural networks group. PNN represent an implementation of a statistical algorithm called kernel discriminant analysis (KDA) [12, 13]. The probabilistic neural net is based on the theory of Bayesian classification and the estimation of probability density function (PDF). Because of ease of training and a sound statistical foundation in Bayesian estimation theory, PNN has become an effective tool for solving many classification problems. A PNN consists of several sub-networks, each of which is a Parzen window pdf estimator for each of the classes. The development of the probabilistic neural network relies on Parzen windows classifiers. The Parzen windows method is a non-parametric procedure that synthesizes an estimate of a probability density function (pdf) by superposition of a number of windows, replicas of a function (often the Gaussian). The Parzen windows classifier takes a classification decision after calculating the probability density function of each class using the given training examples. The multicategory classifier decision is expressed as follows:

$$p_k f_k > p_j f_j \tag{1}$$

where p_k is the prior probability of occurrence of examples from class k and f_k is the estimated pdf of class k.

The advantages of this network type are: rapid training process (faster than BP based networks), guaranteed convergence to the optimal classification with increasing data set and the ability to change the number of learning inputs with minimal or no additional training. The disadvantages are: large memory requirements, slow execution and the representative data set requirement. Unlike many other neural networks, training of PNN is done in a single iteration.

The PNN architecture consists of four layers: input layer, pattern layer, summation layer and decision layer, presented in "Fig 2". This PNN structure recognizes c classes. The first layer shows the input pattern with n features. The number of nodes in the pattern layer is equal to the number of training instances. The number of nodes in the summation layer is equal to the number of classes in the training instances. The input layer is fully connected to the pattern layer. The input layer doesn't perform any computation and simply distributes the input to the neurons in the pattern layer, which is semi-connected to the summation layer. The summation units sum the inputs from the pattern units that correspond to the category from which the training pattern was selected.

The PNN works by creating a set of multivariate probability densities that are derived from the training vectors presented to the network. The input instance with unknown category is propagated to the pattern layer. Once each node in the pattern layer receives the input, the output of the node will be computed:

$$\pi_i^c = \frac{1}{(2\pi)^{n/2}\sigma^n} e^{-\frac{(x-x_{ij})^T(x-x_{ij})}{2\sigma^2}} \tag{2}$$

where n is the number of features of the input instance x, σ is the smoothing parameter and x_{ij} is a training instance corresponding to category c.

The summation layer neurons compute the maximum likelihood of pattern x being classified into c by summarizing and averaging the output of all neurons that belong to the same class:

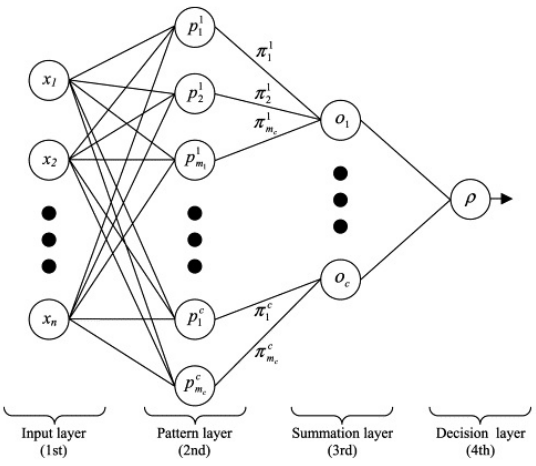

Figure 2. An example of probabilistic artificial neural network

$$p_i(x) = \frac{1}{(2\pi)^{n/2}\sigma^n}\frac{1}{N_i}\sum_{i=1}^{N_i} e^{-\frac{(x-x_{ij})^T(x-x_{ij})}{2\sigma^2}} \quad (3)$$

where N_i denotes the total number of samples in class c. If the *a priori* probabilities for each class are the same, and the losses associated with making an incorrect decision for each class are the same, the decision layer unit classifies the pattern x in accordance with the Bayes' decision rule based on the output of all the summation layer neurons:

$$C(x) = argmax\{p_i(x)\}, i = 1,2,\dots,c \quad (4)$$

where C(x) denotes the estimated class of the pattern x and m is the total number of classes in the training samples. If the *a priori* probabilities for each class are not the same and the losses associated with making an incorrect decision for each class are different, the output of all the summation layer neurons will be

$$C(x) = argmax\{p_i(x)cost_i(x)apro_i(x)\}, \quad i = 1,2,\dots,c \quad (5)$$

where $cost_i(x)$ is the cost associated with misclassifying the input vector and $apro_i(x)$ is the prior probability of occurrence of patterns in class c.

V. Evaluation of Acquired Knowledge

After obtaining the actual classification results, some way of quality assessment is needed for a certain type of neural network. The purpose of the assessment is to determine which type of neural network fits best for some classification problem. Therefore the evaluation of acquired knowledge is an important part of neural network application. During this process, it is needed to determine which verification and validation measures will be used. Different types of these measures exist through specific application [14] and some of them are applied in this paper.

A. Result Verification

There are several different measures used for result verification. Majority of the measures are adapted to one-class classification. This corresponds to the aim of this paper, because neural networks used for anomaly detection in this paper are trained as one-class classifiers. Table I provides an overview of possible outcomes of one-class classification problem solution. There are four possible outcomes of anomaly detection. True positive (TP) and true negative (TN) outcomes represent a correct classification, while false negative (FN) and false positive (FP) outcomes represent an incorrect one. Both types of incorrect classifications represent a hazard. False positives can cause an action which is not needed, but false negatives are actually more dangerous because an anomaly would be ignored.

TABLE I. Possible putcomes of one-class classification problem solution

Outcome	**Actual**		
Desired	***Behavior***	***Normal***	***Anomalous***
	Normal	True positive	False positive
	Anomalous	False negative	True negative

Based on these counts, the following perfomance metrics are calculated (all expresed as a percentage):

- Accuracy (ACC):

$$ACC = \frac{TP + TN}{TP + FP + FN + TN} \quad (6)$$

- Sensitivity or true positive rate (TPR) or recall:

$$TPR = \frac{TP}{TP + TN} \quad (7)$$

- Specificity or true negative rate (TNR):

$$TNR = \frac{TN}{TP + TN} \quad (8)$$

- Precision (PR) or positive predictive value (PPV):

$$PR = \frac{TP}{TP + FP} \quad (9)$$

- Negative predictive value (NPR):

$$NPR = \frac{TN}{TN + FN} \quad (10)$$

- F1 score:

$$F1 = \frac{2TP}{2TP + FP + FN} \quad (11)$$

B. Result Validation

Result validation techniques are mainly linked to neural networks if an input data set is not large enough. In addition to that, they are used to test a neural network with some random sample from the data set. If the data set is large enough, which does not guarantee the neural network will be trained properly. This is due to a possibility of overfitting the network with a large number of similar instances. If that occurs, the neural network could treat some noise as an anomaly. In order to prevent this, some kind of result validation should be performed. Result validation techniques can also show if the neural network parameters are good enough. Commonly used result validation techniques are: cross-validation, regularization, early stopping etc. Result validation techniques are not exclusively used with neural networks. They are also used with other anomaly detection techniques and with value prediction techniques.

The most popular result validation technique is cross-validation [15]. The idea is to separate the available data into a training data set (usually 80% to 90% of the data) and a test data set (the remaining 10% to 20% of the data). The simplest form of cross-validation randomly separates the available data into a single training set and a single test set. It is a risky approach, because an unlucky split could lead to an ineffective neural network. A better approach would be to repeat the previous procedure multiple times, but this approach is also risky because there is a chance that some instances could be used only for training and never for testing, or vise versa. Therefore, a technique called k-fold cross-validation was developed.

The idea behind k-fold cross-validation is to divide all the available data into *k* roughly equal-sized groups. In each iteration of k-fold cross-validation, *k-1* groups are used for training and the remaining one is used for testing. The k-fold cross-validation iterates through a number of folds. After the first iteration, the next group is used for testing, and the remaining data are used for training. This procedure repeats until all of the groups are used for testing once.

The main advantage of k-fold cross-validation compared to other techniques is utilization of all the available data in the process. The main disadvantage is the potential for different validation results due to stochastic process of group forming at the beginning of the validation process. The k-fold cross-validation can give different results each time it is performed. This can be avoided by repeating the process multiple times and using the mean validation result.

VI. RESULTS AND DISCUSSION

The results are presented as a set of different verification measures which show the effect of important parameters change. Given that the k-fold cross-validation technique is mentioned in the paper, in addition to the test results, 10-fold cross-validation results are also presented.

Scores of an ideal classification would all be the same (1), except TPR and TNR (0.5 – their sum is always 1). Given that the initial synaptic weights are chosen randomly, it is possible to obtain different results if a neural network is trained and tested multiple times. Therefore, all of the obtained results are obtained from average confusion matrices (average of multiple training and testing cycles).

A. Data Used as Neural Network Input Data

Neural networks were applied to data from two sections of the boiler, the steam superheaters and the steam drums. These sections consist of two separate systems each, which produce steam of adequate quality together. Process variables used in this paper represent both systems (I and II). The process variables from the steam superheaters are: superheated steam temperature (TS), superheated steam flow (FS) and superheated steam cooling water flow (CWF). The variables from the steam drums are: drum level (DL), drum pressure (DP) and feedwater flow (FWF). All of the input data come from an actual system for monitoring and control present in unit 4 of Thermal Power Plant "Tuzla" with the sampling period of 1 s.

There are 962 instances that represent normal behavior and the same amount representing anomalous behavior in the input data set. That makes a total of 1924 instances for each section. Given that, the 10-fold cross-validation is not necessary because the data set is not large enough, but to test the neural networks with more random data sets. The data set is divided into a training data set (70% of the data), a validation data set (15% of the data) and a test data set (15% of the data).

B. Results of Probabilistic Neural Network Application

Due to the nature of this neural networks type, there are not many parameters that can be changed. Number of neurons depends on the number of instances used in input data set. Also, the learning process is completed in only one epoch, so the only parameter that can be changed is the spread coefficient. The initial value of this parameter is 1 and the changes are performed by decreasing and increasing the value. The minimum value is 0.01, and the maximum is 10. The best results can be obtained if the coefficient value is between 0.5 and 5 for both section. Results of PNN application for anomaly detection in the steam superheaters are given in the Table II. From the results, PNN gives excellent results if the spread coefficient is properly selected (spread = 2). Results of PNN application for anomaly detection in the steam drums are given in the Table III. The best results can be obtained if the value is between 0.5 and 5, but the steam drums results are a bit better if other values are used. The inputs (6 values for both systems) from Steam Superheats and PNN classification outputs are shown in "Fig 3". The inputs (6 values for both systems) from Steam Drums and PNN classification outputs are shown in "Fig 4". The results confirm that PNN is excellent solution for anomaly detection problem.

VII. CONLUSION

In this paper the probabilistic neural network (PNN) was tested with data from real-time thermal power system (TPS) to explore possibilities of anomaly detection.

An anomaly in any part of the boiler affects the operation of thermal power plant unit. Malfunctions can be prevented by timely anomaly detection. Given the system complexity, for the purpose of necessary simplification, only some of the characteristic boiler sections and process variables from those sections were selected for further analysis. All of the input data come from an actual system for monitoring and control present in Thermal Power Plant "Tuzla".

It was shown that the PNN provide excellent results for anomaly detection and with the used data. As for the significance of the results for power generation process control in a thermal power plant, it could be great. Due to the fact that the data are divided so that the very beginning of anomalous state is represented in anomalous data instances, neural networks could be used as a tool for early anomaly detection. Given that, an anomaly reaction time could be significantly reduced. That would provide greater system stability and therefore fewer losses.

Only some data from large sections of the boiler were included in the analysis provided in this paper. In an actual application of neural networks for anomaly detection, data from many other (smaller) sections should be included. In addition to the problem of anomaly detection, future research could be extended to predictive control in industrial systems using neural networks. In any case, in the area of modern advanced automation, neural networks and other forms of artificial intelligence are labeled as the future of complex systems.

Abstract - In middle voltage networks in Croatia there are four neutral earthing concepts: isolated neutral point, low-impedance grounded networks, resonant grounded networks and networks with partial compensation. The paper will generally discuss modelling and simulation software developed for analysis of four grounding concepts mentioned earlier. Model was made using Matlab. Real time simulations were performed to test the behavior of middle voltage networks with different grounding concepts in case when single phase earth faults occur. The manner in which neutral point is treated has a fundamental influence on the value of the current and on overvoltages. The paper will also discuss influences that cable network connected to middle voltage side of network transformer and the moment when a fault occurs have on the value of the current and on overvoltages. Based on the simulation results, the paper presents the possibilities and limitations of various neutral earthing concepts in medium voltage systems.

I. INTRODUCTION

Single phase to earth faults are the most frequent failures in medium and high voltage systems [1]. The values of the currents and of the temporary overvoltages with power frequency in case of a single pole earth fault depend on the neutral point treatment, earth capacitances of the overhead lines or cables connected to the network, voltage level, the value of fault resistance and on the distance between the supply busbars and the fault location [2]. When considering single phase earth faults in medium voltage networks two important aspects need to be taken into account: value of the short circuit current (and consequently touch voltages) and overvoltages. In order to describe the behavior of the network during single phase earth faults simulation model made using MATLAB SimPowerSystem software [3]. Several simulation models were made for same network: isolated neutral point, low-impedance grounded networks, resonant grounded networks and networks with partial compensation. The model described in this paper observes substation during fault and the influence of various neutral earthing methods combined with the influence of the length of middle voltage power lines and the moment when a fault occurs. Every neutral grounding concept has its own advantages and disadvantages.

A real time simulation model like this can be powerful analysis tool to validate which neutral grounding concept to choose for a specific substation regarding network connected to the substation, safety issues, network importance, earth system requirements and costumer interruptions [2].

II. SIMULATION MODEL ELEMENTS

The aim of this paper is to determine the characteristics of single phase earth faults in middle voltage networks in Croatia. All simulation models are consisted of: three-phase 110 kV source, network transformer 110/10(20) kV, middle voltage cables and overhead lines, 10(20)/0.4 kV transformers, series load and single pole fault with earth. MATLAB SimPowerSystems provides component libraries and analysis tools for modeling and simulating electrical power systems [3]. Figure 1 shows a network model in Matlab SymPowerSystem. Simulations of earth fault currents and overvoltages were conducted in 20 kV network with a different grounding concept, different middle voltage cable length and different moment when a fault occurs. All network elements are in detail described below.

The three-phase source is connected in Y with a grounded neutral. This block generates a three-phase sinusoidal 110 kV voltage, 50 Hz with no time variation. Phase angle of phase A is zero degrees.

Network transformer was modelled according to the real network transformer. Network transformer is 110/10(20)/10.5 kV, 40 MVA with winding connection YNynD5. In order to provide real parameters of network transformer equivalent circuit was calculated. Figure 2 gives equivalent circuit of three phase network transformer [4]. This part of network dimensioning was especially complex and important in order to provide real network state.

All cables are represented as distributed parameter lines. In order to dimension middle voltage cable parameters from Elka's catalogue [5] were used. Line to earth capacitances of middle voltage cables are one of the most important factors that need to be taken into account during dimensioning the network model. Two cases were observed in this paper: cable length 1 km and cable length 40 km. The aim of the simulation was to observe the impact that cable length have on overvoltages and on the value of the current.

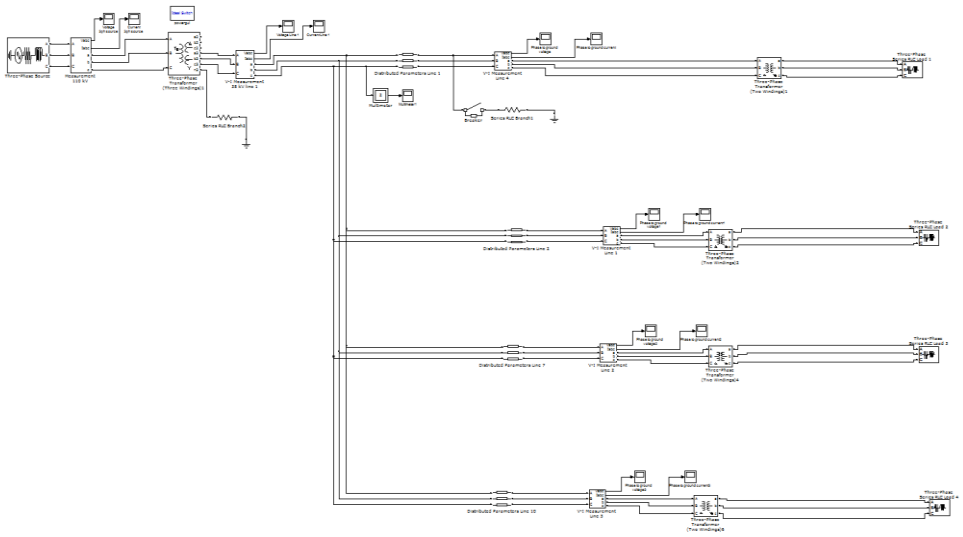

Fig. 1. The network model in Matlab

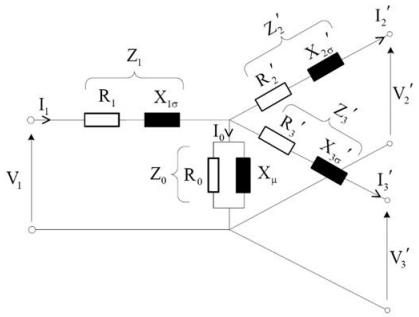

Fig. 2. Equivalent circuit of three phase network transformer

Single pole fault with earth is represented as one-phase circuit breaker connected to ground. In series with circuit breaker is resistance (characterizes the ground resistance). Two cases of single pole fault with earth were observed in order to see what influence the moment when the fault occurs has on overvoltages and current value. Table 1 gives moments when a fault occurs and phase shift of faulted phase. The moment when a fault occurs is represented by t (ms) and φ (°) represents a phase shift of faulted phase. It is expected that the highest values of the overvoltages will occur in cases when the phase shift of faulted phase is $\varphi = 90$ °.

TABLE 1. SINGLE POLE FAULT WITH EARTH

	t (ms)	***φ (°)***
case 1	10	0
case 2	5	90

Neutral grounding resistor was dimensioned according to the real neutral grounding resistors in Croatia (generally 40 Ω for the 20 kV network). The purpose of a neutral grounding resistor is to limit ground fault currents to safe levels so that all the electrical equipment in a power system is protected. In this case ground fault current is limited to 300 A. In case of low ohmic grounded neutral point it is connected between neutral point of middle voltage side of network transformer and the earth.

In order to be able to determine inductance L of Peterson coil (in case of a resonant grounded neutral point and partial compensation) it is necessary to know the three phase grounding capacitance of middle voltage cables:

$$\omega \cdot L = \frac{1}{3 \cdot \omega \cdot C_0} \tag{1}$$

In (1) C_0 represents line to earth capacitances of middle voltage cables, ω represents angular frequency. For the suppression of the arc the Peterson coil should be well tuned within limits [6]. If the value of the Peterson coil is correctly tuned the current of the possible earth fault can be reduced [7]. In this case current will be reduced to zero. In case of resonant grounded neutral point Peterson coil is connected between neutral point of middle voltage side of network transformer and the earth. In case of a partial compensation resistor is connected parallel to low-ohmic resistor between the neutral point of middle voltage side of network transformer and the earth [1].

III. MEASUREMENTS

Number of measurement blocks were used to measure three-phase values of voltages and currents in a circuit. When connected in series with three-phase elements, the three-phase V-I measurement block returns the three phase-to-ground or phase-to-phase peak voltages and currents. The block can output the voltages and currents per unit or in volts and amperes. It measures phase to phase voltages as well as a phase to ground. Comparison of the values before and after the single pole fault with earth was made in order to understand the influence it has to network.

IV. SIMULATION EXPECTATIONS

Length of the middle voltage power lines, neutral earthing method should determine the earth fault current and overvoltages [2]. The moment when fault with earth occurs should influence overvoltages significantly. Highest overvoltages for all four neutral grounding concepts and both cable lengths are expected to appear if a fault occurs at moment t = 5 ms (φ = 90°).

It is expected that currents in the case of the isolated neutral point increase significantly with the increase of the length of middle voltage cables. Internal overvoltages during earth faults are expected to be the highest in the case of the isolated neutral point (compared to all other neutral earthing methods).

In case of the low-ohmic neutral point large number of long cables should increase the value of the earth fault current. Earth fault currents are expected to be the highest in the case of low-ohmic neutral point (current increases especially with the increase of underground cables). Overvoltages in this case are expected to be the lowest.

In case of resonant grounded neutral point the inductive reactance of the Peterson coil is set near the value of the capacitive reactance of the whole network. The capacitive and inductive currents are opposite and resulting current is expected to be very small. In the simulation, it is expected that result current is set to zero. Increase of the length of the underground cables should not influence the value of the current. Overvoltages in case of resonant grounded neutral point are expected to be very high (almost as high as in the case of an isolated neutral point).

Increase of the length of the middle voltage cables should not influence the value of the current in case of the partial compensation, too. Current is supposed to depend only on the value of the low-ohmic resistor. Overvoltages in case of partial compensated networks should be similar as in the case of low-ohmic neutral point.

During a single phase earth fault the voltage of the faulted phase in all simulations is expected to collapse while the voltage of the healthy phases is expected to rise. Figure 2 shows the voltage of the faulted phase for all four ways of transformer neutral point grounding treatment.

Phase to phase voltage of all three phases for all four ways of transformer neutral point grounding treatment should remain unaffected regardless the cable length and moment when a fault occurs. Figure 3 shows the phase to phase voltage for isolated neutral point in case when cable length is 1 km, and the moment when a fault occurs is 10 ms.

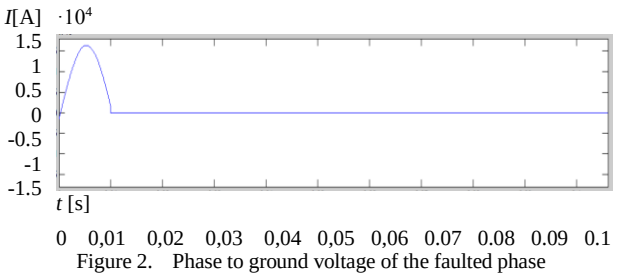

Figure 2. Phase to ground voltage of the faulted phase

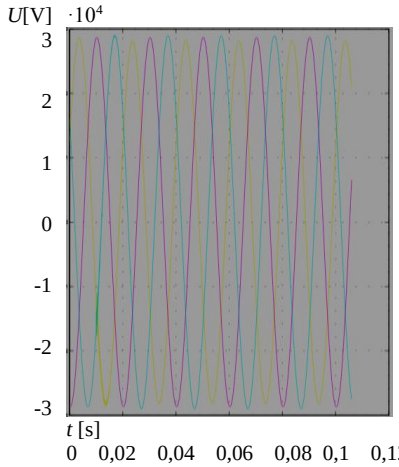

Figure 3. Phase to phase voltages before and after fault in case of isolated neutral point

V. SIMULATION RESULTS

A. Isolated neutral point

Results for two cable lengths and two moments when a fault occurs in networks with isolated neutral point are given in table 2. Figure 4 and figure 5 show the increase of current due to long cables. In case of long cables (40 km) current increases 42.8 times, as expected. It is evident that cable length has little impact on the value of overvoltages. Figure 6 and figure 7 show influence that moment when a fault occurs have on overvoltages. As expected, overvoltages are the highest in case if a fault occurs at 5 ms. The moment when a fault occurs has no influence on the value of fault current.

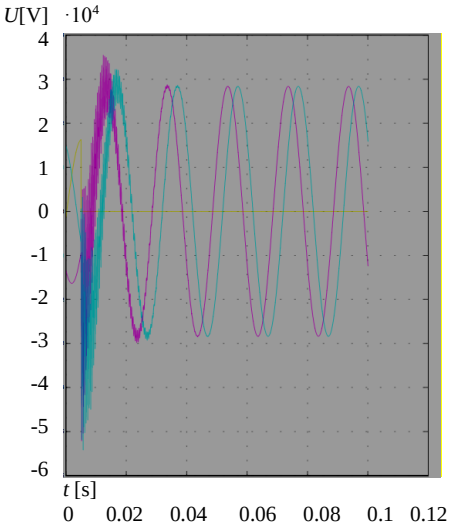

Figure 7. Overvoltages in case of isolated neutral point, cable length 1 km, a fault occurs at 5 ms

B. *Low-ohmic grounded neutral point*

Table 3 gives results for two cable lengths and two moments when a fault occurs in case of low-ohmic grounded neutral point. Figure 8 and figure 9 show increase of current due to long cables. In case of long cables (40 km) current increases, as expected. Overvoltages are the highest in case if a fault occurs at 5 ms. Figure 10 and figure 11 show influence that moment when a fault occurs have on overvoltages in case of resonant grounded neutral point.

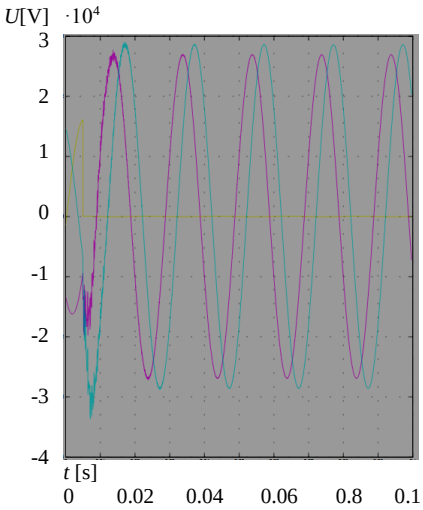

Figure 11. Overvoltages in case of low-ohmic grounded neutral point, cable length 40 km, a fault occurs at 5 ms

C. *Resonant grounded neutral point*

Results for two cable lengths and two moments when a fault occurs in networks with resonant grounded neutral point are given in table 4. Figure 12 and figure 13 show

that current does not increase due to long cables, as expected. In case of resonant grounded neutral point overvoltages are expected to be almost as high as in the case of isolated neutral point. Figures 14 and 15 show overvoltages in case of resonant grounded neutral point for a 40 km cable length.

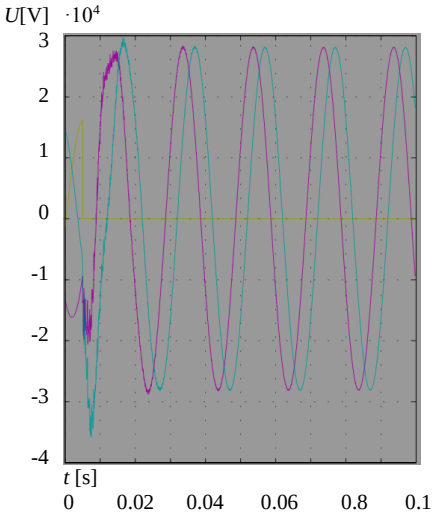

Figure 15. Overvoltages in case of resonant grounded neutral point, cable length 40 km, a fault occurs at 5 ms

D. Partial compensation

Results for two cable lengths and two moments when a fault occurs in networks with partial compensation are given in table 5. Figure 16 and figure 17 shows that the current does not increase due to long cables. Figure 18 and figure 19 show influence that moment when a fault occurs have on overvoltages in case of partial compensation.

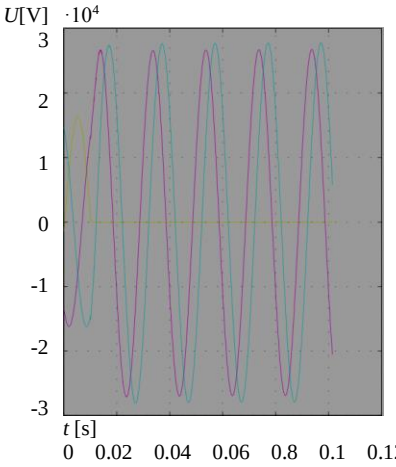

Figure 18. Overvoltages in case of partial compensation, cable length 40 km, a fault occurs at 10 ms

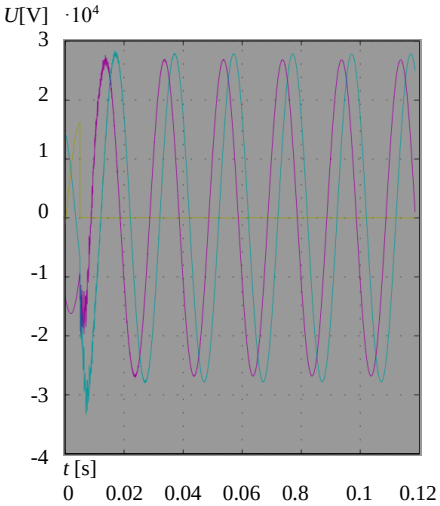

Figure 19. Overvoltages in case of partial compensation, cable length 40 km, a fault occurs at 5 ms

VI. ANALYSIS OF RESULTS

As expected, during a single phase earth fault the voltage of the faulted phase collapsed while the voltage of the healthy phases increased. The voltage of the faulted phase for all four transformer neutral point earthing methods behaved as expected. Phase to phase voltage of all three phases for all four methods of transformer neutral point grounding treatment remained unaffected.

Highest overvoltages were expected to occur in case of isolated neutral point and in case of resonant grounded neutral point. In case of low-ohmic grounded neutral point and partial compensation overvoltages were expected to be similar. Results show matching of expected and simulated results.

It has been showed that overvoltages strongly depend on the neutral point method and on the moment when the fault occurs. Maximum calculated overvoltage factor (transient overvoltages during an earth fault) in isolated network was 3.316.

Highest single pole fault current was expected to occur in case of networks with low-ohmic grounded neutral point. Calculated and simulated results show match with expected values. Fault current in case of networks with low-ohmic grounded neutral point increases from 283.27A to 314.31due to larger number of long cables. In case of isolated neutral point single pole fault current increases from 4.78 A to 204.67 A. In case of resonant grounded neutral point single pole fault current remains the same (total compensation), as expected. Increase of the length of the cables does not influence the value of the current in case of the partial compensation, too. Current depends only on the value of the low-ohmic resistor.

The aim of the study was to show influence various neutral earthing methods, different length and type of the middle voltage power lines and different moments when a fault occurs have on overvoltages and fault current magnitudes. For this particular substation observed in paper resonant grounded neutral point is recommended. In that case danger of too high potential (touch voltage) on earth of substation is reduced to a minimum (fault current is zero). When considering single phase to earth faults in medium voltage networks handling safety issues, especially touch voltages, is the most important aspect.

VII. CONCLUSION

The aim of this paper was to observe influence several neutral grounding concepts, different middle voltage cable lengths and various moments when a fault occurs have on the value of fault current and overvoltages. As expected, the neutral grounding concept determines the behavior of a power system during a single phase to earth fault. With the increase of cable lengths current increases, too, except in case when Peterson coil is connected in order to compensate capacitive component of fault current. In case when Petersen coil is connected between neutral point and earth cable length doesn't influence the value of fault current. Cable length doesn't influence overvoltages as much it influences the value of the current. The moment when a fault occurs has great influence on overvoltages. If a fault occurs at 5 ms overvoltages increase significantly.

Listed neutral earthing concepts should be considered for a specific substation. A decision which concept to choose should be adopted based on simulation results for values of the short circuit currents and overvoltages. The model described in this paper can be used in order to present what particular kind of neutral earthing method to use in specific substation.

Konavoska 2, 10000 Zagreb

***Sažetak*—U ovom radu opisan je sustav dvaju mehanički spregnutih elektromotornih pogona. Primarni elektromotorni pogon je sinkroni s permanentnim magnetima, zasnovan na Siemensovom Sinamics S120 modularnom sustavu, a sekundarni pogon je asinkroni, također zasnovan na Sinamics S120 modularnom sustavu. Na primarnom pogonu projektirani su regulatori momenta i brzine vrtnje, a sekundarni pogon je konfiguriran za promjenu momenta tereta, odnosno za emulaciju opterećenja primarnog elektromotornog pogona. Dana je usporedba odziva na promjenu referentne veličine i momenta tereta za regulator brzine vrtnje sinkronog pogona projektiran prema tehničkom i simetričnom optimumu. Budući da je rad prvenstveno edukativnog karaktera, dane su i smjernice za emulaciju rada radnih mehanizama.**

I. Uvod

Za učenje i proučavanje rada elektromotornih pogona najčešće se koriste laboratorijske makete manjih snaga. Pri tome se opterećenje elektromotornog pogona vrši drugim elektromotornim pogonom bliskih karakteristika. Mehanička sprega vratila dvaju pogona izvodi se krutim ili elastičnim spojkama. Prednost elastičnih spojki je jednostavnije prenošenje maketa na mjesto demostracije, budući da se pogoni mogu lakše odvojiti i pojedinačno prenijeti na potrebno mjesto.

U ovom radu je opisan sustav elektromotornih pogona, koji su mehanički spregnuti zupčastim remenim prijenosom. Prikazano je ponašanje sinkronog elektromotornog pogona pod utjecajem momenta tereta te je direktan nastavak na završni rad [1], izrađen na Tehničkom veleučilištu u Zagrebu, te objavljen kao članak u [2]. U tom je završnom radu opisana optimizacija sinkronog elektromotornog pogona regulatorima struje i brzine vrtnje, u neopterećenom stanju, kojom se postiže brži odziv pogona na promjenu referentne brzine vrtnje, uz ostvareno manje nadvišenje odziva, nego u slučaju automatski određenih parametara od strane proizvođača. U ovom radu prikazano je ponašanje istog sinkronog pogona, ali uz promjenjivi moment tereta koji se izvodi asinkronim motorom spojenim preko zupčastog remenog prijenosa.

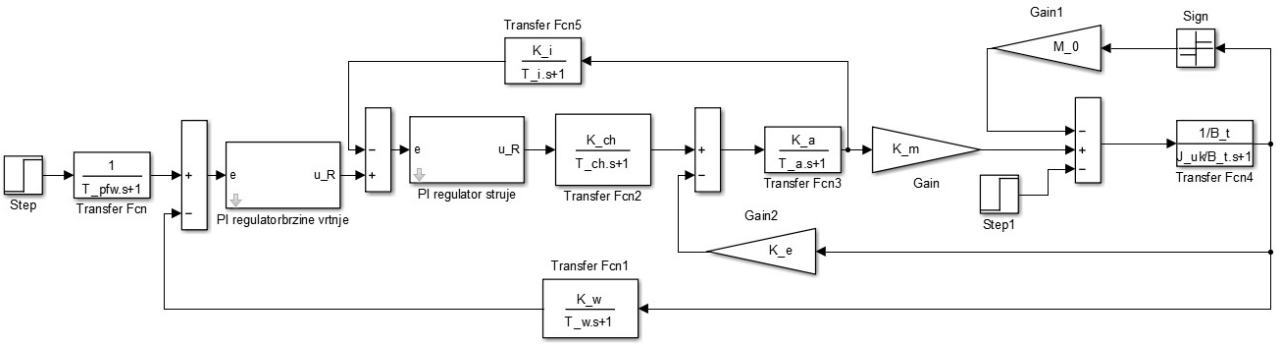
Važan dio pri proučavanju rada elektromotornih pogona predstavlja sposobnost predviđanja određenih pojava, uz poznavanje parametara pogona. Zbog toga su u ovom radu pri iznošenju eksperimentalnih rezultata mjerenja dani i simulacijski rezultati, dobiveni pomoću programskog paketa *Matlab - Simulink*, te su komentirana pojedina odstupanja. Time se bitno povećava kvaliteta edukacije iz područja elektromotornih pogona.

U drugom poglavlju opisan je sustav elektromotornih pogona te je dan matematički model s parametrima za *Simulink*. U trećem poglavlju dani su parametri regulatora struje (momenta) dobiveni pomoću tehničkog optimuma te parametri regulatora brzine vrtnje dobiveni pomoću tehničkog i simetričnog optimuma. U četvrtom poglavlju dan je opis asinkronog pogona kao i postupak podešenja istog za regulaciju momenta. Korištena je alternativna metoda regulacije momenta iz razloga što je direktna onemogućena zaštitom postavljenom od strane proizvođača. U petom poglavlju dani su odzivi veličina sinkronog elektromotornog pogona na promjenu momenta tereta uzrokovanu asinkronim pogonom. U šestom poglavlju dana su zaključna razmatranja i planirani budući rad.

II. Opis sustava i matematički model za *Simulink*

Elektromotorni pogon na kojem su vršena testiranja prikazan je na slici 1. Zasnovan je na Siemensovom Sinamics S120 modularnom sustavu [3] koji se upravlja pomoću programskog paketa *Starter*. U lijevom ormaru na slici 1 prikazan je sinkroni elektromotorni pogon. Sastoji se od sinkronog motora s permanentnim magnetima nazivne snage 0,31 kW i nazivne brzine vrtnje 3000 o/min, energetske jedinice (SINAMICS) nazivne snage 0,37 kW te upravljačke jedinice (SINAMICS S120) s DRIVE CLiQ sučeljem za prihvat signala s rezolvera za mjerenje pozicije motora. U desnom ormaru na slici 1 prikazan je asinkroni elektromotorni pogon. Sastoji se od četveropolnog kaveznog asinkronog motora nazivne snage 0,18 kW, energetske jedinice (SINAMICS) nazivne snage 0,37 kW te upravljačke jedinice (SINAMICS S120). Pozi-

Slika 1. Sinkroni i asinkroni pogon spojeni zupčastim remenom.



Slika 2. Simulink model elektromotornog pogona.

cija motora mjeri se inkrementalnim enkoderom. Sinkroni pogon je konfiguriran i optimalno parametriran postupkom opisanim u poglavlju 3. Asinkroni pogon je konfiguriran na temelju tvorničkih postavki, bez optimizacije.

Simulink model sinkronog elektromotornog pogona s anti-windup PI regulatorima momenta i brzine vrtnje prikazan je na slici 2. Model je ekvivalentan klasičnom istosmjernom pogonu s nezavisnom i konstantnom uzbudom, uz drugačija značenja pojedinih parametara pogona [1], [2]. U tablici I dani su parametri dobiveni iz *Startera* i kataloga pogona. Proračunati i procijenjeni parametri dani su u tablici II.

Pri modeliranju pogona osnovna je pretpostavka kruta mehanička sprega dvaju pogona. Zbog toga se spajanjem vratila asinkronog motora na sinkroni preko krutog zupčastog remena promijenio ukupni moment inercije koji sinkroni motor vidi. Ukupni moment inercije dobiven je zbrajanjem momenta inercije sinkronog motora i momenta inercije asinkronog motora pomnoženog s kvadratom omjera remenica obaju motora [4], te je konačni iznos $J_u = 4 \cdot 10^{-4}$ kgm^2.

Iznos modeliranog Coulombovog trenja određen je mjerenjem q-komponente struje sinkronog pogona u stacionarnom stanju $I_{q,ss}$, uz mehanički vezan asinkroni pogon s isključenim pretvaračem. Dobivena vrijednost je:

Tablica I
PARAMETRI POGONA TEMELJENI NA KATALOGU I PARAMETRIMA DOBIVENIM U *Starteru*.

Parametar	Iznos
P_n	310 W
n_n	3000 o/min
M_n	1 Nm
I_{an}	1,6 A
n_{pp}	3
η	85 %
R_s	5,53135 Ω
R_{ch}	0,135 Ω
L_d	19,56624 mH
L_q	16,89075 mH
f_{sw}	4 kHz
$U_{d,ref}$	0 V
$U_{q,ref}$	145 V
E_n	135 V
U_{an}	153 V

Tablica II
PARAMETRI POGONA TEMELJENI NA PRORAČUNU I PROCJENI.

Parametar	Iznos
J_{am}	$1{,}45 \cdot 10^{-3}$ kgm^2
M_0	0,1474 Nm
B_t	$6{,}484 \cdot 10^{-5}$ Nms/rad
K_a	0,1765 A/V
T_a	3 ms

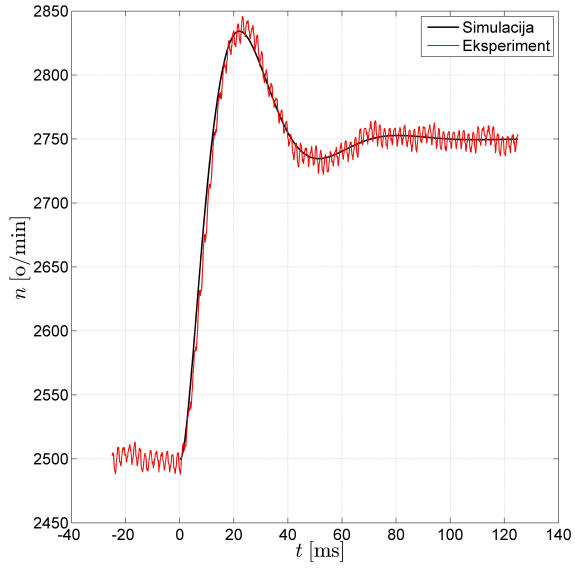
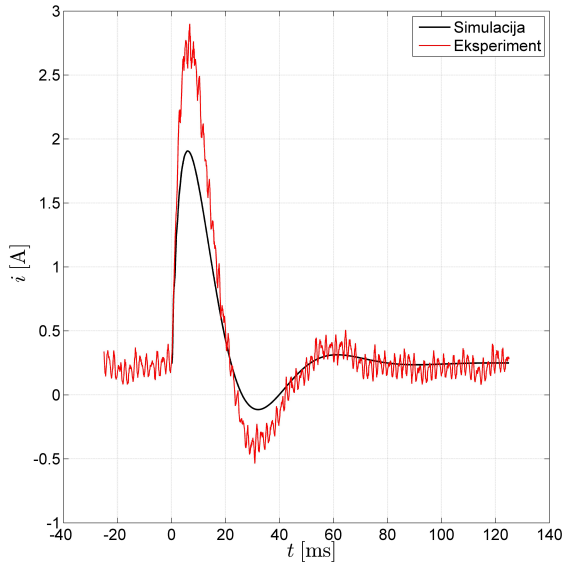
Usporedni rezultati eksperimenta i simulacije odziva brzine vrtnje na promjenu referentne brzine za 250 o/min dani su na slici 3, a struje na slici 4.



Slika 3. Usporedba simulacijskog i eksperimentalnog odziva brzine vrtnje na promjenu referentne brzine od 250 o/min.



Slika 4. Usporedba simulacijskog i eksperimentalnog odziva q-komponente struje na promjenu referentne brzine od 250 o/min.

Simulacija brzine vrtnje približno se poklapa sa rezultatom eksperimentalnog testiranja.

Ako usporedimo simulaciju i eksperimentalna mjerenja u slučaju struje, vidljiva je velika razlika u maksimalnom iznosu struje, gotovo 1 A. Razlika je takva zbog toga što je kod simulacije u obzir uzeto samo Coulombovo trenje. Bolji rezultati mogli bi se dobiti drukčijim modelom trenja (npr. Stribeckovo trenje). U obzir nije uzeta ni elastičnost remena koja također doprinosi ovoj razlici.

III. Parametri regulatora momenta i brzine vrtnje

Rezultati proračuna parametara regulatora dani su u ovom poglavlju, a potpuni proračuni novih parametara regulatora dani su u [4]. Korišteni su tehnički optimum (TO) za projektiranje regulatora struje, te tehnički i simetrični (SO), za projektiranje regulatora brzine vrtnje [5]. Parametri PI regulatora momenta dobiveni tehničkim optimumom uz zadano nadvišenje 10% su:

$$K_{Rit} = 27{,}9, \quad T_{Iit} = 3 \text{ ms}. \tag{2}$$

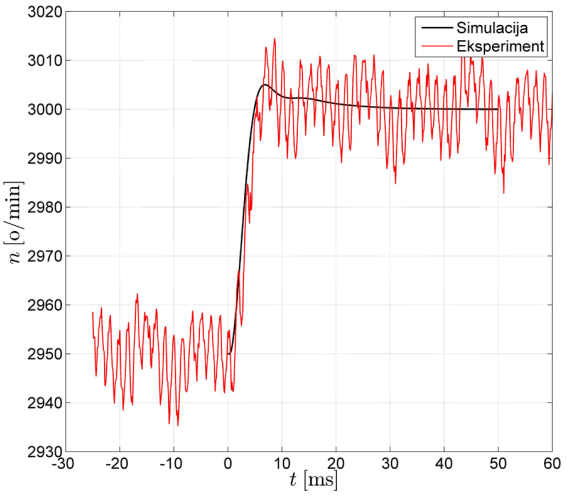
Parametri PI regulatora brzine vrtnje dobiveni simetričnim optimumom uz zadano nadvišenje 25%, korekciju na 40%, te uz PT_1 prefiltar da se postigne 10%, su [4], [5]:

$$K_{R\omega s} = 0{,}4, \quad T_{I\omega s} = 9 \text{ ms}, \quad T_{pf\omega} = 2{,}72 \text{ ms}. \tag{3}$$

Parametri PI regulatora brzine vrtnje dobiveni tehničkim optimumom uz zadano nadvišenje 40% su [4], [5]:

$$K_{R\omega t} = 1{,}2, \quad T_{I\omega t} = 6{,}2 \text{ s}. \tag{4}$$

Proračunati parametri regulatora uneseni su u *Starter* i izvršeni su eksperimenti. Usporedni rezultati simulacije i eksperimenta u slučaju korištenja simetričnog optimuma s parametrima regulatora (3) prikazani su slikom 5 za brzinu vrtnje, te slikom 6 za struju. Testiranja su odrađena na



Slika 5. Usporedba simulacijskih i eksperimentalnih rezultata u primjeni regulatora brzine vrtnje projektiranog pomoću simetričnog optimuma i uključenim prefiltrom brzine vrtnje za postizanje 10% nadvišenja.

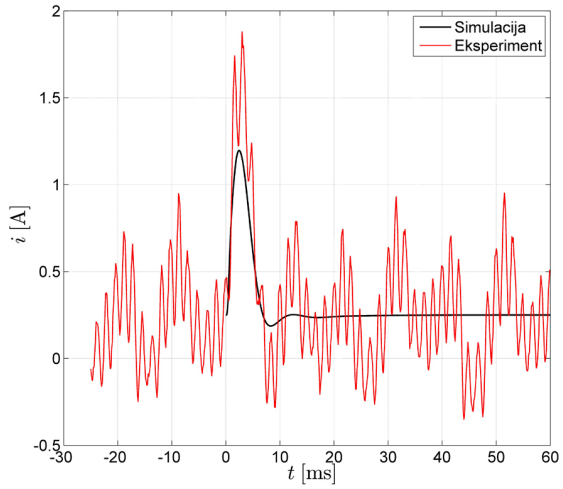
Tablica III
Pokazatelji kvalitete prijelazne pojave dobiveni iz simulacijskih rezultata prikazanih na slici 5.

Parametar	iznos
$K_{R\omega s}$	0,4
$T_{I\omega s}$[ms]	9
t_m[ms]	6,85
t_p[ms]	30
σ_m[%]	10
$T_{pf\omega}$[ms]	2,72

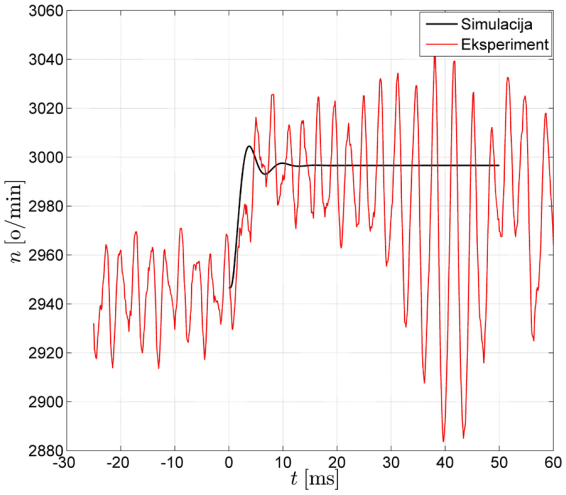
način da je referentna brzina promijenjena za 50 o/min. Zadana promjena je relativno mala kako bi regulator u svim testiranim uvjetima ostao u linearnom režimu rada (više rezultata dano je u [4]). Dodatno je potrebno napomenuti da je pogon vektorski upravljan, u d, q koordinatnom sustavu. Struja i_d regulacijom se održava na nuli, a mjerena struja je i_q i ona predstavlja mjeru elektromagnetskog momenta [1], [2]. Na slikama je struja i_q označena samo oznakom i.

Odzivi sustava korištenjem regulatora projektiranog pomoću tehničkog optimuma prikazani su na slici 7. Rezultati odziva simulacije dani su u tablici IV. U praksi nije bilo moguće primijeniti te parametre. Kao što je vidljivo na slici 7, zbog proklizavanja remena izražene su oscilacije. Potrebno je smanjiti pojačanje regulatora dok se ne dobije ono sa kojim su oscilacije prihvatljive. Korigirani koeficijent pojačanja iznosi $K_{R\omega t}$ = 0,4, a prefiltar brzine vrtnje je isključen ($T_{pf\omega}$ = 0 s). Odzivi simulacije i eksperimenta, brzine vrtnje i struje, dani su na slikama 8 i 9, s rezultatima u tablici V.

Odabrani koeficijent pojačanja omogućuje rad sustava bez izraženih oscilacija, no pojačanje je sniženo toliko da prefiltar brzine vrtnje nije potreban jer nadvišenje je manje od 10%.



Slika 6. Usporedba simulacijskih i eksperimentalnih odziva struje i_q kod primjene regulatora brzine vrtnje projektiranog pomoću simetričnog optimuma i uključenim prefiltrom brzine vrtnje za postizanje 10% nadvišenja.



Slika 7. Usporedba simulacijskih i eksperimentalnih rezultata u primjeni regulatora brzine vrtnje projektiranog pomoću tehničkog optimuma za nadvišenje 40% i uključenim prefiltrom brzine vrtnje za spuštanje nadvišenja na 10%.

IV. PRILAGODBA ASINKRONOG POGONA ZA REGULACIJU MOMENTA TERETA

Asinkroni pogon je Siemensov proizvod, sličan sinkronom pogonu na kojem se vrše testiranja. Sastoji se od upravljačke jedinice CU320-2PN i pretvarača PM340 [1], [2]. Upravljani elektromotor u tom pogonu je trofazni asinkroni, model 1LA9063-4KA11 (tablica VI).

Asinkroni pogon se pušta u rad po uputama danim u [6]. Dodatne postavke uključuju isključivanje rampe u grani referentne struje, čime se omogućuje gotovo skokovita promjena momenta, te ograničenje momenta (slika 10).

Kao što je vidljivo na slici 10, imamo ikonu pod nazivom *Torque limits*, i u njoj se nalaze polja za promjenu iznosa momenta. Moment se u polju *Upper Limit* ograničava na iznos 0, tako da ne može djelovati u smjeru momenta sinkornog motora, a u polju *Lower limit* na iznos -1 Nm. Iznos u polju *Lower limit* je ključna postavka. Kada bi prijenosni omjer između remenica pogona bio 1:1 tada bi iznos u polju *Lower limit* bio ekvivalentan nominalnom iznosu momenta sinkronog pogona kojem stvaramo teret. No, omjer remenica je 1:1,36. To znači da kada asinkronim pogonom postignemo maksimalni moment (zadan u polju *Lower limit*), u našem slučaju 1 Nm, sinkroni pogon vidi (terećen je sa) otprilike 0,73 Nm. Isto tako, kada bi sinkronim motorom htjeli teretiti asinkroni motor 1 Nm tada bi na sinkronom trebalo postići 0,73 Nm.

Testiranje sinkronog motora pod utjecajem momenta tereta uzrokovanog sa asinkronim motorom vršeno je kod brzine vrtnje 1200 o/min. Uključivanjem sinkronog motora na 1200 o/min, uključeni i podešeni (s gore opisanim postavkama) asinkroni motor se, s obzirom na prijenosni omjer, vrti otprilike 880 o/min i u tom slučaju sinkroni pogon je opterećen momentom tereta iznosa 0,73 Nm.

Sinkroni pogon opterećen je s 0,73 Nm iz razloga što asinkroni pogon nije ubrzan, tj. njegova zadana brzina (u *Starteru*) je 0 i on pokušava zadržati tu brzinu (odupire se), a kada podignemo brzinu asinkronog motora preko 880 o/min, npr. 1500 o/min, sinkroni motor je opterećen momentom tereta iznosa 0,22 Nm, što predstavlja iznos momenta trenja i ventilacije (modelirano Coulombovo trenje). Dakle, asinkroni motor je povećanjem zadane (referentne) brzine smanjio moment tereta koji sinkroni motor vidi, jer je pri zadanoj brzini 1500 o/min moment asinkronog pogona ograničen na nulu pa tako sinkroni pogon ne osjeća ništa osim momenta trenja i ventilacije.

Postavljanjem referentne brzine asinkronog pogona na iznos 0, uzrokuje se gotovo skokovito povećanje momenta tereta (udar momenta) sinkronog pogona. To uzrokuje pad brzine vrtnje sinkronog pogona i povećanje struje, čiji su valni oblici snimljeni i analizirani u sljedećem poglavlju.

U postavkama prikazanim na slici 10 moguće je podešavanje za emulaciju različitih radnih mehanizama (ventilatora, pumpi, itd.) posredstvom DCC-a (Drive Control Chart). DCC je grafička konfiguracija i proširenje funkcionalnosti uređaja korištenjem kontrolnih, aritmetičkih i logičkih blokova [7].

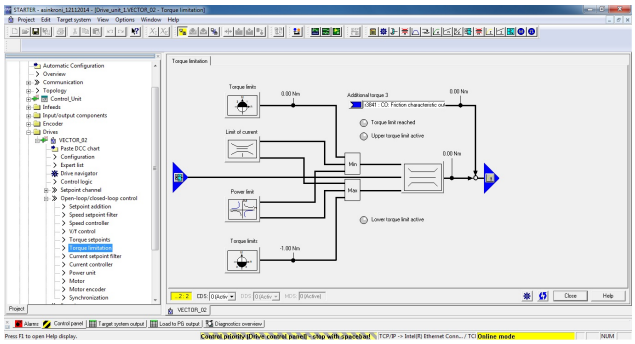
n_{pp}	4
U_n	230V trokut /400V zvijezda



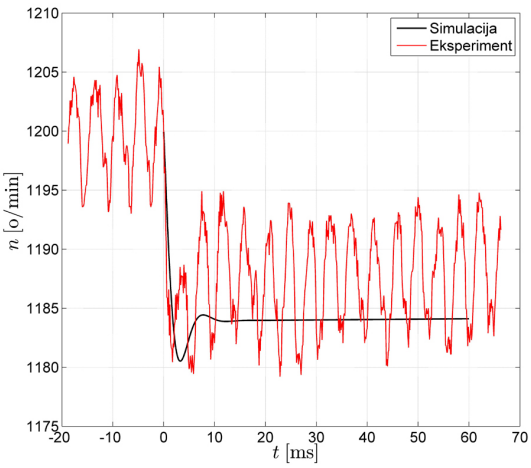
Slika 10. Postavke momenta za asinkroni pogon u *Starteru*.

V. USPOREDBA REZULTATA S MOMENTOM TERETA

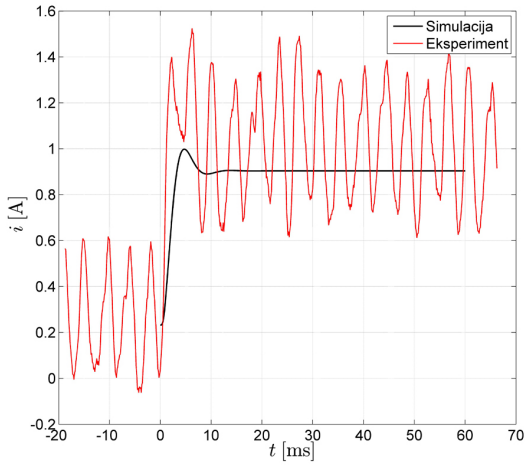
Na slikama 11 – 14 dani su simulacijski i eksperimentalni odzivi brzine vrtnje i struje na promjenu momenta tereta, za tehnički i simetrični optimum.

Vidljive su izražene oscilacije u odzivu eksperimenta i kod brzine vrtnje i kod struje. Amplituda oscilacija u prosjeku iznosi 13 o/min *peak-to-peak*. Javlja se iz razloga što stabilnost pogona (motora) u odnosu na podlogu nije u potpunosti zadovoljena. Također, utjecaj elastičnosti remena i trenje na obje remenice pridonosi većem iznosu oscilacija. Isto tako, čvršći spoj motora sa kućištem te robusnija izvedba kućišta, smanjili bi utjecaj vibracija na odziv sustava.

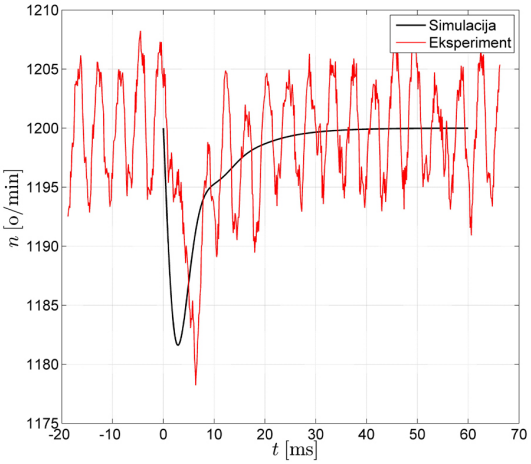
Ono što je najbitnije uočiti na slikama 11 – 14 jest to da je simetrični optimum za projektiranje regulatora brzine vrtnje neosporno bolji izbor od tehničkog optimuma.



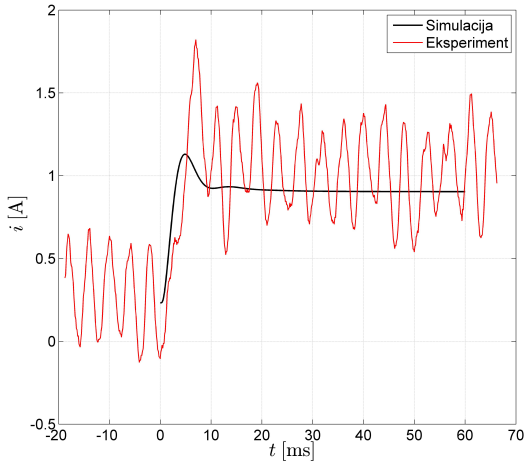
Slika 11. Usporedba simulacijskih i eksperimentalnih odziva brzine vrtnje uz primjenu tehničkog optimuma s parametrima (4).



Slika 12. Usporedba simulacijskih i eksperimentalnih odziva struje uz primjenu tehničkog optimuma s parametrima (4).



Slika 13. Usporedba simulacijskih i eksperimentalnih odziva brzine vrtnje uz primjenu tehničkog optimuma s parametrima (3).



Slika 14. Usporedba simulacijskih i eksperimentalnih odziva struje uz primjenu tehničkog optimuma s parametrima (3).

Odzivi na promjenu referentne brzine su po kvaliteti sumjerljivi, ali glavni razlog izbora simetričnog optimuma u praksi je duljina trajanja kompenzacije poremećaja (momenta tereta). Kod tehničkog optimuma vrijeme kompenzacije poremećaja iznosi otprilike 30 sekundi (cca. 5 integralnih vremenskih konstanti regulatora), a kod simetričnog optimuma vrijeme kompenzacije iznosi otprilike 45 milisekundi. Iznosi maksimalnog propada brzine vrtnje pri djelovanju momenta tereta su također sumjerljivi u oba slučaja, zbog jednakog iznosa pojačanja regulatora.

VI. Zaključak

Terećenje motora drugim motorom zahtjeva poznavanje načina rada upravljačkih jedinica oba pogona, jer se u njima određuju ključna podešenja. Siemensova upravljačka jedinica S120 i pripadajući programski paket *Starter* pružaju mnogo mogućnosti podešavanja sustava, ali ne omogućuju direktnu regulaciju momenta. Stoga je u ovom radu opisano indirektno rješenje za regulaciju momenta.

Detaljnim eksperimentiranjem potvrđena je važnost dobre mehaničke sprege remena i remenice, te stabilnosti pogona u odnosu na podlogu na kojoj se nalaze. Oscilacije u odzivu brzine vrtnje od prosječno 13 o/min *peak-to-peak* su neizbježne zbog elastičnosti remena, no mogu biti i puno veće ako se ne zadovolji uvjet mehaničke stabilnosti pogona. Oscilacije u odzivu struje su također neizbježne zbog samog načina doziranja iste – sklapanjem u pretvaraču, ali u ovom postavu sustava dominantan utjecaj na jako veliku oscilatornost struje u stacionarnom stanju, a time i brzinu vrtnje, ima mehanička sprega dvaju pogona remenom preko kojeg se prenose vibracije.

Usporedbom rezultata učinaka oba optimuma za projektiranje regulatora brzine jasno se može vidjeti koji je od navedenih superirorniji po kvaliteti prijelazne pojave sustava za koji su projektirani. Simetrični optimum proračunom gotovo da ne odstupa od predviđenog, a tehnički optimum ima veća odstupanja i uzrokuje forsiranje sustava. Također, ukupno vrijeme kompenzacije poremećaja je predugačko te je time tehnički optimum neprihvatljiv za brzinu vrtnje elektromotornih pogona.

Budući rad na ovoj temi mogao bi biti promjena granica momenta u *Starteru*, kako bi se mogla ostvariti emulacija rada različitih radnih mehanizama.

Funkcije naprednih mjernih sustava za električnu energiju

Zdravko Lipošćak
HEP-Operator distribucijskog sustava d.o.o., Zagreb, Hrvatska
zdravko.liposcak @hep.hr

Funkcije naprednih mjernih sustava za električnu energiju utvrđuje operator distribucijskog sustava te ih dostavlja regulatornoj Agenciji (HERA) koja na temelju dostavljenih podataka provodi analizu troška i dobiti te pribavlja mišljenje predstavnika tijela za zaštitu potrošača za uvođenje naprednih mjernih uređaja za krajnje kupce. Nadležni ministar na temelju analize utvrđuje odlukom plan i program mjera za uvođenje naprednih mjernih uređaja za krajnje kupce, a provođenje odluke nadzire Agencija. Prilikom korištenja naprednih mjernih uređaja nužno je prikupljati, obrađivati i koristiti mjerne podatke u skladu s propisima o zaštititi osobnih podataka. Od sustava naprednog mjerenja potrošnje električne energije očekuje se veliki doprinos u ostvarenju ciljeva 20/20/20 Europske Unije do kraja 2020. godine; smanjenje potrošnja energije za 20%, smanjenje emisije stakleničkih plinova za 20% i povećanje udjela energije iz obnovljivih izvora za 20%.

U radu je prezentiran problema donošenja odluke o potrebnim funkcijama naprednog mjernog sustava, koji je zbog velikih očekivanja i nužnosti zadovoljenja potreba različitih subjekata, vrlo složen, važan i osjetljiv početni korak u realizaciji cijelog projekta.

I. UVOD

Direktive europske unije 2009/72/CE i 2009/73/CE od 13. srpnja 2009. godine u području naprednog mjerenja zahtijevaju da država članica osigura implementaciju naprednih mjernih sustava koji će pridonijeti aktivnom sudjelovanju kupaca na tržištu električne energije. Isto tako potrebno je provesti ekonomsku analizu dugoročnih troškova i dobiti te pripremiti vremenski plan izgradnje naprednog mjernog sustava u periodu od najviše deset godina. Ukoliko ekonomska analiza pokaže isplativost ugradnje naprednih mjernih sustava za određene kategorije kupaca ili područja primjene, najmanje 80% obračunskih mjernih mjesta je potrebno opremiti naprednim brojilima do 2020. godine.

Zahtjevi europskih direktiva prema izgradnji naprednih mjernih sustava ugrađeni su u hrvatsko zakonodavstvo kroz Zakon o energiji , NN 120/2012 i Zakon o tržištu električne energije, NN 22/2013.

Zakonom o energiji definirano je da operator mreže/sustava utvrđuje tehničke zahtjeve i troškove uvođenja naprednih mjernih uređaja i sustava za njihovo umrežavanje te ih dostavlja Agenciji (HERA). Na temelju podataka Agencija provodi analizu troška i dobiti te pribavlja mišljenje predstavnika tijela za zaštitu potrošača za uvođenje naprednih mjernih uređaja za krajnje kupce. Ministar na temelju analize utvrđuje odlukom plan i program mjera za uvođenje naprednih mjernih uređaja za krajnje kupce, a provođenje odluke nadzire Agencija. Prilikom korištenja naprednih mjernih uređaja nužno je prikupljati, obrađivati i koristiti mjerne podatke u skladu s propisima o zaštititi osobnih podataka.

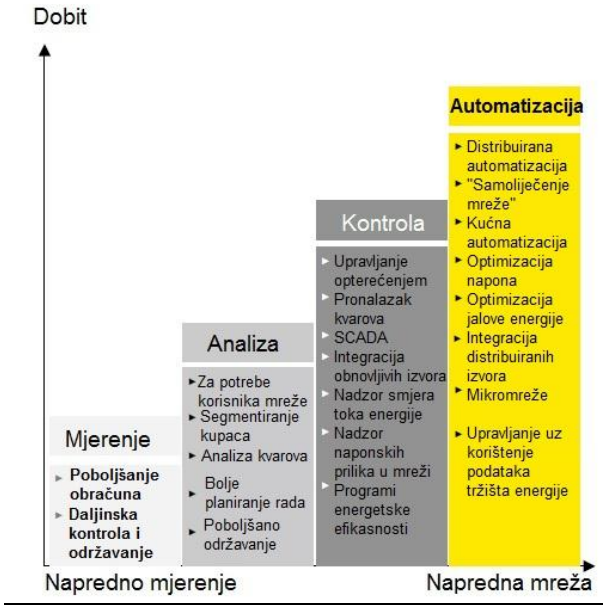
Od sustava naprednog mjerenja potrošnje električne energije očekuje se veliki doprinos u ostvarenju ciljeva 20/20/20 Europske Unije do kraja 2020. godine; smanjenje potrošnja energije za 20%, smanjenje emisije stakleničkih plinova za 20% i povećanje udjela energije iz obnovljivih izvora za 20%.

Zbog velikih očekivanja i nužnosti zadovoljenja potreba različitih subjekata, vrlo je složen i osjetljiv početni korak utvrđivanja tehničkih karakteristika naprednih mjernih uređaja i sustava za njihovo umrežavanje za potrebe hrvatskog tržišta električne energije. Posebno se preporučuje da sustav naprednih mjernih uređaja podržava barem minimalni skup funkcija predložen u Preporuci Europske Komisije 2012/148/EU, a koje su u skladu s aktivnostima normiranja u ovom području. To je potrebno za osiguravanje tehničke i komercijalne interoperabilnosti u naprednom mjerenju, osiguranje privatnosti i sigurnosti podataka te omogućavanje kreiranja i razvoja novih energetskih usluga.

II. NAPREDNI MJERNI SUSTAV

Iako je obveza ugradnje naprednih mjernih sustava za mjerenje potrošnje i proizvodnje električne energije prenesena u hrvatsko zakonodavstvo, niti na razini EU niti na razini našeg zakonodavstva nije definirano što je to napredno mjerenje. Ovaj nedostatak Europska komisija pokušala je ublažiti donošenjem Preporuke 2012/148/EU u kojoj su navedene minimalne funkcionalnosti naprednog mjernog sustava, a konačna odluka o funkcionalnostima prepuštena je državama članicama.

Napredni mjerni sustav osim kroz skup minimalnih funkcija koje mora podržavati, definira se i kao elektronički sustav koji pri mjerenju potrošnje energije osigurava više dodatnih informacija u odnosu na tradicionalna brojila električne energije te ima mogućnost razmjene podatke korištenjem različitih oblika elektronske komunikacije. Napredni mjerni sustav je jedna od najvažnijih karika napredne energetske mreže.



Slika 1. Razvoj od naprednog mjerenja do napredne distribucijske mreže i moguće dobiti novih sustava

Važnost odluke o opsegu funkcija naprednog mjernog sustava je u tome što postoji velika povezanost između željenih funkcija sustava i troškova izgradnje. Dostupni podaci iz do sada provedenih studija troškova i dobiti [1] ukazuju da bi napredni sustav mjerenja mogao stajati prosječno 200 EUR do 250 EUR po potrošaču. Trošak po mjernom mjestu kreće se od oko 100 EUR (77 EUR na Malti, 94 EUR u Italiji) do 766 EUR u Češkoj Republici.

Očekuje se da će napredni sustavi mjerenja donijeti ukupnu korist od 160 EUR po korisniku za plin i 309 EUR za električnu energiju uz pretpostavljenu uštedu energije od 3 %. Procjene uštede energije kreću se u rasponu od 0 % u Češkoj Republici do 5 % u Grčkoj i na Malti. Od zemalja koje su završile s uvođenjem, Finska i Švedska navele su uštede energije u rasponu od 1 % do 3 %.

Za opremanje svih obračunskih mjernih mjesta HEP-Operatora distribucijskog sustava, uz procjenu troškova opremanja i izgradnje sustava od 200 EUR po obračunskom mjernom mjestu, ukupna investicija za 2,3 milijuna kupaca iznosila bi oko 460 mil. EUR.

Prema Preporuci Europske komisije 2012/148/EU napredni mjerni sustav mora imati slijedeći minimalni set funkcionalnosti:

a) Za potrebe kupca, osigurati očitanja potrošnje izravno za kupca i bilo koje treću stranu određenu od strane kupca, standardno sučelje koje će omogućiti rješenja upravljanja energijom u 'stvarnom vremenu', kao što su kućne automatizacije, opremljena sa standardiziranim sučeljem koje omogućuje vizualan prikaz podataka o potrošnji.
b) Očitavati mjerne podatke dovoljno često kako bi se omogućilo njihovo korištenje za postizanje ušteda energije. Osigurati očitanja kupcu najmanje u periodima od 15 minuta te pohranu podataka za daljnje analize (da kupac može očitati povijesne podatke).
c) Za operatora mjerenja, omogućiti daljinsko očitavanja mjernih i kontrolnih podataka,
d) osigurati dvosmjernu komunikaciju između naprednog mjernog sustava i vanjske mreže za održavanje i kontrolu mjernog sustava,
e) očitanje treba vršiti dovoljno često kako bi informacije bilo moguće koristiti za planiranje rada mreže.
f) Za opskrbljivače, podržavanje naprednih tarifnih sustava, korištenje time-of-use registara, daljinska kontrola tarifa, prosljeđivanje informacija o naprednim tarifnim sustavima direktno do kupca.
g) Omogućavanje daljinskog uključenja i isključenja te ograničavanje vršnog opterećenja.
h) Za sigurnost i zaštitu podataka, osigurati sigurnu podatkovnu komunikaciju između brojila i operatora mjerenja, ali i na komunikaciju brojila prema kupcu. Za komunikaciju unutar prostora kupca osim zaštite mjernih podataka potrebno je voditi računa i o zaštiti privatnosti.
i) Sprječavanje i otkrivanje prijevara i neovlaštenog korištenja energije.
j) Za distribuiranu proizvodnju, osigurati dvosmjerno mjerenje radne i jalove energije.

III. FUNKCIONALNOSTI NAPREDNIH MJERNIH UREĐAJA U ZEMLJAMA EUROPSKE UNIJE

Napredni sustavi mjerenja trebaju:

- biti opremljeni namjenskim funkcijama u skladu s normizacijom kako je predloženo u Preporuci Komisije 2012/148/EU radi osiguranja tehničke i komercijalne interoperabilnosti, ili osiguranja mogućnosti naknadnog dodavanja funkcionalnosti,
- jamčiti privatnost i sigurnost podataka,
- omogućavati razvoj usluga za odgovor na potražnju i drugih energetskih usluga i
- podržavati tržišta maloprodaje kojima se potrošačima i energetskom sustavu osigurava potpuna korist.

U osam država članica koje nastavljaju s masovnim uvođenjem naprednih brojila za električnu energiju do 2020., funkcije su u potpunosti kako se preporučuje u Preporuci 2012/148/EU.

Funkcija čija realizacija predstavlja najveći izazov, odnosi se na učestalost kojom se može ažurirati podatke o potrošnji i učiniti ih dostupnima potrošačima i trećim osobama u njihovo ime. Ova će funkcija podržavati izravne povratne informacije o troškovima za potrošače, omogućiti potrošačima donošenje informiranih odluka o načinu potrošnje i olakšati razvoj novih maloprodajnih usluga i proizvoda. Sedam država članica koje nastavljaju s masovnim uvođenjem naprednog mjerenja do 2020. i tri koje ih ne namjeravaju uvesti ne zadovoljavaju tu

funkciju. Ako sustav naprednog mjerenja nema tu funkciju, države članice trebale bi osigurati da se ta funkcija može dodati naknadno ili da se ta funkcija može ponuditi na drugi način.

TABLICA I. PODRŽAVANJE MINIMALNOG SETA FUNKCIONALNOSTI NAPREDNOG MJERNOG SUSTAVA U ZEMLJAMA EU KOJE SU DONIJELE ODLUKU O MASOVNOJ UGRADNJI NAPREDNIH BROJILA

	Napredni sustav sadrži minimalnu funkcionalnost									
Zemlja	**a**	**b**	**c**	**d**	**e**	**f**	**g**	**h**	**i**	**j**
Austrija	+	+	+	+	+	+	+	+	+	+
Danska	+	djel.	+	+	+	+	+	+	+	+
Estonija	+	djel.	+	+	+	+	+	+	+	+
Finska	+	djel.	+	+	+	+	+	+	+	+
Francuska	+	+	+	+	+	+	+	+	+	+
Grčka	+	+	+	+	+	+	+	+	+	+
Irska	+	+	+	+	+	+	+	+	+	+
Italija	+	djel.	+	+	+	+	+	+	+	+
Luksemburg	-	-	+	+	-	-	+	+	-	-
Malta	djel.	+	+	+	+	djel.	+	djel.	+	+
Nizozemska	+	+	+	+	+	+	+	+	+	+
Poljska	+	+	+	+	+	+	+	+	+	+
Rumunjska	+	+	+	+	+	+	+	+	+	+
Španjolska	+	-	+	+	+	+	+	+	+	+
Švedska	+	djel.	+	+	+	+	djel.	djel.	+	+
Velika Britanija	+	+	+	+	+	+	+	+	+	+
+	sadrži funkcionalnost									
-	ne sadrži funkcionalnost									
djel.	djelomično sadrži funkcionalnost									

Čini se da ne postoji izravna veza između raspona zajedničkih minimalnih funkcija koje se razmatraju za uvođenje naprednih sustava mjerenja i njihovog ukupnog troška. Drugim riječima, odabir manjeg broja funkcija iz skupa zajedničkih minimalnih funkcija nužno ne podrazumijeva manje skupe sustave. Štoviše, razlike u podacima o „trošku po mjernom mjestu" u državama članicama pokazuju da na ukupno ulaganje daleko više utječu drugi parametri, uključujući:

- početne uvjete,
- lokalne troškove rada,
- zemljopisna konfiguraciju,
- dodatne značajke osim minimalnog skupa funkcija i
- ukupne scenarije, diskontne stope i razdoblja procjene koji se uzimaju u obzir u pojedinačnim analizama troškova i koristi.

To snažno govori u prilog tome da se od samog početka potrebno u potpunosti pridržavati zajedničkih minimalnih funkcija. Ako se u analizi troškova i koristi države članice ne podupire taj pristup, preporučuje se da se barem omogući nadograđivanje sustava koji će se uvesti kako bi podržavali „pametne" usluge i proizvode u budućnosti. Odabir nedovoljno optimalnog, nefleksibilnog sustava koji se ne može ažurirati u konačnici će uzrokovati više troškove ako, na primjer, ubrzo nakon ugradnje budu potrebne značajne izmjene ili čak potpuna zamjena kao odgovor na zahtjeve tržišta i potrošača.

Trenutačno je samo nekoliko država članica utvrdilo smjernice o funkcionalnim zahtjevima sustava naprednog mjerenja. Ostale su prepustile analizu mogućnosti odgovornima za uvođenje, u većini slučajeva operatorima distribucijskog sustava, bez davanja jasnih poticaja ili zahtjeva kakva obilježja trebaju imati funkcije koje koriste i potrošačima.

TABLICA II. PLANIRANI VREMENSKI OKVIRI UGRADNJE NAPREDNOG MJERENJA U DRŽAVAMA ČLANICAMA EU

Država	Broj brojila [milijun]	Početna godina	Završna godina
Italija	36,7	2001	2011
Finska	3,3	2009	2013
Malta	0,26	2009	2014
Španjolska	27,7	2011	2018
Austrija	5,7	2012	2019
Poljska	16,5	2012	2020
Velika Britanija	31,99	2012	2020
Estonija	0,709	2013	2017
Rumunjska	9	2013	2020
Grčka	7	2014	2020
Francuska	35	2014	2020
Nizozemska	7,6	2014	2020
Danska	3,28	2014	2020
Luksemburg	0,26	2015	2018
Irska	2,2	2016	2019

IV. KUPCI ELEKTRIČNE ENERGIJE – KRAJNJI KORISNICI SUSTAVA

Potreban je intenzivan komunikacijski napor kako bi se pomoglo kupcima da shvate svoja prava, koristi uvođenja naprednih brojila i sudjelovanja u programima upravljane potrošnje [2]. Kupci moraju biti informirani o funkcijama brojila i o tome koji će se podaci prikupljati i u koju će se svrhu te podatke koristiti.

TABLICA III. PROSJEČNI OSNOVNI REZULTATI POZITIVNIH EKONOMSKIH ANALIZA MASOVNOG UVOĐENJA NAPREDNIH MJERNIH SUSTAVA

	Područje vrijednosti	Prosjek (na osnovu pozitivnih CBA)
Smanjenje cijene energije	od 3 do 10 %	5,7 % ± 1,8 %
Životni vijek opreme	od 8 do 20 godina	15 % ± 4 godine
Ušteda energije	od 0 do 5 %	3 % ± 1,3 %
Smanjenje vršnog opterećenja	od 1 do 13%	-
Trošak po mjernom mjestu	od 450 kn do 5.800 kn	1.640 kn ± 990 kn
Dobit po mjernom mjestu	od 140 kn do 5.800 kn	2.300 kn ± 1.200 kn
Dobit za korisnika mreže	od 20 do 80%	-

Loša informiranost kupaca generira različite strahove od nove tehnologije koji mogu uzrokovati i blokadu provođenja projekta:

Informacije -Imaju li potrošači potrebne informacije kako bi donijeli ispravne odluke o potrošnji energije?

Aktivni angažman potrošača zahtijeva slijedeće informacije:

- usporedbu s povijesnim mjernim podacima i podacima drugih potrošača,
- troškove i način korištenja energije ovisne o pojedinom uređaju i vremenu korištenja (tarifi),
- ostvarene troškove po satu i procjenu budućih troškova,
- alarme o neobičnoj potrošnji i trenutne informacije o rezultatima poduzetih aktivnosti,
- novi tipovi podataka koji mogu biti raspoloživi (kvaliteta napona i opskrbe energijom),
- kako dobiti pomoć i detaljnije informacije.

Odabir - Da bi se omogućilo kupcu da dobije najbolju ponudu, potrebno mu je:

- jasan cilj i pouzdane informacije o dostupnim ponudama,
- pristup i mogućnost korištenja neovisnih alata za usporedbu,
- jednostavniji i brži proces promjene opskrbljivača.

Privatnost - Zabrinutost za privatnost može dovesti do gubitka samopouzdanje i angažmana kupca, a uzrok zabrinutosti može biti:

- priče u medijima o prijetnjama hakera, cyber terorizmu,
- korištenje detaljnih podataka o potrošnji kupca bez njegovog dopuštenja.

Troškovi - Kupci će platiti troškove naprednih mjernih uređaja, ali ostvarene uštede su male i neki kupci neće imati koristi;

- prosječni trošak naprednih brojila očekuje se u granicama od € 200 do € 250,
- očekivane uštede energije od 5-6% su nedovoljno dokazane,
- upitna je održivost početnih ušteda ostvarenih u nekim pilot projektima,
- teško je postići neke koristi ukoliko nisu osigurane potrebne funkcionalnosti cijelog sustava.

Kako bi se spriječio najveći broj potrošačkih strahova, osim dobrog informiranja potrošača, najveći izazov u uvođenju naprednog mjerenja biti će osmišljavanje sveobuhvatnog modela upravljanja prikupljanim podacima. Model upravljanja podacima mora omogućiti:

- razmjenu podataka između svih sudionika,
- pohranu ogromnih količina podataka,
- sigurnost,
- iskoristivost podataka za različite analize,
- osiguranje koristi za sve sudionike i promicanje čvrste uloge krajnjih korisnika mreže,
- podržavanje ostvarenje europskih 20/20/20 ciljeva.

V. UVOĐENJE NAPREDNOG MJERENJA U REPUBLICI HRVATSKOJ

Kao što je opisano u uvodnom poglavlju (I.) zahtjevi europskih direktiva prema izgradnji naprednih mjernih sustava ugrađeni su u hrvatsko zakonodavstvo kroz Zakon o energiji i Zakon o tržištu električne energije. Prijedlogom novih Općih uvjeta za opskrbu električnom energijom iz prosinca 2014. godine, Hrvatski regulator tržišta energije (HERA) opisao je i model uvođenja elektroničkih brojila s mogućnošću daljinskog očitavanja, bez zahtijevanja ostalih naprednih funkcija. Ovaj model primijenio bi se ukoliko se ne bi donijela odluka o uvođenju naprednog mjerenja.

Prema trenutnom prijedlogu teksta novih Općih uvjeta rok za opremanje svih 2,3 milijuna obračunskih mjernih mjesta u Republici Hrvatskoj [3] bio bi određen rok od 15 godina, što znači da bi godišnje trebalo ugraditi nešto više od 150.000 brojila. Uz prosječni trošak za ugradnju naprednih brojila od 223 eura, godišnje bi bilo potrebno investirati oko 34 milijun eura ili 263 milijuna kuna.

Na razini pojedinačnog kupca kategorije kućanstvo, dobit od uvođenja naprednog mjerenja ovisi o korištenom tarifnom modelu i količini potrošnje energije. Uz očekivano smanjenje cijene energije od 5,7% i moguće uštede energije od 3%, za kupce s jednom tarifom (plavi model) i prosječnom godišnjom potrošnjom od 3.000 kWh, može se očekivati godišnja ušteda od 66,20 kn.

Daljinsko očitavanje svih brojila omogućilo bi izdavanje mjesečnih računa za potrošenu električnu energiju na osnovu stvarnih očitanja.

VI. ZAKLJUČAK

Direktive europske unije 2009/72/CE i 2009/73/CE od 13. srpnja 2009. godine u području naprednog mjerenja zahtijevaju da država članica osigura implementaciju naprednih mjernih sustava koji će pridonijeti aktivnom sudjelovanju kupaca na tržištu električne energije. Zahtjevi europskih direktiva prema izgradnji naprednih mjernih sustava ugrađeni su u hrvatsko zakonodavstvo kroz Zakon o energiji , NN 120/2012 i Zakon o tržištu električne energije, NN 22/2013.

Oko dvije trećine zemalja članica Europske unije odlučilo se za uvođenje naprednog mjerenja do 2020. godine. Ovim projektom ugraditi će se oko 240 milijuna naprednih brojila, a ukupno ulaganje procjenjuje se na oko 45 milijardi eura. Kod pripreme masovne ugradnje brojila vrlo je bitno razmisliti o funkcijama takvog sustava, a pomoć u tome je zasigurno Preporuka komisije 2012/248/EU.

Napredna brojila svojim funkcijama trebala bi doprinijeti razvoju novih tarifnih modela i omogućiti izravnije sudjelovanje krajnjih korisnika na tržištu električne energije.

Za operatora distribucijskog sustava daljinsko očitavanja mjernih i kontrolnih podataka, omogućiti će brži postupak obračuna potrošnje energije, izračun

gubitaka energije po dijelovima mreže, priključenje većeg broja obnovljivih izvora, brže otkrivanje i otklanjanje kvarova te detaljnije informacije za planiranje rada i razvoja mreže.

Fazi određivanje funkcija naprednog mjernog sustava potrebno je dati posebnu pozornost te temeljiti odluke na do sada provedenim analizama u zemljama članicama Europske unije, kako bi se uz što manja ulaganja, osigurala što veća korist za krajnje kupce, ali i za operatora sustava i ostale subjekte na tržištu električne energije.

Određivanje mjerne nesigurnosti 3D laserskog skenera

Mr Nikolina Mijić,dipl.ing.geod.*,
* EKO EURO TIM d.o.o / Tehničko odjeljenje, Banja Luka, Bosna i Hercegovina
nikolinamijic7@gmail.com

Sažetak - 3D laserski skeneri nude korisnicima nove mogućnosti za konformniji i efektivniji rad, ali u stručnoj javnosti još uvijek ne postoji konsenzus u vezi ustaljene procedure za testiranje tačnosti i kalibraciju 3D laserskih skenera. Proces određivanja mjerne nesigurnosti laserskog skenera realizovan je u Metrološkoj laboratoriji Građevinskog fakulteta u Beogradu. Test polje za metrološku kontrolu formirano je pomoću 46 crno - bijelih signalnih markica. Obrada rezultata mjerenja izvršena je u softverskom paketu MATLAB. Mjerna nesigurnost je određena na osnovu dužine, horizontalnog i vertikalnog ugla lasera.

I. UVOD

Ubrzan tehnološki razvoj u sferi elektroničkog mjerenja dužina rezultovao je upotrebom impulsne metode koja omogućava bezreflektorno mjerenje dužina. Dalji razvoj u tom smjeru rezultovao je pojavom sasvim novih instrumenata koji se zovu laserski skeneri. Od pojave laserskih skenera prošlo je skoro već desetak godina, međutim zbog svojih mjernih karakteristika nezadrživo tehnološki napreduju, cijena im pada i postaju ekonomski sve prihvatljiviji. Primjena terestričkog laserskog skenera može biti zaista široka, počevši od mjerenja građevinskih objekata, mjerenje deformacija na branama, topografski premjer, industrijski premjer, arheološka mjerenja, snimanje fasada, mjerenje kulturnih objekata pa sve do savremenog 3D pogonskog katastra [2]. Za određivanje tačnosti 3D laserskih sistema u laboratorijskim uslovima vrši se testiranje rezultata mjerenja i kalibracija pomoću test polja, i to se vrši upoređenjem sa etalonskim vrijednostima.

U cilju metrološkog obezbjeđenja laserskog skenera potrebno je kritički procjeniti performanse instrumenta, korištenjem nezavisnih procedura, kao što je upoređenje rezultata skeniranja sa test poljem kontrolnih tačaka [3].

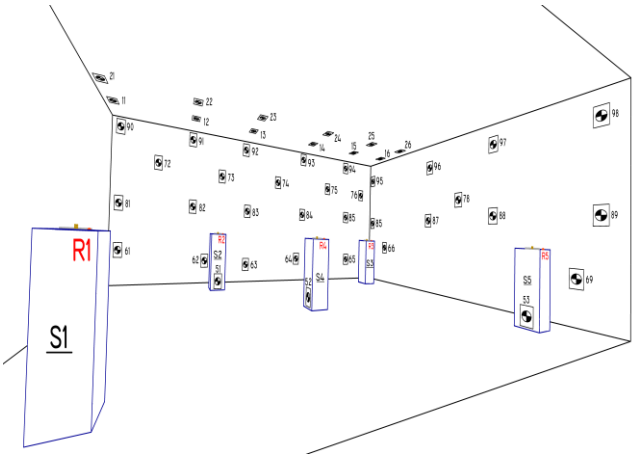
U radu će biti opisan postupak određivanja mjerne nesigurnosti 3D laserskog skenera. Terestrički laserski skener sve se više primjenjuje u praksi, ali ne postoji međunarodni konsenzus oko njihovog etaloniranja i određivanja mjerne nesigurnosti. Predložene su različite metode za postupak etaloniranja terestričkog laserskog skenera, ali se jedna izdvaja kao najvjerovatnija osnova budućeg standarda, a to je korištenje većeg broja kontrolnih tačaka [9].

Eksperimentalna mjerenja su izvršena u Metrološkoj laboratoriji, Građevinskog fakulteta u Beogradu. Pri terestričkom laserskom skeniranju razvijen je jedinstven pristup za etaloniranje terestričkih laserskih skenera, koji je primjenjen na instrument serije Leica Scan Station P20 [3].

II. ETALONIRANJE 3D LASERSKOG SKENERA

Eksperimentalni dio ovog rada odnosi se na etaloniranje 3D laserskog skenera u laboratorijskim uslovima. Model skenera koji je ispitivan je Leica ScanStation P20 [6]. Test polje za metrološku kontrolu laserskog skenera realizovano je u Metrološkoj laboratoriji. Test polje je formirano pomoću 46 crno-bijelih signalnih markica (Slika 1). Izgled test polja odnosno poligona za određivanje pravouglih koordinata markica poligona u koordinatnom sistemu laboratorije. Markice su izrađene na papiru dobrog kvaliteta, sa takvim osobinama da omogućavaju refleksiju prilikom mjerenja totalnom stanicom i da ih prepoznaje skener prilikom mjerenja [3]. Markice su dobro raspoređene u laboratoriji i nalaze se na zidovima i plafonu laboratorije, što je značajno za ocjenu preciznosti mjerenja horizontalnog i vertikalnog ugla. U laboratoriji se takođe nalazi 5 stubova sa opremom za prisilno centrisanje geodetskih mjerila. Provera mjerila u cjelini kao i kontrola rada pojedinih njegovih djelova vrši se neposredno i obuhvata spoljašni pregled i proceduru mjerenja.

Spoljašnji pregled, kojim se mjerilo postavlja na stub uz obezbjeđenu potpunu stabilnost postolja mjerila obuhvata grubu provjeru.



Slika 1. Poligon za određivanje pravouglih koordinata markica.

Mjerilo se izlaže laboratorijskim uslovima u vremenu od najmanje 30 minuta, postavlja se na stub uz obezbjeđenu potpunu stabilnost postolja mjerila. Gruba provjera mjerila obuhvata mehaničku provjeru instrumenta, i ogleda se u:

- Rad položajnih zavrtnjeva postolja instrumenta.
- Ispravnost ekrana (Display) i tastature (Keyboard) mjerila.
- Ispravnost kontakata izvora napajanja i konekcije (USB, Bluetooth, WLAN).
- Podešavanja položaja rotirajućeg ogledala (vidnog polja).

Određivanje mjerne nesigurnosti mjerila, nije moguće izvršiti u slučaju da se prilikom grube provjere samog instrumenta utvrdi neispravnost kontakata izvora napajanja [9].

III. ODREĐIVANJE PRAVOUGLIH KOORDINATA OZNAČENIH MARKICAMA

Svaka tačka u skeniranom oblaku tačaka je definisana sfernim (r, φ, θ) ili pravouglim koordinatama (x, y, z) u koordinatnom sistemu skenera i ima vrijednost inteziteta lasera intensity. Veza između rezultata merenja (r, φ, θ) i koordinata (x, y, z) je oblika:

$$\begin{bmatrix} x_j \\ y_j \\ z_j \end{bmatrix} = \begin{bmatrix} r_j \cos\theta_j \sin\varphi_j \\ r_j \sin\theta_j \cos\varphi_j \\ r_j \sin\varphi_j \end{bmatrix} \quad (1)$$

gdje su r_j, φ_j, θ_j mjerene veličine - dužina, horizontalni pravac i vertikalni ugao za j-tu tačku u oblaku tačaka. Pravougle koordinate tačke u koordinatnom sistemu skenera postavljenog na stubu br. 1 su (x_j, y_j, z_j), označene indeksom i=1 u vektoru koordinata X_i.

A. *Određivanje spoljnih parametara orijentacije skenera*

Georeferenciranje je transformacija oblaka tačaka iz koordinatnog sistema skenera u spoljni (geodetski) koordinatni sistem, u koordinatni sistem laboratorije.

U georeferenciranju je zajedničko to što markice moraju imati poznate koordinate u oba sistema. Veza između dva sistema se opisuje, pomoću 6 transformacionih parametara. Faktor razmere je nebitan u transformaciji [2]. Ovi parametri se nazivaju spoljni orijentacioni parametri (EOPs). U cilju jedinstvenog određivanja 6 EOPs parametara potrebno je znati makar 6 koordinata u oba sistema, tako da tačke nikako ne bi smjele da budu na istoj liniji [5]. U poligonu se koriste 3 ili više markica sa poznatim 3D koordinatama. Ove tačke se zovu kontrolne tačke. Njihove koordinate su određene totalnom stanicom [7]. Geometrija vizurnih markica je takva da su one raspoređene na različitim rastojanjima i ne leže na istoj liniji [3].

Vektor translacije je oblika:

$$\Delta X_{ie} = [\Delta X \ \Delta Y \ \Delta Z]^T \quad (2)$$

R_{ie} je matrica rotacije između koordinatnih sistema, od skenera do koordinatnog sistema laboratorije. Rotaciona matrica predstavlja rotaciju između različitih koordinatnih sistema. Matrica je funkcionalna veza uglova rotacije ω, ϕ, κ, oko x, y i z koordinatne ose. Matrica rotacije se računa kao:

$$\mathbf{R}_1(\omega) = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos\omega & \sin\omega \\ 0 & -\sin\omega & \cos\omega \end{bmatrix}, \quad (3)$$

$$\mathbf{R}_2(\phi) = \begin{bmatrix} \cos\phi & 0 & -\sin\phi \\ 0 & 1 & 0 \\ \sin\phi & 0 & \cos\phi \end{bmatrix}, \quad (4)$$

$$\mathbf{R}_3(\kappa) = \begin{bmatrix} \cos\kappa & \sin\kappa & 0 \\ -\sin\kappa & \cos\kappa & 0 \\ 0 & 0 & 1 \end{bmatrix} \quad (5)$$

gdje su $R_1(\omega)$, $R_2(\phi)$ i $R_3(\kappa)$ matrice rotacije oko x, y i z koordinatnih osa.

U georeferenciranju transformacija između skenera i spoljnog koordinatnog sistema se opisuje kao:

$$X_e = X_{scanner} + R_{ie}(\kappa) X_i \quad (6)$$

gdje su: $X_{scanner}$ koordinate centra koordinatnog sistema skenera u spoljnom koordinatnom sistemu, $R_{ie}(\kappa)$ je matrica rotacije između dva koordinatna sistema. Matrica rotacije je funkcija samo ugla za orijentaciju (azimut κ). Praktično su uglovi ω i ϕ jednaki nuli. Matrica rotacije se računa po izrazu $R_3(\kappa)$.

Parametri transformacije koordinatnog sistema skenera u koordinatni sistem laboratorije se određuju rješavanjem jednačina (6), metodom najmanjih kvadrata [9]. Parametri transformacije se računaju na osnovu tačaka na zidovima laboratorije (ukupno 46 tačaka).

B. *Određivanje pravouglih koordinata markica poligona u koordinatnom sistemu laboratorije*

Matematički model je razvijen na principima self-calibration. Self-calibration se izvodi u laboratorijskim uslovima unutar stabilizovanog poligona. Poligon čine označene tačke na zidovima, plafonu i stubovima laboratorije. U matematičkom modelu uslovnih jednačina učestvuje vektor mjerenih veličina i vektor nepoznatih parametara. Transformacija koordinatnog sistema skenera u spoljni koordinatni sistem može biti implicitno izražena na sledeći način:

$$f = (L, X) = 0 \quad (7)$$

gdje su: L - vektor izravnatih mjerenih veličina

X - vektor ocjenjenih nepoznaih parametara.

$$\mathbf{f}_j^{(i)}\left(\hat{\mathbf{L}}_j^{(i)},\hat{\mathbf{X}}_j^{(i)}\right)=\Delta\mathbf{X}^{(i)}+\mathbf{R}\left(\omega^{(i)},\phi^{(i)},\kappa^{(i)}\right)\mathbf{x}_{scan\ j}^{\ (i)}-\mathbf{X}_j^e=0,\quad i=1,2,...,p;\ j=1,2,...,m, \tag{8}$$

gdje je: p ukupan broj stanica skeniranja (p = 1), m je ukupan broj tačaka unutar poligona za kalibraciju (ukupno 40 tačaka), $\Delta X^{(i)}$ - vektor translacionih parametara za i-tu stanicu skeniranja:

$$\mathbf{\Delta X}^{(i)}=\begin{bmatrix}\Delta X^{(i)} & \Delta Y^{(i)} & \Delta Z^{(i)}\end{bmatrix}^{\mathrm{T}},\quad i=1,2,...,p. \tag{9}$$

$R(\omega^{(i)}, \phi^{(i)}, \kappa^{(i)})$ - matrica rotacije između dva koordinatna sistema za i-tu stanicu skeniranja:

$$\mathbf{R}\left(\omega^{(i)},\phi^{(i)},\kappa^{(i)},\right)=\mathbf{R}^{(i)}=\begin{bmatrix}r_{11}^{(i)} & r_{12}^{(i)} & r_{13}^{(i)}\\ r_{21}^{(i)} & r_{22}^{(i)} & r_{23}^{(i)}\\ r_{31}^{(i)} & r_{32}^{(i)} & r_{33}^{(i)}\end{bmatrix}=\mathbf{R}_3\left(\kappa^{(i)}\right)\mathbf{R}_2\left(\phi^{(i)}\right)\mathbf{R}_1\left(\omega^{(i)}\right)=$$

$$=\begin{bmatrix}\cos\kappa^{(i)} & \sin\kappa^{(i)} & 0\\ -\sin\kappa^{(i)} & \cos\kappa^{(i)} & 0\\ 0 & 0 & 1\end{bmatrix}\begin{bmatrix}\cos\phi^{(i)} & 0 & -\sin\phi^{(i)}\\ 0 & 1 & 0\\ \sin\phi^{(i)} & 0 & \cos\phi^{(i)}\end{bmatrix}\begin{bmatrix}1 & 0 & 0\\ 0 & \cos\omega^{(i)} & \sin\omega^{(i)}\\ 0 & -\sin\omega^{(i)} & \cos\omega^{(i)}\end{bmatrix},\ i=1,2,...,p \tag{10}$$

$X_{scan\ j}^{\ (i)}$ - je vektor koordinata za j-tu skeniranu tačku na poligonu sa i-te stanice skeniranja u koordinatnom sistemu skenera (CS) korigovan za uticaj parametara kalibracije skenera (koji se još nazivaju i dodatni parametri):

$$\mathbf{x}_{scan\ j}^{\ (i)}=\begin{bmatrix}x_j^{(i)}\\ y_j^{(i)}\\ z_j^{(i)}\end{bmatrix}=\begin{bmatrix}\left(r_j^{(i)}-\Delta r\right)\cos\left(\varphi_j^{(i)}-\Delta\varphi\right)\cos\left(\theta_j^{(i)}-\Delta\theta\right)\\ \left(r_j^{(i)}-\Delta r\right)\sin\left(\varphi_j^{(i)}-\Delta\varphi\right)\cos\left(\theta_j^{(i)}-\Delta\theta\right)\\ \left(r_j^{(i)}-\Delta r\right)\sin\left(\theta_j^{(i)}-\Delta\theta\right)\end{bmatrix},\quad i=1,2,...,p;\ j=1,2,...,m \tag{11}$$

gdje je: p = 1 i m = 40, a r, φ i θ označavaju dužinu, horizontalni pravac i vertikalni ugao, koji su sračunati iz približnih koordinata skeniranih tačaka u skeneru CS (x, y, z) kao:

$$r_j^{(i)}=\sqrt{\left(x_j^{(i)}\right)^2+\left(y_j^{(i)}\right)^2+\left(z_j^{(i)}\right)^2}$$

$$\varphi_j^{(i)}=\arctan\left(\frac{y_j^{(i)}}{x_j^{(i)}}\right),$$

$$\theta_j^{(i)}=\arctan\left(\frac{z_j^{(i)}}{\sqrt{\left(x_j^{(i)}\right)^2+\left(y_j^{(i)}\right)^2}}\right) \tag{12}$$

IV. POSTUPAK OPAŽANJA I ODREĐIVANJE MJERNE NESIGURNOSTI 3D LASERSKOG SKENERA

Mjerilo, u ovom slučaju laserski skener serije Leica ScanStation P20, se postavi i fiksira na stub broj 1, djelujući na položajne zavrtnje približno se horizontira dovođenjem mjehura centrične libele da vrhuni. Instrument izvrši samohorizontiranje odmah nakon uključivanja. Postupak se ponovi i prilikom postavljanja instrumena na stub broj 4, jer su i sa ovog stuba vršena opažanja [9].

Opažanje je izvršeno u zatvorenom poligonu, gdje su markice označene kao mete. Poligon za testiranje terestričkog laserskog skenera čine signalne markice na zidovima, plafonu i stubovima laboratorije. Skeniranje je obavljeno sa jednim skenom sa stuba broj 1. Sve signalne markice su vidljive sa stuba broj 1, ali instrument serije Leica ScanStation P20 nije mogao da skenira signalne markice koje se nalaze na plafonu [3]. Idući od markice broj 61 u smjeru kretanja kazaljke na satu izvršeno je skeniranje svih ostalih markica. Postupak je ponovljen i za mjerenja sa stuba broj 4 [9].

A. *Određivanje mjerne nesigurnosti mjerenja dužina*

Postupak određivanja mjerne nesigurnosti mjerenja dužina je vršeno identično za oba stuba. Mjerna nesigurnost mjerenja dužina sračunata je za 32 signalne markice, a potom su vršene kombinacije mjerenja tako što su izbacivana pojedina mjerenja u cilju upoređenja rezultata mjerenja i određivanja broja tačaka sa kojima treba da se vrši etaloniranje. Mjerna nesigurnost mjerenja dužina je sračunata prvo za 32 signalne markice a potom je smanjen broj mjerenja na 20, 15, 10, 5 i 4. Tako je urađeno za oba stuba sa kojih je vršeno opažanje [8].

B. *Određivanje mjerne nesigurnosti mjerenja horizontalnih pravaca*

Postupak određivanja mjerne nesigurnosti mjerenja horizontalnih pravaca je vršen identično za oba stuba. Mjerna nesigurnost mjerenja horizontalnih pravaca sračunata je za 32 signalne markice, a potom su vršene kombinacije mjerenja tako što su izbacivana pojedina mjerenja u cilju upoređenja rezultata mjerenja i određivanja broja tačaka sa kojima treba da se vrši etaloniranje. Mjerna nesigurnost mjerenja horizontalnih pravaca sračunata je prvo za 32 signalne markice a potom je smanjen broj mjerenja na 20, 15, 10, 5 i 4. Tako je urađeno za oba stuba sa kojih je vršeno opažanje [9].

C. *Određivanje mjerne nesigurnosti mjerenja vertikalnih uglova*

Mjerna nesigurnost mjerenja vertikalnih uglova je sračunata na osnovu izraza (12). Postupak određivanja mjerne nesigurnosti mjerenja vertikalnih uglova je vršen identično za oba stuba. Mjerna nesigurnost mjerenja vertikalnih uglova sračunata je za 32 signalne markice, a potom su vršene kombinacije mjerenja tako što su izbacivana pojedina mjerenja u cilju upoređenja rezultata mjerenja i određivanja broja tačaka sa kojima treba da se vrši etaloniranje [8]. Nesigurnost mjerenja vertikalnih uglova sračunata je prvo za 32 signalne markice a potom je smanjen broj mjerenja na 20, 15, 10, 5 i 4. Tako je urađeno za oba stuba sa kojih je vršeno opažanje [9].

V. EKSPERIMENTALNA ISTRAŽIVANJA

Unos i obrada podataka mjerenja izvršena je u softverskom paketu Microsoft Office Excel a provjera rezultata mjerenja je vršena u softverskom paketu MATLAB, gdje je posebno kreiran zapis za

transformaciju koordinata i određivanje vrijednosti mjerne nesigurnosti. Određene su vrijednosti mjerne nesigurnosti za mjerenje dužina, horizontalnih pravaca i nesigurnosti mjerenja vertikalnih uglova. Mjerenja su izvršena sa stubova broj 1 i 4. Vršene su kombinacije mjerenja sa ovih stubova u cilju određivanja broja tačaka sa kojima treba da se vrši etaloniranje [9].

Prilikom etaloniranja terestričkog laserskog skenera, snimljeno je 32 signalne markice, na osnovu kojih su sračunate vrijednosti za mjernu nesigurnost mjerenja dužine, horizontalnih pravaca i vertikalnog ugla. Ove vrijednosti su upoređivane sa manjim brojem mjerenja. Vršene su kombinacije sa vrijednostima koje su dobijene sa 20, 15, 10, 5 i 4 signalne markice. Vrijednosti koje su sračunate su u okviru deklarisanih tačnosti mjerenja [6]. Kombinacije mjerenja su vršene u cilju da se odredi broj tačaka, sa kojima bi bilo najbolje vršiti etaloniranje terestričkog laserskog skenera. Prilikom iscrtavanja dijagrama koji pokazuje zavisnost vrijednosti mjerne nesigurnosti mjerenja, vrijednosti koje su dobijene se lome na 10 tačaka, rastu ili opadaju. U slučaju računanja mjerne nesigurnosti mjerenja dužine (Slika 2 i 3) i vertikalnog ugla sa stuba 1 i 4 (Slika 6 i 7), vrijednosti opadaju, dok vrijednosti mjerne nesigurnosti mjerenja horizontalnih pravaca sa stuba 1 i 4 (Slika 4 i 5), rastu sa smanjivanjem broja mjerenja. Na osnovu obrade rezultata mjerenja i kombinacije pojedinih mjerenja, prijedlog je da se etaloniranje terestričkog laserskog skenera vrši sa 10 tačaka.

VI. ZAKLJUČAK

Na tržištu se pojavljuje sve veći broj proizvođača terestričkih laserskih skenera, mnogi od njih na različite načine izražavaju karakteristike svojih instrumenata, koristeći različite kriterijume kao što su: tačnost, preciznost i rezolucija. Pored određivanja ukupne tačnosti rezultata mjerenja laserskim skenerom drugi važan aspekt osiguranja kvaliteta 3D informacija je geometrijska kalibracija mjerila [3].

U oblasti kalibracije laserskih skenera koristi se analogija sa fotogrametrijskim metodama, gdje se kalibracijom smatra određivanje spoljnih parametara orjentacije i sistematskih grešaka svih snimaka u datom projektu. Kalibracija terestričkih laserskih skenera je zahtjevna procedura zbog velikog broja različitih komponenata iz kojih se sastoji instrument. Etaloniranje komponenata terestričkog laserskog skenera bazira se na poznatom modelu konstrukcije instrumenta i njegovih komponenata, a i takođe u dobrom poznavanju instrumentalnih grešaka [1].

Svaka instrumentalna greška istražuje se pojedinačno pomoću specifičnih eksperimentalnih mjerenja, podešavanju instrumenta i registrovanju uticajnih veličina na proces mjerenja terestričkim laserskim skenerom [2]. Za postizanje milimetarske tačnosti neophodno je testiranje terestričkog laserskog skenera i u laboratoriji i u terenskim uslovima, jer postoje velike razlike koje utiču na rezultate mjerenja [3].

Pri terestričkom laserskom skeniranju razvijen je jedinstven pristup za etaloniranje terestričkih laserskih skenera, koji je primjenjen na instrument serije Leica ScanStation P20. Proces etaloniranja je izvršen za jedan dan. Etaloniranje terestričkog laserskog skenera je proces koji osim poznavanja instrumenta i rada na njemu zahtjeva znanja i iz drugih oblasti geodezije koja su morala biti primjenjena prilikom obrade podataka mjerenja [2].

Na osnovu mjerenja, sračunate su vrijednosti za mjernu nesigurnost mjerenja dužina, horizontalnih pravaca i vertikalnog ugla. Nakon što su sračunate

vrijednosti za 32 signalne markice, postupak je ponovljen i za manji broj mjerenja, tj. sračunate su vrijednosti za 20, 15, 10, 5 i 4 signalne markice [9].

Ove vrijednosti su sračunate za mjerenja sa stuba broj 1 i 4. Cilj računanja vrijednosti mjerne nesigurnosti za manji broj mjerenja bio je da se odredi sa koliko tačaka bi se trebalo vršiti etaloniranje terestričkog laserskog skenera.

Sve vrijednosti koje su dobijene kombinacijom mjerenja su u okviru deklarisane tačnosti [6]. Prijedlog je da se etaloniranje vrši sa 10 tačaka, a to je zaključeno na osnovu dijagrama jer se na toj vrijednosti kod oba stuba i za sve vrijednosti lomi dijagram. Rezultati mjerenja su sljedivi do nacionalnog etalona jedinice dužine i nacionalnog etalona jedinice ugla Švajcarske (METAS) preko laboratorije broj 02-025 [5].

Sažetak

Prikupljanje podataka za analizu operativnih karakteristika površinskog *javnog gradskog prijevoza* (JGP) danas se može izvesti na više načina uz pomoć različitih tehnologija. Cilj prikupljanja podataka s pokretnim osjetilima je jeftina i učinkovita analiza operativnih karakteristika JGP-a. Upravo u razvoju JGP-a traže se rješenja prometne problematike većih gradova.

U radu se prikazuje koncept agilnog prikupljanja podataka o prometnim tokovima JGP-a, te transformacija prikupljanih podataka dobivenih pokretnim osjetilima u definirani logički model prostornih podataka koji je ujedno i sredstvo za mjerenje svojstava prikupljanih podataka. Logički model prostornih podataka razvijen je temeljem *linearnih referentnih sustava* (LRS). LRS-ima se podaci dovode u isti prostorni okvir, a složenost obrade podataka je smanjena za dvije dimenzije. Ostvaren je koncept za računalnu analizu prikupljanih podataka i testiran na sveučilišnom projektu[1].

Analiza se temelji na predviđenim i prepoznatim karakterističnim pravilima ponašanja prikupljanih podataka. Primjena pojedinog pravila vrši se na osnovu teorije prometnih tokova i *mjera težine svojstava* (MTS) dobivenih u odnosu na postavljene LRS-e kao i prema tome donosi li pravilo neku novu informaciju/podatak koji doprinosi analizi ili potvrđuje neku pretpostavku za procjenu operativnih karakteristika.

Aplikativni doprinos ogleda se u izradi fizičkog modela podataka ostvarenog LRS-ima koji pruža podlogu za prometne analize i izračun operativnih karakteristika JGP-a.

I. UVOD

Da bi se stanje u površinskom javnom gradskom prijevozu moglo evaluirati potreban je niz pokazatelja. Posebno su bitni mjerljivi pokazatelji koji služe i za evaluaciju primijenjenih mjera u cilju unaprjeđenja javnog gradskog prijevoza. Niz evaluacijskih aktivnosti povezan je sa smanjenjem vremena potrebnog da vozilo JGP-a prijeđe udaljenost između dvije stanice, što je često povezano sa smanjenjem vremena koje vozilo provede na raskrižjima da bi se u konačnici povećale komercijalne brzine. U tom smislu rade se *logističke analize* utvrđivanja vjerojatnosti izbora prijevoznog sredstva u ovisnosti o poželjnosti njegove uporabe i očituje se pokazateljima koji se ogledaju kroz:

- trajanje putovanja nastalo korištenjem različitih prijevoznih sredstva,
- troškove putovanja za dva prijevozna sredstva s obzirom na prosječne troškove,
- broj dijelova putovanja (pješačenje, čekanje i vožnja pojedinim prijevoznim sredstvom),
- vrijeme utrošeno na vožnju i čekanje prijevoznog sredstva.

Operativne karakteristike JGP-a bitno su obilježene prometnim tokovima drugih načina odvijanja prometa (pješački, automobilski, itd.). Stoga stoji tvrdnja da je JGP kao podsustav ukupnog prometnog sustava izložen, poput mnogih dinamičkih sustava, slučajnim (*heurističkim*) prostorno-vremenskim utjecajima okoline, da uvelike ovisi o prostornim konstrukcijskim elementima dionica i pojedinih odsječaka prometnica, te da na njega utječe niz faktora koji nisu u neposrednoj vezi s tim elementima [1] [2] [3].

Pod pojmom *prostorno-vremenski pokazatelj* najčešće se podrazumijeva vrijeme provedeno na stajalištu, vrijeme izlaska/ulaska putnika, vrijeme vožnje na promatranim dionicama, vrijeme putovanja, zadržavanja na raskrižju, vrijeme prolaska kroz raskrižje te operativna brzina vozila. Navedeni pokazatelji često služe i za evaluaciju primijenjenih mjera u cilju unaprjeđenja javnog gradskog prijevoza [4]. Vrijednosti pokazatelja se koriste i kao ulazne veličine za razne ITS (*Inteligentne Transportne Sustave*) aplikacije [5] [6]. Primjerice, u [7] se tvrdi da se "unutarnja" kvaliteta usluga javnog prijevoza može ocjenjivati i pratiti njeni ciljevi izvedbe temeljem *prostorno-vremenskih pokazatelja*, ali procjena "istinske" kvalitete oslanja se na percepciju performansi sustava od strane korisnika usluge.

Prikupljanje podataka o operativnim karakteristikama JGP-a se vrši na više različitih načina, primjerice: ručnim

[1] Istraživanje, koncept obrade i rezultati istraživanja sačinjeni su u sklopu projekta „*Razvoj planova održive urbane mobilnosti*“ koji je odobren i proveden u sklopu projekta kratkoročne financijske potpore istraživanju Sveučilišta u Zagrebu, temeljem namjenskog višegodišnjeg institucijskog financiranja znanstvene djelatnosti na sveučilištima.

mjerenjem vremena, anketiranjem, podacima iz naplatnog sustava kao i drugim, više ili manje, preciznim podacima i metodama. U znanstvenoj literaturi prepoznat je veliki potencijal prikupljanja podataka *pokretnim osjetilima*. Osnovni takav sustav temelji se na više podsustava različitih tehnologija. Primjenom vozila opremljenih opremom za satelitsko pozicioniranje i komunikaciju te sustava koji bilježe putanje kretanja imamo tzv. „sonda-vozila“ ili *pokretna osjetila* (eng. *Probe vehicle ili Floating Car Data*, skraćeno - FCD) [8] [9] [10] [11].

Razvijeno je niz modela koji se temelje na vremenskim serijama tako prikupljanih podataka i predviđaju vrijednost varijable na temelju povijesnih podataka. Pri tom je problem u nepredvidivosti prometnog toka, najčešće iz razloga jer je podvrgnut prometnim opterećenjima (gužvama), koja nisu ravnomjerna u vremenu, već imaju svoju prostornu raspodjelu i vremenska kolebanja. Razlozi za to su brojni, a najčešće se mogu opisati ograničenjima nametnutim ponašanjem čovjeka, prometnom potražnjom, prometnom regulativom, fizičkim značajkama prometne infrastrukture i sl.

Kako modeliranje vremenskih pokazatelja u stvarnom vremenu i kratkoročno predviđanje zahtijeva da je proces *stacionaran* (eng. *stationarity*), što u slučaju prometnog toka nije zadovoljeno, najčešće se uvodi pojam *sezonalnosti* (eng. *seasonality*) i umjesto teorije o prometnom toku koristi se statistika. Rezultati su pokazali u određenim slučajevima veoma visoku točnost, uz nisko korištenje računalnih resursa, dok su u nekim drugim slučajevima bili neupotrebljivi. Postoji dosta modela koji se koriste za predviđanje i procjenu stanja [12] [13] [14]. Provedena je i njihova verifikacija na njemačkim autocestama [15] i urbanim sredinama gdje su pokazale realistične rezultate s makroskopske razine, *TABLICA I*. Najčešći problem koji je uočen bio je vezan *za nedovoljnu količinu podataka od pokretnih osjetila* kao i *utjecaj specifičnih događaja* na prikupljane podatke.

Za razliku od drugih metoda, pokazatelji operativnih karakteristika JGP-a računati su u odnosu na LRS-ove koji svojom strukturom (*crte i kružni lukovi*) i pridodanim atributima predstavljaju prometne tokove i mogu kao sredstvo za računalnu obradu podataka omogućiti komparaciju podataka na *virtualnoj lokaciji*. Učinak takvog pristupa primjene LRS-a veoma dobro se pokazao na križanjima na kojima dolazi do sukobljavanja većeg broja prometnih tokova. Obrada podataka ostvarena je transformacijom podatkovnih točki u LRS-ove što je u suštini *različito* od linearnog referenciranja iako dosta slično. Linearno referenciranje omogućuje nalaženje točaka i raspona uzduž linearnih sredstava dok transformacijom točki u LRS one ostaju na istom mjestu u prostoru ali je omogućeno mjerenje njihovih svojstava u odnosu na LRS.
